[173] Regarding the activities of the Einsatzgruppen as troops to combat partisans or to murder the Jews (depending on which view one takes), Udo Walendy has written three critical studies well worth reading: Historische Tatsache Nr. 16 & 17, "*Einsatzgruppen im Verband des Heeres*", parts 1 & 2; Historische Tatsache Nr. 51, "*Babi Jar – die Schlucht mit 33.771 ermordeten Juden?*"; Verlag für Volkstum und Zeitgeschichtsforschung, Vlotho 1983, 1983, and 1992.

killings.[174] Obviously, in selecting the victims of such reprisals, one would not choose Ukrainians, Byelorussians or members of the Balkan, Baltic or Caucasian peoples, of whom considerable numbers fought in German units. The fact that the Jews were predominantly unpopular amongst these peoples was mainly due to fairly recent causes. In the previous decades many people had had terrible experiences with Communist commissars, disproportionately many of whom were of Jewish descent, especially in the first few decades of Soviet Bolshevism.[175] The Russian Jewess Sonja Margolina has made some interesting points regarding the involvement of the Russian Jews in the Bolshevist reign of terror:[176]

> *"Nevertheless: the horrors of revolution and civil war, just like those of the repressions later, are closely tied to the image of the Jewish commissar."* (p. 47)

> *"The Jewish presence in the instruments of power was so impressive that even such an unbiased contemporaneous researcher as Boris Paramonov, a Russian cultural historian living in New York, asked whether the promotion of the Jews into leadership positions may perhaps have been a 'gigantic provocation'."* (p. 48)

Margolina has written a particularly detailed analysis of a book which appeared in 1924 under the title *Rußland und die Juden*. This book examines the causes of the Russian Jews' conspicuously above-average participation in the excesses of the October Revolution and the dictatorship that followed it, and analyzed the consequences of this involvement. In their appeal "*To the Jews in all nations!*" the authors of this book discussed by Margolina wrote:

> *"'The Jewish Bolsheviki's overeager participation in the subjugation and destruction of Russia is a sin that already bears within itself the seeds of its retribution. For what greater misfortune could happen to a people than to have its own sons engage in excesses. Not only will this be counted against us as an element of our guilt, it will also be held up to us as reproach for an expression of our power, for a striving for Jewish hegemony. Soviet power is equated with Jewish power, and the grim hatred of the Bolsheviki will transform into a hatred of the Jews* […] *All nations and peoples will be swamped by waves of Judeophobia. Never before have such thunderclouds gathered above the heads of the Jewish people. This is the bottom line of the Russian upheaval for us, for the Jewish people.'"* (p. 58)

Margolina quotes further from this anthology:

> *"'The Russians have never before seen a Jew in power, neither as governor nor as policeman, nor as postal official. There were both good and bad times in those days too, but the Russian people lived and worked and the fruits of their labors were their own. The Russian name was mighty and threatening. Today the Jews are at every corner and in all levels of power. The Russians see them at the head of the Czarist city, Moscow, and at the head of the metropolis on the River Neva and at the head of the Red Army, the ultimate mechanism of self-destruction.* […] *The Russians are now faced with a Jew as judge as well as executioner; they encounter Jews at every step, not Communists who are just as poor as they themselves but who nevertheless give orders and take care of the interests of the Soviet power* […] *It is not surprising that the Russians, in comparing the past to the present, conclude that the present power is Jewish, and so bestial precisely because of that.'"* (p. 60)

In the early 1990s, Professor Dr. Ernst Nolte also pointed out the Jews' intimate entanglement in Communism, though naturally he rejects equating the Jews with Bolshevism. Nolte writes:[177]

---

[174] For the time between Jan. 1, 1943, and Oct. 31, 1944 (22 months), the German authorities have claimed 145,364 personens killed in the partisan warfare, 88,493 imprisoned, and 90,993 civilians "*registered*", *i.e.*, either sent into camps or otherwise punished; cf. F. W. Seidler, *op. cit.* (note 156).

[175] Germar Rudolf, Sibylle Schröder "*Partisanenkrieg und Repressaltötungen*", *Vierteljahreshefte für freie Geschichtsforschung*, 3(2) (1999), pp. 145-153, have discussed this recently.

[176] S. Margolina, *Das Ende der Lügen*, Siedler, Berlin 1992.

[177] E. Nolte, "*Abschließende Reflexionen über den sogenannten Historikerstreit*", in U. Backes, E. Jesse, R. Zitelmann (eds.), *Die Schatten der Vergangenheit*, Propyläen, Berlin 1992, pp. 83-109, here pp. 92f.

> *"For readily apparent social reasons, was not the percentage of persons of Jewish extraction particularly great among the participants in the Russian Revolution, different from the percentages of other minorities such as the Latvians? Even at the start of this century Jewish philosophers were still pointing with great pride to this extensive participation of the Jews in Socialist movements. After 1917, when the anti-Bolshevist movement – or propaganda – stressed the topic of the Jewish People's commissars above all others, this pride was no longer expressed,* […] *But it took Auschwitz to turn this topic into a taboo for several decades.*
>
> *It is all the more remarkable that in 1988 the publication* Commentary*, the voice of right-wing Jews in America, published an article by Jerry Z. Muller who recalls these indisputable facts – though of course they are open to interpretation:*
>
> *'If Jews were highly visible in the revolution in Russia and Germany, in Hungary they seemed omnipresent.* […] *Of the government's 49 commissars, 31 were of Jewish origin* […] *Rakosi later joked that Garbai (a gentile) was chosen for his post 'so that there would be someone who could sign the death sentences on Saturdays'.* […] *But the conspicuous role of Jews in the revolution of 1917-19 gave anti-Semitism (which 'seemed on the wane by 1914') a whole new impetus.* […] *Historians who have focussed on the utopian ideals espoused by revolutionary Jews have diverted attention from the fact that these Communists of Jewish origin, no less than their non-Jewish counterparts, were led by their ideals to take part in heinous crimes – against Jews and non-Jews alike.'"*

Referring to the causal nexus Nolte had postulated between GULag and Auschwitz, Muller concludes:

> *"The Trotskies make the revolutions* [*i.e.*, the GULag] *and the Bronsteins pay the bills* [in the Holocaust]. "[178]

Thus it seems understandable that National Socialism, and the eastern peoples fighting alongside for their freedom, equated the Jews in general with the Bolshevist terror and the activities of the commissars – though such an identification, being sweeping and collective, was unjust. Nevertheless, it is therefore more than plausible that it was Jews, first and foremost, who were made to pay for the partisan warfare and other war crimes of the Soviets. Anyone who (rightly) criticizes this, however, should also not omit to consider where the blame for this kind of escalation of the war in the East was to be found. And clearly it was to be found with Stalin who, as an aside, had treated the Jews in his sphere of influence at least as mercilessly ever since the war had begun, as Hitler had.[179]

Appendix 1:

Wood Preservation through Fumigation with Hydrogen Cyanide: Blue Discoloration of Lime- and Cement-Based Interior Plaster

HELMUT WEBER, WITH COMMENTS BY GERMAR RUDOLF

Water- and oil-based substances are not the only means for preserving wood; for a long time wood has also been fumigated with toxins, such as hydrogen cyanide.

Hydrogen cyanide, or hydrogen cyanide, is a weak acid, which reacts with moist, very alkaline plasters through the process of neutralization: the product is calcium cyanide. The highly reactive cyanide ion combines with iron ions to form, among other things, the complex salt known as Prussian Blue. This is why, in the case of the architectural damage described herein, the iron-rich plaster became discolored blue.

Background

Approximately three years ago [1976] *a church of average size was extensively restored. Aside from drying out the brickwork and removing salt deposits, a fumigation with hydrogen cyanide (of the Zyklon B type) was also performed. This method was used to treat parts of the gallery as well as the structural woodwork for the choir section, which had been infested by various wood pests. It is important to note that this method does not provide protection against reoccurrence; it is not a preventative measure and serves strictly to eradicate the pests already present.*

In such fumigations, gaseous toxins are distributed throughout the space in question. They are left to react for an appropriate period of time, and then the space is aired out and the toxins are removed to the outside world. Of course it is important that the facilities to be fumigated are sealed off as tightly as possible during the procedure.

In the case under investigation here, fumigation was carried out after the outside walls of the building had been dried out with an electro-osmotic device and after the plaster in the interior had been restored. In this context it is important to note that the plaster used was a porous hydrophobic kind with moisture-damming properties: such restoration plasters are characterized by low capillary water absorption and greatest possible permeability to water vapor; limit values may be set at $A \leq 0.3\ kg/m^2h^{0.5}$ *and* $s_d \leq 2$ *m. The plaster contained perlite as filler and, as later analyses showed, had a relatively high iron content, exceeding 1% by weight on average. The plaster was bound with lime and cement and consequently was highly alkaline.*

Several weeks' time elapsed between replastering and the fumigation. The fumigation was carried out by an expert firm, which had already successfully treated several hundred other facilities. And at first there were no problems in this case either. Following the fumigation the remaining work was carried out without complications. The work consisted in the main of re-

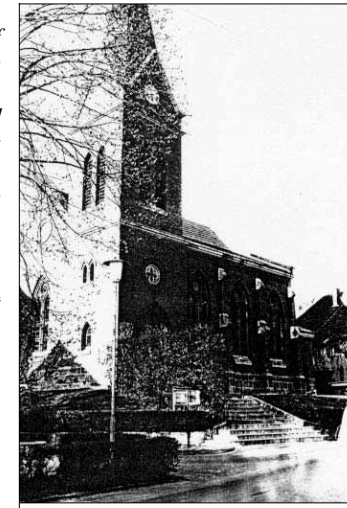

Illustration 1: *The Protestant church in D-96484 Meeder-Wiesenfeld (near Coburg), which in 1976 became the victim of a Zyklon B fumigation.*

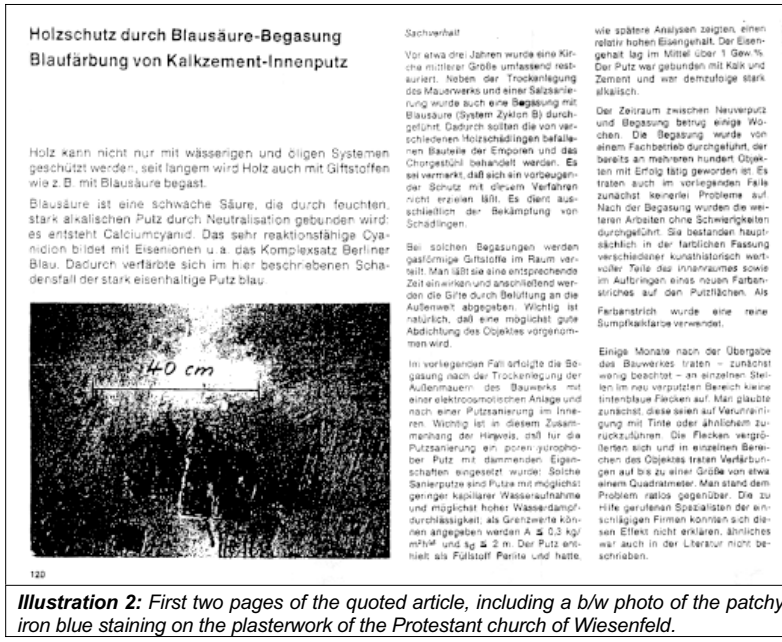
painting various parts of the interior, which were of art-historical value, as well as of the application of a coat of paint onto the new plaster surfaces. The paint used was a pure lime-based paint.

Several months after the building was opened to the public, small ink-blue spots appeared at various places on the newly plastered surfaces. Little attention was paid to them at first; it was assumed that they were ink stains or the like. But the spots grew larger, and in some parts of the building discolored patches up to about a square meter (10 sq.ft.) in size developed. The persons in charge were helpless. The specialists who had been called in from the appropriate firms could not explain this phenomenon, and not even the subject literature contained anything pertinent.

Causes

It took chemical analyses of the plaster to determine the causes of this blue discoloration. These analyses confirmed the initial suspicion that the substance known as Berlin Blue had formed.

Chemically speaking, hydrogen cyanide (HCN) is a very weak acid. It is bound by damp, highly alkaline brickwork through neutralization. This produces calcium cyanide ($Ca(CN)_2$), for example:



$$2\ HCN + Ca(OH)_2 \Rightarrow Ca(CN)_2 + 2\ H_2O$$

The cyanide ion is a highly reactive ion, which joins with metals to form very stable complex salts. The best-known complex salts are the yellow and red iron cyanides. These compounds form when iron ions combine with cyanide: with the iron(II) ion, the yellow ferrocyanide forms, and with the iron(III) ion, the red ferricyanide is produced:

$$6\ CN^- + Fe^{2+} \Rightarrow [Fe(CN)_6]^{4-}$$

$$6\ CN^- + Fe^{3+} \Rightarrow [Fe(CN)_6]^{3-}$$

In the presence of excess iron(II) or iron(III) ions, the yellow or red iron cyanide then reacts to form blue compounds which are described in the literature as Berlin Blue and Turnbull's Blue, respectively:

Holzschutz durch Blausäure-Begasung
Blaufärbung von Kalkzement-Innenputz

Holz kann nicht nur mit wässerigen und öligen Systemen geschützt werden, seit langem wird Holz auch mit Giftstoffen wie z.B. mit Blausäure begast.

Blausäure ist eine schwache Säure, die durch feuchten, stark alkalischen Putz durch Neutralisation gebunden wird: es entsteht Calciumcyanid. Das sehr reaktionsfähige Cyanidion bildet mit Eisenionen u.a. das Komplexsatz Berliner Blau. Dadurch verfärbte sich im hier beschriebenen Schadensfall der stark eisenhaltige Putz blau.

120

Sachverhalt

Vor etwa drei Jahren wurde eine Kirche mittlerer Größe umfassend restauriert. Neben der Trockenlegung des Mauerwerks und einer Salzsanierung wurde auch eine Begasung mit Blausäure (System Zyklon B) durchgeführt. Dadurch sollten die von verschiedenen holzschädlingen befallenen Bauteile der Emporen und das Chorgestühl behandelt werden. Es sei vermarkt, daß sich ein vorbeugender Schutz mit diesem Verfahren nicht erzielen läßt. Es dient ausschließlich der Bekämpfung von Schadlingen.

Bei solchen Begasungen werden gasförmige Giftstoffe im Raum verteilt. Man läßt sie eine entsprechende Zeit einwirken und anschließend werden die Gifte durch Belüftung an die Außenwelt abgegeben. Wichtig ist natürlich, daß eine möglichst gute Abdichtung des Objektes vorgenommen wird.

Im vorliegenden Fall erfolgte die Begasung nach der Trockenlegung der Außenmauern des Bauwerks mit einer elektroosmotischen Anlage und nach einer Putzsanierung im Inneren. Wichtig ist in diesem Zusammenhang ein Hinweis, daß für die Putzsanierung ein porenreicher Putz mit dämmenden Eigenschaften eingesetzt wurde. Solche Sanierputze sind Putze mit möglichst geringer kapillarer Wasseraufnahme und möglichst hoher Wasserdampfdurchlässigkeit, als Grenzwerte können angegeben werden A ≦ 0,3 kg/m²h^{0,5} und s_d ≦ 2 m. Der Putz enthielt als Füllstoff Perlite und hatte wie spätere Analysen zeigten, einen relativ hohen Eisengehalt. Der Eisengehalt lag im Mittel über 1 Gew.% Der Putz war gebunden mit Kalk und Zement und war demzufolge stark alkalisch.

Der Zeitraum zwischen Neuverputz und Begasung betrug einige Wochen. Die Begasung wurde von einem Fachbetrieb durchgeführt, der bereits an mehreren hundert Objekten mit Erfolg tätig geworden ist. Es traten auch im vorliegenden Falls zunächst keinerlei Probleme auf. Nach der Begasung wurden die weiteren Arbeiten ohne Schwierigkeiten durchgeführt. Sie bestanden hauptsächlich in der farblichen Fassung verschiedener kunsthistorisch wertvoller Teile des Innenraumes sowie im Aufbringen eines neuen Farbanstriches auf den Putzflächen. Als Farbanstrich wurde eine reine Sumpfkalkfarbe verwendet.

Einige Monate nach der Übergabe des Bauwerkes traten – zunächst wenig beachtet – an einzelnen Stellen im neu verputzten Bereich kleine tintenblaue Flecken auf. Man glaubte zunächst, diese seien auf Verunreinigung mit Tinte oder ähnlichem zurückzuführen. Die Flecken vergrößerten sich und in einzelnen Bereichen des Objektes traten Verfärbungen auf bis zu einer Größe von etwa einem Quadratmeter. Man stand dem Problem ratlos gegenüber. Die zu Hilfe gerufenen Spezialisten der einschlägigen Firmen konnten sich diesen Effekt nicht erklären, ähnliches war auch in der Literatur nicht beschrieben.

Illustration 2: *First two pages of the quoted article, including a b/w photo of the patchy iron blue staining on the plasterwork of the Protestant church of Wiesenfeld.*

$[Fe(CN)_6]^{4-} + Fe^{3+} \Rightarrow [Fe^{II}Fe^{III}(CN)_6]^-$
$[Fe(CN)_6]^{3-} + Fe^{2+} \Rightarrow [Fe^{III}Fe^{II}(CN)_6]^-$

The formation of these compounds was what had caused the discoloration at the plaster's surface in the church. Conclusive proof of this was easily furnished. Spraying plaster surfaces which had not yet turned blue with a solution of iron(II) or iron(III) salts, respectively, produced a spontaneous blue discoloration, which otherwise would have formed only slowly, as the reaction progressed by itself.

Clean-Up and Restoration

A waiting time of about two years was allowed before attempts were made to rectify the damage, so that, quantitatively speaking, the reaction would have largely run its course. It turned out that even after one-and-a-half years new blue discolorations still formed in some places. Clean-up and restoration itself is costly; all the new plaster that was applied must be removed again. This is all the more regrettable because it necessitates protective measures for all wood paneling in the gallery and for the organ, since otherwise the dust generated by the clean-up activities would inevitably do damage.

After the plaster has been removed, a new plaster as free of iron components as possible will be applied. Either a lime-based mortar or a so-called restoration plaster may be used. After the plaster has hardened, the entire interior must be color-matched to the remaining parts of the church. This is always problematic, since all paints – even lime-based paint – undergo a certain aging process, and mixing the paint to match the ground color present will likely prove difficult.

It is safe to assume that the problem will then be cleared up and that no new blue discolorations will appear. In the areas still bearing the original plaster, i.e., in the upper regions of the church, this is not to be expected anyhow, since the alkalinity required for neutralizing the hydrogen cyanide is not present there.

An easier clean-up method, i.e., a conversion of the blue patches into colorless compounds, is not possible by any common chemical means.

Commentary

It goes without saying that fumigations involving highly toxic substances must be performed only by expert contractors with the appropriate training and licenses. During the treatment the premises in question are kept under guard so that no unauthorized persons can enter them. Despite the toxicity of the substances involved, no accidents have been reported to date. Cases of damage to the facilities themselves have also been very rare. One spectacular case of such damage was reported for the first time in 1974, by Grosser and Roßmann.

But despite being highly uncommon, this report of damage also shows how difficult it is for an architect to use chemicals in construction. Plasters and paints must also be considered from a chemical perspective because, as clearly demonstrated by the present case, it is the combination of various factors which ultimately does the damage. It is suggested that in similar cases of fumigation, an appropriate construction-chemical investigation be conducted first to determine whether discolorations such as were the case here might result. The alkalinity and the iron content of the brickwork or plaster are factors requiring particular attention.

For Further Reading

Grosser, D. , and E. Roßmann: Blausäuregas als bekämpfendes Holzschutzmittel für Kunstobjekte. Holz als Roh- und Werkstoff*, v. 32 (1974), pp. 108-114.*

The preceding account was published on pages 120f. of volume 4 of the series *Bauschäden Sammlung. Sachverhalt – Ursache – Sanierung,* edited by Günter Zimmermann, published in 1981 by Forum-Verlag, Stuttgart, and rediscovered by Walter Lüftl, to whom we owe thanks. A more re-

cent review about damages caused by HCN fumigations, including further cases as here described, was published in 1995.[1]

This striking example ought to suffice to refute any objections to the effect that, for chemical reasons, no long-term stable cyanide compounds could have formed in the walls of those Birkenau crematoria that are termed gas chambers, and that there must be a different explanation for the large quantities of cyanide that are to be found in the camp's delousing facilities, evidenced by the patchy-blue discoloration of the plaster there.[2]

The fact that the expert literature is unaware of more such damages caused by HCN might have mainly three simple reasons:

1. The first fumigation of a building or room normally takes place only after it has been used for quite a long period, *i.e.*, years, since new buildings are not vermin-infested. Therefore the plaster of the fumigated walls is carbonized, *i.e.*, no longer alkaline and thus not liable to accumulate high amounts of cyanides after only one fumigation.
2. Normally, a building is fumigated only now and then, *i.e.*, hardly ever more than once a decade or even longer periods of time.
3. Furthermore, a room to be fumigated normally is at least fairly dry as it is required by the legal regulations and operational instructions. But humidity is required for the accumulation of cyanide and its chemical conversion into long-term stable compounds.

Before we compare the case described in the previous article with the circumstances in Auschwitz and Birkenau, we must point out that, despite affirmations to the contrary, accidents have indeed happened in the course of HCN fumigations of buildings. As in any commercial activity, accidents do occasionally happen here as well.[3] The sweeping claim that highly alkaline plaster is the only kind to combine with hydrogen cyanide is also untrue. While a high degree of alkalinity does facilitate the rapid absorption of large quantities of HCN, slightly alkaline or even neutral plasters can also accumulate considerable quantities over time, as the HCN delousing chambers in Majdanek show (cf. the contribution of Carlo Mattogno in this volume). It is interesting to compare the case described here with the alleged gas chambers in crematoria II and III (in each case, mortuary 1) of Birkenau, on the one hand, with the delousing facilities of Buildings 5a and 5b on the other. These have already been described in detail in the chapter by Germar Rudolf (this volume):[4]

The iron content of the plasters in Birkenau was determined by Germar Rudolf as documented in his report.[4]

The alkalinity of the plasters in the mortuaries of the crematoria will have been similar to that in the church described previously, since in both cases the plasters were cement-based, which are clearly alkaline in the long term. The plaster in the delousing facilities is a lime-based mortar and therefore was probably strongly alkaline only in the beginning – which may have sufficed to form reasonable amounts of iron blue if the fumigations started right away after the plastering had been finished.

Despite the fact that the temperature is generally low in churches, and that as a result plasters there usually have a high moisture content, the plaster in the church in question was likely only moderately

Rudolf's contribution about the 'gas chambers' of Auschwitz.

3 For example, one case is described by S. Moeschlin in *Klinik und Therapie der Vergiftung*, Thieme, Stuttgart 1986, pp. 300f.

4 For a more detailed account, cf. Germar Rudolf, *The Rudolf Report*, Theses & Dissertations Press, Chicago, IL, March 2003, pp. 279-283 (online: vho.org/GB/Books/trr).

LOCATION / PROPERTY	CHURCH CLEAN-UP AND RESTORATION	CREMATORIUM II/III (MORTUARY 1)	DELOUSING FACILITIES OF BUILDINGS 5A/B
Iron content	>1% by vol.	1-2% by vol.	0.5-5% by vol.
Alkalinity	high	high	low to high
Moisture	moderate	high	moderate to low
Time elapsed between plastering and fumigation	several weeks	between several weeks and 3 months	(several weeks???)
No. of fumigations	1	allegedly ≥400	probably ≈300
Cyanide present	clearly apparent	negative or traces not reproducible	clearly apparent (0.1-1% by vol.)

damp due to its hydrophobic (water-expellent or repellent) consistency. The walls of the [underground] unheated mortuaries 1 of crematoria II and III of Birkenau, on the other hand, would have been very moist, especially if one assumes mass gassings to have been a fact (condensation of body moisture on the cool walls). On the other hand, the delousing facilities of Buildings 5a/b, which were located above the ground and were equipped with heating systems, will have had dry and warm walls, except perhaps the external walls on cold (wintery) days.

Since crematoria II and III were built in the winter of 1942-43 and were allegedly put into operation as mass gassing facilities right away, in spring 1943, a time period of between a few weeks and up to three months would have elapsed between the time of completion of the plasterwork and the time of the first fumigation – just as much as, or a bit more than, in case of the church. The time between the completion of the delousing facilities and the first fumigation is unknown, but it was likely no more than a few days, since the disastrous hygienic situation in Birkenau must have urged the SS to operate these facilities as soon as they were finished.

Therefore, the only significant differences between the Birkenau mortuaries and the fumigated church was the higher moisture content of the mortuaries' walls and the possibly longer time gap between completion and start of operation in case of the mortuaries. Both factors are likely to compensate each other. Thus, one would have to expect a similar tendency to form long-term stable cyanide compounds in both cases. But we cannot find any significant cyanide residues in the mortuaries now testified to have been homicidal 'gas chambers'!

If one attempts to maintain a theory of the mass gassings in those mortuaries, despite the actual state of affairs, which is clearly contrary to what one would have to expect under the exterminationist hypothesis, then one is indeed forced to go against eyewitness claims and to minimize the number of gassings, to greatly reduce the quantities of poison allegedly used, and to decrease the application time to a technically absolutely impossible level – while disregarding entirely the lack of any means for introducing the poison gas substance into the rooms, and also disregarding entirely the paradox posed by the alleged gas chambers of Majdanek and Stutthof, where huge amounts of iron blue did from, due to alleged homicidal gassings, as we are told. In actual fact, these facilities in Majdanek and Stutthof were never anything else than simple, straight-forward hydrogen cyanide delousing chambers (compare the chapter by Carlo Mattogno, this volume).

Appendix 2:

Grundlagen zur Zeitgeschichte (Dissecting the Holocaust): Expert Report

JOACHIM HOFFMANN

Preamble

Accredited chemist Germar Rudolf[…] has written me to request an expert statement regarding an anthology titled *Grundlagen zur Zeitgeschichte: Ein Handbuch über strittige Fragen des 20. Jahrhunderts*, edited by Ernst Gauss and published in 1994 by Grabert-Verlag in Tübingen, Germany. The foremost issue was to be the question of the work's scientific, *i.e.*, academic nature, rather than the content per se.

As an historian specializing in recent and East European history, and on the basis of my decades of professional experience and practice in the academic service of the Federal Republik of Germany, I am qualified and entitled to give an expert opinion on the matter in question.

Regarding my personal qualifications, I wish to state that I was a member of the Militärgeschichtliche Forschungsamt [Centre for Research in Military History] in Freiburg from 1960 to 1995. For almost three decades my work has focused exclusively on matters related to the German-Soviet war. Through the publication of academic books and periodical articles on this topic I am well established as an expert in my field, both at home and abroad. Accredited chemist Rudolf […] and the co-authors of the anthology at issue are not personally known to me.

The Formal Aspect

As pointed out in the anthology in question, the book does not offer a comprehensive overview of the course of the National Socialist persecution of the Jews during World War Two. Rather, the focus is on specific individual topics regarding disputed and controversial aspects of killings of the Jews. The various contributions to the book are expertly written in a predominantly investigative style. Where detail and completeness are concerned, the body of supporting and documenting references leaves little to be desired and is extremely helpful to a reader seeking further information, not least of all since sources from the opposing subject literature are also cited without reservation. It appears, therefore, that this anthology is part of the large-scale academic dispute over a serious contemporary issue which reaches far beyond its actual academic scope and into the political realm.

The individual contributions to this anthology are logically consistent and objectively descriptive in structure, even though at times a polemic note does become evident – as is perhaps inevitable in such emotionally charged topics, and as is also quite common in political and historical controversies. In any case, a striving for new understanding is tangibly apparent throughout the book. From this perspective, therefore, the anthology cannot be denied an academic character, particularly if one compares it with many a publication from its opposing side, whose academic nature is also never questioned. There is much in the various contributions that strikes one as thoroughly convincing. Much else may be merely noted with objective interest. Elsewhere, doubts and criticisms also come to mind. The issue may perhaps be simplified by pointing out that what we are dealing with in this great controversy is a rather more accusatory style of literature on the one hand, and a rather more

apologetic one on the other. This is to suggest that in the heat of controversy, both sides may be overly inclined to overshoot the mark and to leave the solid ground of provable facts behind. One might perhaps summarize by saying that the time for conclusive declarations regarding the great persecution of the Jews has not yet come.

The Problem of Self-Evidentness

There can be no doubt about the fact that genocide was committed against the Jewish people by the Einsatzgruppen of the Security Police and the SD and by the SS personnel in charge in the concentration camps in the former General Government of Poland. Hitler, Himmler and Dr. Goebbels clearly admitted these misdeeds on several occasions. The anthology's editor, Ernst Gauss, also considers this as given in his chapter. And in fact, the genocide provides an unspoken backdrop for the anthology at issue. To rule out any misunderstanding, it would perhaps have been better to spell these things out unambiguously and to clarify that an academic controversy today can no longer dispute the mass killings per se, but rather only the numbers of victims and the methods of murder. In this respect, we admittedly may expect to see far-reaching modifications as yet. In this context as well, the rather overused concept of self-evidentness is in need of limitation, or at least of a more precise definition.

Two Important Examples

We shall give two especially significant examples of this.

1) [Downward Revision of the Number of Auschwitz Victims]

From 1945 to 1990, the figure of 4 million victims in Auschwitz was considered self-evident and was accorded judicial notice in the Federal German courts. But where did this figure come from? It originated with Soviet war propaganda. On March 1, 1945, an official Soviet announcement stated for the first time that "*at least five million people were exterminated*" in Auschwitz. This figure was then reduced to four million in the official Soviet communiqué of May 7, 1945. This number of 4 million victims – put about by Soviet war propaganda, in other words by the NKVD, and in no way proven by any evidence whatsoever – was adopted by the public in western countries, and persisted unchanged until 1990, when it was officially reduced to 1.5 million virtually overnight. Currently the number of Auschwitz victims is set at a remaining 631,000 to 711,000, and a further reduction has not been ruled out.

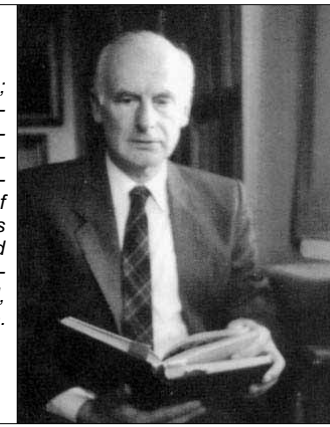
2) [The Total Number of Jewish Victims]

To this day the total number of Jewish victims is generally given as 6 million. According to the current opinion of the German experts on contemporary history, this figure was first provided to the Americans by SS Sturmbannführer Dr. Hoettl in spring 1945, and repeated at the IMT in Nuremberg on November 26, 1945. It must be noted, however, that this selfsame figure was demonstrably first put forth in the foreign press as early as January 4, 1945, several weeks prior to the January 27, 1945, liberation of the Auschwitz concentration camp (with its alleged 4 million victims) – put about by none other than the infamous Soviet Minister of Propaganda, Ilya Ehrenburg. Thus it was Ehrenburg who came up with the figure of six million. [cf. Joachim Hoffmann, *Stalin's War of Extermination 1941 – 1945*, Theses & Dissertations Press, Capshaw, AL, 2001, pp. 189f.]

Regarding Ehrenburg himself, it must be mentioned that in 1941 Stalin had given him the general order to incite a boundless national and racial hatred against all Germans. Ehrenburg's years-long unbridled frenzies of hatred culminated in his call to "*put an end to Germany*" and in an effort

which he described as "*modest and honorable*", namely "*to reduce the population of Germany*", towards which end the only thing left to decide was whether it would be better "*to kill the Germans with axes or with clubs*".

Both examples show that new evidence can immediately overthrow something that is allegedly self-evident, and, accordingly, it is the duty of any contemporary historian to call allegedly conclusive findings into question. Even in matters involving grave charges, the principle of self-evidentness has been known to become invalidated. As an example one need only consider the claim (widely accepted in Germany in particular, but now denied by Yad Vashem itself) that the Germans had manufactured soap from the bodies of murdered Jews – a fabrication that also goes back to Soviet war propaganda. Therefore, the anthology at issue here does not commit anything unlawful, but rather engages in a justified and necessary pursuit in its attempt to critically examine allegedly self-evident issues on the basis of new evidence or findings, as it is in fact the natural task of historiography to do.



The Problem of Eyewitness Testimony

Several contributions to this anthology point out, and rightly so, that the testimony of eyewitnesses is unreliable; these contributions back their claims with numerous examples, some of which are indeed truly grotesque. Such experiences certainly agree with those of other historians of the Second World War. This is not to say that eyewitness statements are entirely superfluous, but practical experience definitely has shown that they must always be examined and corroborated with authentic documents. My personal experience has been that as early as 1970 eyewitness testimony about details of the events of the war was so unreliable that it would have been a breach of professional duties to base a historical treatise on them alone.

Benz's Anthology

On the whole, the contributions to the anthology here at issue frequently manifest a profound understanding of the subject and its associated literature, even though some suggestions made do appear questionable at times. However, the establishment literature about the Holocaust also often contains factual errors. One example in this context is Benz's 1991 anthology *Dimension des Völkermords*, which displays a downright disarming ignorance of the state of affairs on the Soviet side. The authors of the Gauss anthology object, and correctly so, that Benz bases his studies uncritically

Joachim Hoffmann, Dr. phil., born 1930 in Königsberg, East Prussia; studied modern history, eastern european history and comparative ethnology at the University of Hamburg and Berlin's Free University. He received his PhD in history in 1959. Between 1960 and 1995, he was historian at the Militärgeschichtliche Forschungsamt der Bundeswehr (Research Department for Military History of the German Army). His field of expertise was "Armed Forces of the Soviet Union"; Dr. Hoffmann has authored numerous articles and books about political, diplomatic and military history of the 19th century and about the history of the German-Soviet war. In 1991, he was granted the "Dr. Walter-Eckhardt" Award, and in 1992 the "General Andrej Andrejewitsch Wlassow" Cultural Prize. He died in February 2002.

on the announcements made by Soviet war propaganda and on the publications about Soviet show trials. The anthology edited by Benz attempts, by means of elaborate statistical minutiae, to prove the correctness of the six-million figure. Anyone who has worked with demographic statistics knows what serious errors can enter into such complex analyses even under a strictly objective agenda. Benz is entirely unaware that Ehrenburg had already introduced the six-million figure into the annals of war propaganda on January 4, 1945. Thus, he will have to accept the charge that, though unwittingly, he has really only worked to confirm a propaganda figure of Ehrenburg's. From this perspective, his and his co-authors' research findings offer a foothold for fundamental criticism.

Babi Yar

The mass execution of Jewish inhabitants of Kyiv, known as the massacre of Babi Yar, is also subjected to justified and necessary criticism in the anthology here at issue. Over time, the actions of Einsatzkommando 4a of the Security Police and the SD under Blobel have experienced propagandistic inflation to the point where restoring the actual facts to their real dimensions is an obligation for anyone striving for historical veracity. Of course this does not impinge on the fact that thousands of Jews were killed in Kyiv.

Overall Impression

The overall impression evoked by this anthology edited by Gauss is that its contents must be acknowledged – with critical common sense, of course – no less than is always undisputedly and unrestrictedly done with the 'official' literature about the Holocaust. The principle of *audiatur et altera pars* [let the other side be heard] must apply in this case as well! A suppression of this carefully documented work would represent a forcible obstruction of the legitimate striving for scientific and academic understanding. The state of knowledge is never static. Experience has shown that exaggerations and errors always grind themselves down in the course of a normal academic controversy. One must not deny a mature and free researcher and reader his ability to exercise his critical faculties. It would then be only a small step from suppressing unpopular books, to burning them; and then, though with different motivations, we would be right back where the entire misfortune began.

Conclusion

As historian officially commissioned by the Militärgeschichtliche Forschungsamt I have spent two-and-a-half decades studying the Soviet military literature about the history of the Red Army and the Second World War in its original documentary texts – an endless chain of misrepresentations, fabrications, distortions and slander. But even this historical literature turned up the occasional truths. I could not have carried out my academic duties if I had rejected the Soviet publications out-of-hand as being unacademic. The same goes infinitely more for the anthology here at issue, which is on a respectable academic level and which doubtless contributes much to our understanding of aspects of the war, despite any reservations one may have.

[sgd.] Dr. J. Hoffmann, Acad. Director (retired)
[written on September 28, 1995]

On June 15, 1996, judge Burkhardt Stein from Tübingen County Court ordered the confiscation and incineration of all books *Grundlagen zur Zeitgeschichte* and the destruction of all means for manufacturing them (Ref. 4 Gs 173/95). The expert reports presented by the defense were ignored.

Appendix 3:

Censorship in Germany? Never! Unless…

ANTON MÄGERLE

Prologue

In German history, censorship unfortunately has been more of a rule than an exception. It was introduced by the Catholic Church in the form of the Inquisition. However, it was left to the well-known Austrian statesman Metternich to perfect the system of suppressing freedom of speech by means of a comprehensive spy and surveillance apparatus. Neither the German Empire nor the Weimar Republic were particularly soft in their dealings with unwelcome literature,[1] but the worst reputation was doubtless acquired by the Third Reich, which managed, within the twelve years of its existence, to black-list some 10,000 books. While these books were not burned, they did disappear from the shelves of bookstores, to be banished to library archives.[2]

But what is not nearly as well known is the fact that it was the Allied 'liberators' of Germany who staged the greatest campaign of book destruction that mankind had ever seen. Among the victims of Allied displeasure were 34,645 titles as well as, comprehensively, all school textbooks published between 1933 and 1945; not only were these no longer permitted to be printed and sold after the war – they also had to vanish from the archives of many libraries.[3] In the years from 1946 to 1952, the Soviet Occupation Power published four such lists ("*Liste der auszusondernden Literatur*", or list of proscribed literature) of titles earmarked for destruction. In accordance with the instructions in the censors' introduction to the second and third volumes, the first three of these lists also went into force in the western Occupation Zones.

The German Constitution

In its Article 5, Section 1, Clause 3, the current German Constitution (Grundgesetz, or GG) prohibits censorship. Section 2 of that same Article, however, limits this freedom from censorship as per the regulations imposed by "*general laws*", among other things. A fundamental human right can

1 For more see Claus Nordbruch, *Sind Gedanken noch frei? Zensur in Deutschland*, Universitas, Munich 1998.

2 The opinions about this differ slightly: acc. to Dietrich Strothmann, *Nationalsozialistische Literaturpolitik*, 3rd ed., Bouvier, Bonn 1985, some 12,500 books, acc. to Dietrich Aigner, *Die Indizierung "schädlichen und unerwünschten Schrifttums" im Dritten Reich*, vol. XI of the *Archiv für Geschichte des Buchwesen*, Buchhändlervereinigung, Frankfurt/Main 1971, the number was less than 10,000.

3 For some more details see, *e.g.*, Martin Lüders, *Nation und Europa*, vol. 47(9) (1997), pp. 7-11. The list of all books banned by the Allies (*Liste der auszusondernden Literatur*) was recently reprinted by Uwe Berg-Verlag, Toppenstedt (Germany) 1983/84 (Deutschen Verwaltung für Volksbildung in der sowjetischen Besatzungszone/Ministerium für Volksbildung der Deutschen Demokratischen Republik (ed.) *Liste der auszusondernden Literatur.* Index *der in der sowjetischen Besatzungszone verbotenen Bücher nach dem Stand vom 1. April 1946; Erster Nachtrag zum Index der in der sowjetischen Besatzungszone verbotenen Bücher nach dem Stand vom 1. Januar 1947; Zweiter Nachtrag zum "Index" der in der sowjetischen Besatzungszone verbotenen Bücher nach dem Stand vom 1. September 1948; Dritter und letzter Nachtrag zum "Index" der in der sowjetischen Besatzungszone verbotenen Bücher nach dem Stand vom 1. April 1952*, 4 vols., Zentralverlag, Berlin (East) 1946-1948, 1953). It can be found completely at vho.org/censor/tA.html.

thus be suspended, at least theoretically, by everyday laws such as those of criminal law.[4] In this respect, the German Federal Constitutional Court (Bundesverfassungsgericht) has determined that "*general laws*" are such that do not prohibit a specific opinion, or freedom of speech per se. Furthermore, general laws may impose limits on a fundamental right only if doing so serves to safeguard another fundamental right. In accordance with the principle of proportionality, the benefits of both conflicting fundamental rights must be weighed against each other.[5]

Further restrictions imposed on freedom of speech by Article 5 Section 2 GG serve the protection of young people and of personal honor. According to rulings of the German Federal Constitutional Court, the core significance of the human right to freedom of speech is that censorship of publications is permitted only if these publications are at least a constant or typical source of endangerment to the young people who might read, hear or watch them.

Regarding injury to honor, the Federal Constitutional Court has ruled that such injury generally has not occurred if no insulting expressions have been used.

Criminal Law

The German Criminal Code (Strafgesetzbuch, StGB) has at its disposal tools facilitating censorship, particularly in §§ 185, 189 and 130f. While §§ 185 and 189 (slander, disparagement of the memory of persons deceased) may be subsumed under the category of "*injuries to honor*", §§ 130f. (incitement of the people, incitement to hatred) are a mixed grouping of injuries to honor, injury to human dignity (Article 1 GG), and endangerment of the public peace, a conceptual chimera which we shall not investigate in greater detail here.

The autumn 1994 revision of § 130 StGB (the so-called *Lex Deckert*) decreed, among other things, that it is a criminal offense

> *"publicly or in an assembly, and in a manner likely to lead to a breach of the peace,* [to] *endorse, deny or trivialize any act committed under National Socialist rule* [which was] *of the type specified in § 220a Section 1* [*i.e.*, genocide, A.M…]*"*

This is precisely the scenario which the Federal Constitutional Court has actually ruled out: this law criminalizes a specific opinion about one detail of the history of only one single, past regime. From this perspective alone, this "*hastily passed and unthought-out*"[6] "*special law against freedom of speech*"[7] would seem to be unconstitutional, and it has been criticized commensurately in German legal subject literature, where it is described as being, in effect, "*an attack on the intellectual freedom of dissidents*"[8] and "*virtually the classic example of a norm* […] *directed against a specific opinion*."[7]

> *"The legitimacy of this regulation is dubious at the very least. One can already question whether a lie is a criminal wrong at all; one must question whether the mere denial of a historical fact, in the absence*

---

4 Two recent studies of censorship in Germany, highly to be recommended: Jürgen Schwab, *Die Meinungsdiktatur. Wie "demokratische" Zensoren die Freiheit beschneiden*, Coburg: Nation Europa Verlag, 1997, 338 pp.; Claus Nordbruch, *op. cit.* (note 1).

5 The Federal Constitutional Court's decisions were quoted from: Karl-Heinz Seifert, Dieter Hömig (eds.), *Grundgesetz für die Bundesrepublik Deutschland*, 2nd ed., Nomos Verlagsgesellschaft, Baden Baden 1985.

6 Eduard Dreher, Herbert Tröndle (eds.), *Strafgesetzbuch*, 47th ed., Beck, Munich 1995, *Strafgesetzbuch*, 47th ed., MN 18 regarding §130.

7 Stefan Huster, "*Das Verbot der 'Auschwitz-Lüge', die Meinungsfreiheit und das Bundesverfassungsgericht*", *Neue Juristische Wochenschrift*, 1995, pp. 487ff., here p. 489.

8 Daniel Beisel, "*Die Strafbarkeit der Auschwitz-Lüge*", *Neue Juristische Wochenschrift*, 1995, pp. 997-1000, here p. 1000.

of any characteristics of agitation, may be described and dealt with as incitement of the people, of all things."[9]

The concept of "*denying*" something which the state deems true is a new element in German criminal law and poses problems which it seems quite impossible for criminal procedure to solve. In order for denial to objectively constitute a criminal offense, it must be done deliberately; that is, the denier must *know* that he is not telling the truth and the judge must prove this knowledge, which in and of itself is already virtually impossible. But in order to be able to also punish (especially) the so-called 'criminals of conviction' who are convinced that they are telling the truth, the German judiciary has concocted an entirely new definition of intent:

"In this case, intent can only be the knowledge that one's conviction puts one into conflict with that which 'general opinion' indisputably regards as a historical fact. Admittedly, in a state under the rule of law this places a system of criminal law based on guilt squarely at the crossroads [to criminal law based on arbitrariness]. *Just as Auschwitz will ever remain a nightmare for the Germans, the 'Auschwitz Lie' will clearly remain the same for German criminal law."*[10]

However, the revised § 130 StGB includes regulations which even go considerably further. It criminalizes not only dissident views of certain aspects of National Socialist persecution of minorities, but in a sense anything and everything which could be considered incitement to hatred against population subgroups of potentially any definition. In this regard the foremost German criminal law commentary observes that this amendment means that practically any kind of criticism of population subgroups – however they are defined – can become a criminal offense, since the legal right that is supposed to be protected (the anti-discrimination rule) is rendered too general and vague in this Section.[11]

Furthermore, it also permits precautionary censorship, as it were, by providing for the confiscation of publications or other data carriers which are allegedly intended for distribution. The judiciary holds that the intent to distribute prohibited publications exists if a person has in his or her possession, more than one single copy of a data carrier.

That this new German law is difficult to reconcile with international human rights standards is a fact openly acknowledged by Germany's leading politicians, but it is excused by virtue of the country's particular history.[12]

Indexing

The first step in the process of German censorship is the black-listing or "*indexing*" of, for example, a book or pamphlet. This indexing is done by the Federal Review Office for Youth-Endangering Media (*Bundesprüfstelle für jugendgefährdende Medien*, BPjM).[13] Until 2002, this authority could only become active after a complaint by, *e.g.*, a public youth welfare department. However, a more restrictive law introduced in 2002 now allows this authority to index media without the need of a complaint. This indexing means that the black-listed work may no longer be advertised and that it may not be sold or otherwise made available to persons under 18 years of age. In

13 Until 2002, this authority carried the name Bundesprüfstelle für jugendgefährdende Schriften, BPjS.

practical terms this means that the work ceases to exist for the public, as one can then legally learn of its existence only by private means – or, alternately, via the list of indexed works, which the BPjM regularly publishes in its *Report*. By now this list includes thousands of printed, audio and audio-visual works.[14] Once readily accessible by everybody, this *Report* is now sold only to libraries, wholesalers, and retailers, and even libraries have stopped giving free access to it, which renders the censorship activities of this authority more and more obscure. This tendency to hide its censorship activities was even more enhanced in 2002, when the law was changed so that media, which are regarded to be an especially severe threat to the mental development of young people, are now listed in secret lists. The victims of this secret censorship are media whose content violates German criminal law (libel, denigration of the dead, incitement to hatred, stirring up the people), which includes basically all revisionist literature.[15]

Disgusting Hypocrisy: *The German soft porn magazine* Neue Revue *complains about pornography on the Internet and defames John Ball's strictly scholarly web site about interpretation of air photos from locations of the World War II as "*disgusting Nazi-Propaganda*" (www.air-photo.com).*

While the BPjM was initially created primarily to protect German youth from pornography and the glorification of violence, it has increasingly also engaged in the battle against politically or historically unpopular literature. As early as 1990 Eckhard Jesse, who is today a Professor of Sociology in Chemnitz, criticized that the BPjM had "*in many ways turned out to be a gateway for one-sided anti-Fascism*"[16] and that its measures are "*difficult to reconcile with the principles of a liberal society* […], *because, on principle, in an open society the printed and spoken word may not be stifled*."[17]

To date, this astonishing admission of the violation of human rights through censorship under the auspices of the Federal Constitutional Protection Office, which edited the contribution of Jesse, has received little attention.

The decision of German courts in the case of the book *Wahrheit für Deutschland* (Truth for Germany) has taken on a central significance where the BPjM's practice of censorship is concerned. This book dealt in an allegedly unacademic manner with the question of who bears the blame for World War Two.[18] The BPjM black-listed it in the late 1970s. In 1994 the Federal Constitutional Court declared this black-listing decision unlawful,[19] but the BPjM promptly re-indexed the book

[14] The latest "*comprehensive listing*", *Gesamtverzeichnis indizierter Bücher, Taschenbücher, Broschüren und Comics, Stand 30.4.1993*, includes about 2,500 titles. Some 120 more have since joined the ranks. The list of indexed video tapes is about the same length. Added to this are several hundred electronic sound and data carriers. The current indexing lists are published in the periodical of the Federal Review Office for Youth-Endangering Publications, *BPjS aktuell*. To order: Bundesprüfstelle, Postfach 26 01 21, D-53153 Bonn, Germany.

[19] Ref. 1 BvR 434/87.

on slightly reworded grounds.[20] The author's appeal against this, as well as his complaint to the Administrative Court of Cologne, were successful. According to the verdict the BPjM had failed to prove that the book posed a danger to the young people who might read it:

> *"The BPjM fails to realize that it is precisely the possibility for open debate among different views which furthers the critical abilities of young people, and this demands free and unfettered discussion. Besides instruction in historical events, this requires particularly the critical examination of divergent views. In its considerations the BPjM has completely disregarded that this* […] *can (perhaps) protect young people much more effectively from susceptibility to distorting portrayals of history than indexing can, which latter may even endow such opinions with a justified attraction."*[21]

However, this verdict, as well as the Federal Constitutional Court's previous verdict, also indicate that these principles do not apply if it is, for example, the historiography about the fate of the Jews in the Third Reich that is questioned. Such questioning, the argument goes, not only represents a scientifically blatantly incorrect opinion, it also glorifies National Socialism and disparages the Jews as a group. This does not by any means require that the publication in question verbally attacks the Jews or identifies itself with National Socialist ideology. Not even an open declaration of sympathy with the Jews and a condemnation of National Socialist transgressions in other respects will serve in the publication's favor if the factual nature of the Holocaust is questioned at even one single point in the work. German courts consider even one such occurrence to be adequate proof of a glorification of the National Socialist system and of an intention to slander the Jews.

To date, appeals against the black-listing of "*Holocaust-denying*" books have been uniformly unsuccessful, since German courts refuse all motions to bring evidence in such trials.[22] Documentation, however, is very fragmentary in this context. Older books which dispute the factuality of the Holocaust – such as *Geschichte der Verfemung Deutschlands* (History of the Defamation of Germany),[23] *Hexeneinmaleins einer Lüge* (Magic Square of a Lie),[24] *Feuerzeichen* (Fire signal)[25] or *Die 2. babylonische Gefangenschaft* (The 2nd Babylonian Captivity)[26] – are not to be found on the Index of the BPjM. On the other hand, one of the first books of this genre – a book that, regarding its style, must certainly be accorded scientific and academic credit, namely, *Der Jahrhundertbetrug*[27] (The Hoax of the Century) – was black-listed as early as spring 1979.[28]

A work issued by the publisher *Kritik-Verlag*, lately of Denmark, has achieved fame at least indirectly. In the early 1970s this publisher issued a brochure titled *Die Auschwitz-Lüge* (The Auschwitz Lie), in which a former German soldier described his experiences in Auschwitz, which are diametrically opposed to those recounted in the well-known eyewitness testimony.[29] At least in Germany

[29] Thies Christophersen, "*Die Auschwitz-Lüge*", *Kritik* issue no. 23, Mohrkirch: Kritik Verlag, 1973, available today from Vrij Historisch Onderzoek, Berchem Belgium.

the title of this publication became the embodiment of what is otherwise known less polemically as Holocaust revisionism, *i.e.*, the thesis that there was no Third Reich policy of extermination of the Jews. A portrait of Thies Christophersen, the brochure's author, who was prosecuted in Germany and had fled abroad, was used in 1995 by Amnesty International as advertisement for free speech because even the most controversial of all opinions, namely the one that disputes the Holocaust, ought to be protected by the human right to freedom of speech.[30] The publication was not indexed until 1993, fully 20 years after its first publication.[31]

Since the 1994 tightening of criminal law no change has become apparent in the BPjM's decision-making process, and neither is any change necessarily to be expected, since the BPjM proceeds in accordance with the Law for Youth Protection (Gesetz zum Schutz der Jugend, or GjS), not with criminal law.

Confiscations to 1994

The second stage of German censorship is the so-called confiscation (or seize-and-destroy) stage. This stage hardly registers with the public at all, and even Professor E. Jesse, whom we quoted earlier, seems either not to be aware of it or to ignore it. The confiscation of a publication takes place on the order of a court. What happens to the confiscated copies of such a publication is not quite clear, but it probably varies with the police station in charge. One publisher who is quite frequently the target of such book confiscations reported that he had been told that the books are burned under police supervision.[32] In one case the press reported that confiscated literature is being burnt in waste incinerators.[33]

According to information from the German Federal Government, and unlike for indexed works, there is no office or authority which publishes an even remotely complete list of confiscated books; similarly, the confiscation orders issued by the courts are not published anywhere.[34] Certainly every court that orders or revokes the confiscation of a publication is required to communicate its decision to the Federal Criminal Investigation Office (Bundeskriminalamt), which therefore ought to have a complete and current list, particularly as it serves the courts as information central regarding confiscation orders already issued.[35] However, these confiscation orders are published only every now and then in the *Bundeskriminalblatt*, a publication not readily accessible to the public. What goes for the public's review of black-listing does not go for the actual confiscation of the works in question. In this respect the public is left completely in the dark.

Although pornographic or pro-violent publications are also affected by confiscations, these are not discussed here, since the destruction of political or historical publications is a much more explosive issue from a human-rights point of view.

33 *Abendzeitung* (Munich), March 7./8., 1998: "*The remaining copies are occasionally being burnt in a wast incinerator*.", regarding R. J. Eibicht, *Hellmut Diwald*; cf. *Zur Zeit* (Vienna), no. 9/1998 (Febr. 27): "*65 years ago this happened publicly, today this is being achieved on the quiet in waste incinerators*."

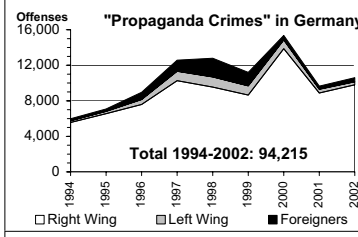
34 Admission of the Federal Government, *Bundestagsdrucksache* 13/4222, March 26, 1996, p. 6. Germar Rudolf tries to compile a list of books confiscated in Germany, see vho.org/censor/Censor.html. Due to lack of official information , this list is necessarily incomplete. Links to confiscated books that are available online can be found there, so no further URLs are given for them in this article's footnotes.

35 *Richtlinien für das Strafverfahren und das Bußgeldverfahren* (Guidelines for penal procedure and fining procedure), No. 208, II + IV; according to Gerd Pfeiffer (ed.), *Karlsruher Kommentar zur Strafprozeßordnung*, 3rd ed., Beck, Munich 1993, p. 2174.

Up to 1994 it was still possible to keep track of all the confiscated publications with political or historical content. The most spectacular case was no doubt the confiscation of the revisionist book *Der Auschwitz-Mythos* (The Auschwitz Myth). Due to the book's 'Holocaust-denying' theses, the author, a former judge, was stripped of his doctorate, and his pension was reduced.[36]

Another interesting case are the confiscations of the books published by the revisionist Jew Joseph Ginsburg, under the pseudonym J. G. Burg. His Holocaust-denying books also fell victim to German book burning, even though – being a Jew, and in light of the contents of his writings – he could hardly be accused of anti-Semitism.

Up to the winter of 1996, and where political and historical publications are concerned, the BPjM itself had listed the confiscation of only a few issues of the Swiss-based revisionist periodical *Der Eidgenoss*. The various issues of the revisionist periodical *Historische Tatsachen* (Historical Facts), on the other hand – which have long been subject to confiscation, and which are published by the same publisher whose book *Wahrheit für Deutschland* the BPjM has now been trying for over 20 years to ban – are not mentioned.[38] It was not until the spring of 1997 that the BPjM updated its list, particularly with four books by the Swiss revisionist author Jürgen Graf. With one exception, however, these books had all been confiscated before late 1994, and one had already been de-indexed again in 1995.[39] The BPjM itself is thus even less clear on the state of confiscations than is the author of the present article.



Germany today:

94,215 Criminal Prosecutions

Because of "Thought Crimes" During the Last Nine Years:

Year	Right	Left	Foreign	Sum
1994	5,562	185	235	**5,982**
1995	6,555	256	276	**7,087**
1996	7,585	557	818	**8,960**
1997	10,257	1,063	1,029	**12,349**
1998	9,549	1,141	1,832	**12,522**
1999	8,698	1,025	1,525	**11,248**
2000	13,863	979	525	**15,367**
2001	8,874	429	353	**9,656**
2002	9,807	331	467	**10,605**

- Right: "Offenses with right wing extremist background", that is: "Propaganda Offenses" and "Stirring up the People"
- Left: "Offenses with left wing extremist background", generally referred to as "other offenses"
- Foreign: offenses committed by foreign extremists, mainly against the German law of organizations ("Vereinsgesetz") by Kurds in the prohibited Kurdian Liberation Army PKK[37]

Especially right-wingers are persecuted in Germany.

[38] However, the black-listing of two of these issues *is* mentioned: *Historische Tatsachen* no. 23 ("*Zigeuner bewältigen eine 1/2 Million*"), Decision No. 4208, *Bundesanzeiger* 204 of Oct. 31, 1991, and *Historische Tatsachen* no. 36 ("*Ein Prozeß, der Geschichte macht*"), Decision No. 4029, *Bundesanzeiger* 64 of March 31, 1990.

[39] Jürgen Graf, *Auschwitz. Tätergeständnisse und Augenzeugen des Holocaust*, Neue Visionen, Würenlos 1994; confiscated by the Mannheim County Court, 41 Gs 2626/94, released by the Mannheim District Court, 5 KLs 7/95.

Confiscations after 1994

This 'moderate' confiscation policy changed radically after the revised § 130 StGB took effect on December 1, 1994. Even though the time from December 1, 1994 (the date the new § 130 StGB came into force), and mid-1997 (the authorship date of this article) is only two and a half years, the list of books ordered seized and destroyed during this period is about as long as that of the books which to our knowledge were confiscated in the previous 45 years of the Federal Republic of Germany's existence.

It is important to note that in most instances the court case reference numbers given refer not only to the confiscation proceedings directed at the books themselves, but refer also to concomitant criminal trials of authors, editors, publishers, booksellers, sometimes even against the printers and multiple-copy purchasers of the publications in question. Criminal prosecution of the purchasers of prohibited publications is initiated even if the books were bought at a time when they were not yet prohibited. In actual fact almost all such trials are of this retroactive nature, *i.e.*, they deal with cases where books were bought before they were confiscated, since as a rule it is no longer possible to obtain the books at all after they have been violently withdrawn from the market.

In reply to an inquiry the Ministry of Justice of the Federal Land of Baden-Württemberg has stated that in the time between the end of 1994 and mid-1996, in Baden-Württemberg alone, there were 32 cases of preliminary proceedings being instituted against private individuals for their multiple purchases of such books.[40] Projected to cover all of Germany, this figure indicates some 250 to 300 such criminal cases.

Revisionist books which, to our knowledge, have not even been black-listed yet – such as *Feuerzeichen* or *Die 2. babylonische Gefangenschaft* – were not the only victims of this new wave of censorship. Books with strictly political content, such as *In Sachen Deutschland* (In the Matter of Germany) or *Wolfsgesellschaft* (society of wolves), were also destroyed. Both these books deal in an unpolemic but rejective manner with the problems of multiculturalism and the supposed incompetence of German politicians. However, since this openly negative attitude allegedly represents incitement against the foreigners in Germany and against the establishment political parties and their representatives, in other words since the books endangered the internal peace of the Federal Republic, they were confiscated.

It is impossible to discuss every prohibited book adequately within the scope of this article. We shall therefore focus on only one case, namely the first seize-and-destroy order that was issued after the legal revision of December 1, 1994. This order was carried out in late March 1995 against the scientific handbook *Grundlagen zur Zeitgeschichte* (Foundations of Contemporary History, German original of this work), which deals very critically with the Holocaust. Since then, 1,000 persons, primarily from the ranks of academia, have spoken out publicly in support of de-indexing this book,[41] and two distinguished historians have even testified in court that the book is scientific and academic in nature and thus ought to be protected under Article 5 Section 3 of the Constitution, where freedom of research is guaranteed without limitations.[42]

[40] Landtag (state parliament) of Baden-Württemberg, 12th session, Paper 12/334, Parliamentary question by Rep. Michael Herbricht REP, "*Appell der 500*" Stuttgart, Aug. 27, 1996. Position of the Baden-Württemberg Ministry of Justice, Stuttgart, Sept. 23, 1996, Ref. 4104 - III/185, Dr. Ulrich Goll.

[41] "*Appell der 100 · Die Meinungsfreiheit ist in Gefahr!*", *Frankfurter Allgemeine Zeitung*, May 17, 1996; in the *Stuttgarter Nachrichten* and the *Stuttgarter Zeitung* on July 19, 1996, with 500 signatures; in the *Westfalen-Blatt* on Sept. 13 and 18, 1996, with 1,000 signatures each.

[42] Expert reports by Prof. Dr. Ernst Nolte and Dr. Joachim Hoffmann, Tübingen County Court, Ref. 4 Gs 173/95; the latter was published in *Vierteljahreshefte für freie Geschichtsforschung*, 1(3) (1997), pp. 205ff., see Appendix 2.

Meanwhile, the Ministry of Justice of Baden-Württemberg has announced that this constitutional provision is not sacrosanct. The Ministry has ruled that destruction of a scientific work is permissible if said work unduly restricts the fundamental rights of a third party.[43] This interpretation is not new, as the German Constitutional High Court decided already in 1985 in the matter of Wilhelm Stäglich/*Der Auschwitz-Mythos*, that the freedom of science is no longer granted when its results allegedly attacks the human dignity of Jews.[44] The implications of this are that scientists may not postulate certain theses and may not question or seek to refute certain establishment theses when this perhaps runs counter to Jewish interests. This ruling of the German Constitutional High Court is quite obviously a violation of human rights, for this interpretation strikes at the heart of the fundamental right to freedom of research, *i.e.*, the right to freedom of choice in the selection of one's theses and the right to openness of research findings (cf. Karl R. Popper[45]). Publications of subject specialists have confirmed that this approach is clearly unconstitutional.[46]

The trial concerning the book *Grundlagen zur Zeitgeschichte* – that is, concerning the freedom of its authors, editor, publisher, printer, sellers and buyers – will likely drag on for several more years and is indeed a crucial case which will contribute significantly to shaping the future course of human rights in Germany.

Personal Fates

Naturally, every trial for printing, publishing or disseminating a prohibited work also involves at least one personal fate. Exactly how many persons have been punished in recent years for their will to disseminate publications which were outlawed afterwards is not known; the aforementioned figure of several hundred preliminary proceedings, however, would indicate that the number is substantial. In the following we shall touch on only four of the most prominent examples from recent years. (The corresponding court case reference numbers may be found with the entries for the books in question, in the appended list of confiscated books.)

First and foremost, we would mention the case of Günter Deckert, the former Federal Chairman of the German right-wing Nationaldemokratische Partei (National Democratic Party). This case even attracted international attention. As early as 1994 Deckert was sentenced to two years' imprisonment for having interpreted, in an assenting manner, an American speaker's English-language presentation which disputed the mass extermination of the Jews in Auschwitz.[47] This case has been partially recounted in the book *Der Fall Günter Deckert* (The Case of G.D.), co-edited by Deckert himself.[48] This book, in which Deckert supported his revisionist views with new arguments, as well as the sale of 50 copies of the revisionist anthology *Grundlagen zur Zeitgeschichte*, resulted in renewed proceedings against him, the bottom line of which was that he was sentenced to another 20 months' imprisonment in spring 1997. He is supposed to be released from jail in August 2000 – after almost 5 years.

[47] Incidentally, this American citizen, Frederick A. Leuchter, was arrested in Germany shortly before he was to appear on a major German television show. He fled to the United States when he was released from pre-trial detention, to await his trial in freedom.

[48] G. Anntohn, H. Roques, DAGD/Germania Verlag, Weinheim 1995

The second-worst fate struck a long-time publisher from Vlotho, the academically accredited political scientist Udo Walendy. In December 1996 he was sentenced, in his last possible appeal, to 15 months' imprisonment for four issues (nos. 1 (2nd ed.), 59, 60 and 64) of his revisionist series *Historische Tatsachen*, a series which includes 77 issues to date. In May 1997 the County Court of Herford struck a supplemental blow, as it were, by sentencing Walendy to yet another 14 months' imprisonment for his issues 66 and 68. Subsequently, Walendy's license as a publisher was withdrawn in September 1999, so it is no longer permitted to Herrn Walendy to publish or distribute any media.[49] This case shows especially clearly how German censorship has escalated since the introduction of the relevant legal revisions in late 1994: while none of Walendy's issues had had any criminal consequences for the author prior to the revision, fully six of the twelve issues that appeared afterwards resulted in trials and convictions, even though neither the style nor the content of the periodical had changed in any way.[50]

Our third example is the fate of academically accredited chemist Germar Rudolf, who also publishes under the pseudonym Ernst Gauss. For drawing up and disseminating a chemical and technical expert report known as *Das Rudolf-Gutachten* (The Rudolf Report), which claims to disprove the mass gassings in Auschwitz, he was sentenced in June 1995 to 14 months' imprisonment and has since been prosecuted and persecuted for authoring or editing various revisionist books and brochures (for example, *Grundlagen zur Zeitgeschichte*, *Prof. Dr. Ernst Nolte: Auch Holocaust-Lügen haben kurze Beine*, *Auschwitz: Nackte Fakten*, *Kardinalfragen zur Zeitgeschichte*, various issues of the Journal *Vierteljahreshefte für freie Geschichtsforschung*). He avoided his first prison sentence as well as the trial for editing the book *Grundlagen zur Zeitgeschichte* by fleeing into exile.[51] Wigbert Grabert, the publisher of the book *Grundlagen zur Zeitgeschichte*, was unable to avoid his punishment, and was fined DM 30,000.00.

And last but not least, we would mention the case of Hans Schmidt, an American citizen born in Germany. He is the head of a US-based right-wing organization that claims to represent the interests of the German-Americans in the United States. In this capacity he has for many years annoyed numerous prominent persons in Germany with Open Letters. When Schmidt visited Germany in the summer of 1995, he was held in custody, awaiting trial, for more than five months, since one of these Open Letters, in which he had described the German elites as "*infested by Jews and Freemasons*", allegedly constituted incitement of the people. Schmidt avoided prosecution by fleeing to Florida.[52]

The fact that there is no publicly accessible list of confiscated books makes it difficult in some cases to determine whether or not a confiscation order exists. Sometimes one only learns of confiscations by the various public prosecutors' offices in the course of full-blown criminal investigations. If proceedings are then stopped or abandoned for reasons other than supposed innocence (for example, a legally valid conclusion to the proceedings, lapse, or a consolidation with other proceed-

[49] Oberkreisdirektor Herford, ref. 32/33.31.10.

[50] U. Walendy has published a separate issue on his own case: *Historische Tatsachen* no. 69: "*Ausgehebelte Grundrechte*", and no. 77 "*'Vv'-Strafhäftling Walendy*", Verlag für Volkstum und Zeitgeschichtsforschung, Vlotho/Weser 1996/1999. Of course it is necessary, when reading this work, to distinguish carefully between facts and the author's opinions, which are perforce subjective.

[51] About Germar Rudolf see Wilhelm Schlesiger, *Der Fall* Rudolf, Cromwell Press, London 1994; Herbert Verbeke (ed.), *Kardinalfragen zur Zeitgeschichte*, Vrij Historisch Onderzoek, Berchem 1996. Naturally, the need to distinguish carefully between facts and the subjective opinion of the author(s) applies in this case as well.

[52] Hans Schmidt has also reported on this: *Jailed in "Democratic" Germany. The Ordeal of an American Writer*, Milton/FL: Guderian Books, 1997, 490p. Again, it is necessary to distinguish carefully between facts and the author's subjective opinion. The Australian citizen Dr. Fredrick Toben shared Schmidt's fate in spring 1999 when he traveled to Germany in order to challenge the censorship of the German authorities. He was subsequently arrested and sentenced; see his website at www.adelaideinstitute.org.

ings, frequently accompanied by the withholding of evidence such as the confiscated books), the legal state of the confiscation proceedings – *i.e.*, with respect to the 'weapon', the book – often remains unclear. And quite a few of the censored publishers and authors are not very co-operative, as they do not want to see their case dragged into the public. They fear damage to their reputation, so they stay silent, too. Obviously, the general confusion regarding the law in matters of German book confiscations is a constant uncertainty factor for every publisher, bookseller and book buyer. For this reason a trend towards preventive self-censorship is becoming increasingly manifest in Germany: to avoid the incalculable risk of criminal prosecution, one is less and less inclined to pick up politically or historically hot potatoes which a judiciary might choose to single out as being right-of-center. This silent, hidden censorship is admittedly the most effective and thus the most dangerous one that can be. That in the long term this must bring catastrophic effects on social and political life in Germany seems not to interest anyone.

Now it does not really matter what one thinks of the theses advocated by this group of persons. The fact is that the human right to freedom of speech must be indivisible, as Professor R. Dworkin already put it in *Index on Censorship*.[53] And since none of the cases described here involved any calls to violence, instructions for violent acts, or trivializations of violence – at most, violence is disputed for certain historical events, or portrayed as less than generally usual in other accounts – the harshness with which the German judiciary proceeds against these dissidents is incomprehensible and unjustified.

If the cases described herein affected any other persons or groups, then there would be a worldwide outcry in the press, denouncing such human rights violations. But since the victims are after all only the *right* ones, the matter is ignored and hushed up. But from an objective perspective there is no difference between, for example, Communists and Jehovah's Witnesses being imprisoned in the Third Reich for their beliefs, and right-wingers and Revisionists being thrown behind bars in the Federal Republic of Germany today for the sake of their publications. Human rights remain human rights. They go for leftist radicals just as for right-wingers.

Considering the results of a more comprehensive, highly recommended study about the deterioration of civil rights in Germany in general,[54] one must conclude that Germany's tradition of free speech is rather underdeveloped. The general German attitude behind this – 'tough measures are justified to prevent the repetition of this dark (Third Reich) chapter of our history' – is understandable, but it is wrong, too, since it leads to the paradox and perverse situation where, in order to prevent the persecution of minorities and the burning of books, minorities are persecuted and books are burned. This is exactly the situation we are facing in Germany today. In light of her history, the only correct position for Germany to take would doubtless be the strict and impartial granting of human rights for everyone – and that is not to suggest that this time they ought to be denied the other side for a change, either. Obviously, where human rights are concerned, Germany is caught in a historical vicious circle, or, to use a different metaphor: the pendulum is swinging wildly from one extreme to the other. It is high time that it came to rest in the middle.

A Brief History of Holocaust Revisionism

WILLIS A. CARTO

I am not the first to point out that every person who sets down history in some measure revises that which has gone before, or there would be no point to his efforts. In the U.S., which is the focus of this essay, the term 'historical revisionism' was first used to describe the work of historians after the first World War who debunked the war guilt theory which undergirded the Versailles Treaty, the left-over wartime propaganda that Germany was singularly guilty for that pointless and tragic war. In this effort, Dr. Harry Elmer Barnes was prominent, although not the only historian involved. Thus, it was only natural that the term 'Holocaust revisionism' came into use to describe a process that began immediately after the second World War, a process in which Dr. Barnes was involved, although this time, rather quietly, for the peddlers of false history relative to 'The Holocaust' – as the extermination tale has come to be known – are far stronger, better organized, fueled by vast quantities of money, and able to stifle the writings and tar the reputation of anyone so foolish as to contradict the extreme thesis that six million Jews were gassed or otherwise dispatched by the National Socialists.

This writer's education into the credibility of the six million thesis began, when I came across a simple letter to the editor of *Our Sunday Visitor* in the June 14, 1959, issue written by Steven F. Pinter, who claimed to have been in Dachau for 17 months after the war as a U.S. government attorney and said there were no gas chambers there or in any other detention camp in Germany. This simple letter could not outweigh the tons of newsprint and books concerning the Holocaust, of course, but from that time forward I began weighing the evidence on both sides instead of accepting the exterminationist thesis uncritically. I was a potential Holocaust revisionist.

The first writer to seriously debunk the Holocaust, aside from early critics of the Nuremberg War Crimes trials who only mentioned it marginally, was a remarkable Frenchman, Paul Rassinier, a Socialist who had himself been a German wartime detainee, or as they say, 'concentration camp survivor'. His first two books, *Passing of the Line* and *The Lies of Ulysses*, were published in French in 1948 and 1950, respectively (Editions bressanes, Paris), followed by many more book, perhaps the most famous being *The real Eichmann trial, or the incorrigible vanquishers* and *The Drama of the European Jews*.[1]

In Germany, Dr. Dr. Dr. Franz J. Scheidl started as early as 1945 to write a comprehensive work about *The History of the Defamation of Germany* consisting of eight volumes, four of which were dedicated to the 'Holocaust' and other propaganda of WWII.[2] The manuscript was finished in 1950, but because no publisher dared to touch it, the author published a revised version himself as late as 1967.

Meanwhile, in California, a sometime Stanford history professor, Dr. David Hoggan, was working on what became the first book in English on the same subject. Apparently, he began his labors in 1960 and by 1968 had mailed copies of the manuscript to friends and others he knew would be in-

---

For a more comprehensive history of Holocaust revisionism, see Carlo Mattogno, "*The Myth of the Extermination of the Jews: Part II*", *The Journal of Historical Review*, 8(3) (1988), pp. 261-302; online: vho.org\GB\Journals\JHR\8\3\Mattogno261-302.html.

1 *Le Véritable Procès Eichmann ou les vainqueurs incorrigibles / Le Drame des juifs européens*, Les Sept Couleurs, Paris 1962/1964 (online: abbc.com/aaargh/fran/archRassi/vpe/vpe.html and …/archRassi/dje/dje.html.

2 *Geschichte der Verfemung Deutschlands*, 8 Vols., published by author, Vienna (partly online: www.vho.org/D/gdvd_2)

terested. How many copies he sent out is unknown, but it is known that he sent copies to Barnes, Ralph Townsend of Springfield, Virginia, Prof. James J. Martin of Colorado Springs, and Tom Serpico, publisher of Catholic miscellany and historical books in Hawthorne, California. This manuscript, an account of inconsistencies in the Holocaust tale, was written anonymously, although I assume that many persons who received it knew the identity of the author. After he read it, Tom Serpico passed his copy to me.

I reasoned – incorrectly as it was – that the author was probably Barnes, whom I did not at that time know personally. I asked Tom if he was going to publish it and he was not. Being the proprietor of a small publishing house, The Noontide Press, I immediately published it in 1969, citing the author as Anonymous and writing a brief introduction using a pseudonym, E. L. Anderson. To it I appended four short articles that had appeared in *The American Mercury* magazine which I published at the time. One of the articles was by Dr. Austin J. App, titled, "*That Elusive Six Million*", which had appeared in the Summer 1966 issue of *Mercury*. The volume consisted of 104 pages of the Hoggan manuscript plus the four page introduction and 13 pages of reprints from *Mercury*, including Dr. App's seminal article. I was genuinely surprised to learn, shortly after the book's publication of its first printing of 2500 copies, that the real author was David Hoggan.[3]

In 1972 in England, Richard Verral, under the pseudonym of Richard Harwood, brought out the first edition of *Did Six Million Really Die?*[4] Later editions were titled *Six Million Lost and Found.* Largely a republication of Noontide's *The Myth of the Six Million* in an illustrated 8.5×11 format, with some additions and textual changes by Verral, millions of copies of this 'new' edition of the Noontide book have since been circulated (including in tabloid newspaper format edition) and it has been translated into several languages.

In 1973, Thies Christophersen published in German his personal account of Auschwitz entitled *The Auschwitz Lie*.[5] In 1974, it was published in English and has become one of the most widely-distributed documents in the field.

In 1975, Earl W. Thomas of Silver Spring, Maryland, had Barnes translate Rassinier's *Drama of the European Jews*, added a foreword by Michael Hardesty and published it under Steppingstones Publications. Later, in 1978, with the blessing of Rassinier's widow and under the imprint of The Noontide Press, I published a library-quality hardbound compilation of Rassinier's various works under the title, *Debunking the Genocide Myth – A Study of the Nazi Concentration Cams and the Alleged Extermination of European Jewry*.[6]

In 1976, the first edition of Arthur R. Butz's *The Hoax of the Twentieth Century* appeared in England. In 1978, I published the first American edition of this full-sized, indexed, 315-page, heavily-documented work through The Noontide Press. Later, after I set up the Institute for Historical Review (IHR), the IHR assumed publication of the Butz book. The book was mentioned even in the mainstream press and has gone through ten printings.[7]

In late 1978 and early 1979, Dr. Robert Faurisson, then professor at the University of Lyon, France, published his two famous revisionist articles in the renowned French newspaper *Le Monde*, challenging the gas chamber myth, which caused a major uproar in France.[8]

In 1979, the German Judge Dr. Wilhelm Stäglich published his book *The Auschwitz Myth*, in which he critically analyzed the evidence for the 'Holocaust', mainly as presented during the Frank-

furt Auschwitz Trial in 1963-1965.[9] This book of high scholarly standards caused a major furor in Germany, leading to its confiscation and burning, the withdrawal of Stäglich's PhD title by the once famous University of Göttingen, and the change of German penalty law to outlaw revisionism.[10]

The year 1979 was a significant year for Holocaust revisionism in general with the sponsorship of the First International Revisionist Conference in Los Angeles, the founding of the IHR, and the preparation of the first issue of *The Journal of Historical Review* (datelined Spring, 1980) and mailed to former subscribers to the *Mercury*, which I suspended at that time to make room for the new publication. Volume One, Number One of the *Journal* was devoted to printing the papers delivered to the 1979 conference by Udo Walendy, Dr. Austin J. App, Louis Fitzgibbon, Dr. Arthur Butz, and Prof. Robert Faurisson.

Between that issue of the quarterly *Journal* and the Winter, 1992 issue were 43 others, all issued on time except for a single issue combining the Summer, Fall and Winter, 1984 issues, a circumstance required by the firebombing and total destruction of the IHR by arsonists on July 4, 1984. At least $400,000 in book, video and magazine inventory, all internal records including book manuscripts, all equipment and furniture were a total loss.

After this debacle, it was uncertain that the IHR could continue. However, my wife Elisabeth and I decided to attempt another incarnation which, by dint of hard labor and a growing public acceptance of Holocaust revision, became even more successful than before – until October 1993, when the IHR came under the control of others.

During the period beginning with its founding through 1993, in addition to the 45 issues of the *Journal*, the IHR brought out the following books regarding the Holocaust:

- 1979, *Anne Frank's Diary a Hoax*, Ditlieb Felderer;
- 1983, *The Dissolution of Eastern European Jewry*, Walter Sanning (aka Wilhelm Niedereiter);
- 1986, *The Auschwitz Myth*, Judge Wilhelm Stäglich;[11]
- 1987, *No Time for Silence*, Dr. Austin J. App;
- 1989, *The Confessions of Kurt Gerstein*, Henri Roques,

as well as many other books on other aspects of historical revisionism, wartime propaganda and the promotion of piece.

Today, the two primary periodicals in the English language that carry historical revisionism are *The Barnes Review* (*TBR*), a 72-page bimonthly of which I am the publisher,[12] and the more scholarly magazine *The Revisionist* (*TR*), a 120-pages quarterly of which Germar Rudolf is the publisher.[13] In addition to Holocaust revisionism, both magazines carry forward the tradition of historical revisionism that began after World War I to which it adds revision of all historical subjects from the prehistoric period to contemporary.

As the owner of Theses & Dissertations Press, Germar Rudolf also publishes a series called *HOLOCAUST Handbooks*, of which *Dissecting the Holocaust* was the first issue.[14] In the back of this book, the reader can find detailed information about other books of this series.

HOLOCAUST Handbooks, Vol. 2:

Germar Rudolf

The Rudolf Report

Expert Report on Chemical and Technical Aspects of the 'Gas Chambers' of Auschwitz

In the years after its first publication, the so-called *Leuchter Report* about the alleged gas chambers of Auchwitz and Majdanek has been subject to massive, and partly justified, criticism. In 1993, Rudolf, a researcher from the prestigious German Max-Planck-Institute, published a thorough forensic study about the alleged gas chambers of Auschwitz which irons out the deficiencies and discrepancies of the *Leuchter Report*.

The Rudolf Report is the first English edition of this sensational scientific work. It analyzes all existing evidence on the Auschwitz gas chambers and exposes the fallacies of various failed attempts to refute Rudolf's Report. The conclusions are quite clear: The alleged gas chambers of Auschwitz could not have existed.

In the appendix, Rudolf describes his unique persecution.

"These scientific analyses are perfect." H. Westra, Anne-Frank-Foundation,

"[T]*he report must be described as scientifically acceptable."*

Dr. Henri Ramuz, Professor of Chemistry

455 pp. A5, b/w & color ill., bibl., index; pb: $/€30.-/£20.-; hardcover: $/€45.-/£30.-

HOLOCAUST Handbooks, Vol. 3:

Jürgen Graf

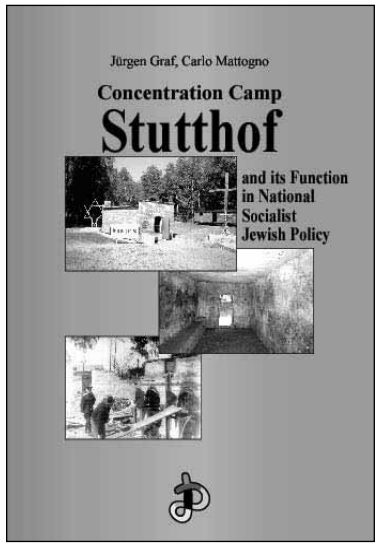
GIANT With Feet of Clay

Raul Hilberg and his Standard Work on the "Holocaust"

Raul Hilbergs major work "The Destruction of European Jewry" is generally considered the standard work on the Holocaust. The critical reader might ask: what evidence does Hilberg provide to back his thesis that there was a German plan to exterminate Jews, to be carried out in the legendary gas chambers? And what evidence supports his estimate of 5.1 million Jewish victims?

Jürgen Graf applies the methods of critical analysis to Hilberg's evidence and examines the results in the light of Revisionist historiography. The results of Graf's critical analysis are devastating for Hilberg.

Graf's *Giant With Feet of Clay* is the first comprehensive and systematic examination of the leading spokesperson for the orthodox version of the Jewish fate during the Third Reich.



160 pp. pb, 6"×9", ill., bibl., index, $/€ 9.95-; £7.-

HOLOCAUST Handbooks, Vol. 4:

Jürgen Graf, Carlo Mattogno

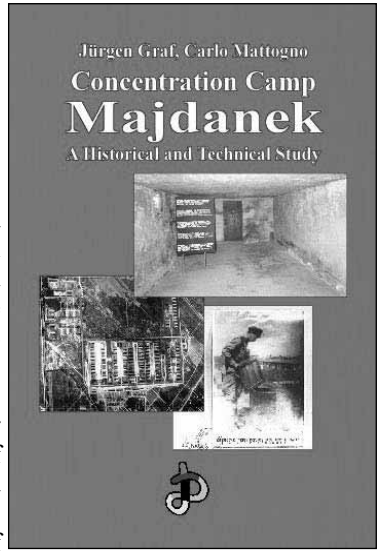
Concentration Camp Stutthof

and its Function in National Socialist Jewish Policy

The concentration camp at Stutthof near Danzig in western Prussia is another camp which had never been scientifically investigated by Western historians. Officially sanctioned Polish authors long maintained that in 1944, Stutthof was converted to an "auxiliary extermination camp" with the mission of carrying out the lurid, so-called "Final Solution to the Jewish Problem." Now, Jürgen Graf and Carlo Mattogno have subjected this concept of Stutthoff to rigorous critical investigation based on Polish literature and documents from various archives.

Their investigations lead to unambiguous conclusions about the camp which are radically different from the official theses. Again they have produced a standard and methodical investigative work which authentic historiography can not ignore.

122 pp. pb, 6"×9", b/w & color ill., bibl., index, $/€15.-/£10.-



---

HOLOCAUST Handbooks, Vol. 5:

Jürgen Graf, Carlo Mattogno

Concentration Camp Majdanek

A Historical and Technical Study

Amazingly, little scientific investigation had been directed toward the concentration camp Lublin-Majdanek in central Poland, even though orthodox Holocaust sources claimed that between fifty thousand and over a million Jews were murdered there. The only information available from public libraries is thoroughly discredited Polish Communists propaganda.

This glaring research gap has finally been filled. After exhaustive research of primary sources, Mattogno and Graf created a monumental study which expertly dissects and repudiates the myth of homicidal gas chambers at Majdanek. They also investigated the legendary mass executions of Jews in tank trenches ("*Operation Harvest Festival"*) critically and prove them groundless.

The authors' investigations lead to unambiguous conclusions about the camp which are radically different from the official theses. Again they have produced a standard and methodical investigative work which authentic historiography can not ignore.

320 pp pb, A5, 6"×9", b/w & color ill., bibl., index, $/€25.-/£18.-

HOLOCAUST Handbooks, Vol. 6: (September 2003)

Don Heddesheimer

The First Holocaust

Jewish Fund Raising Campaigns With Holocaust Claims During And After World War I

We all know that the suffering and death of Six Million Jews during the second world war was an event unparallelled in world history. But do we really?

The First Holocaust is an extremely irritating book, because it proves us all wrong. Supported with many publications from mainstream US media, in particular *The New York Times*, Don Heddesheimer provides the evidence to show that between 1916 and the late 1920s, mainly American Jewish organizations were claiming that up to *six million Jews*(!) would suffer terribly in poverty sticken Eastern Europe.

In this context, it was claimed that eastern European Jewry would face a Holocaust if they did not receive massive aid. With such claims, millions of dollars were raised in the United States, which at the end were probably used to finance the Bolshevic revolution in Russia.

This book is a key to understand the much more successful Holocaust propaganda which was unleashed during World War II.

HOLOCAUST Handbooks, Vol. 7: (August 2003)

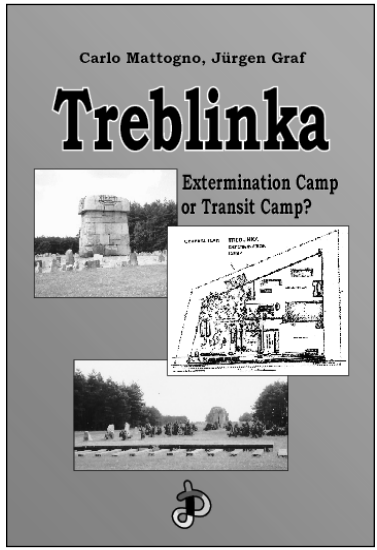
Arthur R. Butz

The Hoax of the Twentieth Century

The Case Against the Presumed Extermination of European Jewry

With his book *Hoax of the Twentieth Century*, A. R. Butz, Professor of Electrical Engineering and Computer Science, was the first (and so far the only) writer to treat the entire Holocaust complex from the Revisionist perspective, in a precise scientific manner. This book exhibits the overwhelming force of historical and logical arguments which Revisionism had accumulated by the middle of the 70s. It was the first book published in the US which won for Revisionism the academic dignity to which it is entitled. It continues to be a major revisionist reference work, frequently cited by prominent personalities.

Because of its prestige, no library can forbear offering *The Hoax of the Twentieth Century*, and no historian of modern times can ignore it. A "must read" for every Revisionist and every newcomer to the issue who wants to thoroughly learn about revisionist arguments. This issue is a revised version with a new preface.



440 pp. pb, 6"×9", ill., bibl., index, $/€25.-; £18.-

HOLOCAUST Handbooks, Vol. 8: (Spring 2004)

Carlo Mattogno, Jürgen Graf

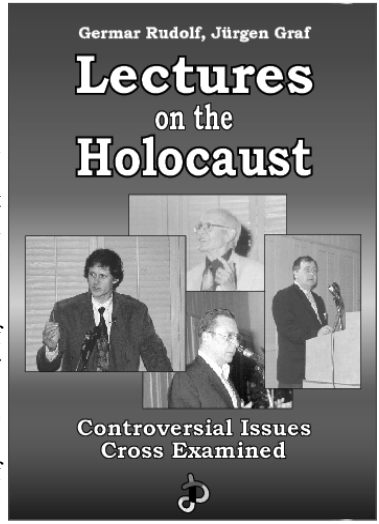
Treblinka

Extermination Camp or Transit Camp?

Holocaust historians alleged that at Treblinka in East Poland, between 700,000 and 3,000,000 persons were murdered in 1942 and 1943. The weapons used were alleged to have been stationary and/or mobile gas chambers, poison gases of both fast acting and slow acting varieties, unslaked lime, superheated steam, electricity, diesel exhaust fumes, etc. Holocaust historians alleged that bodies were piled as high as multistoried buildings and burned without a trace, using little or no fuel. Graf and Mattogno have now analyzed the origins, logic and technical feasibility of the official version of Treblinka. On the basis of numerous documents they reveal Treblinka's true identity: it was a transit camp.

Even longtime Revisionism buffs will find a lot that is new in this book, while Graf's animated style guarantees a pleasant reading experience.

The original testimony of witnesses enlivens the reader, as does the skill with which the authors expose the absurdities of Holocaust historiography.



ca. 432 pp. pb, 6"×9", ill., bibl., index, $/€25.-/£18.-

HOLOCAUST Handbooks, Vol. 9: (Summer 2004)

Germar Rudolf, Jürgen Graf

Lectures on the Holocaust

Controversial Issues Cross Examined

In 1992, German scholar Germar Rudolf held several lectures at various academic societies in Germany. His topic was very controversial: the Holocaust in the light of new forensic findings. Even though Rudolf presented nothing short of full-fledged Holocaust Revisionism to the mainstream audiences, his aguments fell on fertile soil, because they were presented in a very pedagogically sensitive and scholarly way. This book is an updated version of these lectures, enriched by contributions of Swiss scholar Jürgen Graf.

The book's style is unique: It is a dialogue between the two lecturers on the one hand who introduce the reader to the most important arguments and counter arguments of Holocaust Revisionism—backed up with sources and references to further reading—and the reactions of the audience to these presentations on the other hand: supportive, skeptical, and also hostile comments, questions and assertions. It reads like a vivid and exciting real-life exchange between persons of various points of view, a compendium of Frequently Asked Questions on the Holocaust and its critical re-examination.

There is no better way to introduce readers unfamiliar with revisionism to this highly controversial topic.

ca. 400 pp. pb, 6"×9", ill., bibl., index, $/€25.-/£18.-

AUSCHWITZ: PLAIN FACTS

A RESPONSE TO JEAN-CLAUDE PRESSAC

With two major works on the Auschwitz concentration camp, French pharmacist Jean-Claude Pressac attempted to refute revisionists with their own technical methods. Whereas his first work remained rather obscure, Pressac's second book on "the technique of mass murder" was praised by the mainstream in Europe, who proclaimed victory over the revisionists. They did not reckon with the revisionists' rebuttal. . . . In *Auschwitz: Plain Facts*, Pressac's works are subjected to a detailed and devastating critique by leading revisionist scholars. Although Pressac deserves credit for having made accessible many hitherto unknown documents, his writings could not refute the revisionists, because Pressac violated many scientifi c principles: He made claims that he either could not prove or which contradict the facts. Many documents he quoted do not state what he claimed they do. Most importantly, he did not pay any attention to "the technique" of the mass murder at issue, as his books claim. They neither contain references to technical or scientific literature, nor any technical consideration at all. In fact, he reveals such a massive technical incompetence that his works belong to the category of novels rather than history. Despite these defi ciencies, Pressac is still hailed as the savior of the Auschwitz-Holocaust by the mainstream. Auschwitz: Plain Facts is a must read for all those who want to argue against the lies and half truths of established historiography. Softcover, 212 pages, #542, ***$20*** plus S&H. Available from TBR Book Club. See inside for ordering form or call TBR toll free at 1-877-773-9077 to charge to major credit cards.

Preface

By Germar Rudolf

1. The End of Jean-Claude Pressac

Between the late 1980s and the mid 1990s, French pharmacist Jean-Claude Pressac was the darling of Western media with respect to research into the history of the concentration camp Auschwitz. The media hoped to have found in him the technically qualified expert who could counter the arguments and the methods of those who wish to revise the history of the concentration camp complex Auschwitz in particular and the Holocaust in general. The contributions of Serge Thion and myself give an overview of this exaggerated praise from the judicial system, the media, and scientists. My own article makes it clear that these hymns of praise have been premature and that Pressac's book does not meet the standards of scientific work.

Even in terms of technical competence, the work Pressac has delivered is unsatisfactory in many respects, as Prof. Faurisson and Carlo Mattogno will show in this book. His friends of the same cast of opinion also seem to be skeptical of his technical qualifications, since the English version of Pressac's last[1] work was somewhat censored by being subsumed in a collection supported by other pieces, as Prof. Faurisson will show in his short addendum.

The present book was written to demonstrate to the world that the works of the one who has been advertised as *the* Auschwitz specialist were better considered to be novels than studies that should be taken seriously as a work of historical science. The present book constitutes a corrective review, with the consequence that the historical account on the subject of the concentration camp complex Auschwitz will be fundamentally revised. The revision of the historical account on concentration camp Auschwitz, begun by revisionists and brought before a broader public by Pressac, now returns to its origins.

---

[1] Pressac died in summer 2003, see Jürgen Graf, "Jean-Claude Pressac and revisionism," *The Revisionist* 1(4) (2003), pp. 426-432; Carlo Mattogno, "My Memories of Jean-Claude Pressac," ibid., pp. 432-435.

2. Should there Be Freedom for Revisionism?

This book, which challenges the traditional historical version on the annihilation of the Jews in the concentration camp complex Auschwitz through an analysis of Pressac's latest and last book, claims to be in conformance with the standards of science and scholarship. After reading it, the reader will certainly agree with that. But that did not stop the German authorities from ordering the confiscation and destruction of all copies of this book and all data and data carriers used for its writing.[2] As editor of this book, I avoid prosecution only because by that time I had fled Germany.

If this book is scholarly indeed, then it should be protected by Germany's surrogate constitution, the so-called Basic Law, which in Article 5, Section 3, protects science without restriction, on the condition that the book does not itself harm similarly protected fundamental rights of others.

The German authorities – and many other European countries[3] – justify the burning of this book[4] by claiming that works that end in completely or partly denying or refuting the intentional, industrially organized annihilation of European Jews by the National Socialists – in other words, the Holocaust – are fundamentally incapable of being scientific, since anyone who operated according to scientific method must automatically come to the conclusion that the generally accepted description of the Holocaust corresponds to historical reality.

Others object that revisionist works should not be afforded the protection of Civil Rights even if they fulfill formal criteria of being scholarly and scientific. The reason given for this is that it is a clearly established fact that the Holocaust happened and that any assertion to the contrary represents an offense to the human dignity of Holocaust victims, their descendants and relatives, and to the Jewish people generally. By denying the Holocaust, fundamental rights of others are massively harmed. Since human dignity must be valued more highly than freedom of science, therefore science should be for-

---

2 The German edition can be found online at vho.org/D/anf. It was ordered seized and destroyed in 1997 by County Court Böblingen, ref. 9(8) Gs 228/97). On April 8, 1999, the German Agency for the Protection of the Youth put it on its index of literature endangering the youth: *Bundesanzeiger*, no. 81, April 30, 1999.

3 France, Belgium, Austria, Czechia, Switzerland, Spain, the Netherlands, and Poland also punish historical dissenters. Other European countries are in the process of introducing similar censorship laws. Canada and Australia persecuted dissenters with their "Human Rights Commissions." *Cum grano salis*, the following argument is valid for these countries as well.

4 That confiscated books are indeed burned by the German authorities, was confirmed by two newspaper reports: *Abendzeitung* (Munich), March 7/8, 1998: "The remaining copies will possibly be destroyed in a garbage burning facility." (www.germarrudolf.com/persecute/docs/ListPos58_d.pdf); *Zur Zeit* (Vienna), No. 9/1998 (Febr. 27): "*65 years ago this happened publicly, but today it is accomplished secretly in waste incinrator facilities*." (www.germarrudolf.com/persecute/docs/ListPos59_d.pdf)

bidden to adopt such theories, because the mere proposition that the Holocaust – the purposeful, planned destruction of the Jews by the Third Reich – did not happen is an implicit claim that Holocaust history was knowingly fabricated for the purpose of deception and possibly in order to obtain material or political advantages. This would be an affront to the dignity of anyone who might be implicated thereby that cannot be tolerated.

In what follows I would like to analyze this matter more thoroughly.

3. Unrestricted Research and Revision: Basis of Science

The basis of the reasoning just stated is that freedom of science should be thought a lesser good than human dignity. This idea is questionable. Science is not merely a plaything of unworldly researchers. On the contrary, it is not only the highest manifestation of our capacity to perceive and understand, but in the word's most general sense it is the basis of *every* human capacity to perceive and to understand that exceeds that of animals. It is the basis of *every* human mode of living and doing that is distinguishable from the modes of living and doings of animals. One could say that science, in the word's most comprehensive sense, first made man human and gave him that dignity that lifts him above the animals. The freedom of science is thus inextricably involved with human dignity.

Scientific understanding serves human decision-making both on the individual and on the political level; the natural drive to seek knowledge was implanted in man by nature. In order to make valid decisions, that is, decisions which conform to reality, it is an essential precondition that scientific knowledge be true. Truth as the only test for scientific validity means: every other influence on the process of discovering scientific truth, whether economic or political, must be excluded. It also must be made certain that all scientific findings can be published and distributed without hindrance, because it is only through the unhindered confrontation of scientific opinions in open forums that it can be insured that the most convincing opinion, being most in conformity with reality, will prevail. In our case that means that there can be no reason to suppress an opinion in accord with scientific norms in any way.

Increasingly in recent years the freedom of science in the area of contemporary history has been constrained, in that scientists who offend against the ruling *zeitgeist* through expression of their scientific views have their social reputations destroyed by political or media inquisitions or are threatened with loss of their professional standing. Sometimes the judicial system is brought in in order to add criminal prosecution to professional ruin. The recently intensified criminal prosecution of revisionist opinion in Germany through modification of Sec. 130 of the German Penal Code, which punishes not only the denial of genocide committed by the Third Reich, but also anything positive ut-

tered about that period of German history,[5] is a striking example of the growing inquisitorial drive in Germany's society.

Prof. Hellmut Diwald has characterized this shielding of discussion on the Holocaust with the penal law as follows:[6]

> *"In the history of the Third Reich there is no complex of questions that is more hopelessly kept from close examination by German historians than the horrible fate of the Jews during the war. The Basic Law of Bonn* [capital city of West Germany] *does guarantee the freedom of research and science. But a series of related decisions and verdicts has shown that one would be well advised neither to expose oneself to the risk of being a test case for the freedom to invoke this fundamental right by choosing this subject matter nor to expose oneself to the lesser risk of even peripherally violating the 21st Law modifying the Penal Code of June 15, 1985, and provoking an indictment due to such an offense. This means that the very complex of questions of contemporary historical research has been made taboo, which, together with the continually upheld theme of collective guilt, burdens the German people like no other event."*

There is a general understanding that the intensified punishment of revisionist viewpoints primarily serves to combat uneducated, unteachable right-wing extremists. The philologist Dr. Arno Plack thinks otherwise. In his view, the[7]

> *"'actual intended groups' with respect to the punishment of the 'Auschwitz lie'* [are ...] *the office-holding German historians, who, because of forced confession (one time!) and threat of punishment impose upon themselves a judicious form of restraint with respect to certain decisive questions.* […] *A judicial system that clamps down on* [possibly] *erroneous opinions that are not due to any intention to injure is not without effect. It fortifies the widespread tendency to be silent in the face of burning questions; it demands readiness to give the expected lip service and it stirs up doubt as to* [apparently] *irrefutable facts even among all those who have learnt, 'The truth always prevails.'* […] *Finally, such a judicial system stimulates denunciation.* […]
>
> *By the principles of a liberal community, the best weapon in the battle of opinions is not prohibition or punishment, but argument, the 'weapon word,' as Lev Kopelev has said. If we are not to lose our belief that democracy is a viable form of society, we cannot accept that it should defend against* [presumably] *making Hitler inoffensive with the same compulsory methods which the dictator himself quite naturally used to suppress contrary opinion.* […] *I believe his* [Hitler's] *ghost, his repression of mere*

doubt, his tendency simply to prohibit what was not acceptable in the ruling system, yet needs to be overcome in those who overcame him."

As part of the intensified persecution of Holocaust revisionism, Germany's legislators and judges have decided to put revisionist research on the "Index of Forbidden Knowledge." One indication of this are the numerous confiscations of revisionist books published by my publishing company. The present book is not the only victim of German government book burning. As a matter of fact, the list of publications confiscated and banned by German authorities that I either wrote, edited, or published includes now at least 14 items.[8] In effect, a moratorium on research *has* been declared. In Germany, the research goal to clarify the technical and historical background of the supposed mass murder of Jews has been put into the "Catalog of Forbidden Research Goals." The only opinions and conclusions that will be accepted are those that fit the predetermined picture.

This official behavior is incompatible with the thousands of years old principles of Occidental epistemology, which Prof. Hans Mohr has concisely expressed as follows:[9]

"'Freedom of research' also implies that the purpose of research may be anything whatever. An 'Index of Forbidden Knowledge' or a 'Catalog of Taboo Research Objects' are irreconcilable with self-understanding and the worth of science, because we must unfailingly and in all circumstances maintain that understanding is better than ignorance."

It is equally irreconcilable with self-understanding and the worth of science when the protectors of the *zeitgeist* may require this or that conclusion or forbid some other. That science is free always and before all else presupposes that it is free to take any approach and reach any conclusion. No science that is worthy of the name can exclude any conclusion beforehand.

Biologist Prof. Dr. Walter Nagl once said it very concisely:[10]

"The exact sciences [like other scholarly disciplines] *are extremely conservative and dogmatic. Any corroboration of a paradigm is welcome, whereas any innovation or revision will long meet with resistance; the instinct for preservation (including self-preservation!) is stronger than the search for truth. Therefore, new findings usually gain acceptance only when sufficient numbers of researchers vouch for them: then the dogmatic status quo topples, a 'scientific revolution' occurs, a new paradigm replaces the old.* […] *The bottom line is that no student, no researcher and no layman should believe any facts to be 'conclusively proven,' even if the textbooks present them as such."*

---

9 *Natur und Moral*, Wissenschaftliche Buchgesellschaft, Darmstadt 1987, p. 41.

10 *Gentechnologie und Grenzen der Biologie*, Wissenschaftliche Buchgesellschaft, Darmstadt 1987, p. 126f.

Usually it takes a number of researchers attacking the same point in order for newer theories to prevail over older, no longer adequate theories. Although some science has held good for thousands of years it is also true that no scientific paradigm – whether in the exact or in the social sciences – can claim to have eternal validity. Rather it is the duty of scientists and also lay people not simply to accept the obvious, supposedly finally proven facts, even when they are there in the textbooks, but always to look critically on them. This applies also to research into the Holocaust complex. I agree with German left-wing historian Prof. Dr. Peter Steinbach, who once stated:[11]

> *"The Basic Law* [German constitutional law] *protects scientific research and basically wants the impartiality of this research. This is especially true for history, which is, after all, not about defining a central thread and making it binding, but about making offers for the discussion. In a pluralistic society, this must be manifold and controversial."*

In particular, in historiography and in the publication of the findings thereof there is now the phenomenon that German journalist Eckhard Fuhr, speaking of the treatment of irksome scientists, has characterized as systematic falsification.[12] It is not the scientifically determinable truth of a scientist's assertion that is the criterion for media and politicians, but rather the question of its political usefulness.

Under pressure to conform to the *zeitgeist* and in fear of the inquisition conducted by the media and the political and judicial authorities, many scientists feel forced to compromise and to adjust their research findings to the political standard. This suppression of the full truth or even the promotion of a half- or even a complete lie due to public pressure is the most baneful thing that can happen to science. Such conduct not only destroys respect for science but also inflicts immeasurable harm on our people and on all mankind.

I agree furthermore with Prof. Dr. Christian Meier's assertion:[13]

> *"But otherwise one can in my view say that what we historians work out in accordance with the rules is not dangerous. I do not think that truth, if it is the truth, is dangerous."*

In the writing of history especially, it is half-truths and lies that are dangerous for the amity of peoples.

With respect to our thesis this much is clear: No matter which theories revisionists start out from and no matter which results they may come up with, they should be free to do their work and should not be restricted in any way as long as they satisfy the norms of scientific method. To penalize a certain result of scientific work would be to kill the freedom to do science and with it science itself, which without question violates Article 19, Sec. 2 of Germany's

---

[11] P. Steinbach, ARD Tagesthemen (First German Public TV news), June 10, 1994

[12] *Frankfurter Allgemeine Zeitung*, Dec. 23, 1994, p. 1.

[13] In: *Berichte und Mitteilungen der Max-Planck-Gesellschaft*, Heft 3/1994, p. 231.

Basic Law, which lays down that no fundamental right may be infringed on in an essential way. Restriction of the freedom of science can therefore never depend on what theories a scientific work starts out from or what results it comes up with. The freedom of science can only be restricted with respect to the methods that are used to acquire knowledge. For example, research which endangers the mental or physical health of persons is not covered by human rights.

Since in science there are no final or self-evident truths, then also there can be no such truths in respect to scientific investigation of the events of the Third Reich. Even in this subject area it is a fundamental duty of science to criticize old results and revise them when necessary.

Revisionism is an essential component of science.

4. Toward Freedom of Expression

It is not difficult to protect the freedom to express an opinion that corresponds with that of the ruling class. The most horrible dictatorships fulfill that criteria. A nation that honors human rights distinguishes itself in that it allows the freedom of expression to those whose ideas are not welcome to the ruling class. The right to freedom of expression is the citizen's defense against state interference:[14]

> *"In its historical development down to the present the function of fundamental rights consists in providing the citizen defensive rights against the use of state power (Decision of the German Federal Constitutional Court, BVerfGE 1, 104,). Standing judicial opinion is that this is its primary and central effect even today (BVerfGE 50, 337)."*

Taken on its own merits, an opinion that contradicts the current historical description of the Holocaust endangers neither the formal foundations of any nation, such as human rights, national sovereignty, the division of power, or the independence of justice, nor the formal legitimacy of those who hold power, so such an opinion must be tolerated. However, there is hardly any other area in which many Western nations proceeds more repressively against undesired opinions than with respect to the Holocaust.[15]

The right to free expression can only be restricted when its exercise infringes the human rights of others. When someone says the Holocaust did not happen the way we have always heard it did, or says it did not happen at all, his right to free expression will be *de facto* denied. The reason given for this is

---

[14] K.-H. Seifert, D. Hömig (eds.), *Grundgesetz für die Bundesrepublik Deutschland*, Nomos, Baden Baden 1985, pp. 28f.

[15] On the reasons for this behavior, cf. G. Rudolf, "Revisionism – an Ideology of Libération," *The Revisionist*, in preparation.

often that such assertions harm the dignity of those Jews once persecuted and killed, their descendants today, and the entire racial group of Jews.

Such argument follows the principles of protecting the direct victim of a crime in order to protect it from slander thereafter. For example, most would accept that it cannot be allowed for people to slander a woman who has been raped, saying she invented the story of the rape only to sneakily get retribution from, or take revenge on, the tried and convicted rapist for some other reason. This applies even when there may be doubt as to the truth of the woman's representations in light of her statements and the court records. The same protection must be allowed to every Jewish fellow citizen whose former (possibly only claimed) torturer was duly convicted. Nevertheless, it is not clear to me why all the relatives of the victim and all the members of the same religious group should enjoy the same protection.

In every case, however, he who maintains that the supposed crime did not take place must be given the opportunity to produce the proof of his assertion. Anything else would be contrary to the order of a nation under the rule of law. To determine whether the proof is correct, there must be scientific examination of the evidence.

For example, a scientific work that comes to the conclusion that there never was a Holocaust would not improperly diminish anyone's dignity, since the results of scientific work may not be forbidden without coming into conflict with the fundamental right to freedom of science (Art. 19, Sec. 2, Basic Law). In a state under the rule of law, such a work must be permitted to be used as evidence in order that an accused might provide evidence in defense of his opinion.

The only things that could possibly be outlawed are accusations that certain persons have lied with sinister motives, provided such accusations are not backed up with convincing evidence. But even such potential libels against alleged victims of crimes should be a matter of civil law suits, not of criminal law.

5. Battle Zone "Common Knowledge"

Section 244 of Germany's criminal procedural rules permits judges to refuse evidence on the grounds of "common knowledge." This provision allows judges not to have to prove over and over again things that have been proven in court many times before and which are commonly accepted as true. There is nothing objectionable about this paragraph, which seeks to restrict delaying tactics in judicial procedure. To return to our previous example, a woman who has already proven several times and in the opinion of the court could still prove that she actually was raped should not be required to prove it anew before the whole world each time someone comes forward who disputes the

event. Of course, this "common knowledge" principle does not exclude that there are circumstances, under which the evidence should be reexamined. It is a judicial rule even in Germany that common knowledge does not endure forever and that there are times when the principle should be suspended.

For one, the principle fails when a significant dispute about the commonly accepted fact occurs in public. For another, every court is duty-bound to suspend the principle when it receives evidence that is superior in evidentiary value to evidence formerly submitted. A third principle is laid down in Section 245 of the German rules, which determine that judges must not reject evidence that is already present in the court room, since in such cases obviously no delaying tactics are being used.[16]

However, it is media inquisitions organized by mostly left-leaning governing elites as well as draconian prosecution of any dissenter, even of any academic historian, which make it impossible to hold a significant public debate on Holocaust matters.

This would not be so bad if one were at least permitted to present in court evidence that is both already present in the court room and which is superior in evidentiary value to what had been presented to German courts before.

Unfortunately, every court in Germany does rejects any motion to introduce evidence already present in the court room or to determine merely the fact, as to whether or not new evidence is superior to old. This often happens by arguing that on the grounds of "common knowledge" it would not be permissible to accept *any* evidence intended to refute the officially prescribed version of this particular historical event. Of course, common knowledge may never be a reason to reject evidence already present in the court room, and the evidentiary value of evidence is something that can certainly never be common knowledge. However, the German Federal Supreme Court has approved this practice in open violation of German law, because – let me paraphrase the court's decision here: "We always did it that way."[17] In the meantime, the same court has even ruled that defense lawyers who dare to offer or ask for evidence supporting revisionist claims commit a crime themselves and have to be prosecuted for incitement to hatred.[18]

6. On the Defense of Human Rights

The most radical position of the opponents of Holocaust revisionism is that which denies all freedom to revisionism whatever, on the grounds that revisionism and its theories harm the dignity of Jews. I have some questions about this:

- Whose human dignity is more diminished, that of the alleged victim whose claimed suffering is disputed, or that of the convicted defendant who may have been erroneously convicted?
- Whose human dignity is more harmed, that of the alleged victim of whom some people think his suffering is a lie, or that of the scientist who is accused of lying and whose career is destroyed, his family ruined, and who is finally put into jail?

German courts protect the dignity of every Jew who, in connection with the Holocaust, has been accused of lying directly or (supposedly) indirectly, from any conceivable attack. In the sense of the extended protection for victims many are prepared to accept this.

When the same courts use the absolute objection of "common knowledge" to refuse to hear any mitigating evidence they dismiss or prohibit everything that could protect the dignity of the scientist who is accused of constructing a pseudoscientific structure of lies. Does not the scientist have the same right to the protection of his dignity as any Jewish citizen? Is he not entitled to have his arguments heard and considered in court?

German courts protect at law the dignity of the actual or supposed victims of the Holocaust from any conceivable attack. When these courts use the absolute objection of "common knowledge" to refuse to hear any mitigating evidence they dismiss or prohibit everything that could restore the dignity of the convicted SS man. Does not the convicted SS man have dignity that needs to be protected? Many of our contemporaries may have asked themselves this question, and the fact that many would probably answer this question spontaneously with a stark "No" shows that the principle of equal treatment before the law has long disappeared from the understanding of many citizens. But, in fact, the dignity of the SS man and the dignity of the Jew are equally deserving of protection.

German courts protect the dignity of the supposed Jewish victims from any conceivable attack. At the same time they dismiss or prohibit anything that could restore the dignity of those of whom it is said, they were members of a criminal organization, like the SS. They dismiss or prohibit anything that could restore the dignity of the ordinary Wehrmacht soldier, of whom it is said by his service he enabled and prolonged the murders.

German courts protect the dignity of the members of the entire Jewish race from any conceivable attack. They dismiss or prohibit anything that could restore the dignity of the entire German people, who are marked as criminals.

The German state and its component German judicial system accept every injury to the dignity of the German people and each German person, or injure it themselves, and forbid anything that might defend this dignity. Does not this nation and its judicial system commit a massive breach of Article 1, Section 1, of its constitutional Basic Law, in which human dignity is stipulated as inviolable and the government is expected to use every power it possesses to defend the dignity of every person?

Does not this country and its component judicial system violate the equal treatment principle laid down in Article 3, Sections 1, 3 of the German Basic Law by defending the dignity of the Jews but neglecting or even forbidding the defense of the dignity of Germans generally, and of SS members, Waffen SS members, and Wehrmacht soldiers in particular?

Does not this country and its component judicial system deny to all who hold an exact scientific worldview the freedom to profess that worldview, a freedom specified in Article 4, Section 1, of the German Basic Law? We are compelled to believe in bodies that burn by themselves, in the disappearance of millions of people without any trace, in geysers of blood spurting from mass graves, in boiling human fat collecting in incineration pits, in flames meters high spurting from crematory chimneys, in Zyklon B insertion hatches that are not there, in gassing with diesel motors, which is not practical for murder, and so on and so forth. The next thing we will be asked to believe in are witches riding on broomsticks.

Does not this country and its component judicial system refuse to allow someone to communicate his opinion of things connected with the Holocaust from the standpoint of his worldview derived from the exact sciences, contrary to Article 5, Section, 1 of its Basic Law?

Finally, does not this country and its component judicial system deny to every researcher, scientist, and teacher his right to conduct an unprescribed, unrestricted search for the truth and to publish his scientific opinion, contrary to Article 5, Section 3, of its Basic Law?

This country and its component judicial system are inflicting an ongoing injury to the majority of its people, in that it refuses the presentation of possible mitigating evidence, contrary to Articles 1, 3, 4 and 5 of its Basic Law,

It would seem to be high time to change this practice if we are to keep it from being said that this country – together with many others in Europe – is grossly violating human rights. A first step should be to stop banning scientific books and throwing their authors into prison.

Germar Rudolf, Steinenbronn, May 5, 1995
revised in Chicago, March 20, 2005

Pressac and the German Public

By Germar Rudolf

1. The Claim

1.1. The Media

The *Frankfurter Allgemeine Zeitung*, the most respected newspaper of the German-speaking world and one of the most respected newspapers worldwide, published an article by Joseph Hanimann entitled "*Ziffernsprache des Ungeheuerlichen*" (Math Language of the Monstrous) on Oct. 14, 1993, on page 37. In this piece Hanimann reported on the book by French pharmacist Jean-Claude Pressac published at the end of September 1993 by the publishing arm of the French National Center of Scientific Research (*Centre National de la Recherche Scientifique*, CNRS) on the crematories of Auschwitz, that supposedly sheltered the technology for the mass murder of countless persons, mostly Jews.[1] Hanimann wrote:

> *"The book is filled with photographic material and construction plans. It reads like an engineer's handbook in which technical data, such as incineration capacity and fuel consumption per corpse coldly document the whole monstrous thing.* […]
>
> *The principal benefit of this publication is that the technical details have been historically analyzed for the first time."*

The amazed layman learns that the claimed worst crime of human history has been subjected to a technical-criminological investigation for the first time 50 years after the fact. Almost every vehicular death and ordinary murder is routinely investigated by technical and criminological experts as soon as possible after it is reported. Why the 50 years' delay here? Hanimann himself indicates the answer:

> *"The author, who can think the ice-cold logic of technicians and can speak the hollow speech of the numbers of race-murder, meets the techni-*

[1] J.-C. Pressac, *Les Crématoires d'Auschwitz. La Machinerie du meurtre de masse*, CNRS Éditions, Paris 1993.

cians of the time and the revisionists of today on their own ground. But at the same time one gets the impression that someone else in the mirror is writing the book: Pressac's earlier teacher, the revisionist Faurisson. In that Pressac expends his entire power of argument to prove what is clearly true, the reality of the gas chambers, his former doubt seems to linger."

Apparently there are people who dispute the mass murder in Auschwitz on technical and scientific grounds. These people must be met with scientific-technical expertise. Yet again the layman must wonder: Were not the doubters formerly portrayed as crazies whose arguments need not be taken seriously? Why do we need to argue with them and bring up such a big gun as a publication put out by the most prestigious scientific institute of France? Are the objections of the deniers worthy of discussion? Do their arguments have substance? In that case, why were they withheld from the German readership of the reputedly most thorough newspaper in Germany? Why do we hear about them first through a supposed refutation? Why does the *Frankfurter Allgemeine Zeitung* conceal from its readers the views of the deniers, who after all were the real reason for Pressac's book? Does not the *Frankfurter Allgemeine Zeitung* trust its readers to be able to distinguish between true and false argumentation? Are the readers of *Frankfurter Allgemeine Zeitung* not very bright after all, despite of this newspaper's own advertisement quip? Or are the editors afraid that the readers might discover that those who put the newspaper together are not very bright? Question upon question...

Apparently readers' criticisms of this one-sided discussion of the subject had an effect on Joseph Hanimann, because in his discussion of the German edition of Pressac's book,[2] under the title "*Teuflische Details*" (Diabolic Details) on Aug. 16, 1994, (p. 8) we find, in addition to what was essentially a repeat of what he had already written, the following passages:

"The German Germar Rudolf describes Pressac's proofs as fraudulent; Faurisson has himself published a 'Réponse à Jean-Claude Pressac' (Answer to ...). Out of context, he welcomes what he takes to be Pressac's 'concessions' to the revisionist viewpoint: that the number of victims is less than that formerly given, that no decision for mass murder was taken at the Wannsee conference, that Zyklon B was used for combating typhus, that the crematories of Birkenau were originally planned without gas chambers. The exiguousness of the objections that Faurisson can raise to Pressac clearly shows his embarrassment."

Other reviews evaluated Pressac's new book similarly. For example, in the German daily newspaper *Die Welt* on Sept. 27, 1993, in a piece entitled "*Neue Erkenntnisse über Auschwitz*" (New Insights about Auschwitz), Greta Maiello wrote:

"The result is a comprehensive and highly professional study."

---

[2] *Die Krematorien von Auschwitz. Die Technik des Massenmordes*, Piper, München 1994.

A piece entitled "*Die Maschinerie des Todes*" (The Machinery of Death), which appeared in the weekly *Welt am Sonntag* on Oct. 3, 1993, signed by "ell," contained the following:

> *"*[This book…] *describes even the tiniest technical details as to how people were killed in the concentration camps."*

In "*Die Gaskammer-Erbauer von Auschwitz*" (The Gas chamber Builders of Auschwitz), Peter Hillebrand of the *tageszeitung* in Berlin said on March 21, 1994, about the German edition of Pressac's book:

> *"By means of technical data he* [Pressac] *can now confirm the existence and the operation of the gas chambers.* […] *In his book, which will appear soon in German, he describes with gripping, ice-cold technical detail the work of the fitters, site engineers and architects. It is just this painful description of technical detail, revealing changes of plans, fudging and bungling* […] *which demonstrates the incomprehensible unscrupulousness of the builders of these killing facilities."*

Following an interview with Pressac in the piece "*Die Technik des Massenmordes*" (The Technology of Mass Murder) in *Focus*, no. 17 (pp. 116ff.) on April 25, 1994, Burkhard Müller-Ullrich added this commentary:

> *"What has been missing until now has been proof of the technical method of mass murder. The revisionists – an international group of private historians, mostly confessed National Socialists, who deny the crime or want to 'minimize' it – attack just this point.* […] *Pressac's merit is that with his book he has undermined the foundation for any objections of the revisionists and Auschwitz-deniers, if there ever was any.* […] *Even Nolte did not know about the conclusive, indisputable refutation with which Pressac disposed of the main point of the Auschwitz-deniers, that a mass gassing of several thousand people in one day in a single camp was technically impossible."*

On April 29, 1994, in the daily newspaper *Süddeutsche Zeitung* under the caption "*Die Sprache des Unfaßbaren*" (Speech of the Incomprehensible) Harald Eggebrecht stated:

> *"*[…] *since the brutal resurgence of neo-Nazis and their shameless denial of the annihilation of the Jews in the gas chambers of Auschwitz, propped up with pseudoscientific theories that the murder machinery was impossible on so-called technical grounds, it has appeared necessary to prove Auschwitz all over again.* […] *In this document concerned with the careful analysis of all documents there are only a few lines in which Pressac grabs hold of the horror.* […] *As said before, this book is not a sensation, this is no argument from the defense against the attack of the unteachable, the shameless, the cynics and the relativizers à la Ernst Nolte, assuming that one should take their arguments and theorization seriously as belonging in a scientific discussion. Whoever does that is well on the*

way to believing in an 'Auschwitz lie' and acceptance of the Nazi era as an integrateable period."

Manfred Kriener, discussing Pressac's masterwork under the heading "*Die Technik des Massenmordes*" (The Technique of Mass Murder) on June 18, 1994, in the regional daily newspaper *Stuttgarter Nachrichten*, was equally forthright:

"Pressac has written on technology, but not a technical book. The shadow of the piles of corpses and the suffering of the victims are always present. […] *His books have become part of the material that now make Auschwitz one of the 'best documented mass killings of all human history.'* […] *The hope that Pressac, as a former 'revisionist,' can persuade his former intellectual comrades to the opposite view is surely illusory. Only the wrong-headed would read such books.* […] *Comprehension of the mass murder and its practical, technical realization – that is Pressac's main contribution."*

This much is clear: The print media present the work of Pressac as a technically-oriented study on a high scientific plane, which, though not strictly limited to technical matter, was intended to, and is capable of, refuting the supposedly pseudo-scientific arguments of the supposedly ignorant and "neo-Nazi" revisionists and Auschwitz deniers.[3]

1.2. The Judicial System

The criminal justice system in Germany refuses to allow an accused who is charged with publicly denying the Holocaust in part or wholly to present any evidence in support of his view. The reason they give for this is sec. 244, para. 3, sentence 2 of the Code of Criminal Procedure, which states that evidence will not be allowed when a thing is commonly known to be true. Since the Nuremberg trials of 1946, Germany's judicial system has operated on the presumption that the Holocaust is as well-known a fact as that the earth revolves around the sun. The objection on common knowledge can be defeated by three things: first, by a discussion within competent scientific circles; second, if the accused presents new evidence that is superior to all previously submitted evidence; and third, if evidence relevant to the issue is already present in the court room. For example, a technical-scientific expert report would be superior to any previous evidence if only witness testimony and documents had been presented before, because the latter are inferior in evidentiary power to technical evidence.

---

[3] Hans-Günther Richardi deviates from this general line in his article, "Untilgbare Spuren der Vernichtung," *Süddeutsche Zeitung*, Aug. 13-15, 1994, p. 9, in that he describes Pressac's book as "documentation," by which he may mean that he thinks Pressac's new book merely served as a reason for someone to write a general study on Auschwitz.

Recently, two technical expert reports have been commonly presented by the defense as evidence for the correctness of the views of their clients, namely, the Leuchter Report[4] and the Rudolf expert report.[5] When these expert reports were presented in a criminal trial recently, the court refused to accept them as evidence, saying that they were not only not capable of resolving "doubts" in "competent scientific research," and that they did not constitute new evidence superior to previously submitted evidence. To quote the Upper Land Court of Celle:[6]

> *"The evidence submitted is mainly supported by researches of Diplom Chemist Rudolph*[7] *and the so-called 'Leuchter Report' of the American Fred A. Leuchter.* […] *As to the discussion of the question in technical circles, we merely point out that the 'Leuchter Report' has been criticized, and that the French pharmacologist and toxicologist Pressac*[8] *as well as the retired Social Counselor Wegner have produced expert reports that came to an opposite conclusion. Therefore, there are no facts to prove that the new research presented has led to a discussion in the technical community due to new doubts as to the consensus nor that there is any ground for thinking the evidence presented is superior to evidence already at hand."*

Social Counselor Wegner, at the time of the quoted court decision a man of nearly 90 years of age, had made a fool of himself with his article,[9] which did not even approach the standards of a competent technical expert report, since he was not qualified in chemistry, toxicology, or other technical matters, and because he had never tried to put his writing in the form required by the rules and customs of these disciplines.[10] He is therefore of no relevance in any discussion in technical circles. Pressac, however, was portrayed as the single technical specialist who argued against the revisionists – even though he had never addressed the arguments in my expert report. Nevertheless, for the court, Pressac's works constitute a refutation of revisionist arguments, or are at least a match for them. Pressac is the last reed to which German justice can cling when they raise the objection "common knowledge" – for the purpose of suppression of evidence.

7 Incorrect: the spelling is "Rudolf."

8 Incorrect: Pressac is neither a pharmacologist nor a toxicologist, merely a pharmacist.

9 W. Wegner in: U. Backes, E. Jesse, R. Zitelmann (eds.), *Die Schatten der Vergangenheit*, Propyläen, Frankfurt/Main 1990, pp. 450ff.

10 See my detailed refutation in G. Rudolf, *Auschwitz-Lügen*, Castle Hill Publishers, Hastings 2005.

1.3. The Historians

Eberhard Jäckel, Professor of Contemporary History in Stuttgart, Southwest Germany, is one of the most widely-known European specialists on the Holocaust. He wrote a review of the German edition of Pressac's book, which appeared shortly thereafter, under the heading "*Die Maschinerie des Massenmordes*" (The Machinery of Mass Murder), in the German weekly *Die Zeit* on March 18, 1994. In the review he said:

> *"It has angered a few readers that he* [Pressac] *has described all this with the unfeeling precision of a heating technician. For every assertion he has a letter or a quote from the records of the construction office. What is even more aggravating is that he gives the impression that he is the one who discovered the evidence. In fact, the method of operation has been known for a long time, though without the technical details, and moreover it is questionable whether they were developed in the way he describes.* […] *He has been researching for ten years but he has not become a sound historian. His book is through and through technical, limited to a single mode, one might say benighted. Nevertheless, it is useful for just that reason. The usefulness is not so much that there is now a completely irrefutable proof for the existence of the gas chambers.* […] *It is useful that Pressac has refuted the anti-Semitic deniers with their own technical arguments. One waits in suspense to see what they will think of next. But since they are not interested in the truth, but only in the seeming justification of their prejudices, not even Pressac will convince them. The greatest usefulness of the book lies in this, that we can now understand the operation in its technical details."*

Thus the opinion of the Holocaust court historians did not deviate markedly from that of the media. They are of one viewpoint in their evaluation of Pressac as the technical-scientific wonder weapon against the "evil" revisionists, but there are discrepancies with respect to the evaluation of Pressac's working methods. Jäckel is angry that Pressac pretends that he alone has discovered the wheel. Indeed, most of the work had already been done by others, including not only the established historians and hobby-historians but also by revisionists such as Faurisson – something Jäckel omitted to mention.

The response from the German official Institute for Contemporary History when asked to make a comment on my expert report was revealing:[11]

> *"The Institute for Contemporary History will make no comment on this expert report. In our opinion, it is useless to go in detail into the diverse attempts of the revisionist side to dispute the mass gassings in Auschwitz. The fact of these gassings is obvious and has only recently been reconfirmed by the records of the construction office of the Waffen SS and police*

[11] H. Auerbach, Institut für Zeitgeschichte, letter of Dec. 21, 1993, to G. Herzogenrath-Amelung.

found in the Moscow archives (see the publication by Jean-Claude Pressac, Les Crématoires d'Auschwitz. La machinerie du meurtre de masse. – Editions CNRS, Paris 1993)."

Here again Pressac was brought out as a decisive weapon against the revisionists.

2. The Reality

2.1. The Scientific Basis

Briefly defined, science is any research open to examination by outsiders and the systematic description of same. Examination by outsiders means that anyone could undertake the same research through experimentation based on defined conditions and logical deduction. Also, the source data that the researcher has relied upon must be publicly available. This means that conclusions that are based on original documents or on the data of foreign scientific research should be identified such that the outsider can retrieve the original documents or the publications of the quoted scientists. Further, proper scientific procedure requires the inclusion in the research of at least the most important of the current scientific theories and counter-theories; there should be a systematic treatment of known works on the same subject. Also, a scientist should make clear the premises of his research; he should distinguish between facts and opinion and should acknowledge the limits of his technical competence if this is not clear from the context of the publication.

Pressac grossly violates many of these principles. R. Faurisson, for example, will show below how Pressac's method of citation cannot be accepted as scientific. Over and over he constructs sentences with several assertions and then proves the assertions with a document that bears on only one of them, if at all. Also he frequently mixes his personal, usually unfounded opinion with statements taken from documents he references without making clear that he is doing so.

The way Pressac organizes his work also leaves much to be desired, since he has apparently not taken the trouble to use the documents he has analyzed to form an overall picture of Auschwitz camp, which, if he had done so, might provide a very different picture from the one he presents. Instead, he sifts through the haystack of documents for this or that indication of a presumed crime and omits to include possibly exonerating documents in his investigations.

In Pressac's work one can find hardly any opposing opinions. Although he alleges that he will show that the arguments of the revisionists are invalid – and the media, contemporary historians, and judicial officers sing the same song –, Pressac systematically excludes all facts, sources, views, and conclu-

sions that put his conception in question. No revisionist work is named, no revisionist argument is discussed. Since Pressac is invoked because of the revisionists and against them, this fact alone must be the death stroke to his work.

Nowhere does Pressac tell us that as a pharmacist he does not have the requisite technical or historical training nor has he taught himself sufficiently in these areas. With his book and the hubbub, with which the media responded to it, he created, if only sloppily, the impression that he would publish definitive results in these technical areas. If he wanted to meet the requirements adhered to by scientists, he had a duty to make it clear that he did not possess expert qualifications

2.2. Technology and Physical Science

One might be tempted to pardon the systematic omission of contrary viewpoints if Pressac had been true to the task he set for himself in the title of his book, which, as we were incessantly reminded by the media, contemporary historians, and judicial officers, was to deliver a technically founded treatment of the question of the crematories in Auschwitz. Unfortunately, his work does not contain a reference to any source from a technical publication. It does not contain the results of a single technical study of his own or anyone else. Here is an example: With respect to the time it would take to cremate a corpse in the crematories at Auschwitz, a figure necessary for the determination of maximum capacity, Pressac's book does not contain any calculation or figure based on technical literature. Instead, it contains a collection of conflicting values in various places throughout the book (1 hr., p. 7; 30-40 min., p. 13; 1 hr. 12 min., p. 15; 15 min., p. 28; 1 hr. 36 min., p. 34; 34-43 min., p. 49; 13 min., p. 72; 29 min., p. 74; 22 min., p. 80)[12] For some incomprehensible reason Joseph Hanimann praised J.-C. Pressac in the *Frankfurter Allgemeine Zeitung* for his determination of the capacity of the crematories at Auschwitz…

In this book, C. Mattogno will demonstrate in detail that Pressac fails to examine critically and mostly even ignores the contradictions on technical processes that appear in the witness statements and documents – as though he had not noticed them. Significantly, one notices dry comments from Pressac that this or that witness has exaggerated and cannot be relied upon, but there is nothing in his book as to what could be proven to be technically possible. In this Pressac does not differ from the other historians and hobby-historians of the credulous Holocaust brotherhood.

[12] Page numbers of French original.

2.3. Historiography

Pressac's book also does not measure up to the requirements made on works within the discipline of historiography. In that respect it differs little from the works of others of the same intellectual orientation.

For example, where is the critical evaluation of testimony and documentation, the alpha and omega of all historiography? As mentioned above, there is no sign of any critical evaluation of witness testimony. One looks in vain for any evaluation even of the most important of the 80,000 documents that Pressac studied. C. Mattogno gives one example of how necessary critical evaluation is to documents found in the KGB archives.

One cannot necessarily demand of a work that sets out to investigate the technology of mass murder through study of the crematories of Auschwitz that it furnish an historical overview of the events in the camps of Auschwitz. What one can and must demand, however, is an overview of the technical and organizational conditions and operations in the camp directly or indirectly connected with the claimed killing machinery. In this respect as well, Pressac is blind to technical facts that contradict the picture of a ghastly, inhumane killing camp: recreation facilities, infirmaries, expensive, ultra-modern sanitary facilities, civil, non-criminal use of the crematories, ground water drainage, waste water filtration, biogas reclamation from sewage sludge, industrial work programs, and so on.

3. The Evaluation

3.1. The Press

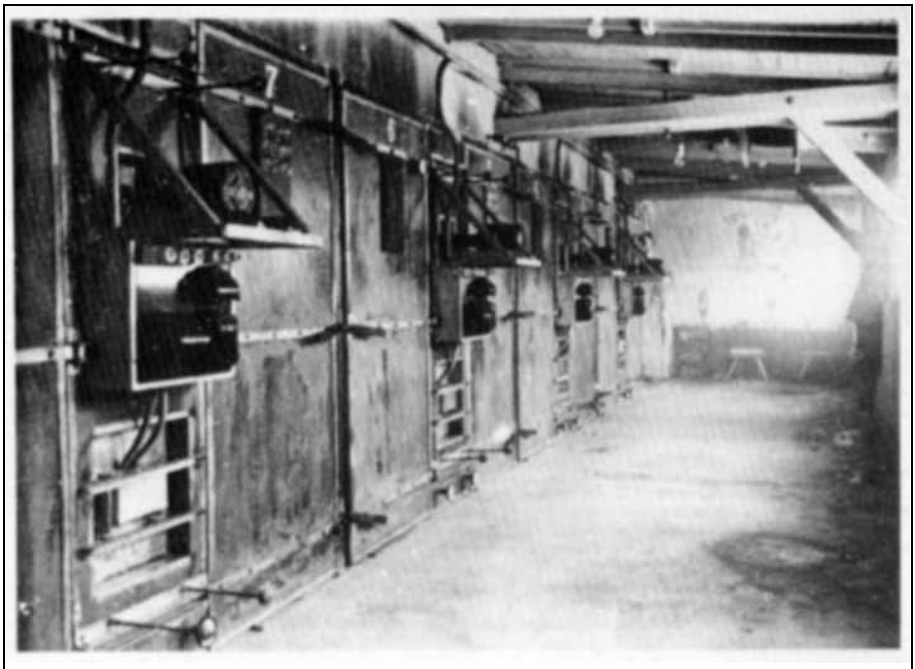
When the chief editor of the *Frankfurter Allgemeine Zeitung* was asked to explain why they had praised Pressac's book so uncritically and whether there was any one on the editorial staff with a technical or scientific background who might have recognized the above-mentioned defects of the book, they declined to answer and referred the inquiry to the responsible journalist Joseph Hanimann, living in Paris. The latter, when he answered, stated that it was neither part of his assigned duty nor within his competence to critically review Pressac's book, that it was his task to report on events in France, which included the publishing of Pressac's book and the accompanying publicity campaign. In addition, he did not see any reason to undertake a critical review of Pressac's book, because to his knowledge no reputable historian saw any reason to do so.[13] In German editorial offices critical journalism does not appear to be called for when court historians cough. Anxious obedience is a better description of such behavior. Apparently Mr. Hanimann also does not under-

[13] Exchange of letters between *Frankfurter Allgemeine Zeitung*/J. Hanimann and G. Rudolf.

stand that historians are not the proper respondents for technical or natural scientific questions. One could not expect an historian to recognize deficiencies in these areas. This sort of reporting demonstrates the incompetence of the journalists and editors of the *Frankfurter Allgemeine Zeitung* on this subject and the fact that our journalists do not do much more than to rewrite uncritically what others of the same orientation have already written. It is the same with the other reviewers, whose similar-sounding phrasing make the rewriting sometimes patent.

Hanimann's review of the German edition of Pressac's book, published by the *Frankfurter Allgemeine Zeitung* on Aug. 16, 1994, was a little bit better. Although his judgment on Pressac's book was identical with that of October of the previous year, he at least named two of the leading revisionists. By chance, however, he omitted to mention that, which he allowed to Pressac by mentioning his profession (pharmacist): he withheld from the reader that both revisionists were academics. Whether Hanimann's belief that Pressac embarrassed Faurisson is true or not we will leave to the judgment of our readers. It is strange, however, that Hanimann imputes to me that I described Pressac's technical documentation as a forgery. I have discussed Pressac's book in a technical paper, in which my judgment is the same as that expressed here.[14] The word "forgery" does not occur in this work in connection with Pressac's documentation. I did mention the forgery of the Demjanjuk identity card found in the Moscow archives[15] in order to emphasize the necessity of critical evaluation of documents, something Pressac negligently avoided. However, the *Frankfurter Allgemeine Zeitung* did have the fairness to publish a correction by me as a letter to the editor on Aug. 26, 1994, on p. 8, including a list of the assertions which were actually made in my expert report.

The *Stuttgarter Nachrichten* has shown itself more unscrupulous in its handling of the truth than Hanimann. They embellished their above-mentioned article with a picture from Pressac's book of a hot air clothing disinfestation apparatus in the gypsy camp of Auschwitz-Birkenau[16] and captioned it with these words:



"The Machinery of Mass Murder: The Gas Chambers of Auschwitz."

---

[14] Germar Rudolf, "Gutachten über die Frage der Wissenschaftlichkeit der Bücher *Auschwitz: Technique and Operation of the Gas Chambers* und *Les Crématoires d'Auschwitz. La Machinerie du meurtre der masse* von Jean-Claude Pressac," Jettingen, Jan. 18, 1994, Engl.: Germar Rudolf, Carlo Mattogno, *Auschwitz Lies*, Theses & Dissertations Press, Chicago 2005.

[15] Cf. D. Lehner, *Du sollst nicht falsch Zeugnis ablegen*, Vowinckel, Berg, undated.

[16] J.-C. Pressac, op. cit. (note 2), picture section; also in Pressac, *Auschwitz: Technique and Operations of the Gas Chambers*, Beate Klarsfeld Foundation, New York 1989, p. 63, under the headline "Disinfestation installation of the gypsy camp in sector B.IIe of Birkenau" and with the original(!) German photo caption "Entwesungsanlage Zigeunerlager" (http://holocaust-history.org/auschwitz/pressac/technique-and-operation/page063.shtml).

**"The Machinery of Mass Murder:
The Gas Chambers of Auschwitz"**

Falsification of a photograph by mislabeling: the Stuttgart daily newspaper Stuttgarter Nachrichten *(June 18, 1994). This photo actually shows a hot air disinfestation installation for prisoner's cloths in the gypsy camp of Birkenau. The original caption states "Disinfestation Installation Gypsy Camp":*

Entwesungsanlage Zigeunerlager

This suggested to the readers that these hot air disinfestation chambers had something to do with the killing gas chambers. But this picture appears in Pressac's book explicitly and unambiguously labeled as a disinfestation chamber, thus as harmless equipment for cleaning prisoner's clothing to prevent disease and to *protect* lives. If we are to believe that the responsible journalist Manfred Kriener made a mistake, we must attribute to him either illiteracy or partial blindness. My personal opinion is that this is one of the vilest falsifications and most brazen deceits I have ever encountered.

It is characteristic of the media's mode of thinking on the revisionists that, on the one hand, they defame all of them categorically as "Nazis" or reproach them as apologists for the National Socialist regime. The average reader is probably influenced by this mostly false imputation, yet it has no bearing on any technical argument and can only have the effect of diverting the discussion from the technical area to the political. This politization of the subject by

the media (and also by the court historians and the judicial system) can never contribute to a scientific discussion – it represents the violation of science.

On the other hand, one constantly comes across media warnings to the effect that everybody should beware of the danger of revisionist arguments. On May 19, 1994, the Swiss weekly *Weltwoche* wrote:

> *"Hence our warning to all that may come in contact with this propaganda material that only barely disguises its anti-Semitism: Do not get into a discussion with a revisionist! Whoever denies the murder of Jews in the gas chambers of the Nazi regime lies and cannot claim the right to freedom of opinion, as the Constitutional High Court in Karlsruhe recently decided."*

Here we have it: Because of the potential danger to one's spiritual contentment due to knowledge of the truth, it is safer to see nothing, hear nothing, say nothing! It is better to warn, threaten, malign, and censor.

I may also point out that a Swiss newspaper refers to a German court decision as a guideline for Swiss citizens. As if Switzerland were a mere appendage to Germany.

3.2. Justice

The decision of the Upper District Court of Celle mentioned above refers explicitly to the works of Werner Wegner und J.-C. Pressac as counter-expert reports opposed to revisionist works. In fact, an expert report can be used in a trial as countervailing evidence only when it has been submitted by one of the parties. It is an error of procedure to deny a motion to submit evidence on the grounds that there is a paper somewhere that reaches a different conclusion. It is beyond the competence of the court to decide whether or not the works of Wegner and Pressac are capable of refuting the arguments of the revisionists. For example, it has never been asserted that Pressac has refuted my expert report – since my work appeared after Pressac's books, Pressac could not possibly refute me –, yet since spring 1992 I have been rejected as expert witness without any legally permissible reason given. Whether the responses of the opposing side can refute revisionist arguments is a question for technical experts to clarify. Above all, this is an interdisciplinary question whose explication cannot be accomplished by a court and which a court has no business dealing with.

It is a peculiar arrogance to require that there be a public discussion on revisionist theories as a condition for overcoming the objection of "common knowledge," since anyone who makes revisionist utterances in public is charged and sentenced without possibility of defense through the invocation of this very same "common knowledge." It is the incantation "common knowledge" which blocks public discussion.

Our judicial system assumes the power to make decisions on scientific questions, despite gross incompetence, and persecutes scientists of an opposite viewpoint with methods that are comparable to those of medieval witch trials.

3.3. Historians

It is elementary that historians are not qualified to resolve technical or exact scientific questions in a competent fashion. It is apparently less elementary that the foundations of historiography can only be what is consistent with physical laws, the laws of logic, and with what was technically possible in the period under investigation. These scientific disciplines dominate even historiography – even if this is not to the taste of many historians. Technical and physical scientific questions play an overriding role in the question of the claimed mass murder of Jews during the Third Reich, because such a gigantic mass murder without trace represents a phenomenon that needs a technical investigation – quite apart from the critical evaluation of so many absurd witness statements that our court historians have accepted uncritically for decades, as though they were children hanging on the storyteller's every word. Even Pressac is critical of this practice:[17]

> *"No, no. One cannot base competent historical writing on witness testimony alone."*

It is unique that even the supposedly super-competent German Institute for Contemporary History could do no better in response to the my expert report than to appeal to the common knowledge of the Holocaust, since their mention of Pressac, who merely interpreted documents and testimony, completely fails to meet the points made by my technical and natural scientific expert report, and therefore cannot invalidate it. There cannot be much substance to the arguments or the competence of these "scientists" working for the Institute for Contemporary History, supposedly the international leaders in the field of Holocaust research.

4. The Freedom of Science

In a decision on Jan. 11, 1994, Germany's Constitutional High Court stated:[18]

> *"The protection of the fundamental right to a free science does neither depend on the correctness of its methods or results nor on the soundness of the argumentation and logical reasoning or the completeness of the points*

[17] J.-C. Pressac in an interview with Burkhard Müller-Ullrich, "Die Technik des Massenmordes," *Focus*, No. 17, April 25, 1994.

[18] Ref. 1 BvR 434/87, pp. 16f.

of view and the evidence lying on the base of a scientific work. Only science itself can determine what is good or bad science and which results are true or false. […] *It is not permissible to deny a work to be scientific just because it has a bias and gaps or because it does not consider opposing viewpoints adequately.* […] *It is removed from the realm of science only if it fails the claim to be scientific* […] *systematically.* […] *An indicator of this can be the systematic neglect of facts, sources, views, and results that oppose the author's view."*

In almost all of their works established historiography ignores the opposing scientific opinion of the revisionists on the subject of the Holocaust.[19] This would be understandable if revisionist research were considered so insignificant and ridiculous that no one need bother with it. However, the numerous papers in research publications and in the media prove that it is the theories and methods of the revisionists that determine the questions and methods of Holocaust research today. In the French philosophical monthly *Les Temps Modernes*, edited by Claude Lanzmann, issue for 11/93, under the title "*La Catastrophe du Révisionnisme*," Robert Redeker described the situation as follows:[20]

"Revisionism is not a theory like any other, it is a catastrophe. […] *A catastrophe is a change of epoch.* […] *revisionism marks the end of a myth* […] *it means the end of our myth."*

In the issue for 12/93 he continued these thoughts under the title "*Le Révisionnisme invisible*":[21]

"Far from signifying the defeat of the revisionists, Mr. Pressac's book 'The Crematories of Auschwitz. The Technique of Mass Murder' signifies its paradoxical triumph: The apparent victors (those who affirm the crime in its whole horrible extent) are the defeated, and the apparent losers (the revisionists and with them the deniers) come out on top. Their victory is invisible, but incontestable. […] *The revisionists stand in the center of the debate, determine the methods, fortify their hegemony."*

Revisionist theories and methods therefore cannot be ignored, but are obviously the principal challenge for the established historiography. Therefore one *must* deny that the established Holocaust historiography can claim to be

---

[19] The only exception worth mentioning unitl the mid 1990s was Berlin historian Prof. Dr. Ernst Nolte's book *Streitpunkte*, Propyläen, Berlin 1993.

[20] "Le révisionnisme n'est pas une théorie comme les autres, il est une catastrophe. […] Une catastrophe est un changement d'époque. […] Le révisionnisme marque la fin d'une mystique […] il indique le terminus de notre mystique."

[21] "Loin de signer la défaite des révisionnistes, le livre de M. Pressac Les crématoires d'Auschwitz. La machinerie du meurtre de masse en consacre le paradoxal triomphe: les apparents vainqueurs (ceux qui affirment le crime dans son étendue la plus ballucinante), sont les défaits, et les apparents perdants (les révisionnistes, confondus avec les négationnistes) s'imposent définitivement. Leur victoire est invisible, mais incontestable. […] Les révisionnistes se placent au centre du débat, imposent leur méthode, manifestent leur hégémonie."

science, since it disregards the arguments and the publications of the revisionists. This applies to Pressac's book especially.

The present book constitutes a systematic documentation of Pressac's numerous scientific errors, not to mention his fraudulence. It is a revisionist book that is concerned almost exclusively with the opinions of the opposing side. It proves all its research and conclusions in detail.

Our judicial system sees the picture reversed: The revisionists, they say, are not scientific and should be criminally prosecuted because their theories supposedly offend the Jews. But the court historians, whose method is provably unscientific, are allowed to play the fool and can potentially offend the German people with their theories, because, by the ruling of the highest court in Germany the latter are unable to be offended – there is no "defined group" in that case.

In 1997, the German judicial system decided to haul the authors of the present book into court and to ban their work, perhaps also because it highlighted the fact that with this work the last reed to which the judicial claim of "common knowledge" clung has been broken.

The public is reminded that only the truth can be a stable foundation on which peace and understanding between peoples can thrive. Truth can only be found through free, unhindered scientific discourse and never through a historical description fixed by penal law.

History by Night or in Fog?

By Serge Thion

"Historian by night," writes the Paris daily newspaper *Le Monde* in its presentation of the new work of an "amateur" who happens to be a pharmacist by day.[1] While for the last twelve years revisionists have been reproached as being merely "amateurish historians," suddenly this term is presented as a quality that guarantees the worth of the new thesis being promoted by the media as the definitive response to the revisionists. I shall not be so cruel as to recall that this one joins a long list of "definitive responses" that have figured on various lists, since the big trials of 1980-1982, and including masterworks such as Filip Müller's *Eyewitness Auschwitz: Three Years in the Gas Chambers*,[2] or Claude Lanzmann's cinematographic production *Shoah*.[3]

Jean-Claude Pressac, the author of the book *Les crematoires d'Auschwitz* (The Crematories of Auschwitz),[4] has already been presented several times as the ultimate champion, the man who will finally terminate Professor Robert Faurisson. He showed up during a colloquium at the Sorbonne in 1982 that was supposed to have already settled the question. His patron at that time was the Great Moral Conscience of our age, Pierre Vidal-Naquet, the White Knight in the struggle against revisionism. Because the discussion dealt mainly with material and technical questions, which were way beyond Vidal-Naquet's competence as a specialist of Greek history, he had palmed Pressac

off onto another archenemy of revisionism, Georges Wellers, a little-known chemist who happened also to be the editor of the journal of the Jewish documentation center in Paris.

After a long period of hesitation, Wellers published a paper by Pressac in his holy and irreproachable journal, *Le Monde Juif* (July-September 1982). In that paper Pressac developed his theory of "little gassings," abandoning altogether the canonical version that had ruled until then. He replaced it with the view that, of course, gassings had taken place, but on a smaller scale than previously thought, and that all figures must now be revised downwards. The impact of Pressac's new theory was negligible. Other means were needed to make use of Pressac in the struggle against revisionism. The Klarsfeld clan, with its strong community and media ties, was ready to intervene.

With their help, Pressac produced an enormous hodgepodge.[5] In his research in the Auschwitz archives, he was not able to find any definitive proof that the Nazis had set up a murder factory there. Instead, he found a number of circumstantial traces that he thought might lead to some kind of presumption of extermination. It was couched in language reminiscent of a weak court case.

His 1989 book, *Auschwitz: Technique and Operations of the Gas Chambers*, included hundreds of plans, blueprints, photographs and documents from the Auschwitz camp's technical departments, which were, of course, part of the SS administration. In an effort to make this massive and disorganized dossier more convincing, the Klarsfelds organized its non-dissemination. Reports of its existence were considered more effective than its actual distribution in bookstores. Translated into English (no French-language edition was ever made available), and published in New York, it was not publicly sold, and was sent to few of those who ordered it. It was given merely to "responsible community leaders" and "opinion makers." Through its impalpable existence, it was supposed to promote the idea that there now existed, finally, "The Response" to revisionism.

Revisionists quickly managed to get hold of copies of this work, which neither Vidal-Naquet nor Klarsfeld obviously had ever read closely. Otherwise they would have caught a certain number of oddities and inconsistencies that would have caused them to doubt that they had picked the right horse.

Pressac was trotted out again to battle against Fred Leuchter, the American expert of gas chamber construction who had carried out on-site examinations of, and took wall scrapings from, the supposed gas chambers, and who con-

---

[5] J.-C. Pressac, *Auschwitz: Technique and Operations of the Gas Chambers*, Beate Klarsfeld Foundation, New York 1989. Reviews and analysis of this book that have appeared in the *Journal of Historical Review*: M. Weber, 10(2) (1990), pp. 231-237; C. Mattogno, ibid., 10(4) (1990), pp. 461-485; R. cluded that massive and repeated gassings would have been physically impossible.[6]

Now we are presented for the fourth time with what the press calls the definitive argument. This time Pressac has another patron, an official historian by the name of François Bédarida who has been for quite some time head of the so-called "Institute of the Modern Age." He once distinguished himself by taking part, along with some shadowy political figures, in a phony academic "jury" that decreed, without reading it, that Henri Roques' thesis on the "confessions" of Kurt Gerstein[7] was completely worthless. Having thus styled himself a master, Bédarida, whose works on English history are deservedly almost unknown, also wrote a thin booklet, in the form of a catechism, about the so-called Holocaust. It has been distributed free of cost to every history teacher in France in order to provide them with guidelines on how to stuff their pupils' heads with sanitized notions about Second World War events. Emboldened by such mass distribution, Bédarida felt brave enough to write an article in *Le Monde* (July 22-23, 1990) in which he revised the Auschwitz death toll downwards.[8] It did not occur to him to explain why this revision was necessary, or the basis for his view that not four million, but rather 1.1 million people supposedly died in Auschwitz. Obviously still not entirely confident of himself, he added that the archives have still not been explored. He would not elaborate to explain why 45 years have not been enough time. Here's where Pressac came in.

Along with a few minor satellites, this luminary of historical thought, Bédarida, served as Pressac's patron. This patronage was not negligible, because Pressac's second book was published by the National Center for Scientific Research (CNRS). In order to obtain this prestigious label, the book was submitted to an ad hoc committee of specialists. There must have also been an official evaluation of some kind, which we would be delighted to read.

What does Pressac's book really say? It presents incontrovertible evidence that the Germans built crematories. Of course, only journalists believe, or pretend to believe, that the revisionists deny the existence of the crematories or of the concentration camps. These concentration camp crematories are well-known and have been documented since 1945. The issue has been whether they disguised secret facilities for carrying out mass killing.

Pressac, who combed through tens of thousands of documents left behind by the Auschwitz *Zentralbauleitung* (Central Construction Office), states categorically that these installations, as planned from the outset, show no sign of

---

7 Henri Roques, *The Confessions of Kurt Gerstein*, Institute for Historical Review, Costa Mesa, CA, 1989.

8 See R. Faurisson, "How many deaths at Auschwitz?," *The Revisionist* 1(1) (2003), pp. 17-23.

lethal or homicidal intent whatsoever, and that they were specifically designed and built to contend with the health problems caused by a rather high mortality rate in the camps, above all after the beginning of the war. These problems, he shows, were linked with the raging epidemics that could (and did) wreak havoc not only among the camp inmates, but also among the Germans in the camps as well as the outside population. In this context, crematories had no ethical import, but were conceived as facilities to maintain public health, of the inmates as well as others.

Having carried out a detailed study of the correspondence between the Auschwitz Central Construction Office and the outside private civilian firms that contracted for specific jobs, Pressac is able to provide us with a thorough – and quite tedious – history of the different phases in the construction of the various crematories, including the numerous changes in plans by the chiefs of the SS construction office. Evidently lacking anything like a long-term perspective, these officials depended closely on their superiors, who envisioned grand projects without bothering much about the budgetary and procurement problems that those poor subordinates would have to solve on the spot.

Among these thousands of documents, where there are no secrets, where the SS "politicians" scarcely interfere; documents which after the war were divided among Germany, Poland, and Moscow; documents that remained intact at the end of the war, the department head having "neglected" to destroy them: among all these documents, there is not a single one that states clearly that these facilities were ever used for mass killing. Not one.

Pressac offers no explanation whatever of this strange fact. To be sure, following others, he states that the references found in certain documents to "special actions" refer in coded form to the existence of that monstrous crime. But the documents oblige him also to state "special actions" could and did designate all sorts of "other," quite banal activities, and that the term "special" (in German, "*Sonder*-") was very widely used in the German military and non-military administration during that period.

The great value of Pressac's work would therefore lie in its almost complete sifting through of the documents dealing with the construction of the crematories, the presumed site and instrument of the alleged crime. As in his previous writings, he picks out "traces" of criminal intent. Many of these, incidentally, he's had to leave by the wayside. A number of "traces" he presented in his 1989 book are conspicuously missing from the 1993 work.

He notes, for example, that the SS wanted to install ventilation systems in the underground morgues of the crematories. He considers that this shows an intent to use these rooms for criminal purposes. Pressac is so convinced of this that he doesn't even bother to consider alternative explanations that would occur to less prejudiced souls, such as, for example, the need to disinfest, during typhus epidemics, the morgues with Zyklon B (used throughout the camp for disinfesting clothes, barracks, and so forth).

He thinks he's found a criminal "trace" in the fact that a wooden fan was requested in the ventilating system, because wood is more resistant to corrosion by hydrocyanic acid than metal. Yet, several days later, the engineer in charge had the wooden fan replaced by a metal one!

Pressac also states that the "definitive proof" of the existence of a homicidal gas chamber in crematory facility (Krema) II is found in a document dated March 1943 (cited on p. 72, doc. 28), which shows that the Auschwitz services were looking for gas detectors capable of detecting traces of prussic acid (hydrocyanic acid). But because he has explained earlier that these services used "tons" of Zyklon B for disinfestation, this "proof" is not particularly probative.

Eighty thousand documents. That's the number Pressac cites in his interview with the *Nouvel Observateur*.[9] These 80,000 documents, which he says he consulted in a matter of some days in Moscow, concern exclusively, if I'm not mistaken, the SS Central Construction Office at Auschwitz. One office among many others, therefore, but the one that would have been responsible for designing and constructing the infamous "industrial slaughterhouses." One might be astonished to learn that such installations are entrusted to the same low-level functionaries who dealt with the barracks, the bakeries, the road works, and so forth. No secret, no particular precautions were taken, as these same low-level officials didn't hesitate to subcontract with private firms, from which no particular discretion was requested. This is explained, as Pressac abundantly demonstrates, by the fact that these facilities were not designed or planned for a lethal purpose, but, quite to the contrary, as means of local public health control.

It's very clear: of these 80,000 documents, only a fraction of which concern the crematories, not a single one deals explicitly with an installation for killing. Otherwise, this document would have long since been brandished triumphantly to the public. Until Pressac, one could surmise that there were hidden or inaccessible archives, harboring such a document. But Pressac tells us that these archives (concerning the Auschwitz construction office) are now complete, and that the chief of this office, evidently believing they contained nothing incriminating, took no measure to destroy them at the end of the war.

In short, it must be acknowledged that among this mass of documents, which are supposed to clarify this issue, there are only a few that raise any suspicion. Where logically we should have found 1,000 or 10,000 incriminating documents – considering, as Pressac concedes, there was no code language, that no documents were destroyed, and that everything was done according to superior orders – one finds only a few minor elements, the interpretation of which remains open.

---

[9] *Nouvel Observateur*, Sept. 30-Oct. 6, 1993, p. 94.

These "traces" might conceivably support the charge if we could reconstruct a context in which only one interpretation is possible. Or, if several interpretations were possible, a historian should discuss the various ones before choosing his answer. This is not Pressac's practice. He dares not entertain the possibility of alternative interpretations of the documents. For if he were to give up calling these "the beginnings of proofs" (indeed, in a *France-Inter* radio interview he protested only feebly when a hasty journalist treated his "beginnings of proofs" as well-established proofs), Pressac would have to concede that all his work had been in vain. He would have to concede that he had rigorously demonstrated that German officials and engineers conceived and planned, in a rather disorderly way, crematory facilities that, as a matter of fact, did not work very well. No. This no one has ever doubted. He would have to admit that he had spent ten years of his life pushing on an open door, a door whose plan, conception, and stages of construction he describes in meticulous detail. What is truly interesting here is precisely that he found nothing obvious, in spite of exhaustive research.

What does Pressac do to salvage what he can of the extermination thesis? Injections. The basic text of his book, that is, the product of his own research, is a careful chronicle of the planning and construction of the crematories. He refers here to the archives. The reference notes provide sources: they follow each other with abbreviations to archives (abbreviated as ACM, ARO, AEK, and so forth), according to the key given on page VIII. However, if one turns to check the reference notes that are grouped together on pages 97-109 – and disregarding the rare bibliographic references or the occasional bits of factual information ("*Pohl was Oberzahlmeister*" – Pohl was chief paymaster) – one finds that the series of archival references is interrupted here by non-archival references, either to the official Polish *Kalendarium*[10] (or Auschwitz Chronicle – more about this later) or to the supposed postwar "memoirs" of Auschwitz commandant Höss. These non-archival references, we find, are the sources cited by Pressac for the passages in the main text dealing with homicidal gassings.

For example, on page 34 he abandons the archives to write about a "first gassing,"[11] and, in the same paragraph, he writes of the cremation "in one or two weeks of intensive work" of 550 to 850 corpses, leading to the deterioration of an oven. There exists no obvious or necessary link between the first "fact," based on the *Kalendarium* and Höss, and the second – an oven's deterioration – the factuality of which is established from archival documents. This link is a merely a supposition that is dishonestly presented here as a fact.

Tauris, London 1991. Danuta Czech is head of the scientific research department of the Auschwitz State Museum in Poland.

[11] "De nos jours […] durée anormale de ce gazage."

This rigorous scholar then tells us that "it is estimated today that very few homicidal gassings took place in this crematorium, but they have been exaggerated because they impressed direct or indirect witnesses." We know that Pressac is a poor writer, but just what is an "indirect witness"? And what does it mean to "exaggerate" a gassing? We need to decode here, I think. What Pressac means to say in this tortured sentence, I suppose, is more or less this: sure, there has been a lot of talk about gassings in crematory building (Krema) I, in the Auschwitz I (main) camp. Genocidal gassings are supposed to have begun there. However, because the revisionists have pointed out so many inconsistencies, Pressac ("it is estimated") has chosen to give ground ("they have been exaggerated"), attempting to explain inconsistencies by claiming that witnesses were "impressed," even if they were not actually present, but who nonetheless are regarded as "indirect" witnesses. Not a single source, not a single document is cited by Pressac to justify this climb-down.

Pressac knows full well that the "classical" view cannot be defended, but in order to salvage something of it he must make concessions, without being able to justify them either. "It is estimated today…," and presto! – the trick is done. What follows is of the same nature. He writes (p. 35):

> *"As gassing forced the total isolation of the area of the crematorium* [not a single witness has ever made such a statement, but this point is a result of revisionist criticism]*, and since it was impossible to carry them* [gassings] *out while construction was in progress* [same comment]*, it will be decided at the end of April to transfer this sort of activity to Birkenau* [Auschwitz II camp]*."*

There is a pure invention, a supposition asserted as a fact by Pressac so that he can land on his feet and rejoin Establishment history.

The amusing paradox in all this is that Pressac respects the Establishment history only with regard to gassings. As for the rest, he joyously tramples dogmas underfoot. The famous "Wannsee Conference" of January 20, 1942, which so many thoroughly dedicated historians have designated as the time and place of the decision to exterminate, is swept aside in a mere six lines (p. 35). Pressac does what revisionists do: he reads the text of the Wannsee Conference protocol, which speaks of the evacuation of the Jews to the East, and says nothing of industrial-scale liquidation. He confirms that not a single specific instruction was sent to the Auschwitz Central Construction Office as a result of this high-level conference. The fog surrounding the supposed genocide decision becomes thicker and thicker.

On page 39 we come to the two little farmhouses near Birkenau that are supposed to have been the next sites of gassing extermination.[12] In the middle of the information culled from the archives, one finds a new injection from the *Kalendarium*. On page 41 Pressac reports that Himmler informed Höss "of the

[12] "Courant mai […] sans plus de précision."

choice of his camp as the center for the massive annihilation of the Jews." As Pressac himself tells us, Höss' account contains enormous implausibilities and cannot be trusted at all (footnote 132). It's a rotten branch, but it's the only one left for Pressac to cling to, because he's done no research whatsoever in the realm of policy. That's a job for historians, and thus one far beyond the abilities of our pharmacist. At the same time, though, there is a need to suppose that someone, at some time, made the decision to initiate this vast homicidal enterprise, which was then carried out by low-level functionaries. Himmler might have made the decision, but because Pressac can't find anything to support that supposition, he relies on Höss' admittedly dubious account. Better something than nothing.

When Pressac comments on the work of the inmates' Sonderkommando teams "dragging the bodies from the gas chambers" (p. 43), the source he cites (note 141) is once again the *Kalendarium*. Third injection.

Later, on page 47, Pressac tells us that large quantities of Zyklon B were deemed necessary to combat the typhus epidemic that raged in the camp, and that they had been requested from higher authorities on account of a "special action" – which obviously was to disinfest buildings. (One SS man was even poisoned, as the previous page confirms.) Further on this same page, Pressac adds that Central Construction Office officials gave consideration to building a new crematorium "because of the situation created by the 'special actions'" – an obvious reference to the measures taken in an effort to halt the epidemics. How Pressac manages to conclude from this information that Auschwitz had been chosen "as the site of [the] massive annihilation of the Jews" remains a profound intellectual mystery.

Here was an administration that struggled to contain an epidemic that may have killed 20,000 people (according to Pressac),[9] which had learned from higher authorities that the camp would again be considerably expanded (to accommodate tens of thousands of new deportees from the East, who were considered particularly "lousy"), and which was trying to gather the weapons to combat typhus: tons of Zyklon B and crematories. (Recall that at the Bergen-Belsen camp the British were unable to contain the epidemic that was raging there when they arrived. Some of the most "incriminating" photographs of horrific scenes from the camps were taken at Bergen-Belsen when it was under British administration.)

Pressac then launches his own personal theory (p. 47), which only makes sense if he is attempting to conform to an already established explanation pattern:

> *"This stupefying cremation facility* [nevertheless obviously in strict accord with the needs dictated by the situation there] *could not but attract the attention of the SS officials in Berlin* [obviously, since they authorized the expenditures] *who afterward associated it with the 'final solution' of the Jewish problem."*

This assertion has no basis in the documents found in the archives.

Ever eager to protect his rear, Pressac believes that these "special actions" (a term that covered anything and everything in the military-administrative jargon of the period) were used as a pretext to obtain authorization from Berlin to construct crematory facility (Krema) III, which he determines actually had a "public health function." In using this "special action" term, then, the sneaky SS men of Auschwitz sought to make Berlin believe that their crematory requirements were linked to the extermination of the Jews, whereas in reality they concerned only the real, normal needs of the camp. This is a good example of Pressac's acrobatic abilities.

I shall not dwell on the issue of open pit incinerations, which provide Pressac with an opportunity (p. 58) to severely criticize Höss' account, except to point out that he invents a figure of 50,000 corpses, burned in two months, based on a calculation of alleged killings that is derived, without actually quoting it, from the *Kalendarium*. Pressac pays no attention to the 100,000 cubic meters of wood (at a minimum) that would have been required, and of which there seems to be no trace in the archives.

Pressac has himself confessed that he first got involved with Auschwitz because he wanted to write a novel, several scenes of which would be set there. We know that many people have had a similar itch. This compelling urge re-emerges from time to time, for instance on page 65, when he simply conjures up, out of the blue, relations between the director and the engineers of the Topf company (which built the ovens for the crematories). The three following pages – in which Pressac, the suburban pharmacist, impersonates the terrible SS as they look for ways to rationally organize gassings – are probably also taken from a novel we'll never read. The welcome details are not derived from the archives, but rather from a testimony dear to Pressac, that of a person named Tauber (footnote 203).

When he evokes the first alleged gassing in crematory facility (Krema) II – supposedly the real industrial killing plant – and which was probably finished in March 1943, Pressac does not cite archival sources, but rather the secondary source *Kalendarium* and Tauber's testimony (pp. 73-74). The second alleged gassing is also based on the *Kalendarium*.

There is no point in going on. Pressac's injection technique is now quite clear. The reader must keep his eye riveted to the footnotes in order to detect the changes in the story line. All this would be quite acceptable if the sources used were of comparable value. But for some time now historians have learned to refer to Danuta Czech's official *Kalendarium* only with the utmost caution. Of this work, Pressac himself writes (note 107, p. 101):

> *"Danuta Czech has produced a work that is vulnerable to criticism because, without explanation, it retains some testimonies while dropping others, and because it favors testimonies above documents. This peculiar historical orientation persists in the latest, third, edition, now published in*

Polish […] *which makes no room for the Central Construction Office documents of the Central Archives in Moscow. This greatly lessens the veracity of this fundamental work, which unfortunately was composed with a vision a little too skewed in the strained political atmosphere of the 1960's* [in Poland]*."*

What Pressac is really trying to say here, God only knows. For many people, though, this is a work that comes straight from the Polish government's Auschwitz State Museum, and thus from the exploitation of Auschwitz by Russian and Polish Stalinism as an instrument to encourage anti-fascist sentiments in the West during the Cold War. We know well the real value of the "testimonies" that were mass produced at that time. If Pressac were really confident of sources of this kind, it would be logical for him to use them. But he shows the greatest mistrust. Nevertheless, his account of homicidal gassings comes exclusively from such sources, the value of which he himself acknowledges to be severely limited. These stories have already been published a thousand times. It was their internal weakness that moved Paul Rassinier to criticize them, and launch the movement now known as Holocaust revisionism.[13] In continuing to use them, with only slight cosmetic adjustments, Pressac seems to make a fool of himself.

But the most extraordinary thing about Pressac's book is the pretense that it dispenses entirely with testimony to make its case. That is what Pressac claims to journalists. They swallow this lie because they more easily trust commentary than the text itself. By burying in the depth of his footnotes his use of the most hackneyed products of the Polish Stalinist dossier, Pressac thus appears to respond to the revisionists on their own ground, that of verifiable fact, as long as one accepts that the physical laws of nature are as valid today as in 1944-1945.

In chronicling Pressac's inconsistencies, I have refrained from referring to Pressac's earlier writings, comparing them with his most recent book. But others might be less indulgent and could be naughty enough to point out variations, reversals, and other shifts of position that such a reading would obviously disclose.

I shall also spare the reader a crucial facet of the discussion of basic facts, the capacity of the crematories in terms of their actual output (an appropriate term when speaking of an industrial facility). To be sure, Pressac clearly realizes that there is a difference between the outputs claimed by Topf company salesmen and the reality of operation, hampered by breakdowns and design and manufacture flaws. But Pressac goes no further to establish the actual figures, and when he provides an estimate of 1,000 cremations per day for Kre-

[13] Engl. see P. Rassinier, *Debunking the Genocide Myth*, The Noontide Press, Torrance, CA, 1978; *The Holocaust Story and the Lies of Ulysses*, 2nd ed., Institute for Historical Review, New Port Beach 1990.

mas II and III, one sees clearly that he takes his readers for chumps. In the most modern crematory facilities, the limit is four bodies a day per oven. In the largest Auschwitz crematory facility, Krema II (at Birkenau), with its 15 ovens, one might envision tripling or even quadrupling the rate. In that case a peak figure of 300 bodies per day could be attained (but at the risk of wearing out everything very quickly). Pressac carefully avoids venturing into this technical area. Elsewhere, he says that the "ideal" figures provided by the SS to Berlin are propaganda lies, but that they are nevertheless to be trusted (p. 80). In his latest book, Pressac carefully refrains from citing the figures for coal provisioning of the crematories, which appeared in his 1989 work.[5] In the light of those figures, it is all the more difficult to believe that two or three kilograms of coal would have been enough to burn a single corpse. If he had found in Moscow additional invoices to make his estimates less improbable, he certainly would have let us know about them.

In the main body of his later book, this macabre accounting is only marginally important. It becomes important only in Appendix Two, "The Number of Deaths at KL Auschwitz-Birkenau" (pp. 144-148), where Pressac uses his estimates of cremation capabilities to revise downwards the numbers given in the "testimonies" found in the *Kalendarium*, to simply decree that there were fewer trains, and that they carried fewer persons. He writes as if the arrival of the trains was pre-determined by the efficiency of the crematories. This is obviously absurd.

Other discrepancies occur in his calculations that I will pass over here. Regarding the deportation of Jews from Hungary (about which Rassinier had already noticed the impossibilities of the estimates of official Polish sources), Pressac rejects out of hand the estimates of Georges Wellers, telling us in passing that the Israeli Yad Vashem center holds documents showing that 50,000 Jewish women from Hungary were transported onwards from Auschwitz to Stutthof, near Gdansk/Danzig. (Because these Jews had not been registered upon their arrival at Auschwitz, they are normally considered to have been "gassed.") Pressac believes that there is a need for further research. With regard to the number of Polish Jews who were deported, he mentions "the uncertainties of this question, due to an absence of documents."

To return to the question of the Jews deported from Hungary, Pressac places himself in untenable positions. For example, he accepts the stories about cremation pits, which have been completely disproved by the aerial reconnaissance photographs of Auschwitz taken by Allied aircraft at precisely that period. He does so because it is necessary to increase the theoretical cremation capacity in order to account for a theoretical total of 438,000 Hungarian Jews arriving at Auschwitz from Hungary. (This would have been twice the total population of Auschwitz at that time.) His abstract calculation (p. 148) is that the SS could have annihilated 300,000 persons in 70 days. But this raises a question: where could these 300,000 persons, dead or alive, have been

herded or stockpiled during the two months it would have been necessary to burn them all? And why do we find no sign of them in the aerial reconnaissance photos?

Pressac arrives at a figure of 630,000 people who were supposedly gassed at Auschwitz. In the German edition of his book, he reduced this number further down to 470,000 to 550,000.[14] Suddenly the million victims of Auschwitz are no million anymore. Several years ago, the Poles lowered their official figures of Auschwitz "gassing" victims. Raul Hilberg in the United States, François Bédarida in France, and Yehuda Bauer in Israel have each lowered their figures. Pressac lowers them still further. Now, just how and why were these figures lowered? Has some new information come to light? Not at all. The calculations are being fudged in other ways. Pressac, who is certainly foxy but also a bit naive, shows how to do the trick.

Because most of the figures of deportees are merely guesswork estimates, they are subject to change. Wellers "loaded" the rail convoys with 5,000 deportees each. Hilberg disagrees, finding that 5,000 persons per rail convoy is too many. So he simply says to hell with it, and decides on 2,000. If one calculates on the basis of 120 train convoys, this makes a big difference (240,000 compared with 600,000). Along comes Pressac, who is not happy with either of these – not on the basis of rail convoy capacity, but rather crematory capacity. Accordingly, he lowers (pp. 146-7) the figure of rail convoy capacity to 1,000-1,500. Should he have ever realized that his estimates of crematory capacities were illusory, and that cremation pits would have been visible from the air, he would have had to lower them again. None of these calculators have gone to look in the archives. They've done it off the cuff. Thus, if the figures change, it's not because the documents demand it, but rather on the basis of the prevailing fashion and these calculators' hunches.

The Reception of Pressac

As has consistently been the case throughout the 15 years that this gas chamber controversy has been public, the most interesting aspect has been the behavior of the press. Its role in molding public opinion is crucial. Anyone who wants a clear understanding of the historical background and context of the so-called Holocaust must do a great deal of research precisely because the problems have not yet been fully clarified. In this, the journalists, and the experts whom they quote, are thus in a position to separate truth from falsehood and, for the public at large, to differentiate between the Good and the Evil. In

[14] J.-C. Pressac, *Die Krematorien von Auschwitz. Die Technik des Massenmordes*, Piper, Munich 1994, p. 202.

two books,[15] I have attempted to chronicle this media agitation, of which the large-scale worldwide publicity for Pressac's book is the latest chapter.

It must be said that the Pressac media campaign has been carried out in fine style. Pressac, who had been rather quietly working in the shadows, so to speak, was launched into public awareness as if a public relations expert had masterminded the operation. *L'Express*, a leading French news magazine, was first to open fire, with a cover photo by famous French photographer Raymond Depardon and a big headline:[16]

"Auschwitz: The Truth."

The classic Orwellian translation of this headline would be: "Auschwitz: The Lie."

Soon followed the *Nouvel Observateur*[17] with a weekend at Auschwitz with Pressac, along with the heavy artillery of the "leading specialists." *Libération*, a Paris daily, joined in with two pages and more photographs and documents.[18] *Le Monde*, another Paris daily, then appeared with a half-page article from the pen of Laurent Greilsamer, who has followed the Faurisson affair in the courts for a long time.[19] Then came a barrage of television and radio publicity. La Ville-du-Bois, the little town south of Paris where Pressac sold his drugs, hadn't known such uproar since the Hundred Years War in the 14th century.

"A work that will serve as a reference for historians of the whole world," said *L'Express*. Thanks to the Soviet archives "the first synthesis of knowledge of one of the most important events of the 20th century has been accomplished," *L'Express* went on to remark. This commentary was provided by someone named Conan and another chap called Peschanski, a research fellow who owes obedience to Bédarida.[20] The distinguished commentators affirm

17 *Nouvel Observateur*, Sept. 30-Oct. 6, 1993, pp. 88-90, 92, 95-97. By Claude Weill, including interviews with J.-C. Pressac, Pierre Vidal-Naquet, Raul Hilberg and Claude Lanzmann. Eight pages are devoted to this trip, which calls to mind those Mediterranean cruises in which noted archaeologists act as tour guides. The allusion is quite explicit (p. 92): "Pressac runs through the ruins like an English archaeologist on the site of Ephesus." The image is revealing: the English were in fact the first, in 1863, to dig at Ephesus. It thus evokes a 19th century context, the beginnings of scientific archeology, the discovery or rediscovery of the great lost civilizations. Pressac, seen as an eccentric gentleman from an adventure novel, is about to reveal an unknown world for us. Everything we've known until now is made null and void by the triumphal "running" of the discoverer, resurrecting the past, and almost recreating it.

18 *Libération*, Sept. 24, 1993, pp. 28-29.

19 September 26-27, 1993, p. 7.

20 Denis Peschanski is a research fellow with the Contemporary History Institute of the CNRS (Centre National de la Recherche Scientifique). Pressac's *Les Crematoires d'Auschwitz* was published under the guidance of Bédarida by the CNRS press. The cardinal principle of the

that both the decision for and the execution of the "Judeocide" (a new term that has yet to gain wide acceptance) were shrouded in "absolute secrecy," of which we might say that it still hasn't been pierced.

But why did the archives lie dormant? "Because an important current of Jewish memory refused any rational approach to the Final Solution, which was deemed an 'unspeakable' and 'unthinkable' event." One would prefer, of course, a more straightforward denunciation, naming names and citing references, but at *L'Express* prudence prevails. The idyllic situation at the archives was disturbed by the "literature of denial," which set about picking out the errors "logically numerous in witness testimonies or in the postwar Soviet texts that made Auschwitz a theme of ideological propaganda." The fine sleuths at *L'Express* haven't noticed that every single assertion by Pressac regarding homicidal gas chambers is based directly on these very Soviet and Polish texts. But then one can't demand too much of journalists. It is Pressac who is supposed have personally discovered that "the technological history of the Final Solution still remains to be written." It is impossible for a well-bred journalist, as they prefer them at *L'Express*, to recognize that the father of this brilliant "discovery" (in France) is none other than Professor Robert Faurisson. After all, it wouldn't do to acknowledge that from that discovery on, every advance in this area owes something to him.[21]

In his 1989 book – published in New York by the Klarsfelds – Pressac boasted that, on the basis of his work in the archives in Poland and Germany (50,000 documents), he was solving the riddle in its entirety. Now, he says, the 80,000 documents from the Soviets will tell us more. However, the 1989 work – of 564 large-size pages – was far more comprehensive, and dealt with many more subjects. Had the journalists done their homework, they would have recognized that Pressac's 1993 book is much more limited in scope, and is much more circumspect, indeed diffident, in its assertions than the 1989 work.

After having explained the book's stupefying discovery – that the administration administered, that the Central Construction Office made plans and requested estimates and invoices – the subtle analysts of *L'Express* assert that Pressac "found proof of the organization of the killing." There's the trick. Pressac swims in a sea of ambiguities. He does not positively state that he has found "proofs," but rather traces, or clues, which are almost as good as proof. Journalists can't afford to indulge in such subtlety, and Pressac makes no protest against their distortions. As in a child's game, he seems to say: "I didn't say it. He did." Pressac is always able, faced with real criticism, to take refuge

---

world of Parisian literary criticism is well known: "No one is better served then by oneself – but it shouldn't show."

[21] The most basic principles of the history of ideas, as taught at Sorbonne University, have to be destroyed. Thus is the intellectual honor of the bedaristic followers.

in this infantile position. These "proofs," he writes (p. 82), are "precise indications" that "betray the rules of secrecy." This secret is so secret that it may not exist, Pressac himself having explained that there was no coding in the documents.

In the list of clues magically transformed into proof, the most ridiculous is not in his book but in what he told the press:[22]

> *"In a real morgue, there is a need to use disinfectants, like chlorinated water or cresol, but not a product for killing lice."*

The pharmacist who sells drugs to his everyday customers obviously has no idea of the scale of the problems arising from a full-scale typhus epidemic. The crematories were built to deal with a situation in which 250 to 300 corpses, swarming with disease-bearing lice, were delivered every day.[23] Can one imagine heaping them up in the morgues without further ado? Sending in a team to wash them in chlorinated water, while in all the other facilities, including the barracks, Zyklon B was used to kill lice?

If these morgues had not been treated in an efficient way, they would have been great reservoirs of infection – biological bombs. Pressac, with his bottle of chlorinated water, is a public menace. He should lose his license as a pharmacist for daring to say such things. Why such an idiotic remark? To persuade the reader to believe that the morgues would have been the only place in the camp where the use of Zyklon would not have been normal. Because the SS knew about chlorinated water,[24] they had no need to disinfest the morgues with Zyklon. The logic here is ridiculous. But this reasoning has a hidden corollary: If the SS had used Zyklon in the morgues to protect the crematory personnel (themselves included), they could have done it only once in long periods. Without ventilation, the lethal gas would have stagnated. Consequently, they needed a ventilation system for these semi-underground rooms. This would explain why they requested the installation of such a system there.

Pressac rightly provides considerable detail about this. But because he has already concluded in advance – and without the least support from the 130,000 documents available to him – that the very existence of a ventilation system is a "clue" providing evidence of a homicidal plan, he must discard in advance any possible alternative interpretation. That is why the two *L'Express* journalists dutifully accepted, like holy water, this role of chlorinated water. Holy water for journalistic holy writ.[25]

Similarly, the journalists have no problem forgetting about the January 1942 Wannsee Conference. They swallow Pressac's currently fashionable

[23] Information from the Auschwitz camp death registry volumes (*Sterbebücher*), for the period of the epidemics. See: J.-C. Pressac, op. cit. (note 4), p. 145.

[24] Where, among the 130,000 documents, are the invoices for chlorinated water?

[25] One has heard about the famous powder chambers of Mr. Kahn. Now we get a chlorine water guarantee from Pressac.

view as avidly as they swallowed, five or ten years ago, other authors who said just the opposite. Nothing else was to be expected. Journalists now easily accept the notion that, by late May or early June 1942, an anonymous "political will," of unidentified origin, "found [by some kind of chance] in the technical innovations [although, says Pressac, the oven technique is quite elementary and somewhat archaic] implemented at Auschwitz (thanks to engineer Prüfer) the means for an industrial-scale extermination." To put it in a nutshell, thanks to this obscure little engineer, a salesman of cremation ovens who receives a percentage cut from sales he makes for Topf company, the highest-level officials of Nazi Germany (who? Himmler himself?) would have said to themselves: "What a windfall! Hurray for Prüfer! Now we can really kill Jews!" Without wishing to seem overly critical, it is difficult to believe that a "genocide" of that alleged magnitude could have been decided in such a manner. For journalists turned historians, though, this latest revelation is as much revealed truth as the old one, and an act of faith costs nothing.

In the same way, these journalists have no trouble accepting without a murmur the numerical hocus-pocus that Pressac presents as "calculations." Without knowing why, we come down from 5.5 million deaths at Auschwitz (the Soviet figure in 1945) to 800,000. The *L'Express* journalists even predict that these figures, as well as estimates of deaths in the other camps and in the ghettos will be similarly revised downward in the future. It appears to be a general trend, and readers should be ready for it. (Do they already have new figures in mind?) But, basically, none of this is very important, they add in closing, because "the nature of the Final Solution remains unchanged." Personally, I take the view that only religious dogmas never change. (And sometimes even they change.)

L'Express also published an article by Bédarida, sponsor of Pressac's work. The bédarida is a little known species of squid. It swims in the cultural soup and propels itself rapidly toward all directors' chairs, to which it adheres with strong suckers. Always on the defensive, it emits jets of ink to cloud its surroundings. Author of a thin but definitive booklet on "the Nazi Extermination Policy," Bédarida courageously acknowledged that he did not have "all the necessary knowledge" on this subject. He sees in Pressac a case of biological mutation (he "transformed himself into a historian"), and believes that this pharmacist has become "an incontestable, if not unique, expert." Contested he is, however, and not only by revisionists. Unique, perhaps, if one considers only Establishment history, produced by all sorts of bédarida squids, and the effects of the anti-revisionist laws. When he adds that Pressac has subjected the documents to a "pitiless critique," he looks like a fool to the astute reader. He regards as "terrifying" a work devoted to the study of construction plans, ventilation problems, overheating and other matters that are the daily concern of every civil engineer. This characterization seems to me to show, among the squid, a tendency toward bombast. When he adds the words "an ir-

refutable terrifying work," he is hallucinating. There are answers. Bad luck for the squids.

How is it possible, asks the sucker,[26] that no one had looked into these questions before this? He could have told the plain truth: that it's because nobody knew how to respond to Professor Faurisson. (For years it was fashionable to say that he didn't even deserve a response.) No, Bédarida prefers to claim that in those days people instead emphasized the "perpetrators and the victims." And how to justify this late date – 15 years after Faurisson raised the matter? Bédarida's explanation – the opening of the Moscow archives – is pure eyewash. Pressac's wretched hodgepodge that supposedly "settled everything" was published in 1989 – before the opening of the Moscow archives. The only new thing culled from the 80,000 documents found in Moscow is the story of an apparatus produced by the Siemens company to kill lice with short waves. It seems that some experimental use was made of this machine at Auschwitz near the end of the war.[27] This was new for Pressac and for most of us. Should this machine be added to the long list of mythical industrial-scale installations, including the Jewish soap factories, the electrified swimming pools, the vacuum and steam chambers, the heated iron plates, the trains of quicklime cars, and so forth, which, although described in numerous and precise testimonies, have sunk into oblivion from whence they could be revived only through the immense talent of a Claude Lanzmann? Because it does not seem that this Siemens machine could kill people, it's been ignored. This is the big novelty from Moscow, suppressed for 45 years by the KGB!

In 1979 I rhetorically asked "how" before "why."[28] In 1993 the squid is still looking for "how and why." It's not historical research work that has made real progress in those years, but rather that a number of obstacles meant to prevent such research have been removed. The road is still not clear, but one day it certainly will be.

Journalist Claude Weill must have access to secret information because in the *Nouvel Observateur* he writes "that the existence of the gas chambers and the reality of the Jewish extermination policy have been overwhelmingly demonstrated. The evidence is available to anyone who can read and who is willing to open his eyes." I pray Mr. Weill to open my eyes, to make this evidence public so that Mr. Pressac's labors would become quite useless and thereby permitting him to concentrate on his work as a druggist.

Weill tells his own little story. He visits Auschwitz where he follows Pressac around, listening to his technical arguments. But after a while, he breaks down. These discussions are odious, and he asks Pressac to get to the point.

---

[26] Presently glued to the chair of Secretary General of the International Committee of Historical Sciences.

[27] J.-C. Pressac, *Les Crematoires d'Auschwitz* (1993), pp. 83 ff.

[28] In "Le Comment du Pourquoi," 1979, which was included as the first part of *Verite historique ou verite politique?*, op. cit (note 15).

The learned pharmacist responds: those who refuse to do scholarly and technical work "are making Faurisson's bed for him." This throws the journalist for a loop. Overwhelmed, he sadly faces the fact that history will win in the end, that the good times are over, and that "the Shoah will not escape the historians' cruel scrutiny." I didn't know that historians have a cruel look. Cruel for whom? This sentence says a lot, I think. But then the journalist can be pretty cruel himself: he cites figures of total deaths at Auschwitz provided by several earlier authorities, and crudely calls them "lies." The Pope, Willy Brandt, and many other important visitors to Auschwitz have bowed down before the memorial plaque there bearing these "lies." Considering how these official figures were arrived at, there's no reason why the latest figures supplied by Pressac won't one day also be called "lies."

In concluding his article, Weill expresses some skepticism. He finds some of Pressac's conclusions "hasty," the throwing overboard of the Wannsee Conference "not entirely convincing," the lowering of the number of victims "a bit imprudent." Pressac "has not closed the debate."

Not being fully convinced, this journalist needs to cover himself. So the Grand Masters of the Official Truth are permitted to speak. The first is Pierre Vidal-Naquet, who introduced Pressac to the Establishment. The first thing he shows us is that, as usual, he can't read: Vidal-Naquet believes that the "point" made by Pressac about the precise date of the "first gassings" is derived from the Moscow archives. This is clearly wrong.[29] This "point" is actually the result of an argument typical of Pressac: he sees in the archives records that the buildings were not usually completed by the dates given by "authorities" (based on "memory"). Pressac then searches for the dates on which construction of the crematories were completed, then refers back to the *Kalendarium* (which is also largely based on "memory," and which even Pressac himself calls dubious) to determine what gassings took place that day. Evidently the Moscow archives make no mention of any homicidal gassings. As for Pressac's calculations, Vidal-Naquet finds them a bit hasty, too much based on assumption, it's "not so simple," "probably." The man who earned the Legion d'Honneur by dint of his anti-revisionist efforts prefers Hilberg's figures, which he calls "rather solid." Vidal-Naquet hesitates more than usual. He seems to be having second thoughts about his wisdom in launching Pressac, who has become the satellite of others and who threatens to crash land.

---

[29] In an unforgettable article, published in 1980, Vidal-Naquet explained that because Faurisson had written something (supposedly) faux (false), he was a faussaire (falsifyer). This may be found in Vidal-Naquet's book, *Assassins of Memory: Essays on the Denial of the Holocaust* (Columbia University Press, 1992). I dismantled this stupid pun and the poor arguments of Vidal-Naquet in *Une Allumette sur la banquise* (Le Temps irreparable, 1993). *Assassins of Memory* was reviewed by Mark Weber, *Journal of Historical Review*, 13(6) (1993), pp. 36-39 (www.ihr.org/jhr/v13/v13n6p36_Weber.html).

Then comes Raul Hilberg. After being grilled on the stand during the first Zündel trial at Toronto, in 1985, this professor of political science has learned to be more cautious.[30] He laments that Pressac isn't really a historian, that his is not the "the last word on the subject." He complains that "important research is still necessary," that "considerable research is still needed," that "the German sources should be studied further," and that there is still a lot of work to do. One wonders what this fellow's been up to since he began his study of this subject in 1948.

But Hilberg says something very embarrassing: an extermination order by Hitler has already been missing; now an extermination order by Himmler is likewise nowhere to be found. Höss and Himmler did not even meet "during the crucial period." What now? Is it Höss who decided everything by himself? Or was he in the dark as well? An extermination order by Höss to his subordinates cannot be found either. Another mystery. Perhaps we should ask Vidal-Naquet.

But the best, as usual, comes from Claude Lanzmann. He's a raw fundamentalist, dazed, totally inaccessible to the least reasoning, but with an animal's intuition. He showed this intuition in making the movie *Shoah*, in which he abandoned all (or nearly all) reference to the documents. He knows the documents. He doesn't know what they really mean, but he has a photographic memory and rightly says that all the documents cited by Pressac were already known. Lanzmann defends his work as a movie maker in almost Celinian terms: art should create emotions, nothing else. ("I prefer the tears of the Treblinka barber to Pressac's document on the gas detectors"). Lanzmann is very modern; he likes to hit below the belt, crying to avoid thinking, toying with the macabre. Pressac's material "drives out emotion, suffering, death," he says. Lanzmann tramples on Vidal-Naquet, who licked his boots for years:

> *"The sad thing is that a historian, his being doubtless threatened by the truth, the force, the evidence of the testimonies, does not hesitate to endorse this perversity* [Pressac's book]. *A historian abdicates before a pharmacist* […]*"*

Lanzmann smelled a rat in Pressac. He understands much better than the media and academic crowd, which rushed to embrace Pressac in the hope of finishing off revisionism, that

> *"Faurisson is the only one this convert wants to talk to. To be listened to by him* [Faurisson]*, he* [Pressac] *must speak his language, make his thought processes his own, accept his method, produce the crucial evidence, the ultima ratio, that will convince his former master.* […] *In order to refute the revisionists' arguments, one must give them legitimacy, and*

[30] Although the media routinely calls Hilberg a "historian," that is not his profession. He, too, is another "amateur."

they thus became the central point of reference. The revisionists occupy the whole terrain."

The poor man is right. He must feel quite lonely with his useless reels. He had to first delay, and then completely reorganize his movie because of Faurisson's work. In fact the terrain is not occupied by the revisionists – who are persecuted everywhere – but by the remnants of an imploded belief. Lanzmann, late in life, has become the epic poet, the cantor, of this belief. It's not just the revisionists' questions that caused the implosion. Time destroys myths: *fugit irreparabile tempus*, irreparable time flies. Because modern times require modern myths. Lanzmann is turning into dust. Soon nothing more will be left of him than a shroud worn out by the wind. Each year Jack Lang[31] will lay down flowers at the spot where it was found.

The *Libération* article is quite cautious. The journalist who wrote it – Philippe Rochette – sticks to Vidal-Naquet's 1979 phrase:[32]

"It [gas chamber killing] *was technically possible because it occurred."*

The author of that phrase has been having regrets.[33] The *Libération* journalist effortlessly swallows the fantastic element of Pressac's book: the technicians, the foremen of the private firms who took part in the construction of the crematories, "saw." It is an interesting use of the word. "They saw." These two words say it all: the entire story and its refutation. But it's pure speculation. Nothing in the documents indicates that "they saw" anything implied by this lapidary formulation. In his interview with *Libération*, Pressac is less than hinting broadly when he says calmly:

"I was close to Faurisson, who trained me rather well in deniers' theory in the late '70s."

And, further on, he returns to one of the most amusing arguments in his book: the only members of the Central Construction Office who were ever tried, Dejaco and Ertl, in Austria in 1972, were acquitted because (he says) the Austrian judges couldn't read a blueprint or a technical description. Nevertheless, the court had access to documents from the Moscow archives. The Austrians, therefore, were cretins who awaited, without knowing it, the light emanating from Pressac's pharmacy. But it seems that Pressac himself did not inquire into the trial of Prüfer, the Topf company engineer who designed the

---

[31] For 10 year minister for culture in France's socialist government.

[32] This phrase appears in the 1979 declaration co-authored by Pierre Vidal-Naquet and Leon Poliakov, which was signed by 34 scholars. It is quoted in the foreword to *Assassins of Memory* (p. xiv), and in L.A. Rollins, "The Holocaust As Sacred Cow," *The Journal of Historical Review*, 4(1) (1983), pp. 29-41, here p. 35; Robert Faurisson, "Revisionism On Trial: Developments in France, 1979-1983,," ibid., 6(2) (1985), pp. 133-181, here pp. 166f.; and M. Weber, op. cit. (note 29), p. 38.

[33] Regarding this phrase, Vidal-Naquet wrote, for example, in the review *L'Histoire* (June 1992, p. 51): "We were certainly wrong, at least in the form, even if the basis of our interrogation was justified." In fact, there never was any interrogation.

cremation ovens, which took place before a Soviet court in April 1948. The transcripts of the Prüfer interrogations must certainly be somewhere in the Russian archives. The Soviets of 1948, doubtless as stupid as the Austrians in 1972, did not believe that Prüfer was the prime mover of extermination (as Pressac argues). Well then, whose turn is it to go to the Moscow archives now?

I have kept the article in *Le Monde* for dessert.[34] Its author, Laurent Greilsamer, has long followed the judicial saga of Professor Faurisson, toward whom he has always shown the same hatred. That's why it's amusing to note that he praises Pressac exactly for what he found so blameworthy in Faurisson: for being an amateur historian, for starting with an examination of the weapon used in the crime, for being a pioneer, for being curious about everything, and for deliberately turning his back on the survivor testimonies to interest himself in the ruins and the documents. "Elementary," he says. This "elementary" weighs several tons of court papers! But there is more. Pressac's conclusions, writes Greilsamer, "revise, in the noble meaning of the term, that which the community of historians believed was established." How beautifully inspired is this revision "in the noble meaning of the term"! No camouflage, no coded language, everyone understands, we are in full clarity.

Why then, this journalist wonders with hypocritical anguish, hadn't anyone said these things earlier? "Fear of provoking a scandal," he writes. Pressac adds:

> *"Because people weren't mature enough. The subject was too sensitive and the Berlin Wall hadn't yet come down. Don't forget that the history of Auschwitz was written in Poland by the Communists and that, even in France, the Gayssot law*[35] *forbids free expression."*

Revisions therefore had to be administered "in homeopathic doses." We have seen that Dr. Pressac, however, has used the opposite technique: a large dose of revision, coupled with intravenous injections of the Polish *Kalendarium* to sedate memory sufferings caused by amputation of illusions. The journalist is not sufficiently alert to ask what Pressac would write if there were no Gayssot law.

---

[34] *Le Monde*, Sept. 26-27, 1993, p. 7.

[35] Gayssot is a Communist member of the French parliament. The "Fabius-Gayssot" law of July 1990 forbids "contesting the crimes against humanity" as defined by the Nuremberg Tribunal, and specifies heavy fines and jail terms for violators. The law was passed as a trade-off between the Communists and the Socialists, to obtain continued support from the Communists in parliament for the Rocard government. I don't know whether this critical review violates the Gayssot law, but it's clear that Pressac's book (and thus all the press accounts of it as well) infringes the law seriously. (For more about this law, and the legal assault in France against Holocaust revisionists, see Mark Weber, "French court orders heavy penalties against Faurisson for Holocaust views," *Journal of Historical Review*, 13(2) (1993), pp. 26-28.)

Pressac is happy to talk to *Le Monde*. An amateur, he can easily dismiss the intellectual establishment:

> *"The researchers have kept quiet in order to hold onto their precious positions. There has been cowardice in the universities, and the revisionists have taken advantage of this for denial. Personally, I am doing the basic work. Anyone with common sense could do it."*

I love it.

He is more careful with the false "eyewitness" testimonies:

> *"We shouldn't say they lied. We must take into account a factor of personal emotionalism."*

This is outrageous. Pressac knew full well that there have been deliberate, organized, profitable lies, which have nothing to do with "factors of personal emotionalism" (which may exist, surely, as in every testimony of whatever nature).

Lanzmann is right. Without Faurisson, there would be no Pressac. Pressac is 90 percent Faurisson, with the rest coming from easily identifiable and discredited sources. The media simply falls into line. One wonders who's more hypocritical: Pressac, who half saws away, in his notes from Höss and the *Kalendarium*, the branch on which he's sitting, or the journalists, who accept with joy and recognition from Pressac everything they rejected when it came from Faurisson?

There is, perhaps, a way out of this tangle. It is indicated in a remark by Bédarida (in *L'Express*). He says that Pressac was first attracted to revisionism but later refused to follow this group "on the road of denial." On the other hand, the Italian writer Umberto Eco said to *Le Monde* that revisionism is all right, that it's natural; it is possible to calmly discuss the documents, but one mustn't fall into "denial," which, he says, consists of denying that anything bad was done to the Jews during the Second World War.

I wonder if a new line is being drawn here. It makes a distinction between, on the one hand, revisionism, once again beautiful and good, exemplified by Pressac and his patrons and followers, who are obliged to adopt the revisionist method because it is the normal method of historical research, and, on the other hand, "denial," banished to the outer limits of taboo, including those who doubt the gas chambers, as well as (non-existent) deniers of the concentration camps, the rail deportations, and so forth. The consequence of this new view would be that revisionism, recognized at last, would demonstrate (in the style of Pressac, that is, with the help of "bavures" = blunders, bloopers) the existence of homicidal gas chambers, but in a way that they would lose their diabolical character. The death figures could be dropped much lower without infringing the nature of the Shoah. Faurisson and his associates would lose the use of their rational armament, captured by their enemies, and would be banished to the void by the Gayssot law. This might offer the best opportunity for the restored squids to pursue and enhance their brilliant careers.

Reply to Jean-Claude Pressac on the Problem of the Gas Chambers

By Robert Faurisson

Note to the Reader

Jean-Claude Pressac's book *Les Crématoires d'Auschwitz. La Machinerie du meurtre de masse* (The Crematories of Auschwitz. The Machinery of Mass Murder), to which the present work is a reply, unquestionably falls foul of the Fabius-Gayssot Act as formulated in the French penal code, and especially as it has been applied by the judges of the 17th chamber of the Paris criminal court and those of the 11th chamber of the court of appeal, along with their colleagues in Caen, Fontainebleau, Amiens, Nice and elsewhere. Although not bound to do so by statute, they have punished the expression of the slightest suggestions, reservations, or leanings denoting the possible existence of a revisionist heresy with respect to the dogmas decreed in 1945-1946 by the judges at Nuremberg.

In Pressac's brief introduction alone (p. 1-2) there are four grounds for conviction.

The author states or lets it be understood that at the Nuremberg trial the judges failed to obtain "unambiguous technical information on the machinery of mass murder"; that their understanding of the facts was "hardly sufficient"; that their reconstruction of the history of the genocide and the homicidal gas chambers was not "free of oral or written testimonies, which are always fallible," and that, to take only one example, the date they had ascribed to the "launching of the industrial phase of the 'Final Solution'" was so far off the mark that today it ought to be set one year later. A hundred other grounds for conviction could be picked out from the two hundred or so pages of his book. The statements he has made to the media can only aggravate his case (cf. especially the article by Laurent Greilsamer in *Le Monde*, September 26/27, 1993).

If Pressac completely escapes prosecution under the Fabius-Gayssot Act or any other law, the same should go for those who respond to him on the same ground. On the other hand, if the latter are prosecuted, then Pressac should also be brought before the 17th chamber of the Paris criminal court, together with the officials of the CNRS (Centre National de la Recherche Scientifique) who have published his book, independently of any extinctive prescription governing procedure.

Foreword

Just who are the revisionists? And what do they say?

There has been talk of them since the late 1970s. Yet, to all intents and purposes, they are never seen or heard, and their arguments, if they have any, are always presented by their adversaries, if at all. Their writings cannot be read. The law forbids it. They are convicted, physically attacked, imprisoned. Why?

A special law has been made against them: the Fabius-Gayssot Act. Another law against them is being drafted: the Méhaignerie-Pasqua-Goldenberg Act.

At the same time, they are said to be dead, dead and buried!

In his recent work, *Les Crématoires d'Auschwitz. La Machinerie du meurtre de masse*, the pharmacist Jean-Claude Pressac gives a response to the leader of the revisionists in France, which is to say, Professor Robert Faurisson, whom he never mentions but to whom he refers indirectly – a response that is at once new, scientific and definitive. At any rate, such is the claim of a deafening media campaign that has just developed throughout the Western world.

J.-C. Pressac presents himself as a careful researcher striving for perfection. Before the media, he affects the coolness and calm of the man of science coming to grips with the "problem of the gas chambers" of Auschwitz. As for his book, it is teeming with technical data – at least, so it appears.

Robert Faurisson had to reply to such a book. He knows its author, who approached him in the early 1980s and confided in him concerning his doubts about the existence of gas chambers at Auschwitz. J.-C. Pressac went so far as to offer his services for research. His offer was taken up on a trial basis. Then he was dismissed by the professor for his inaptitude for scientific study, his difficulty in expressing himself, "his confused mental state, his panicky fears, his horror of clarity and of forthright stances."[1]

First published as *Réponse à Jean-Claude Pressac sur le problème des chambres a gaz*, diffusion RHR, BP 122, 92704 Colombes Cedex, 1994, 96 pp.

[1] Cf. *Revue d'histoire révisionniste* no. 3, November 1990/January 1991, p. 130.

No newspaper has contacted Robert Faurisson to ask him his opinion of a book that, according to the journalists' own announcements, wipes out, apparently, so many years' worth of research. Could it be that the journalists know or suspect that there is actually nothing new in the substance of J.-C. Pressac's book, that it is scientific in appearance only and that, at bottom, yet another author has yet again demonstrated the soundness of the revisionist position without wishing to do so?

In late 1978 and early 1979, the time when *Le Monde* published the views of Professor Robert Faurisson on the "rumor of Auschwitz" or the "problem of the gas chambers" (the latter expression was coined by Olga Wormser-Migot, a historian of Jewish origin), a powerful media counter-offensive wanted the public to understand that revisionism had been nipped in the bud. In June 1982, an international symposium at the Sorbonne, announced in the press with fanfare, was, apparently, to confirm the death of historical revisionism. A number of other such gatherings held in the following years, in France and abroad (particularly the one at Oxford in 1988, organized on a grand scale by the late press magnate Robert Maxwell), spread the news of sensational documents or arguments capable of burying the phenomenon of revisionism for good. In 1986 the "affair of the Nantes doctoral thesis" burst open in France, then all over a certain part of the world. Henri Roques, the author of the thesis, found himself pilloried: he was stripped of his doctorate and we, the public, were assured that his text would vanish into the oblivion of history. In 1990 there was another media mobilization, this time with the purpose of laying to rest the University of Lyon researcher Bernard Notin. Some highly publicized trials in Lyon, Israel, Germany, Austria, and Canada took up where the supposed victories over revisionists, each one always more definitive than the rest, had left off; moreover, the fact that their voices were nowhere to be heard doubtless proved that the revisionists were dead, really dead. Anti-revisionist writings were brought out with great fanfare at frequent intervals: such had been the case, in 1980, with Filip Müller's *Trois ans dans une chambre à gaz d'Auschwitz*; in 1980,[2] with Georges Wellers's, *Les Chambres à gaz ont existé*,[3] and, in 1984, with the book by Eugen Kogon, Hermann Langbein, Adalbert Rückerl and twenty-one other authors, *Les Chambres à gaz, secret d'état*.[4] Every year there were new Holocaust museums, exhibitions, films like *Holocaust* or *Shoah*, documentaries and spectacles to show the defeat inflicted on the revisionists.

The book by J.-C. Pressac merely takes its place in that recurring series of theatrical stagings.

---

3 Georges Wellers, *Les Chambres à gaz ont existé*, Gallimard, Paris 1981.

4 Éditions de Minuit, Paris 1984. Engl.: Eugen Kogon, Hermann Langbein, Adalbert Rückerl et al. (ed.), *Nazi Mass Murder*, Yale, New Haven 1993.

But one must give him credit: unintentionally, J.-C. Pressac has at a stroke lifted the prohibitions that weighed on free historical research. His book constitutes, in effect, a challenge to the Fabius-Gayssot Act, a law of which he states that it "prohibits free expression" in historical matters, but which he, for his part, violates at will.[5] And so the way is open…

In May 1992 the *Revue d'Histoire Révisionniste* (*RHR*) was compelled to suspend publication after its sixth issue, and book publishing has never been its vocation. Therefore it cannot publish this *Réponse à Jean-Claude Pressac* either as a series of articles or a book. But it has assumed the task of distributing it. For two years, Robert Faurisson was the scientific advisor of our review, to which he personally gave numerous contributions in the form of articles or studies bearing his signature. Despite the measures taken against us by Interior Minister Pierre Joxe (order of July 2, 1990), and despite the rigours of the Fabius-Gayssot Act instituting the offence of historical revisionism ("disputing the existence of crimes against humanity" such as those punished by the Nuremberg tribunal), the *RHR* had thus provided a forum for the outlaw.

Fifteen years ago, Faurisson publicly took the initiative – and he was the first to do so – of placing the "problem of the gas chambers" on a material and scientific plane. For a long time his daring appeared sacrilegious. At present, the revisionists' opponents are compelled to come forth on the field where Faurisson hoped to see them engage. It is normal that someone should be able to rebut the recent work of J.-C. Pressac, which styles itself as essentially technical, with a response that is essentially technical. As will be seen, Professor Faurisson – whose specialty is officially known as "criticism of texts and documents (literature, history, media)" – has done just that.

Thanks to Faurisson's analysis, this *Réponse à Jean-Claude Pressac* constitutes a discourse on the method to follow in examining a historical problem, and illustrates how, with the help of the media, false science – represented here by the pharmacist J.-C. Pressac – can create false semblances. It allows us, at the end of 1993, to take stock of the concessions that the official historiography has had to make to historical revisionism; finally, it helps the factual truth reassert itself against the aberrations of a war propaganda that has gone on for far too long. As long as people lend credence to these aberrations, they will not be able to see that the true war crime, the true "crime against humanity," is war itself and the train of true horrors that it brings.

The editors of the *Revue d'Histoire Révisionniste*
December 24, 1993

---

[5] *Le Monde*, September 26/27, 1993.

1. Introduction

Jean-Claude Pressac's recent work bears the title *Les Crématoires d'Auschwitz* and the subheading *La Machinerie du meurtre de masse* (the crematories of Auschwitz; the machinery of mass murder), (CNRS éditions, August 1993, viii-156 pages and a 48 page photographic section). The book's title keeps its promise, but its subheading does not. In it there is a striking contrast between the plethora of evidence and documents attesting, on the one hand, to the existence of the crematories at Auschwitz – which no one disputes – and, on the other hand, the absence of evidence and documents attesting to the existence of homicidal gas chambers there, a greatly disputed point.

1.1. Neither a Photograph nor a Drawing

From an author who asserts that the Nazi gas chambers existed one is entitled to demand a physical representation of those extraordinary chemical slaughterhouses. However, Pressac's book contains neither a photograph, nor a drawing, nor a sketch, nor a depiction of a scale model of any homicidal gas chamber. In the 48 pages of photographic plates there are 60 "documents," but none of them bears any relation to homicidal gas chambers, not even, as will be seen below, the only "document" (no. 28, on the ten gas detectors) presented – abusively – as evidence. The author has not even dared to reproduce a photograph of the "gas chamber" of crematory I, the one that all those who go to Auschwitz visit. Nor has he shown the interior and exterior of the very telling remains of the alleged gas chamber of crematory II at Birkenau. The scale model imprudently displayed by the Poles in Block 4 of the Auschwitz Museum is not shown either. The reason for so many omissions is easy to guess: the least attempt at a physical representation of one of those alleged homicidal gas chambers of Auschwitz would immediately make obvious the physical and chemical impossibility of any gassing with hydrogen cyanide in the structures in question.[6]

1.2. Nothing of a Novelty

This book, quite modest in content, has nothing new about it. It is essentially a shortened version of the tedious compendium that Pressac published in English in 1989 under the misleading title *Auschwitz: Technique and Opera-*

[6] With respect to the photographic documentation, and in particular for photographs of the Polish scale model, the reader is referred to the 25 page section that I added to Wilhelm Stäglich's *Le Mythe d'Auschwitz. Étude critique*, traduit et adapté de l'allemand (*The Auschwitz Myth. A Critical Study,* translated and adapted from the German), La Vieille Taupe, 1986, p. 485-510, under the heading "Illustrations. Le mythe d'Auschwitz en images."

tion of the Gas Chambers,[7] which I have reviewed in two articles entitled "*Auschwitz: Technique and Operation of the Gas Chambers* (1989) ou Bricolage et 'gazouillages' à Auschwitz et Birkenau selon J.-C. Pressac (1989)"[8] and "Improvised Gas Chambers and Casual Gassings at Auschwitz and Birkenau According to J.-C. Pressac (1989)."[9] At the risk of sounding presumptuous, I note today that my critique of 1990 has led Pressac to shorten his discussion of the gas chambers, reducing it to a few poor, extremely confused pages, and, first of all, to choose in French a far less ambitious title than that of his work in English.

1.3. Auschwitz: 800,000 Dead Instead of Nine Million

The sole important novelty of this book in French lies in Pressac's figure for the number of dead at Auschwitz. In the film by Alain Resnais, *Nuit et Brouillard* ("Night and Fog"), that figure was nine million ("Nine million dead haunt this landscape," states a voice at the end of the film). At the Nuremberg trial, a document having "the value of genuine evidence" (doc. URSS-008) set the figure at four million. Until April 1990, it was that same figure that was inscribed in nineteen different languages on nineteen large slabs at the Birkenau memorial. In that month the authorities of the Auschwitz Museum discreetly removed those inscriptions to put in their place the figure of one and a half million. In France, historian François Bédarida estimated 950,000.[10] Now here is Pressac opting for the figure of 775,000, rounded up to 800,000, the number of Jews gassed being estimated at 630,000 (p. 148).[11] The true figure is probably 150,000 dead from 1939 to 1945, both Jews and non-Jews, with the great majority of the deaths being due to natural causes, especially epidemics of typhus and typhoid fever.

8 *Revue d'histoire révisionniste*, no. 3 (November 1990/January 1991), p. 65-154, publication hereafter cited as *RHR* (online at www.vho.org/F/j/RHR).

9 *The Journal of Historical Review*, Spring 1991, p. 25-66; Summer 1991, p. 133-175.

10 *Le Monde*, July 22/23, 1990, p. 7.

11 I have been informed by a reliable source, which I cannot disclose, that Pressac intends, when he can, to reduce the total of deaths at Auschwitz to 700,000, if and when the disposition of the public seems ready for this new reduction. In 1989, speaking only of the gassed, he put their number at "between one million and 1.5 million people" (*A.T.O.*, p. 553).
Editor's remark: This paper was written before the German edition of Pressac's book appeared in 1994. In that edition, Pressac revised the general Auschwitz death toll downwards to between 630,000 and 710,000 (p. 202).

1.4. Pressac no Longer Believes in "Wannsee," but he still Believes in Hitler

One other novelty is that Pressac no longer believes that the Germans decided on the physical extermination of the Jews on January 20, 1942, at a gathering at Wannsee presided over by Reinhard Heydrich (cf. below). It appears that he no longer believes very much in the existence of a policy to exterminate the Jews either (which is called "genocide"). In any case, he never implicates Adolf Hitler.[12] The Führer's name appears in the book only four times: first, with respect to Hitler's "architectural projects," "which were to glorify the German renewal and help bring down unemployment" (p. 6), then with respect to one of his secretaries, Martin Bormann (p. 10), and his diatribes against the Jews (p. 65), and finally on the subject of "the [economic] recovery brought on by Hitler's accession to the Chancellorship" (p. 137).

1.5. The Theory of "Casual Gassings"

The Pressacian theory on Auschwitz is a most bizarre one: it involves "casual gassings," "makeshift jobs," "slips" and "bunglings." Certainly, Pressac uses the term "casual gassings" (*gazouillages*) only in private conversation, but that jocular expression well sums up the theory in question.

According to Pressac, the Germans improvised both the crime and the crime weapon. They casually gassed here and there, now and then, in varying proportions, rather than gassing methodically and continuously, and carried on thus until they had killed millions. *To begin with, still according to Pressac, at Auschwitz, the Germans HAD NOT EVEN BUILT ANY HOMICIDAL GAS CHAMBERS.* He admits that crematories II and III at Birkenau, for example, finished in 1943, had not been designed in August 1942 for killing but only for incinerating corpses.[13] He acknowledges that the crematory buildings contained innocuous cold rooms (which he calls morgues) for storing corpses awaiting cremation but, he adds, it was these morgues that the Germans, in obscure circumstances and at an uncertain date, decided to transform into homicidal gas chambers. The Germans involved were, at the most, some SS captains, lieutenants and non-commissioned officers along with a few *civilian* engineers and technicians whose specialties were cremation, isolation and ventilation, and not, as one might have expected, eminent political figures and

---

[12] Pressac has such a fondness for Adolf Hitler that he keeps a bust of him in his house, at the top of a stairway leading to a room in the attic. He has made the room soundproof in order to listen to military music there in comfort (for confirmation, see Pierre Guillaume, *Droit et histoire*, La Vieille Taupe, 1986, p. 124).

[13] Editor's note: As concerns crematories IV and V, Pressac does not tell us what, at the origin, the respective purposes of their rooms were, rooms that, according to his theory, were subsequently transformed into execution gas chambers.

chemists, physicians and toxicologists. The chief of operations was a former builder who had become a specialist in the making of cremation ovens in a company in Erfurt, Topf und Söhne (p. 10). This evil genius was called Kurt Prüfer. After the war the Americans arrested him, interrogated him, then, considering that he had never built anything other than crematory ovens, let him go. Prüfer returned to Erfurt, which was in the Soviet occupation zone. Woe befell him there: he was arrested by the KGB, interrogated and, in April 1948, sentenced to twenty-five years' forced labor.[14] Four years later he died in prison.

According to Pressac, Prüfer and his aids worked so poorly that the transformation of the morgues into gas chambers was something approaching a makeshift job. As they had fitted them, for example, air flowed in from near the ceiling and out from near the floor, which, as Pressac himself agrees, is normal for a morgue used for storing corpses; however, hydrogen cyanide gas, the main factor of Zyklon B, is less dense than air; therefore, he writes, the ventilation system ought to have been designed the other way round, so as to lead the gas out from above after the gassing of the victims. Indeed, the use of hydrogen cyanide gas in such a room would be "technically insane" (p. 71). However, instead of changing around the system, the ventilation specialists kept it as it was. They were happy enough with verifying "the ventilation power" (*ibid.*). They did much ventilating in these gas chambers. The author dazzles us with his considerations on the direction of winds and draughts, and on the power of the ventilators. Not without reason, some facetious revisionists have found fault with him for transforming the gas chambers into air chambers and for putting a bit too much wind in his words.

Pressac lets it be understood that the slap-dash work of these little German technicians could not leave any really visible traces or evidence of their criminal activity; he also warns us that, instead of good, solid evidence of the existence of execution gas chambers, we can only hope to discover slight clues, beginnings of or bits of evidence, some helpful details pointing to what in his idiom he calls criminal "slips" or "bungles." Of course, it takes a most particular wisdom to detect these tiny traces of a crime without precedent in history and this wisdom, it goes without saying, can only be that of Pressac, pharmacist by day and historian by night.

1.6. Pressac's Promises and Reality

In his introduction, he promises us a "rigorous history" of Auschwitz, from which we shall get "a near-perfect understanding of the criminal engineering" carried out there, and a "historical reconstruction finally free of the oral or

[14] Pressac, who considers the Soviets and the KGB as being rather cleverer than the Americans, writes that Prüfer "was sentenced to *only* 25 years forced labor" (p. 137).

written testimonies which are always liable to error and, in addition, are shrinking in number with the passage of time" (p. 1-2).

We shall see that this is nothing but bluster and that the body of the book is, quite to the contrary, replete with confusions, incoherencies and approximations; recourse to witnesses is a constant practice whenever the author deals with alleged killings by gas. Even on the matter of the crematory ovens his words are desultory and often obscure.

In judging such a work, the very simplest of criteria should be applied: if the author offers a photograph or a drawing of a Nazi gas chamber, we shall hear him out; otherwise we shall not. Pressac, who is a good photographer, a good draughtsman and probably a good model builder, has carefully avoided the test of truth that would have consisted in proposing a graphic or material representation of one of those prodigious chemical slaughterhouses. Consequently, one really ought not to dwell on this product of a muddled brain. For my part, however, I shall nonetheless do so in order to let the reader gauge the catastrophe that this book constitutes for the partisans of the exterminationist theory.

Proceeding in five steps, I shall bring up, one after the other, the obvious facts that the author has not been able to ignore, the realities he has passed over in silence, the devices he has borrowed from other "Holocaust" historians, deceits of his own creation and, finally, his novelistic ramblings.

To close, I shall restate the proposal of the American Fred Leuchter and suggest to our adversaries that they set up an international commission of experts that should examine on site, at Auschwitz and Birkenau, the weapon used in of one of the most atrocious crimes allegedly known to history; in this way the structures and facilities where hundreds of thousands of Jews (millions, it used to be said)[15] were killed with hydrogen cyanide gas would be put to forensic investigation.

For historians who like to think that they have at last undertaken a scientific study of Auschwitz, there is no longer any reason to refuse such an investigation.

---

[15] Cf., for example, the statement "Auschwitz, where more than five million men, women and children perished, of whom 90% were Jews" ("Manifestation du souvenir à Paris devant le Mémorial du martyr juif inconnu" [Remembrance ceremony in Paris at the Memorial to the Unknown Jewish Martyr], *Le Monde*, April 20, 1978). According to this statement in *Le Monde*, therefore, over four and a half million Jews perished in the Auschwitz and Birkenau camps alone!

2. The Obvious Facts that Pressac Could not Ignore

Because of fundamental discoveries due to the revisionists, there exist certain embarrassing obvious facts that the exterminationists can no longer conceal. Pressac follows the trend.

2.1. "Wannsee" is no Longer "Wannsee"

For decades, the historians of the alleged "Holocaust" of the Jews repeated that on January 20, 1942, at Berlin-Wannsee, the Germans had decided to exterminate the European Jews. It took until 1984 for the exterminationists, gathered in a congress at Stuttgart, to abandon this argument in the utmost discretion.[16]

Then the world had to wait until 1992 for Yehuda Bauer to declare publicly that the argument in question was "silly."[17] Conforming to the new official truth, Pressac writes:

> *"On the 20th of January the gathering known as 'the Wannsee Conference' took place in Berlin. If an action of 'removal' of the Jews towards the East was foreseen, with mention being made of a 'natural' elimination* [of some Jews] *through labor, no one then spoke of industrial liquidation. In the days and weeks that followed, the* Bauleitung *at Auschwitz received no call, telegram or letter demanding the study of an installation adapted to that purpose."* (p. 35)

In his "chronological summary," he confirms: "January 20 [1942] – Wannsee Conference in Berlin on the removal of Jews towards the East" (p. 114). He indeed writes "removal" and not "extermination."

2.2. Not much Could be Secret about Auschwitz

We used to be told that the location of Auschwitz had been chosen for its remoteness and possibilities of secrecy. In reality, Pressac is obliged to acknowledge that the camp was established in an outlying district of the town of Auschwitz, itself situated within an international railway network linking to Berlin, Vienna and Warsaw (p. 9). We may add that, every day, train passengers rode close by the camp.

Today there is no longer any dispute of the fact that the Auschwitz camp swarmed with civilian laborers, of German, Polish or other nationalities, busy at all sorts of tasks, including the building and maintenance of the crematories;

---

[16] Eberhard Jäckel, Jürgen Rohwer, *Der Mord an den Juden im Zweiten Weltkrieg*, DVA, 1985, p. 67

[17] *The Canadian Jewish News*, January 30, 1992; cf. also "Wannsee: 'Une histoire inepte,'" *RHR* no. 6, May 1992, p. 157-158.

except during typhus epidemics, most of these laborers returned home at the end of every working day. This reality is, in itself, incompatible with the necessity to shroud in the greatest secrecy the existence and operation of chemical slaughterhouses devouring victims by the hundreds of thousands (by the millions, it used to be said). These civilians wore a green armband (p. 62):

> *"For the building of the crematories of Birkenau, the services of twelve civilian concerns were engaged* […]. *Each building project* […] *employed between a hundred and a hundred and fifty persons, of whom two thirds were detainees and one third were civilians, under the direction of foremen from the firms involved."* (p. 56)

The author does not explain the anomaly that ought to have appeared before his eyes both in this abundance of foreign civilians at the scene of the crime and in the fact that operations supposed to constitute the biggest secret in the Reich were run by foremen of civilian firms from outside the camp.

2.3. The Archives Have Survived in Very Great Number

It used to be blithely asserted that in January 1945 the Germans had destroyed nearly all the camp's archives. Pressac admits that the extant items from the Auschwitz archives run into the tens of thousands, if not hundreds of thousands, at Auschwitz itself or in Moscow. Those of the central construction office (*Zentral-Bauleitung*) are intact. As they were, in Pressac's view, the most compromising of all, these documents' destruction should have been a clear priority. Why were they not destroyed? The common sense answer is that, as they did not contain a single trace of any gigantic crime, precisely because that crime had not occurred, there was no reason to destroy such archives. Our author, for his part, offers another explanation as to why the SS men did not destroy these documents: they were unaware of the "explosive" nature of their contents (p. 1). With him, this is customary: as soon as he comes upon a phenomenon that he does not understand or care to explain, he tends to ascribe it to the foolishness or ignorance of the SS.

2.4. 1972, the two Chief Architects Had to Be Acquitted

For my part, I have always pointed to the acquittal, by a Vienna court in 1972, of Walter Dejaco and Fritz Ertl, the two chief architects of the Auschwitz crematories. The Soviet and Polish Communists had lent the court the documents in their possession. The conclusion that one will normally reach is that those documents provided no proof of any crime whatever; all of them necessarily appeared to have the most ordinary reasons to exist when looked at from a technical point of view, i.e. that of architects, engineers and other experts. Pharmacist Pressac, for his part, concludes that all of those specialists were incapable:

"[…] *no one – neither among the judges nor the alleged experts – was capable at the time of using the excellent historical material provided by the Poles and the Soviets."* (p. 96)

Access to the papers and documents from the Dejaco-Ertl trial, in the possession of the Austrian judiciary, is denied to revisionists. Why are they not published?

2.5. Typhus Epidemics Combated through the Use of Zyklon B

Typhus – which had always been endemic in the populations of Eastern Europe – brought its ravages to bear at Auschwitz. In the western part of the Soviet Union, the Germans had noted "one hundred and fifty thousand cases of typhus in summer 1941" (p. 32). On this subject Pressac, compelled to mention certain truths that have long been stated by the revisionists, writes,

"The SS physicians knew that the Auschwitz region was marshy. They had already been confronted with the problem of untreated water, which led to typhoid fever caused by the Eberth bacillus. Towards the end of May 1942 numerous cases of typhoid appeared among the inmates; thus in early June the consumption of tap water was prohibited to the SS and the employees of the seventeen civilian firms operating in the camp. To compensate, mineral water was provided free and in abundance. Looking to summer, the physicians anticipated as nearly inevitable cases of malaria, borne by the mosquitoes of the marshes. To face this danger, an SS hygiene institute had to be set up at Raisko, and that was done in October. But the typhus took them by surprise. They thought that the prophylactic measures (quarantining, head shaving) and hygienic measures (treatment of body hair, showering) applied to detainees upon arrival would, by eradicating the vector, the louse, keep the scourge out of the camp. That was the case as concerned the inmates, but the affliction came from those who had not been submitted to such treatment, the civilians, who were daily in close company with the detainees.[18] *Soon, the latter were infected and, since the hygienic conditions in the KL were lamentable, the death count soared. From May to December 1940, the monthly death toll is estimated at 220; from January to July 1941 it trebled; from August to December 1941 it reached a thousand; in July 1942 it surpassed 4,000. The sanitary situation*

[18] For its part, the Polish Resistance strove to propagate typhus and typhoid fever; we owe this revelation to the *Revue d'histoire révisionniste* no. 1, (May 1990, p. 115-128): "Le rapport Mitkiewicz du 7 septembre 1943 ou l'arme du typhus" (The Mitkiewicz Report of September 7, 1943, or the weapon of typhus; engl. vgl.: G. Rudolf, "Aspects of Biological Warfare During World War II," *The Revisionist*, 2(1) (2004), pp. 88-90.). This report notes that in the period from January to April 1943 there were "several hundred cases" of "spreading of the typhoid fever microbe and typhus-bearing lice" (p. 127). The French resistance used identical procedures (*ibid.*, p. 116, n. 1).

became uncontrollable. It was necessary to keep the typhus from spreading to the surrounding area. The whole camp had to be isolated and no one must leave. On July 10 [1942] *a partial quarantine was ordered."* (p. 43)

He adds:

"But as the ravages of the typhus epidemic continued unabated and the situation became catastrophic, the total isolation of the camp was decreed on July 23 [1942]*."* (p. 46)

The epidemic went on to cause as many as 250 to 300 deaths per day among the inmates, the civilians and the SS (p. 50). Pressac fails to mention that the head physician, Dr.Popiersch, himself died of typhus.[19] In the period from September 7 to 11, 1942, the first epidemic reached its peak, with 375 deaths in one day (cf. the table on page 145). A second epidemic, then a third broke out in the first half of 1943 (p. 82).

Disinfection, particularly by means of Zyklon B, constituted a vital necessity:

"In the week of July 5th to 11th [1942]*, the building housing the SS guards, which was swarming with vermin, was gassed* [with Zyklon B]*."* (p. 16)

At Birkenau, the *Zentral-Sauna*

"was a well functioning sanitary complex; it was to be equipped with four rooms for delousing by hot air (document 23), three industrial autoclaves (document 24), a room for head shaving, a room for medical examinations and fifty showers. With this facility the SS intended 'definitively' to forestall any resurgence of typhus at Birkenau. The detainees were to be shaved, examined, disinfected and showered while their effects were deloused. Unfortunately, the installation was not operational until late January 1944." (p. 69)

Document 23 and, especially, documents 24 and 40 illustrate the degree to which the Germans were concerned with hygiene, particularly in that part of the camp at one time occupied by Gypsies. Documents 42 and 43 show inte-

---

[19] Cf. Comité international d'Auschwitz, *Anthologie* (blue), French Version, vol. I, 2nd part, (Warsaw, 1969), p. 196. Among many other German victims of typhus at Auschwitz we may mention Dr. Siegfried Schwella (Dr. Popiersch's successor), the wife of Gerhard Palitzsch, camp *Rapportführer*, and the wife of Joachim Caesar, head of agricultural works. Other Germans whose names are known contracted typhus without dying from it, amongst them Dr. Johann-Paul Kremer, Dr. Heinrich Schwarz, Dr. Kurt Uhlenbrock and Dr. Josef Mengele. Amongst the most famous detainees who died of typhus were Dr. Marian Ciepilowski, who cared for the Soviet prisoners, Professor Zygmunt Lempicki and the dentist Danielle Casanova, whom legend long held to have been killed by the Germans. The Germans, in the east, lived in constant fear of typhus; Adolf Hitler himself was vaccinated against it on February 7 and 14, 1943, at Rastenburg (on this, cf. the memoirs of his physician, Dr. Theo Morell, in David Irving, *The Secret Diaries of Hitler's Doctor*, New York, McMillan 1983, p. 109).

rior and exterior views of the battery of nineteen disinfection gas chambers using Zyklon B (this building was never to be completed).

Auschwitz was equipped with

> *"the most recent delousing technique developed in Germany. It was a stationary delousing unit using ultra-short waves (decimeter or centimeter waves)."* (pp. 82f.)

As early as 1946 Marc Klein, professor at the University of Strasbourg's medicine faculty and a former Auschwitz inmate, mentioned this "microwave delousing" and the impressive number of measures taken by the German physicians in their attempts to care for detainees living in the conditions of very close quarters inherent to a forced labor camp.[20]

2.6. Cremation: a Hygienic Measure

Pressac writes:

> *"To prevent typhus and other uncontrollable epidemics from spreading, the bodies of war dead, along with the microbes that they carried, had to be reduced to ashes. Prüfer* [as far as Auschwitz was concerned] *was there for that."* (p. 32)

Initially the Germans had buried corpses but Auschwitz was situated in a marshy zone. At times the water table there rose almost to ground level. It became necessary to unearth these bodies and burn them.

> "[…] *the substances produced by the corpses' putrefaction began to infect the ground water, which, in the course of its rise, risked being thoroughly infected. There was nothing for it but to unearth the corpses and incinerate them in open air before winter."* (p. 57)

The better part of the book is devoted to the history of the crematories, i.e., to the history, first, of the buildings called crematories, then to that, in particular, of those crematories' ovens. The account is tedious, desultory, barely comprehensible. It holds that the ovens were subject to frequent breakdowns (p. 22, 81, note 108, etc.), a fact that must diminish, in due proportion, the delirious capacities that the exterminationists, including Pressac, generously attribute to them (300,000 cremations in 70 days [p. 148], or more than 4,285 per day!).

2.7. Crematories Planned without Homicidal Gas Chambers

Here we come to the most important concession that the author has had to make to the revisionists: the four crematories of Birkenau, designed in August 1942, that is, at a really late stage of what the official historians call the policy

[20] "Observations et réflexions sur les camps de concentration nazis," *Études germaniques* no. 3, 1946, p. 18.

of extermination of the Jews, were "planned then without gas chambers" (p. 53). Moreover, the *precise* date at which these crematories, finished between March 31 and June 25, 1943, were "planned with" gas chambers is not to be seen.

His concession is significant: in 1982, at a time when historians affirmed that all the crematories had been planned and built *with* gas chambers, our author, in a moment of boldness, had dared to write that crematories IV and V were designed *without* gas chambers. Then, in 1989, making amends, he wrote that the two crematories had been designed *with* gas chambers. Today he reverts to his position of 1982: those crematories were designed *without* gas chambers. He said nothing in 1982 with respect to crematories II and III; then, in 1989 and today (1993) he rules that they had been planned *without* gas chambers. Concerning crematory I, which predated all the others, one cannot quite determine whether, for Pressac, at some moment in his variations on the subject, the Germans planned it *with* or *without* a gas chamber. The same uncertainty reigns with respect to the mysterious Bunkers 1 and 2.[21]

2.8. Other Obvious Facts that he Could not Fail to Mention

If we limit our observations to the collection of photographs, there appear other obvious facts that the author could not hide. Far from working in secret, as becomes criminals, the staff of the central construction office at Auschwitz obligingly let themselves be photographed (doc. 12). Pressac could have added photographs showing these engineers, architects and technicians working in their offices where they proudly exhibited the plans of their crematories. Still in the same collection are depicted an installation for heating widely separated parts of the camp (doc. 44), inmates at work in stables (docs. 45 and 46), munitions plants or synthetic fuel factories manned by inmates (docs. 47 and 48), enormous potato storehouses (doc. 49) – whose presence is somewhat surprising in a complex called, by the Allies, an "extermination camp" – a water treatment facility located near the crematories (doc. 50), detainees working at one of the pig farms (doc. 51), greenhouses and fields of crops (doc. 52).

For the moment, regarding the obvious things that the author could not fail to mention, it will be noted how strongly everything seen so far argues against the case for an extermination at Auschwitz. It has taken the huge pressure exerted by revisionist work to have these facts acknowledged.

---

[21] For references to these diverse changes of position, see *RHR* no. 3, p. 74-79; cf. also my *Réponse à Pierre Vidal-Naquet*, La Vieille Taupe, 1982, 2nd edition, p. 67-83.

3. Realities that Pressac Never Mentions

The author passes over in silence a considerable number of realities showing that Auschwitz and Birkenau cannot have been "extermination camps" (an expression invented by the Allies) but rather a complex of concentration, labor and transit camps. He has also stayed silent on a large number of documents of the highest importance. I shall keep to a few examples.

3.1. Neither a Photograph nor a Plan of Crematory I

Here we have a book devoted to the "crematories of Auschwitz" which, paradoxically, in the sixty photographs and documents that it offers does not contain a single photograph or plan of crematory I and its "gas chamber"! However, it is this first crematory, with its purported homicidal gas chamber, that, let us repeat, is shown to all the visitors as the very proof of the crime. Pressac reproduces the photograph of an oven at Dachau (doc. 7) or at Buchenwald (doc. 60) but he does not show the ovens of Auschwitz I!

He proceeds in this way purposely, for he knows that this crematory, with its "gas chamber," is nothing but a hoax. He could hardly remind his readers that I discovered that fact in 1976, on site, and a few years later set forth the proof of it in the book that I wrote in collaboration with Serge Thion.[22] Nor could Pressac apprise his readers that I had been the first in the world to discover – after much difficulty – the plans of all the crematories of Auschwitz and Birkenau in the archives of the Auschwitz Museum, to publish some of them, and thus to show the physical and chemical impossibilities of any homicidal gassing in those buildings.

3.2. No Photograph of the "Gas Chamber" of Crematory II

Nor, for that matter, does he dare show us a photograph of the ruins of what he dares to call the gas chamber of crematory II at Birkenau and which was, in reality, a morgue set partly beneath ground level (*Leichenkeller*). **The concrete roof, now caved in, was quite clearly devoid of any opening provided for the pouring in of anything whatsoever.** The only two holes to be seen in it today are the result of drillings made after the war: the twisted and bent reinforcement bars in the concrete attest to this. Consequently, the Pressacian theory that the SS men poured Zyklon B pellets into that "gas chamber" through four openings provided for that purpose is untenable for reasons of plain physical facts that anyone can go and see for himself today on the spot.

---

[22] Serge Thion, *Vérité historique ou vérité politique?*, La Vieille Taupe, 1980, p. 316-317.

3.3. Not a Word about the Forensic Studies

The author does not breathe a word of the forensic studies by the American Fred Leuchter[23] and the German Germar Rudolf,[24] or the technical analysis by the Austrian Walter Lüftl,[25] all of which have come to the conclusion that there were no homicidal gas chambers at Auschwitz and Birkenau.[26]

Above all, he passes over in silence the Krakow forensic study. Intending to counter the report made by F. Leuchter, the Auschwitz Museum authorities commissioned a forensic study by the criminological institute of Krakow; the result was such that the study's findings, dated September 24, 1990, have been kept hidden.[27] What right has Pressac to ignore these scientific factors of the Auschwitz dossier? If the studies in question do not meet with his approval, he should tell us so in his book, and propose one that does. Moreover, it is high time that we demanded of those who criticize the revisionists that they, in their turn, provide a forensic study of the crime weapon supposedly used at Auschwitz and Birkenau. A scientific examination of buildings (or ruins of buildings) only half a century old is very easily done. Why such stubbornness in refusing that study or examination, while at the same time claiming, like the revisionists, to be approaching the history of Auschwitz scientifically?

3.4. Not one Complete Photograph from *The Auschwitz Album*

The most valuable document on the realities of Auschwitz is a collection of 189 photographs, usually called *The Auschwitz Album*. It gives the lie to the wild imaginings voiced on the fate of the Jews arriving at Auschwitz-Birkenau in 1944. It is so embarrassing for the exterminationists that they waited thirty-six years after its discovery in 1945 before finally publishing all its contents in 1981. Until then, only some of the *Album*'s photographs had been offered, now and then, in various works. And still, in 1981, the full publication had to be accompanied by a lengthy, quasi-novelistic text by Serge Klarsfeld on the

[26] F. Leuchter, based near Boston, specialist of American penitentiaries' gas chambers; G. Rudolf, at that time a doctoral candidate at the Max Planck Institute of Stuttgart; W. Lüftl, president of the Austrian Federal Chamber of Civil Engineers, Vienna.

[27] For the text of this counter-study, which the revisionists have managed to obtain, see "Crise au Musée d'État d'Auschwitz / La Contre-expertise de Cracovie" (Crisis at the Auschwitz-Museum: The Counter-study of Krakow), *RHR* no. 4, February 1991, p. 101-104. Engl.: "An official Polish report on the Auschwitz 'gas chambers,'" *Journal of Historical Review*, 11(2) (1991), pp. 207-216.

collection's "miraculous" discovery. Two years later the same Klarsfeld entrusted Pressac with the task of producing an "established, complete version" with one of the largest French publishing houses, the éditions du Seuil. [28]

Apart from the image of the Jewish woman on the cover (*cut out* from one of the items in the collection), Pressac does not reproduce a single photograph from the precious *Album*!

3.5. Not a Word about the Aerial Reconnaissance Photos

Pressac reproduces none of the aerial reconnaissance photographs of Auschwitz and Birkenau published in 1979 by the Americans Dino A. Brugioni and Robert G. Poirier.[29] It is true that these photographs deliver the proof that no crowds ever gathered next to the crematories, that the chimneys did not emit plumes of smoke (cf., in *Les Crématoires d'Auschwitz*, "two squat chimneys spitting flames," p. 91) and that the "incineration ditches" are a figment of the imagination.

3.6. Not a Word about the Morgue Corpse Register (*Leichenhallenbuch*)

It took until 1989 for the Auschwitz Museum to resign itself to unveiling the existence of the death registry of Auschwitz I, the *Leichenhallenbuch* (morgue book, not to be confused with the general camp death registries, the *Sterbebücher*).

In the new edition (1989) of her calendar of events at Auschwitz-Birkenau (*Kalendarium der Ereignisse im Konzentrationslager Auschwitz-Birkenau 1939–1945*), Danuta Czech informs us of something that she curiously "forgot" to mention in the first edition, issued in six parts:[30] the existence of the highly important registry of the names of persons whose corpses were placed in the morgue (*Leichenhalle* = corpse hall) of crematory I between October 7, 1941, and August 31, 1943 (*Kalendarium*, 1989, p. 10 and *passim*). Even if some of those dead may, in the early days of the camp's existence, have been buried and not cremated, in this we indeed have a document that should give

---

[28] For comparison, one may first consult the American edition, which is relatively honest (*The Auschwitz Album*, New York, Random House, 1981, xxxiii-167 p.), then the Pressacian edition, which is remarkably dishonest (*L'Album d'Auschwitz*, French edition, compiled and completed by Anne Freyer and Jean-Claude Pressac, éditions du Seuil, 1983, 224 p.); cf. *RHR* no. 3, Annex 3: "Les Tricheries de Pressac dans *L'Album d'Auschwitz*," p. 149-152.

[29] *The Holocaust Revisited: A Retrospective Analysis of the Auschwitz-Birkenau Extermination Complex*, Washington, CIA, February 1979, 19 p.

[30] *Hefte von Auschwitz* no. 2 in 1959, no. 3 in 1960, no. 4 in 1961, no. 6 in 1962, nos. 7 and 8 in 1964, no. 10 in 1967.

an idea of the real number, not simply a theoretical number, of cremations carried out.

Many other documents concerning the cremation of the dead are ignored by Pressac: for instance, the death notices specifying that there had been a cremation, telegrams or telexes announcing a death, certificates of the dispatching of funerary urns, the reports stating the total number of corpses incinerated or of those stored in the morgues.[31]

The myth holding that those slated for gassing were simply not registered could not rightly discharge Pressac from having to provide us with the information in question in a book entitled *Les Crématoires d'Auschwitz*.

3.7. Other Documents Passed over in Silence

Other documents are passed over in silence, for example those concerning requests for allocations of wood, coal and coke and the delivery to the crematories of any kind of fuel, not to mention the documents that prove that the ovens could not operate 24 hours a day.[32]

3.8. Other Silences

I shall not go over again here what, in my report on his previous work,[7] I detailed under the titles "Trois petits secrets de J.-C. Pressac" (Three little secrets of J.-C. Pressac)[33] and "Omissions délibérées" (Deliberate Omissions).[34] A whole chapter could be written on the variations of the Pressac thesis in the last eleven years, which include some 180° turnabouts in his considerations on Auschwitz. Pressac casts a veil over these episodes, and, in particular, on his own attempt to incinerate the body of a rabbit in a hole in his back garden to see whether any credence should be lent to the accounts of the Germans' burn-

---

[31] Cf. for example, for Buchenwald, the death notice (*Totenmeldung*) reproduced by Reimund Schnabel, *Macht ohne Moral*, Frankfurt, Rödenberg-Verlag, 1957, p. 346.

[32] Cf. the instructions for use reproduced in J.-C. Pressac, *A.T.O.*, p. 136.

[33] *RHR* no. 3, p. 134-135.

[34] *Ibid.*, p. 137-140. It is significant that Pressac does not breathe a word of the abundant revisionist bibliography. He does not cite the fundamental work of American professor Arthur Robert Butz, *The Hoax of the Twentieth Century*, which has been republished a number of times since 1976 by the Institute for Historical Review (now available from Theses & Dissertations Press, Chicago; editor's remark). He does not mention the *opus magnum* of Canadian barrister Barbara Kulaszka, *Did Six Million Really Die? Report of the Evidence in the Canadian "False News" Trial of Ernst Zündel – 1988*, (with a preface by Robert Faurisson; Toronto, Samisdat Publishers [206 Carlton Street, Toronto, Ontario, M5A-2L1], 1992, 564 pages, 28 x 21 cm.). He pretends to be unaware of the erudite studies by the Italian Carlo Mattogno, the Spaniard Enrique Aynat, and the Americans Mark Weber and Paul Grubach, who have reduced to nothing his 1989 book in English, *Auschwitz: Technique and Operation of the Gas Chambers*.

ing thousands of corpses in "incineration ditches." The experiment proved unsuccessful, despite repeated efforts. The author had concluded that it was impossible, what with the relative lack of oxygen, to incinerate corpses in the bottom of a ditch, especially at Auschwitz where, as I have already noted, the water table rose almost to ground level. As we shall see below, this does not stop him from asserting in his book that at Auschwitz the Germans sometimes burned their victims in "incineration pits"; they even threw them alive "into the burning ditches" (p. 91)!

Not content to pass over in silence so many realities and so many documents of such great importance, Pressac has used other means to hide the truth about Auschwitz: he has employed expedients that are standard for the area under discussion, along with some of his own making.

4. Expedients that Pressac Borrows from other Historians

Whether one considers the obvious facts that Pressac has not been able to ignore or the realities that he never mentions, all leads to the conclusion that no trace is to be found at Auschwitz and Birkenau either of genocide or of homicidal gas chambers. For someone who is set on defending the exterminationist case nevertheless, only one solution remains: subterfuge. And our improvised historian adopts just that: he follows the example of some illustrious predecessors in using the expedients customary of Léon Poliakov, Georges Wellers, Pierre Vidal-Naquet, Raul Hilberg and Christopher Browning or, for that matter, a certain French law court.[35] There are at least four such expedients: the unsubstantiated assertion, the recourse to unverified testimony, the deciphering of an alleged code and, finally, the grouping together not of evidence, but of a mixed bundle of scraps of evidence, of traces of "slips" and "bungles" that the SS are said to have inadvertently left behind.

4.1. Unsubstantiated Assertion

In his 1989 book, Pressac had brought up at least five times "Himmler's order of November 26, 1944, to destroy the Birkenau Krematorien II and III," "together with the order to stop the gassings," "thus making the end of the gassings official."[36] In my review of it I wrote:[37]

> *"Our autodidact merely repeats here, without verifying them, the statements of some eminent Jewish authors (with variations on the dates)."*

[35] Cf. *RHR* no. 3, p. 204-205., and *RHR* no. 4, p. 192-193.
[36] J.-C. Pressac, *op. cit.*, p. 115, 313, 464, 501, 533.
[37] *RHR* no. 3, p. 83-84.

What does the autodidact do now, in his new book? He writes: "In late November [1944], on a verbal order of Himmler, the homicidal gassings were stopped" (p. 93), but, of course, he offers no evidence of the existence of that order, now presented as "verbal" and whose date has suddenly become imprecise. Just as arbitrarily, he writes that on July 17, 1942, Himmler "witnessed a homicidal gassing at Birkenau" (p. 115). Unruffled, he then declares that the physical extermination of the Jews:

> "*was decided on by the SS authorities in Berlin* [which ones?] *only from May/June 1942, and was subsequently* [when, exactly?] *made technically concrete by the SS construction office at Auschwitz and the engineers of the firm J.A. Topf und Söhne of Erfurt."* (p. 2)

He dispenses with citing any evidence or testimony when writing that human beings were gassed in Bunker 2 (p. 42), that "on July 4th, a convoy of Slovakian Jews were 'selected' [it being understood that some in the convoy were gassed] for the first time" (p. 43), that "in November 1942 the SS men of the construction office resolved to fit out the crematories with homicidal gas chambers" (p. 66), that ventilation specialist Karl Schultze was "given the low-down [*sic*] by Prüfer on the particular purpose of the ventilation system of morgue 1 [of crematory II]" (p. 71). By "particular purpose" Pressac means that it was a business of homicidal gassings. In the same way, he affirms that "the SS were able to annihilate up to 300,000 people in 70 days" (p. 148), that two foremen climbing down from scaffolding or a roof "told foremen from other firms of the yellow and violet flames that discolored [!] the sylvan green of the forbidden zone" (p. 58), and that "towards the end of October 1942 the idea, obvious enough, of transferring the 'gaseous activity' [*sic*] of Bunkers 1 and 2 [to a crematory] was applied" (p. 60).

Staying within the routine of unsubstantiated assertions, he adopts as his own the most conventional of the lies of anti-German propaganda: the tale of the alleged gas chamber at Dachau that "happily, was never put into operation" (p. 68).

A full list of the assertions of this kind, which Pressac never takes the trouble to back up either with a piece of evidence or even a testimony, would be a long one. The relative brevity of his book should not excuse such an absence of evidence, testimonies and exact source references for assertions or, rather, accusations of such gravity.

4.2. Recourse to Unverified Testimonies

Hastening to forget the promise made in his preface, he has recourse to testimonies all throughout his book. For example, those of SS men Pery Broad and Rudolf Höss, of detainees Henryk Tauber and David Olère and other witnesses whose names he avoids giving: in these last instances he makes reference to the *Kalendarium* of Danuta Czech, who, herself, used testimonies.

It takes a certain audacity indeed to bring up the testimony of SS man Pery Broad, manipulating it in the process (p. 18).[38] In 1989 Pressac said of this written testimony that it "raises problems," and that "the form and tone of his declaration sound false"; he added that, in the form in which we know it, it was "visibly colored by a rather too flagrant Polish patriotism," that its original manuscript "is not known" and that, in his own opinion, "[Broad's] declaration has been 'slightly' reworked by the Poles."[39]

The testimony of SS man Rudolf Höss, which Pressac very often brings into play (cf. his name in the index of *Crématoires d'Auschwitz*), is totally discredited today. In 1989 Pressac himself stated that the "involuntary errors found throughout his autobiography" had an explanation: "He was present, without seeing,"[40] an observation which, concerning a man presented as an "eye-witness," is unexpected. In 1993 he executes his own witness in the lengthy note 132 (p. 102-103), where he uses the following words with regard to Höss: "sizeable improbability," "plain anachronism," "chronological errors," "imaginary visit," "death-counts […] regularly multiplied by two or three." He concludes: "Despite his essential role in the 'Final Solution,' Höss can now no longer be considered a reliable witness with respect to the dates and numbers."

On the subject of the Jewish cobbler Henryk Tauber (notes 203 and 223), in 1989 Pressac listed his grave "mistakes," contradictions and "contestable points," concluding that he had never, in fact, been witness to homicidal gassings. He explained that, Tauber allowed himself some formidable exaggerations and a "type of imposed falsehood [that] has to be excused, I stress, because of the political climate of the period 1945-1950."[41]

As for David Olère, Pressac presents the man's Indian ink drawings as "documents" (cf. docs. 30 – erroneously labeled 33 –, 31, 32, 35). However, in 1989, he deemed that this witness suffered from "Krematorium delirium."[42]

---

[38] One may compare the text to which Pressac refers in his note 55 with the text of Pery Broad's "declaration" in *Auschwitz vu par les SS*, State Museum of Auschwitz, 1974, p. 166 (Engl.: Jadwiga Bezwinska, Danuta Czech (eds.), *KL Auschwitz Seen by the SS*, H. Fertig, New York 1984). Pressac has avoided all the points that prove that it is false testimony, especially Broad's mention, in the passage cited, of "*six* holes for aerage (*sic*, for aeration) closed with lids"!

[39] J.-C. Pressac, *op. cit.*, p. 128. Even P. Vidal-Naquet, protector of the one whom he calls the "suburban pharmacist," concedes: "In the documentation on Auschwitz there are witness statements that give the impression that they have adopted the language of the victors. This is the case, for example, with the SS-man Pery Broad […]" (*Les Assassins de la mémoire*, La Découverte, 1987, p. 45).

[40] J.-C. Pressac, *ibid.*

[41] *Ibid.*, p. 483-484, 489, 494.

[42] *Ibid.*, p. 556.

In fact, his drawings are of a grotesque lyricism. Pressac commented on one of them as follows:[43]

> *"Whether the picture is entirely imaginary or is based on what the artist actually saw, this is the only one showing a homicidal gassing."*

It could be seen that, in this picture or drawing, the pellets of Zyklon B spread themselves about from a can lying on the floor of the "gas chamber," a detail that conflicts with Pressac's argument holding that the pellets were brought in from outside through a "grilled duct for the pouring in of Zyklon B" (doc. 31: drawing by David Olère).

As for the other testimonies, of which neither the source nor the name of the witness is indicated, Pressac in his new book mentions them in footnotes, which all give Danuta Czech's *Kalendarium* as reference. However, according to him, this *Kalendarium*, its author and the testimonies quoted have little value as references. In effect he writes:

> *"In retaining without explanation certain testimonies at the expense of others and in giving the testimonies priority over documents, Danuta Czech has produced a book that exposes itself to the attacks of critics. This particular historical orientation persists in the third and newest version of Czech's* Calendar […]*, now published in Polish and not yet utilizing the store of Bauleitung documents in the central archives of Moscow, strongly diminishing the veracity of this fundamental work, established, unfortunately, with a viewpoint a bit too tinted in the tense political context of the '60s."* (note 107)

If that is the case, why should the author have referred regularly to a source that he considers so questionable?

The reader will be surprised to note that in 1993 Pressac no longer even mentions two testimonies of which he made the greatest use four years ago in his book in English:[7] those of Nyiszli (the presumed author of the best-seller *Médecin à Auschwitz*) and Filip Müller (presumed author of the best-seller and LICRA Prize winner *Trois ans dans une chambre à gaz d'Auschwitz*). Could this mean that he has been able to learn something from my remarks on his abuses of their testimonies?[44]

Without daring to mention F. Müller by name, he uses his testimony in a furtive manner. Let us recall the episode of the "incineration ditches":

> *"Towards the end of the summer, with Zyklon B lacking, those from the convoys who were unfit for work, who were still sent to Auschwitz, were thrown directly into the burning ditches of crematory V and Bunker 2. – n. 293."* (p. 91)

Note 293 refers us to the following text:

---

[43] *Ibid.*, p. 258.

[44] Cf. *RHR* no. 3, p. 126-130, "Drôlerie [involontaire] de Pressac à propos de M. Nyiszli," and p. 123.

"Hermann Langbein, Der Auschwitz-Prozess, eine Dokumentation*, Band I, Europa Verlag, Vienna, 1965, p. 88."*

If one opens that book at the page indicated (in fact, p. 88-89), one will discover that this testimony on victims thrown alive into the incineration ditches comes from F. Müller, who added details that Pressac has preferred to wipe away: the ditches were 2.5 meters deep – a fact which, apart from decreasing the availability of oxygen for combustion, would have made any burning impossible, what with the water-soaked character of the ground – and… the fat dripping from the corpses was scooped up and poured over them to speed up the incineration!

4.3. Deciphering the Code

Many historians have affirmed that the Germans used a "code" to designate their alleged policy of extermination of the Jews. To that assertion, those historians added another: they claimed to possess the key to the code. Consequently, their work consisted in "decoding," i.e. to find in the documents what they themselves had just put there. And one has to admit that they decoded a lot. In 1989 Pressac denounced the "myth of the '*Tarnung* / camouflage,'" the "coding" or secret language.[45]

In 1993, he is to be found indulging in the very custom that he once condemned. In his turn, he decodes in abundance. According to him, "final solution" of the Jewish problem ended up meaning liquidation of the Jews (context of page 29) and "special commando" (*Sonderkommando*) designated a squad of Jews assigned the task of carrying the corpses of the gassed to the cremation ditches (p. 43). For Pressac today, the expressions "special treatment" (*Sonderbehandlung*) or "transfer of the Jewish population" disguised the meaning "liquidation by gas of unfit Jews at Birkenau" (p. 46). The expressions "special actions" or "treated" had the same horrible implication (p. 64, 77).

But, sometimes, Pressac falls prey to doubt. So it is that he admits that the expression "special action" could merely have the meaning of a police intervention or mobilization in the Auschwitz camp on the occasion of a spontaneous strike by the civilian workers (p. 63), whereas "special measures" could merely designate some sanitary measures (p. 82 and note 256).

On "special treatment" (*Sonderbehandlung*), he ought to read more attentively what he himself cites. When he tells us that an official of the camp requested a grant of 60,000 marks to build "four barracks for the special treatment of the inmates at Birkenau" (p. 46), the fact is that the purpose, as the text clearly says, was to house *inmates* in *barracks* and not to send *newly arrived detainees* into *gas chambers*.

---

[45] J.-C. Pressac, *A.T.O.*, p. 247, 556.

4.4. The "Slips" and "Bungles" of the SS

The author calls a "criminal slip" "any indication noted in any document (writing, drawing, photo) relative to an abnormal use of the crematories and which can only be explained by the massive gassing of human beings" (p. 60). Sometimes, instead of "slip" (*bavure*) he employs the word "bungle" (*bévue*).

It seems that, in practice, this definition amounts to saying that, if Pressac – and no one else – finds a detail concerning the use of the crematories (of the cremation ovens?) that he, a pharmacist, considers abnormal, and that he, a pharmacist, cannot understand, then one must conclude that it is the clue to an enormous crime. When one reflects how even the most knowledgeable man of science can remain perplexed by a problem concerning his own field and when one recalls that the beginning of wisdom consists, when one does not know, in not talking, one can only admire here the pharmacist's artlessness and presumption. The author should remember his own experience. In his 1989 book, he devoted a whole chapter (number 8 of part two) to… thirty-nine "'criminal traces' or 'slips.'" Today he has apparently retained only five or six of those "slips," a fact that would indicate he has now managed to understand thirty or so innocuous details which, four years ago, seemed to him to constitute clues to an abominable crime. In my review of 1990 I discussed those thirty-nine "slips"[46] and can only refer my reader to that text. Here I shall revisit only some of them and comment on the new "slips" that Pressac claims to have discovered.

4.4.1. The "Disappearance" of the Corpse Slide (pp. 64f)

By no means did this slide disappear to make way for stairs by which the designated victims would have had access, on foot, to the "changing room" on the way to the "gas chamber." If the slide does not appear in a partial plan dated December 19, 1942, it is most likely for the simple reason that, since the architect's drawing concerned only a stairway leading to the street, there was no reason, here, to represent that slide which, in any case, appeared nine months later in a drawing of September 24, 1943.[47] Still today the remains of this inclined surface (*Rutsche*) are visible in the ruins of crematory III; it was the route by which a cart transported a corpse or corpses. In 1989 Pressac said as much himself and presented a photograph of those remains![48] As for the narrow stairway of the alleged "changing room," it obviously would not have sufficed for the entry of veritable throngs of humanity.

---

[46] *RHR* no. 3, p. 89-104.
[47] J.-C. Pressac, *op. cit.*, p. 327.
[48] *Ibid.*, p. 544-545.

4.4.2. *Vergasungskeller* (p. 69)

Since the plans available to us are so imprecise, no one is able to situate this *Vergasungskeller* (gassing cellar?) and thus to determine its exact nature. It could have been a basement room where disinfection gear was stored: cans of Zyklon, gas masks, filtered detectors, sheets for laying out Zyklon pellets, tools for opening the cans, etc. But other purposes are possible.[49]

4.4.3. A Gas-Tight Door and Fourteen (Fake) Showers (p. 80)

I refer to my review, in which I discussed the banal character of the presence, in a crematory, of gas-tight doors and showers.[50] Let us note, besides, that in the German document there is no mention of fourteen (fake) showers, but of fourteen real shower-heads.

4.4.4. The Heating of the "Gas Chamber" (p. 73)

I refer to my review[51] and add that, in any case, the suggestion of installing a heating system was abandoned several days after it was made, as Pressac himself says (p. 77). Consequently, there is no point in discussing this any further.

4.4.5. The Means for Inserting Zyklon B (p. 79)

I refer to my review.[52] I repeat that, as can be noted still today, the roof of the alleged gas chamber has no opening, no such means. Moreover, the Italian revisionist Carlo Mattogno has rightly alerted me to a translation error made by Pressac: *Drahtnetzeinschiebvorrichtung* implies an implement for "inserting" (*einschieben*) and not for "pouring." It is possible that this German word designates the steel latticework set in the concrete, which enabled the insertion or installation of something or other.

4.4.6. The Wooden Ventilating Fan (pp. 70f and doc. 26)

Nothing is so ordinary as a wooden ventilating fan. Pressac explains that this fan was made of wood because a metallic one would have been corroded by the gas drawn from the "gas chamber." Six pages further on (p. 77), he says that the SS, a few days later, decided to "replace the wooden ventilating fan for airing out the gas chamber with a metallic one." This is an explanation invented by Pressac for the needs of his case: the SS considered that Schultze had "exaggerated the danger of corrosion." This story of the ventilating fan is, let it be said in passing, characteristic of Pressac: hot air, incoherence and in-

---

[49] Cf. *RHR* no. 3, p. 100-103.
[50] Cf. *RHR* no. 3, p. 95-99.
[51] *RHR* no. 3, p. 104.
[52] *RHR* no. 3, p. 99-100.

competent SS men in whose minds he invites the reader to detect a line of reasoning which, in fact, he himself has made up out of nothing.

4.4.7. The "Normal" and "Abnormal" Gas Chambers (p. 89)

A confused passage deals with the "extraordinary slip" that an ordinary civilian employee supposedly made in writing a letter to the "Testa" firm, distributors of Zyklon B. This "slip," says Pressac, consisted in using the term "normal gas chamber," and "Testa," he says, used the same expression in its reply. Pressac deduces from this that there must have existed "abnormal" gas chambers, i.e. homicidal ones! He does not reproduce the text of this correspondence, but gives us a rather confused summary from which it *seems* to emerge that, quite simply, the "normal" gas chambers were those designed to function with Zyklon B and the "abnormal" gas chambers were those which, designed to function with Zyklon B, were later to undergo "an adaptation of equipment" in order to function with another product, Areginal, due to the shortage of Zyklon B in May 1944.

4.4.8. The Ten Hydrogen Cyanide Gas Detectors (p. 71-72)

With the hydrogen cyanide gas detectors we leave the sphere of "slip" and "bungles," of "criminal traces" and "beginnings of evidence" to discover, finally, "definitive evidence" and even "*the* definitive evidence."

Of what, exactly?

Of the "existence of *a* homicidal gas chamber in crematory II" (p. 72). The reader is astonished to see the immense edifice of the gravest accusation brought against the German people thus built on a simple business letter.

On March 2, 1943, the firm Topf und Söhne of Erfurt sent a letter to the central construction office at Auschwitz concerning an order for ten hydrogen cyanide gas detectors for crematory II. There is nothing odd in that. The letter is commercial, with nothing secretive about it. It reads quite plainly *Gasprüfer/Krematorium* (gas detectors/crematory). The instruments were called *Anzeigegeräte für Blausäure Reste* (hydrogen cyanide trace detectors). These are what I called the "residual gas detection equipment" in my *Mémoire en défense*…,[53] an expression which, on that occasion, was the translation of *Gasrestnachweisgerät*. [54] This equipment could be found wherever the gassing (*Vergasung*) gear was stored and wherever disinfections with Zyklon B were carried out. What with the ravages effected by typhus at Auschwitz and the accumulation of corpses of epidemic victims in the crematories, operations to

---

[53] *Mémoire en défense contre ceux qui m'accusent de falsifier l'histoire*, La Vieille Taupe, 1980, p. 171.

[54] See below, in the appendix, the text of document NI-9912 concerning the use of Zyklon B; this "residual gas detection" was such an ordinary necessity of disinfection gassings that it is mentioned six times therein.

disinfect those places were sometimes necessary and the use of these detectors, made of sensitive paper, was normal. Since 1922[55] and up to today, Zyklon has been used to disinfect dwellings, silos, libraries, ships etc.

In some of these deceptive expedients that Pressac borrows from the historians, one can often detect a large dose either of ignorance or of bad faith, but, as will be seen, the apothecary uses deceits of his own devising.

5. Deceits that are Pressac's own

I have proved more than once in the past that Pressac has no qualms about resorting to trickery. As I have mentioned above (n. 22), one of the appendices to my review of his book in English bore the title "Les Tricheries de Pressac dans *L'Album d'Auschwitz*" (Pressac's Cheatings…). In that article I particularly recalled two glaring examples of fraud; in the first case, a plan of Birkenau was deformed: Pressac had cut out part of a road to have his readers believe that the Jews who took that way could only end up at the crematories. In the other case, the cataloguing of the photographs' origins, their layout and the titles of the various sections had been fraudulently manipulated on a large scale.

In *Les Crématoires d'Auschwitz* Pressac makes a sort of confession on these two points: on the map on page 48 he discreetly restores the roadway that I had rebuked him for removing; as for the manipulated photographs, they have all disappeared, including the one that he showed last in his 1983 edition of *L'Album d'Auschwitz*, presenting it as striking evidence of the existence of a homicidal gas chamber.

5.1. Improper Insertions

With Pressac the most common hoaxing consists in the *insertion*, in an altogether inoffensive set of words, of one or several words that alter the character of that set, making it imply the perpetration of a ghastly act by the Germans.

As we have seen, where one document (p. 80) mentions "fourteen showers" [or: showerheads], the author speaks of "fourteen (false) showers." In slipping in the word "false," in parentheses, he distorts the sense of the document that he cites and insinuates that we are in the presence of a *real* homicidal gas chamber equipped with *false* showerheads to fool the victims.

Here is a set of three sentences concerning a visit by Himmler to Birkenau:

---

[55] Law promulgated on July 17, 1922, by the Ministry for Food and Agriculture (*Reichsgesetzblatt*, Jahrgang 1922, p. 630-631).

> *"Next, he visited all the areas of interest of the camp and Birkenau (document 19). Then, he witnessed the sorting of a convoy of Dutch Jews and the gassing of the unfit ones in Bunker 2. Finally he toured the 'Buna'* [works] *at Monowitz, which at the time were nothing but a huge building site. – n. 142."* (p. 44)

The first sentence, properly referenced, relates a fact. The third sentence, also properly referenced, relates another fact. But the sentence inserted between those two relates a fictitious event. The episode of the sorting and the gassing, which Himmler supposedly witnessed, has been invented but, inserted between two proved facts, it acquires all the appearances of a proved fact.

5.2. Marrying a Big Lie to a Small Truth

Sometimes the big lie comes at the start and the small (and referenced) fact follows close behind. Such is the case in the passage:

> *"The victims, numbering between 550 and 850, were incinerated in the two double-chamber ovens of the crematory in one or two weeks of intensive labor which caused damage to the second oven. – n. 108."* (p. 34)

On turning to the referenced document – whose text is not given – one discovers that the only truth contained in the passage is that a certain oven was damaged on a certain day.

Sometimes, also, the little facts precede the big lies. That is the case in the following passage concerning Dr. Wirths, head physician of the camp:

> *"*[In his report on the insufficiency of delousing gear] *he expected a return of typhus if 'special measures' (*Sondermassnahmen*) to improve the sanitary situation were not taken quickly. He held that it was pointless to require SS doctors to make the selection amongst the new arrivals, if those fit for work were being mown down by typhus just afterwards, and that sending the lot of them off to the gas once they got off the train would avoid that waste."* (p. 82)

Here, the big lie is contained in the words: "and that sending the lot of them off to the gas once they got off the train would avoid that waste." The result is that a head physician preoccupied with the sanitary situation in the camp, as Dr.Wirths might well be, is presented by Pressac as a man who "knew" that Auschwitz had homicidal gas chambers.

This manner of marrying the true and the false would obviously allow someone to write that, one day or other, at the Berghof, Adolf Hitler decided on the extermination of the Jews, *then* received such or such Third Reich dignitary for tea, or that *just before* that afternoon tea, he had taken the decision of the genocide of the Jews. A note would provide a source that, on inspection, would establish only the reality of that afternoon tea. In these two forms the hoaxing would risk a quick exposure but, in the forms adopted by Pressac

for his inventions about Himmler, Höss or the SS at Auschwitz, it is simply less blatant.

5.3. Tampering with Plans and Maps

A good number of the plans drawn by Pressac are the result of tampering. The plan of Birkenau on page 48 is an illustration of this practice. Near the zone of the crematories there was a large, rectangular-shaped space, designated "B II f" on the plans. The part on the left was covered by a playing field and that on the right by a men's hospital. The playing field and the hospital were for the inmates, Jews and non-Jews alike. Their existence was altogether normal. Between that playing field and the yard beside crematory III there was only a line of demarcation marked by simple barbed-wire fence, which did not at all conceal the crematory from the players' or spectators' view. But, for the exterminationist case, the presence of a playing field and a hospital, both for the inmates of a so-called "extermination camp," is hard to admit. In particular, how can it be explained that the SS would permit crowds of internees to have a direct view of a crematory whose activities were allegedly ultra-secret and near which, we are told, thousands of victims gathered every day?

Unable to conceal the existence of the hospital, too well known today, Pressac has found a way to make the burdensome playing field, with its view of a crematory, disappear. In his map on page 48 he proceeds as follows: on the right-hand part of the area, where the hospital was, he has decided to write nothing at all, leaving a blank caption; but in a caption on the left-hand part, where he should have written "playing field," he has put the words, "B II f: camp hôpital."[56] A pitiful bit of trickery.

Other drawings contain their own hoaxes, like the one on page 90 in which the author has put the words "gas chamber" (for killing) where nothing of the sort appeared in the original plans.

5.4. Deceptive Wording even in the Titles

Pressac's practice of tacking a truth onto a lie or a lie onto a truth is so regular that it can be noted in the titles of some chapters, and even in the body of words formed by the title and subheading of his book.

Chapter VI is entitled: "Le Contrat Mogilew et le Premier Gazage Homicide à Auschwitz" (The Mogilev contract and the first homicidal gassing at Auschwitz) (p. 31), whilst the following chapter bears the title: "Le Début du

[56] There is an exact representation of Sector B II f in *Hefte von Auschwitz*, no. 15, Verlag Staatliches Auschwitz-Museum, 1975 (plates between pages 56 and 57). The playing field is called *Sportplatz* and the hospital area is called *Krankenbaulager für Männer*; there were several other hospital areas.

Meurtre de Masse des Juifs et l'Epidémie de Typhus" (The Beginning of the mass murder of Jews and the typhus epidemic) (p. 41). As will be seen, in the former instance the truth precedes the lie and in the latter the lie is followed by the truth. In the first title, in effect, a real contract (the "Mogilev contract") concerning cremation ovens is used to lend credibility to the lie of the execution gas chambers of Auschwitz and, in the second, the lie of the execution gas chambers of Auschwitz is propped up by the reality of the typhus epidemics that ravaged the camp. Let us add that here Pressac exploits, in his customary way, the confusion already existing in the minds of too many readers between cremation ovens and the "gas chambers," as well as between the corpses of typhus victims and those of the "gassed."

As for the body of words formed by the title and subheading of his book, it illustrates just this type of deceit: in *Les Crématoires d'Auschwitz. La Machinerie du meurtre de masse*, the title is true and the subheading is a lie. Playing on the reader's confusion of "crematories" with "murder," Pressac has loaded the dice.

5.5. Substitution of "(Homicidal) Gas Chamber" for "Morgue"

The author's most frequently used deception consists in substituting the expression "gas chamber(s)" for "morgue(s)"; he does so whenever the opportunity arises. For example, he writes:

> *"On March 10* [1943]*, Schultze and Messing tested the inflow and outflow of the ventilation systems of the crematory II gas chamber for sixteen hours. Apparently, the installation was not yet correct, for Messing worked there another eleven hours on the 11th and another fifteen hours on the 13th – n. 227."* (p. 73)

Note 227 makes reference to a document whose text is not provided; this document reveals that the work of the two men was obviously not done in a homicidal gas chamber but in a morgue that Pressac has decided to christen "homicidal gas chamber." He dares to add: "There were tests carried out with the insertion beforehand of Zyklon B." If he does not support this assertion with a reference to any source, it is because the proximity of note 227 suffices to lend an appearance of seriousness to a pure invention.

5.6. Substitution of "(Homicidal) Gas Chamber" for "Disinfection Chamber"

Another form of deceit consists in citing documents on the disinfection gas chambers and letting the reader believe that it must be a question of homicidal gas chambers. On the subject of a certain foreman, he writes:

> *"In his daily work report, he noted: 'Install gas-tight windows.' On March 2, having to lay a concrete floor in the area where the gas-tight windows had been installed, he wrote: 'Concrete floor to be laid in gas chamber.' – n. 233."* (p. 76)

As is often the case with Pressac, the reference note is there only to impress and gives no source text. It takes an expert to look, for example, in the registry of the Auschwitz locksmiths' workshop (*Schlosserei*) to realise that here it is merely a matter of a disinfection gas chamber. The Pole Jan Sehn, investigating magistrate in the Rudolf Höss case, had compiled extracts from this registry. Quite unwittingly, in copying a document labeled "no. 459 of May 28, 1943," he shows us that the Germans of Auschwitz called this type of gas chamber *Entwesungskammer* (delousing chamber) or, more simply, *Gaskammer* (gas chamber). In effect, the document in question reads:

> *"Entwesungskammer K.L. Auschwitz* […]. *1. Die Beschlâge zu 1 Tür mit Rahmen, luftdicht mit Spion für gaskammer* [sic]*."* (delousing chamber for Auschwitz concentration camp […]. Fittings for 1 door with frame, air-tight, with spy-hole for gas chamber).

In 1989 Pressac announced, for once quite honestly, that he had discovered the inscription "GASKAMMER" (GAS CHAMBER) just above the words "WASCH- und BRAUSEBAD" (WASH and SHOWER-ROOM) in a Birkenau *disinfection* barracks and added:[57]

> *"The association of showers and gas chambers could have became* [sic] *showers are gas chambers, in the minds of prisoners. Possible."*

In his 1993 book, far from seeking to dispel that confusion in the minds of his readers, he maintains it by means of a deception that consists in *inducing them to believe* – without expressly saying so – that, when the Germans used the phrase "gas chamber," they meant quite bluntly: homicidal gas chamber.

5.7. Documents with no Bearing on the Elements to Be Proved

With regard to the alleged "incineration ditches" (which are, let us recall, a physical impossibility, especially in the marshy ground of Birkenau), Pressac writes:

> *"The capacity of* [crematory] *V's oven was rapidly exceeded and small ditches were dug beside its gas chambers, in which to incinerate the victims in the open air (document 57)."* (p. 90)

Document 57 neither proves nor even illustrates anything of the kind. It is a photograph that has been peddled by books and articles on the "extermination of the Jews" for nearly half a century. This photograph often passes for an attestation to the reality not of incineration ditches but rather of homicidal gassings. It cannot be established either when, where or by whom it was

[57] J.-C. Pressac, *A.T.O.*, p. 549.

taken. It shows some civilians amidst what seems to be a scattered set of naked corpses lying on the ground; in the distance rise plumes of smoke that is *light-colored*, as if emanating, not from corpses, but from tree branches (perhaps, if the photograph is genuine, this is the smoke of a fire meant to offset the smell and repel insects). In any case, no ditches are to be seen.

5.8. Use of Fictitious References

With Pressac another form of deceit consists in attributing the status of adjudicated and established fact to what he personally has just invented. Instead of writing: "I have changed my mind and at present think that…," he will write: "At present it is thought that…."

In 1989 he stated with assurance that the first homicidal gassing at Auschwitz had taken place exactly on September 3, 1941.[58]

Four years later, in the present work, he prefers to write:

> *"Nowadays, the carrying out of the first homicidal gassing is situated somewhere in the period between the 5th* [of December] *and the end of December* [1941]*."* (p. 34)

He does not substantiate the new dating any more than he substantiated the old one. He ascribes to nameless persons, who are in fact nonexistent, a personal change of opinion that he finds painful to admit. By this means, he cheaply gets out of having to tell us why he has changed his mind and why he is, this time, much more vague. I am inclined to believe Carlo Mattogno who, in an unpublished article on the *Les Crématoires d'Auschwitz*, reveals how, in 1992, he showed Pressac that the first Auschwitz gassing could not have taken place, especially not on September 3, 1941.[59]

Using the same subterfuge, Pressac further writes:

> *"Today it is reckoned that very few homicidal gassings took place in this crematory* [I]*, but that their numbers were magnified because they so impressed the direct or indirect witnesses."* (p. 34)

Behind this "it is reckoned," which implies some number, hides the "I reckon" of a lone reckoner.

In 1989, Pressac set the number of homicidal gassings at crematory I at 10,000.[60] Today, he estimates these gassings to have been "very few," giving no particulars. Here again, he has changed his opinion without saying why and, here again, he has taken refuge in vagueness.

While we are at it, we shall relish the explanation, not to say the justification, of the lie: Direct witnesses (which ones?) or indirect witnesses (what

---

[58] *Ibid.*, p. 132.

[59] Cf. Carlo Mattogno, *Auschwitz: la prima gasazione*, Padua, Edizioni di Ar, 1992; Engl.: *Auschwitz: The First Gassing*, Theses & Dissertations Press, Chicago 2005.

[60] J.-C. Pressac, *A.T.O.*, p. 132.

does "indirect" mean?) got such an intense impression from the gassings that they "magnified" their number.

This phrase "very few homicidal gassings" brings to mind the prevarication of the assistant curator of the Museum of Majdanek who, when she was questioned by Pressac on the subject of a gas chamber in that camp, replied that "that gas chamber had been used very little, but really very little," which, our man subtly adds, meant that it had "not been used at all."[61]

5.9. A Deliberately Maintained Confusion

The author is confused by nature. But he plays on his own mental confusion in order to throw his readers off track, cloud their minds with all sorts of incoherence and dupe them. He piles it on, like the ass that behaves like an ass because doing so serves its purpose. Whole pages, such as those that he devotes to "the first clear 'criminal slip'" (*sic*), ought to be particularly clear because, after all, they deal with an event of the greatest importance (p. 60-61); however, they seem to be irredeemably confused by design. Elsewhere, simple sentences like "These official figures are mendacious propaganda and yet are valid nonetheless" (p. 80) allow their author to escape all responsibility and find refuge in equivocation.

The top of page 47 provides the example of confusion that, it seems, can only be deliberate. Here, Pressac describes the "clever bit" thought up by the SS at Auschwitz to conceal from Berlin the fact that they did not have typhus under control. With it, the SS men involved decided to "blame the Jews," i.e., explain that their extermination enterprise had used up "frightful quantities of gas [normally] employed" for disinfection! Whereas, according to Pressac, they devoted 97% or 98% of the gas to the gassing of lice and 2% or 3% to the gassing of Jews (the apothecary does not say where he went to get these figures), the SS men therefore decided to "have [Berlin] believe that most of the Zyklon B delivered was used for the homicidal gassings in Bunkers 1 and 2"; but, in Berlin, the SS authorities were unaware of the methods of the "treatment" of the Jews; however, they knew its "aim"! The passage could hardly be more muddled.

The rest of the account is not any clearer or more coherent. From our author's point of view, such a hodgepodge presents the advantage of speaking to us about the gassing myth whilst leaving us unable to grasp how the components of his reasoning relate to one another, thus also unable to make any critique of that reasoning.

---

[61] J.-C. Pressac, "Les carences et incohérences du 'Rapport Leuchter,'" *La Lettre télégraphique juive*, December 12, 1988, p. ix.

5.10. The Tightrope Walker and the Hoaxer

Another form of confusion that serves to deceive the reader, when Pressac has mounted an absurd explanation, consists in imputing the absurdity of it to the foolishness of the SS. For example, in an attempt to describe the gassing procedure in crematories IV and V, he is forced, considering the layout of those structures, to invent the story of an SS man who, walking alongside them with a ladder in his arms, would prop said ladder near the various hatches of the various gas chambers and, opening the hatches with one hand, pour in the Zyklon B pellets with the other; the SS man would perform this exercise six times. In 1989,[62] we were informed that he climbed the ladder three times at each stop, which meant, we were told, that he had to climb up the ladder eighteen times and down it eighteen times, thirty-six ascents and descents in all; Pressac considered the process "irrational," "ridiculous" and a "balancing act" but, he added, "the camp authorities consider[ed] that a little physical exercise would do the medical orderlies responsible for gassing a world of good." The "task [of the SS-man] was something of a tightrope walker's act," he writes in *Les Crématoires d'Auschwitz* (p. 76). But the tightrope walker, in fact, is none other than our hoaxer performing one of his favorite numbers.

5.11. A Concentrate of Deceptions: the Two Accounts of Homicidal Gassings

Accounts of homicidal gassings should constitute the main part of Pressac's new book; however, they take up only an extremely limited space. Part of page 34 relates a homicidal gassing in Block 11 and, while the author is at it, a homicidal gassing in crematory I, whereas part of page 74 describes a homicidal gassing in crematory II. And that is all!

To ascertain the number of deceptions here, the reader need only count the instances of two types: on the one hand, the grave assertions that are not accompanied by any evidence, mention of source or reference and, on the other hand, statements that *seem to be* supported by evidence, mentions of source and references. Amongst the latter, the reader will be able to verify that he has been tricked every time, for every time there is a reference either to anonymous testimonies, or to witnesses regarding whom Pressac himself, moreover, admits that one should be wary, or whose names are concealed (in this case, he refers to the *Kalendarium*), or finally to documents proving only "the small truth" and having no relation to "the big lie." This is what may be observed, on the one hand, in notes 106 to 109 and, on the other hand, in notes 228 to 230, as well as in the references to documents (*sic*) 30 to 35.

---

[62] J.-C. Pressac, *A.T.O.*, p. 386.

Let us take a document and a note as examples.

"Document" 30 consists of nothing but the photograph of a can of Zyklon B! As for note 228, it states simply, "*Kalendarium* ..., *op. cit.*, p. 440." However, if the reader takes it into his head to consult said work at the page indicated, he will discover that it is from this calendar – of which the author spoke the greatest ill in note 107 – that Pressac draws the fiction of the 1,492 gassing victims (Jews arriving from Krakow); as for Danuta Czech, who made the calendar, she borrowed the tale from the inescapable Henryk Tauber who, she points out, admits that he saw nothing because during the gassing the *Sonderkommando* to which he belonged had been locked by the Germans in… the dissection room of crematory II!

5.12. A Hail Storm of Deceptions

Let us linger for a moment on the story of the gassing of those 1,492 Jews in crematory II.

In addition to the deceptions that I have just enumerated, it is worth noting that Pressac has, on this score, eliminated all the material contingencies that he finds awkward. The SS men cannot have poured the Zyklon B into four openings in the roof for the simple reason that no such openings existed – a fact that can be noted on site still today.

Moreover, Pressac knows very well, from having read the documents that I published in 1980 (in particular, Nuremberg documents NI-9098 and NI-9912,[63] pertaining to Zyklon B and its use), that the members of the *Sonderkommando* could never have entered the gas chamber "after fifteen or twenty minutes" and, working in a space of 210 square meters (30 m × 7 m),[64] undertaken the colossal task of shaving off all the victims' hair, pulling out their gold teeth, removing their wedding rings and jewelry, dragging 1,492 corpses to a small hoist and incinerating those corpses in "two days" (p. 74). He knows that hydrogen cyanide gas, the main ingredient of Zyklon B, adheres strongly to surfaces, that airing it out is a long and difficult job (it takes nearly a day of aeration for a room at ground level with windows), that it is absorbed by the hair, skin and mucous and penetrates the body to the point of making the handling of cyanide-poisoned corpses a perilous business (contamination can arise from simple contact). Never could the *Sonderkommando* have entered a sea of hydrogen cyanide gas to remove, huffing and puffing, 1,492 cyanide-poisoned corpses. Even for those wearing a mask with a special filter (the "J" filter), any physical effort in the presence of hydrogen cyanide is

[63] As mentioned above, a translation of Document NI-9912 is given in the appendix of the present work. It is of fundamental importance in appreciating the degree of danger in using Zyklon B.

[64] The space taken up by seven strong concrete pillars should be subtracted from this area of 210 square meters.

ruled out because exertion brings on accelerated breathing, which will draw the gas through the filter. For all the wind that Pressac's ventilators might blow there, no ventilation system could have got rid, in a few minutes, of the molecules of poison adhering to the floor, the ceiling, the walls and the door, infused in the bodies or kept in gas pockets between the piled-up corpses. On this point, I refer to the technique used in the American gas chambers for executing a single convict with hydrogen cyanide gas.[65]

As for the incineration of 1,492 corpses in two days in a set of fifteen ovens (coke-fuelled and probably operating only 12 hours in 24), Pressac knows that it is impossible, since it would involve almost fifty cremations per day per oven (today, in France, a gas-fuelled and therefore much more efficient crematory oven can complete only three to five cremations in an eight-hour day).

And then, in any case, where would they have been able to put the 1,492 corpses of the GASSED *awaiting cremation?* The author, to whom the question has been put so often, knows that there is no answer.

But there is another question that comes to mind.

According to Pressac, the four crematories of Birkenau had been turned into slaughterhouses. For example, in crematories II and III, the two rooms meant for the reception and storage of bodies arriving each day had been surreptitiously transformed, one into a vestibule or changing room where the Jews undressed (*Leichenkeller 2*), and the other into a gas chamber where those same Jews were gassed (*Leichenkeller 1*). If this were so, then absolutely no place is to be seen where the Germans might have been able to receive and store the corpses of the one hundred detainees who died, on average, in the camp each day, particularly because of the epidemics that were precisely the reason why those crematories had been planned and built[66] (and what is true with regard to crematories II and III holds equally, in other terms, for crematories IV and V).[67]

The problem is therefore the following:

If the buildings called crematories were, in fact, nothing but slaughterhouses for the reception, killing and incineration of Jews, where, at Birkenau, could the corpses of those who died of natural causes, and, in particu-

---

[65] S. Thion, *op. cit.* (note 22), p. 301-309.

[66] The four crematories began operating between March 31 and June 25, 1943; Pressac confirms that, for the year 1943, the death registries (*Sterbebücher*) permit an estimate of 100 as the daily mortality of "ungassed" persons (p. 145-146).

[67] With respect to crematories IV and V, Pressac persists in eluding the question that I put to him fifteen years ago: "How can one possibly call homicidal gas chambers the two rooms in these crematories that both contain a coal-fired oven?" Also, the layout of the premises is such that the first thing that the future victims would have seen upon entering these crematories would have been the large space used as a cold room, a room that Pressac would have us believe was used for storing the corpses of the gassed!

lar, those of the victims of the epidemics that ravaged the camp, be received, stored and incinerated?

In other words: ***Where were Birkenau's true crematories?***

Pressac bridles at the restraints of submission to facts and at the refusal of fantasy and lies that every historian, at least in principle, must impose on himself. He is much more at ease in fiction, particularly that of the novelist.

6. The Ramblings of the Novelist

When examining a study of historical nature, it is not customary to dwell much on its style. A historian lacking grace of expression may rightly enjoy more esteem than another who is known for the elegance of his style. But Pressac is one of a kind. His conception of narrative, his vocabulary, the phrasing of his sentences are without parallel in their carelessness, vulgarity and ungainliness. If I am mistaken, let someone name me a single book of history – or even of fiction – where such a poverty of intellect and so many clichés, so many lumbering and dull-witted expressions are displayed as in the extracts that follow. Pressac writes a flat and base prose, especially when he seeks to elevate his style, to adorn it or give it some color.

Here are samples from a "rigorous history" (p. 1), on which I shall refrain from commenting. I simply suggest to the reader that, as he goes through them, he always consider the following question: where in blazes did Pressac, who presents himself to as the discoverer of a "rigorous history," find the evidence of all the things he tells us here?

"The conversation turned sour and the SS-man hung up." (p. 24)

"Naumann mustn't have been a 'normal' SS-man, for a real SS-man never apologized, whatever his behavior." (ibid.)

"This call made the engineer extremely happy […]. *But his colleague Shultze was less so."* (ibid.)

"Good news usually comes in pairs." (p. 25)

"Naumann […] *asked humbly* […]*."* (ibid.)

"It was then that Prüfer dropped a clanger, trying to push his luck. Naumann's refusal had greatly frustrated him. He schemed so well […]*"* (ibid.)

"[…] *a certain SS adjutant Heider* […]*."* (ibid.)

"A latent battle was begun from that moment […] *to sabotage this imposed business deal.*

[…] *thanks to a wise administrative blockage* […] *and the unanticipated help of a fire perhaps caused by an Allied bombing raid* […]*."* (ibid.)

" […] *he received a curt response* […]*."* (ibid.)

"[…] *without privileged relations with party bigwigs* […] *The personnel of the firm sympathized, for Ludwig, aware of his limits, unlike his aggressive, pretentious, morally rigid and married younger brother, was quite affable."* (p. 30)

"Of course, this was a pure lie […]*."* (ibid.)

"But, being beholden to them became a servitude and a mortal snare to Ludwig as the events to follow will show." (ibid., end of chapter)

"Prüfer said no more in the personal – and probably only – letter he wrote to Bischoff. In effect, an incredible request had been submitted to Prüfer, which left him panting with hope of commercial success." (p. 31)

"But Prüfer had just fallen again into his regrettable failing: exaggeration, […] *ranted and raved, in vain, deeming it useless to turn Kammler against him* […]*."* (p. 37)

"The SS men of the political section, fearing for their precious lives […]*."* (p. 40)

"Himmler had, in cowardly manner, unloaded an abominable criminal task on Höss who, hardened jailer though he was, did not at all appreciate the dubious 'honor' bestowed upon him." (p. 45)

"[…] *the Reichsführer's mad passion for the fearsome corps de ballet, his Waffen-SS divisions."* (ibid.)

"[…] *unhoped-for manna* […] *the Jews' undressing out in the open caused disorder* […]*."* (ibid.)

"A clever bit was found: put the blame on the Jews for the frightful quantities of gas used." (p. 47)

"[On the subject of detainees who died of typhus] *the civilians and SS men accompanied them to the beyond* […]*."* (p. 50)

"[…] *while chatting with SS members he had learnt something he was not supposed to know* […]*."* (p. 52)

"Actually, Prüfer had had one bit of bad luck after another, for Ertl got a severe scolding from Bischoff […]*."* (p. 53)

"[…] *which badly needed it* […]*."* (ibid.)

"The project was insane […]*, but none of those brilliant Topf engineers was aware that they had just crossed the boundary between the normal and the abnormal, which later led them to topple into criminal complicity."* (p. 55)

"The three SS-men were back at Auschwitz for the midday meal. It is not known whether they were able to swallow it." (p. 58)

"[…] *hell had half opened its reddish maw day and night in the depth of the birch forest."* (ibid.)

"[SS general Pohl showed up unexpectedly] *at Auschwitz to learn what was happening there and where the tons of Zyklon B that had been allocated were disappearing.* […] *When he asked about the Zyklon B, he was told that it was being used to destroy both the lice and the Jews. Pohl, im-*

pressionable and sensitive, asked nothing more. […] *once back in Berlin, he informed Ernst Grawitz, the chief of the SS physicians, a pretentious and aggressive fool, who turned up on the 25th at Auschwitz where his idiotic advice* [etc.]*."* (p. 59)

"Holick's and Koch's return to Erfurt certainly caused a serious stir in the firm. Belonging to Prüfer's department, they made their report to him and mentioned the blazes of Birkenwald. If the engineer knew what was going on there from hearsay, he had never seen its result. Made ill at ease by the account, he must have advised them to be quiet and to hurry home to enjoy Christmas. Holick, who had already become acquainted, at Buchenwald, with the concentration camp world, which he perceived as hard and implacable, could not imagine that Hitler's diatribes against the Jews might materialize into horrors that he had witnessed with Koch. A Topf letter of early March 1943 implies that the two men talked. They did so either at the factory, perhaps after having been questioned by the Topf brothers on their stay at Auschwitz, or at home with family members or friends, who hastened to 'confide' their statements to the heads of the firm. As soon as the story leaked, Prüfer must have been summoned by the Topfs and ordered to explain himself. That interview would seem to have occurred in early January 1943. It was all too easy for Prüfer to inquire politely of Ludwig Topf if he had had as good a Christmastime as the year before with the charming Miss Ursula Albrecht, to add that this young woman must be relieved and happy that the Director was no longer a soldier, then to convince Ernst-Wolfgang Topf, who had approved the first Auschwitz deals and signed with pride the contracts for the sale of ten triple-chamber ovens for crematories II and III, that if the 'Krematoriumsbau' department had not landed those sales, the competition, the Heinrich Kori or the Didier-Werke firms in Berlin would have taken care of them. In addition, the Topf ovens had not participated in the Birkenwald atrocities and only had a sanitary purpose, that of destroying pathogenic germs by fire. If Ernst-Wolfgang Topf accepted Prüfer's biased explanations, Ludwig Topf, neutralized, did not reject them either, for having signed, after his return from the army, the estimate for the ventilations of crematory III, he implicated himself most heavily by signing nine months later that for the airing-out apparatus of crematoria IV and V, which were distinctly criminal." (p. 65)

"[Prüfer] *noted with a feigned sadness that the guarantee of crematory IV's oven had expired* […]*."* (p. 79)

"Topf furiously opposed this detachment of vaults […]*."* (p. 81)

"[…] *he denied it vehemently."* (p. 82)

"[During a visit by Himmler] *The convoy of cars crossed the bridge over the train stations, stopped at the goods station to see the new potato storehouses, abutting on the ramp where the Jews were sorted (document 49), and departed at high speed towards Birkenau. The passage in the re-*

port dealing with Birkenau reads: 'The KGL's 1st and 2nd building sections as well as the crematories and the troop quarters were then inspected in detail. On this occasion, the clean interior of the inmate quarters in the 2nd building section, which had just become occupied, was particularly appreciated.' The SS men went by the water treatment station (document 50), the KGL's two potato storehouses under construction, and made straight for Harmense where there were duck and chicken farms and a fishery near the new barrier on the Vistula. A slight car accident did not at all moderate the mad speed of the inspection, which swooped down on the new female detainee camp of Budy, with its piggeries (document 51), stables and forestry school. Then, at top speed, they took the 'Reichsstrasse' leading to Raisko, whose SS Institute of Hygiene and SS Establishment for Agricultural Research, with its outhouses, were explored from top to bottom (document 52). They toured the greenhouses at a charging pace […]*."* (p. 85)

"[…] *which provoked a loud show of disappointment, hardly hiding a craven sense of general relief."* (p. 86)

"They had a hearty feast there." (ibid.)

"[Title of chapter XI:] *Horror, pettiness and final disarray."* (p. 87)

"[IG Farben] *were crying and moaning for a thousand tons* [of cement…]*."* (p. 91)

"The 'chief' [Pohl] *was generous, too generous* […] *knew that he was promising wind* […]*."* (ibid.)

"[…] *the gypsy children, stricken with 'noma,' with necrotic cheeks and feverish eyes, smiling through fetid gangrene, afflicted Pohl. Having before him the radiant gaze of these little bird-like, ragged creatures, immobile before of the doors of the black barrack-stables, with above them in the azure sky, to the left, two squat chimneys spitting flames and to the right, a whitish cloud rising from the Birkenwald, Pohl must have understood that his administration had transgressed the ethical norms and would therefore be stigmatized. Remembering the day – Monday, the 22nd of May 1933 – when he had, in the gardens of the casino of Kiel, first met Himmler, he cursed it. But the worst was to come."* (ibid.)

In his youth, Pressac had been keenly impressed by a novel by Robert Merle[68] inspired by the story of Rudolf Höss, one of the three successive commandants of concentration camp Auschwitz.[69] For his part, he dreamed of writing a novel himself one day in which he "would describe a universe resulting from a German victory in 1945 or 1946,"[70] a universe where he would have evoked the extermination of the Jews at Auschwitz. *Les Crématoires*

---

[68] *La Mort est mon métier* (*Death is My Trade*), 1952.

[70] *Ibid.*, p. 541.

d'Auschwitz. La Machinerie du meurtre de masse is, to some extent, the novel of which he dreamed.[71]

7. Conclusion

Pressac thought that he had found a middle way between the exterminationist thesis and the revisionist thesis. His own thesis is, as we have seen, hybrid and weird: at Auschwitz, an altogether subaltern personnel of civilian and military engineers and technicians had underhandedly converted innocuous cold rooms for the storing of corpses into homicidal gas chambers, whose technique and operation the author is unable to set out for us in a scientific manner.

Pressac's chosen method of proceeding consists essentially in ignoring the material realities: the structure of rooms that can still be seen today at Auschwitz and Birkenau and that he dares to christen "homicidal gas chambers," the dangers of using Zyklon B, the daunting difficulties in evacuating gas, *the lack of any space to store the bodies of the gassed awaiting incineration, the total absence of places to receive, store and incinerate the corpses of those who died of natural causes* (since the crematories intended for that purpose had, we are told, been transformed into chemical slaughterhouses reserved for the reception, gassing and incineration of the Jews), the impossibility for the crematory ovens to burn so many corpses. His method of setting forth his case also involves dissembling and cheating, especially in the use both of documents and of sources and references.

The result of his work is wretched. The single bit of somewhat interesting information that may be drawn from this book is that, according to Pressac, the tally of (Jews) gassed at Auschwitz and at Birkenau was 630,000 and the tally of dead (from 1940 to 1945) was 775,000, a figure rounded up to 800,000. This information is also devoid of any scientific value since nothing is shown to support it. It only attests to the necessity of effecting a cut in the usual estimations, a cut that is doubtless a prelude to further reductions of the same type in a relatively near future.[72]

Of the 80,000 items in the archives in Moscow that were consulted or that could be consulted, Pressac has really used only one: an insignificant business

---

[71] A novel marred by so many misspellings and typographical errors that it is astonishing that it should have been published by CNRS éditions.

[72] Pressac and the exterminationists had put some hope in the archives in Moscow and in those of all the big cities in the East. They have had to forget that hope: neither Pressac nor Gerald Fleming has made any discovery in Moscow; as for Shmuel Krakowski, he has found nothing in Prague, Budapest, Riga or Vilnius that might confirm the "Holocaust" thesis ("Neue Möglichkeiten der Forschung/Die Holocaust-Forschung und die Archive in Osteuropa," *Antisemitismus in Osteuropa*, Vienna, Picus Verlag, 1992, p. 115-129).

letter about gas detectors (*Gasprüfer*). I have reasons to believe that he has passed over in silence the existence of items altogether favorable to the revisionist case; in particular, I think that he discovered in those archives some *detailed* plans of the *Leichenkeller* or morgues of crematories II and III, as well as some *detailed* plans of the rooms in crematories IV and V that he has christened "homicidal gas chambers." The Germans were never happy with *mere general plans*: the extraordinarily precise and detailed drawings of the *Leichenkeller* at Sachsenhausen that I personally discovered in 1986 attest to that.[73]

At Auschwitz, we are told, the Germans committed a crime of gigantic proportions. A forensic study of the weapon that they allegedly used to perpetrate such an outrage is therefore indispensable. Today forensic studies are carried out on remains that are thousands of years old. That being the case, why not make such a study of buildings or remains that are only half a century old? If crematory I had to be considered, as we are told, "partly reconstructed," how would that hinder a forensic study, were it only to determine precisely which parts were original and which were reconstructed?[74] As for

---

[73] Cf. *RHR* no. 3, p. 106-107.

[74] The muddled explanation given by the Auschwitz Museum, which holds that the reconstructed "gas chamber" of crematory I is "very similar to the one which existed in 1941-1942," dates from long ago. It does not date from September 1992, as David Cole imagined. That young American revisionist of Jewish origin believed he had achieved quite a feat in obtaining an explanation of that kind from the mouth of Franciszek Piper, the director of the Museum archives, in a 1992 televised interview. However, I myself had already received that response seventeen years before, on the March 17, 1975, from the mouth of another Museum official, Jan Machalek. I have often related the episode because, turning this muddled explanation to good account, I did not content myself with it, as did D. Cole, but asked to see the drawings so as to get an idea of what had been reconstructed and what had not been reconstructed. It was then that I discovered what I have never ceased to describe in my books, articles and recorded talks and in depositions before courts in France and Canada, with proof in hand, as "the hoax of the gas chamber in crematory I." See especially *Storia Illustrata,* August 1979, p. 26; Serge Thion, *Vérité historique ou vérité politique?*, La Vieille Taupe, 1980, p. 185, 314; *The Journal of Historical Review*, Summer 1980, p. 109; Winter 1981, p. 335; Summer 1990, p. 187; Spring 1991, p. 33-35; *RHR* no. 3, p. 75-77; the transcript of my testimony at the first Zündel trial in Toronto in 1985, p. 2364-2366; see also my video-film on "Le Problème des chambres à gaz" (1982) and my cassettes on the same subject. Moreover, already in 1968 the historian Olga Wormser-Migot had admitted that Auschwitz I was "without a gas chamber" (*Le Système concentrationnaire nazi (1933-1945)*, P.U.F., 1968, p. 157). At the first Zündel trial in Toronto in 1985 Raul Hilberg spoke of a "partially reconstructed gas chamber" (transcript of trial, p. 774). In the same year Pierre Vidal-Naquet said of crematory I that it had been "reconstructed by the Poles after the war […]; there is no doubt about the remaking" (*L'Allemagne nazie et le génocide juif,* Gallimard/Le Seuil, 1985, p. 510, 516). In his 1989 book, Jean-Claude Pressac insisted three times on the fact that this crematory, "far from being a faithful reproduction of the original state," had been "restructured," "reconstructed" and "reconstituted," and that "transformations… have been made" (*A.T.O.,* p. 108, 123, 133). It is a pity that in September 1992 D. Cole should have been satisfied with F. Piper's stereotypical explanation and that, being unfamiliar with the dossier, he

the alleged "gas chamber" of crematory II, it is, under its collapsed roof, just about fully preserved – a godsend for the experts. Instead of making a forensic study of some hair, some metal objects and mortar, as was done after the war,[75] why not demand a forensic study of this place?

In publishing *Les Crématoires d'Auschwitz*, the authorities at the CNRS have put their backs to the wall. The book's introduction promotes a "historical reconstruction finally free of the oral or written testimonies which are always liable to error and, in addition, are shrinking in number with the passage of time." The time has come to put this idea into action. If those authorities believe that they must reject all forensic work of specialists and independent laboratories which, since 1988, have come to uphold the revisionist thesis and if, moreover, they have reasons, which they refuse to make public, to keep secret the results of the counter-study carried out in 1990 by the institute of criminology at Krakow at the request of the Museum of Auschwitz, there remains for them the solution of undertaking their own forensic study, or of entrusting an international commission of experts with that task.

The greatest crime in history cannot continue to go unanalyzed scientifically: a thoroughly public study is needed. The judges of Nuremberg coolly saved themselves the bother of conducting one, as have a good many others since, particularly those of the so-called "guards of Auschwitz trial" (Frankfurt, December 20, 1963 – August 20, 1965); during their two investigatory visits to Auschwitz, those German judges did not even subject the presumed crime weapon to scrutiny. That absence of curiosity was deliberate, as was the decision to prohibit the revisionist Paul Rassinier from attending the trial.

Of course, it is easy to see what the legend that has developed around the name of Auschwitz would lose from such a study, but there is no doubt that science, history and justice would gain.

Here as elsewhere, the revisionists have opened the way; it would be enough to imitate them and set to work, seriously.

© December 1993

did not confront his interviewee with the drawings that I had published twelve years before, which clearly exposed the fraud of the alleged "partial reconstruction."

[75] "Criminological Institute of Krakow," July, 12 1945, report signed by J. Robel.

8. Appendix: Document NI-9912

Document NI-9912 demolishes all alleged "testimonies," without exception, on the use of Zyklon B to kill human beings.[76]

The reader will note that document NI-9912 mentions in six places the use of a device for the detection of hydrogen cyanide residues (cf. the terms *"Gasrestnachweisgerät"* or *"Gasrestnachweis"*).[77] Without this device, the disinfection with Zyklon B was impossible. It is therefore incomprehensible that Pressac should dare to offer as definitive proof of the existence of *homicidal* (!) gas chambers the mention, in a purely commercial letter, of an order for ten units of this type widely used during disinfection gassings. At the beginning of 1943, the central construction office at Auschwitz (*Zentral-Bauleitung*) had trouble procuring these units from the usual supplier. At that time the limitations for all products were becoming ever more severe. There is, therefore, nothing abnormal in the fact that the *Bauleitung* should turn to the firm Topf and Sons. Even in times of peace and prosperity it happens that a firm will request from a third party a product that it cannot obtain at the source. All the more in times of war and rationing. Moreover, in his own book, Pressac mentions other orders addressed to third parties (on page 57, it is a matter of obtaining bitumen, and on page 70, the *Zentral-Bauleitung* is seen turning to the same Topf and Sons to have them find… lifts!).

Document NI-9912 comes from the archives of the Nuremberg trials. It was registered by the Americans at a late date, August 21, 1947, under the classification mark NI (Nuremberg, Industrialists). It comes from the Degesch[78] archives and is listed under four headings, including the one devoted to "Atrocities" [*sic*].

The original is in the form of four large pages fit to be tacked onto a wall. It is a small poster that must have been distributed in very many copies, in the present case by the hygiene institute of Prague, probably in the middle of the war. Its contents show that it is a text of directives for the use of Zyklon (prussic acid or hydrogen cyanide) to exterminate vermin in buildings, which could

---

[76] For a good part, this appendix is taken from Robert Faurisson's *Mémoire en défense…*, *op. cit.*, p. 165-178.

[77] The word *"Gasprüfer"* (gas detector) is a generic term. It applies to any device for the detection of any gas. In the business letter cited by Pressac the ten detectors are specifically designated as *"Anzeigegeräte für Blausäure-Reste"* (devices for detection of traces of hydrogen cyanide) (doc. 28).

[78] Abbreviation of *Deutsche Gesellschaft für Schädlingsbekämpfung* ("German company for pest control"), which produced, in particular, Zyklon B.

be either civilian or military buildings (apartment blocks, barracks, etc.). This document reminds us in timely fashion of a truth learned from experience: of all deadly weapons, gas will doubtless long remain the most difficult to handle; when it kills, it kills so well that it can be deadly for the killer who dares to use it.

Just as it is easy to kill oneself with prussic acid, it is difficult to kill one's neighbor without running terrible risks oneself.

This document describes the properties of Zyklon B, its risk of exploding, its toxicity. Only persons holding a certificate delivered at the end of a special training course can use this product. The planning and preparation of a gassing call for measures and tasks that require several hours, if not days. Then comes the operation itself. Amongst the numerous details it will be noted that the Zyklon B pellets are not simply poured in a heap or cast about. In order for Zyklon B to have its full effect, it must be spread in a thin layer on paper sheets; none of it must go astray into a corner and all of it is to be retrieved at the proper time. It will take from six to 32 hours to kill the vermin (on average 21 hours). Then will come the most critical moment: that of the airing out. The text says:

> *"Aeration presents a great danger for both participants and non-participants. Therefore it should be carried out carefully and gas masks should always be worn."*

This aeration will have to last "at least 20 hours." The building must be closely guarded the whole time, and even afterwards. To make sure that no gas remains, the specialists, always in their masks, enter the place carrying strips of paper serving as gas residue indicators. Twenty hours previously, the simple opening of doors and windows as well as that of still more easily opened fixtures (entailing an effort that is nothing compared with the moving of thousands of bodies!) had presented a certain danger since, after the airing out of each floor, the men had had to go out into the open and remove their masks to breathe fresh air for at least ten minutes. All of this was in keeping with the danger at hand posed by the residual gas, and I leave it to the reader to discover, in every line, how flagrantly the accounts of witnesses to homicidal "gassings" at Auschwitz offend against the laws of physics and chemistry when seen in the light of this document.

Editor's remark: The following English translation of Document NI-9912 follows the official English translation, but was improved with the help of Michael Humphrey.

Document NI-9912

Guidelines for the Use of Prussic Acid (Zyklon)
for Destruction of Vermin (Disinfestation).

I. Properties of Prussic Acid:

Prussic acid is a gas that is released by evaporation.

Boiling point: 26° C.
Freezing point: -15° C.
Specific weight: 0.69.
Vapor density: 0.97 (Air = 1.0).
Liquid form evaporates easily.
Liquid: clear and colorless as water.
Smell: unique, bitter-sweet.
Powerful ability to penetrate.
Prussic acid is water-soluble.

Danger of explosion:

75 g. Prussic acid in 1 cbm. air. (Normal application is ca. 8 - 10 g. per cbm., so not explosive). Prussic acid should not be brought into contact with open fire, glowing metal wire, and so forth. It burns slowly and loses its potency completely. (It produces carbonic acid, water and azote.)

Toxicity to warm-blooded animals:

Prussic acid acts without notice, therefore it should be considered *highly poisonous* and *highly dangerous*. Prussic acid is one of the most powerful poisons. 1 mg. per kg. - body weight is enough to kill a man. Children and women are usually more sensitive than men. A very small quantity of Prussic acid does not harm men, even with constant breathing. Birds and fish are very sensitive to Prussic acid.

Toxicity to insects:

The effect of Prussic acid on insects depends less on temperature than is the case with other gases; that is, it even works at cold temperatures (even down to -5° C). For many species, particularly bedbugs and lice, the eggs are more sensitive than the imagos.

Toxicity to plants:

The degree of toxicity depends on the amount of vegetation on the plant. Plants with hard leaves are less sensitive than those with soft leaves. Mold and dry rot are not killed by Prussic acid.
Prussic acid does not kill bacteria.

II. Forms in which Prussic Acid is used:

Zyklon is a mixture of Prussic acid and an irritating agent absorbed in a substrate. The substrate may be wood disks, a granular red-brown material (“Diagriess”) or small blue cubes (“Erco”).

The irritating agent is used as a warning method, and has the additional advantage that it stimulates the breathing of insects. Release of Prussic acid and the irritating agent by simple evaporation. *Zyklon will keep for 3 months.* Use damaged cans first. *Always use up the contents of a can completely*. Liquid Prussic acid harms polish, varnish, paints, and so on – gaseous Prussic acid will not. The toxicity of Prussic acid is not affected by the irritating agent, but the danger is reduced.
Zyklon can be made harmless by burning.

III. Symptoms when Poisoned:

1. Slight poisoning:

Dizziness, headache, vomiting, discomfort, and so on. These symptoms will disappear if one quickly goes out into fresh air. Alcohol reduces the resistance to Prussic acid gassing - do not drink alcoholic drinks before gassing.
Administer: 1 tablet Cardiazol or Veriazol to prevent heart trouble, another tablet 2 to 3 hours later if need be.

2. Severe poisoning:

The victim collapses suddenly and is unconscious. First aid: fresh air, remove gas mask, loosen clothing, assist breathing.
Lobelin intramuscular 0.01 g.
Camphor injections are forbidden.

3. Poisoning through the skin:

Symptoms as for 1. Treatment also the same.

4. Stomach poisoning:

Treat with:
Lobelin 0.01 g. intramuscular – iron sulfate vitriol – calcinated magnesia.

IV. Protection against Gas:

When gassing with Zyklon use only special filters, such as filter insert “J” (blue-brown) made by the Auergesellschaft, Berlin, or the Drägerwerke, Lübeck.
If gas gets into the mask, leave the building immediately and change filters, then test the mask and mask seating for tightness. The filter insert is exhausted when gas can get into the mask. With filter “J,” first go into the open air for about 2 minutes, so that moisture from the breath can build up in the filter insert. – *The filter must never be changed in a gas-filled room.*

V. Personnel:

For every disinfestation, a disinfestation team will be used, consisting of at least 2 men. The gassing leader is responsible for the gassing. His duties in-

clude particularly inspection, aeration, giving the all-clear and safety measures. The gassing leader should appoint a deputy in case he is absent. The orders of the gassing leader should be obeyed without hesitation.
Untrained personnel or *trained personnel without a certificate* must *not be used for gassing operations*. Such persons also should not be allowed to enter a room filled with gas. The gassing leader should know where his personnel are at all times. All personnel should be able to prove at all times that they possess official authorization to use Prussic acid for disinfestation of pests.
These guidelines should be followed exactly in all cases.

VI. Equipment:

Every man should have with him at all times:

1. His own gas mask.
2. At least 2 special packets for use against Zyklon Prussic acid.
3. The manual “First Aid for Prussic Acid Victims.”
4. A copy of the work order.
5. Authorization certificate.

Every disinfestation team should have with it at all times:

1. At least 3 additional special packets.
2. 1 Trace gas detector (*Gasrestnachweisgerät*).
3. 1 Lobelin injection device.
4. Lobelin, 0.01 g. ampules.
5. (Cardiazol), Veriazol tablets.
6. 1 prybar or spike-hammer to open Zyklon cans.
7. Warning posters of the prescribed kind.
8. Sealing material.
9. Paper sheets on which to lay out Zyklon.
10. A flashlight.

All equipment should be kept clean and in working condition. Damage to equipment should be repaired immediately.

VII. Planning a Gassing:

1. Will the gassing work?
   a) Type and situation of the building.
   b) Nature and condition of the roof.
   c) Nature and condition of windows.
   d) Presence of heating shafts, air shafts, holes in the wall, and so on.
2. Determine the kind of pests to be exterminated.
3. Calculate the volume of the space. (Do not rely on plans, make your own measurements. Only measure exteriors, include masonry in the calculations.)

4. Prepare the occupants (Remove house animals, plants, food, undeveloped photographic plates, drinks and tobacco, gas mask filters).
5. Determine openings difficult to seal. (Air shafts, drains, large openings with wooden planking, roofs).
6. Determine necessary safety measures. (Guards, work gangs for sealing).
7. Set the date for the operation and the time needed for evacuation.
8. Make plans for the safety of the neighborhood, if necessary.
9. Notify the authorities.

VIII. Preparation for a Gassing:

1. Sealing.
2. Open all doors, wardrobes, drawers, and so on.
3. Spread bedding out.
4. Remove open liquids (left-over coffee, wash-water, and so on).
5. Remove food.
6. Remove plants and house animals (aquariums, and so forth).
7. Remove *undeveloped* photographic plates and film.
8. Remove dressings for wounds, medications whether open or in packages (especially charcoal).
9. Remove gas mask filters.
10. Prepare to inspect the result.
11. Evacuate the occupants.
12. Collect keys. (All entry door keys.)

IX. Gas concentration and Treatment Period

depend on

– the type of pest,
– the temperature,
– the degree to which the space is filled,
– the air-tightness of the building.

For inside temperatures of over + 5° C one should ordinarily use 8 g./cbm. Prussic acid.

Treatment period: 16 hours, when no other conditions, such as a closed-in method of construction, permit a shorter period. In warm weather one may reduce the period to 6 hours. When the temperature is under + 5° C the period should be extended to at least 32 hours.

The strengths and treatment periods given above apply to: bedbugs, lice, fleas and so forth, and to eggs, larvae and pupae.

For clothes moths when the temperature is over 10° C, 16 g./cbm. and 21 hours application time.

Flour moths, as for bedbugs.

X. Gassing a Building:

1. Check to make sure all persons have left the building.
2. Unpack the Zyklon cases. For each floor, prepare the necessary quantity.
3. Distribute the cans. One man goes into the building, receives and distributes the cans brought to him by the work gang (He puts them by the sheets of paper.)
4. Dismiss the work gang.
5. Deploy the guard; the leader of the gassing team gives them his orders.
6. Check that the sealing and evacuation are complete .
7. Put on all gas protection gear.
8. Open the cans and pour out the contents. Spread the contents out thinly, so that the Zyklon evaporates quickly and the required concentration of gas is reached as soon as possible. The treatment should begin on the highest floor, the cellar should be treated before the first floor if the former has no exit. Rooms already treated should not be entered again, if possible. The treatment should be carried out slowly and methodically. Go slowly on stairways especially. The treatment should be interrupted only in case of emergency.
9. Lock and seal the entry doors (Don't forget the keyholes) and give the keys to the gassing team leader.
10. On every outside door put up a placard with the inscription: "WARNING: Poison gas – deadly danger – entry forbidden." If necessary, the warning placard should be multilingual. It should show at least 1 clearly visible death's head.
11. All gas protection gear, resuscitation equipment and *trace gas detectors* should be handy. Every member of the gassing team should know where these items can be found.
12. At least 1 member of the gassing team should remain near the building being gassed. The guard should be notified of his position.

XI. Aeration:

Aeration presents a great danger for both participants and non-participants. Therefore it should be carried out carefully and gas masks should always be worn. Aeration should be done in such a way that *gas-free air can be reached in the shortest possible time,* that gas flows off to one side, *where there is no danger to non-participants.* When the aeration is difficult, one man with special training should remain with the building to observe the flow of gas.

1. Make sure that no persons not involved with the gassing remain in the vicinity of the building.
2. Post the guards such that they can observe the entrances to the building without being in the way of the flowing gas.
3. Put on gas masks.

4. Enter the building, shut the doors but Don't lock them.
5. First open the windows on the side of the building away from the wind. Aerate one floor at a time. Begin with the first floor and allow a rest of at least 10 minutes after each floor.
6. In each room of the building the hallway doors, connecting doors and windows should be opened. If any windows are difficult to open, wait to open them until after most of the gas has blown away.
7. Planking and other seals that cannot be easily handled should only be removed after most of the gas has blown off.
8. When there is freezing or danger of freezing, be sure that heating systems and water lines do not freeze.
9. Rooms with valuable contents such as clothes storage may be closed as soon as the windows are opened.
10. Make sure that open doors and windows do not close on their own.
11. Seals on chimneys should be removed after the provisional all-clear.
12. Aeration should last at least 20 hours.
13. The guard should remain near the building throughout the aeration.

XII. Provisional All-Clear:

A gassed room can be provisionally opened to access as soon as the paper strips used as *trace gas detectors* (*Gasrestnachweisgerät*) show a lighter blue than the middle of the reference color scale – windows and doors being kept open. Only aeration and clean-up work can be carried on in provisionally opened rooms. Under no circumstances should anyone rest or sleep in a provisionally opened room. The windows and doors of such rooms should be kept open.

XIII. Clean-up after the Provisional All-Clear:

1. Removal of remnants of Zyklon from the gassed rooms. Usually they should be sent back to the manufacturer along with cans and cases. The inscription "Poison" should be removed from the cases before they are sent. Moist, wet or dirty remnants, and damaged cans should never be returned. They can be thrown in the trash or on the cinder heap, but should never be dumped into drains.
2. Mattresses, straw mattresses, pillows, upholstered furniture and other such objects should be shaken or beaten in the open for at least one hour under the supervision of the gassing team leader or his deputy (in rainy weather at least two hours in the hallway).
3. The stuffing of straw mattresses should be replaced, if possible. The old stuffing need not be burned - it can be reused after further aeration.
4. If chimney upper openings were covered, the seals should be removed carefully, otherwise there is danger that the fires in ovens and fireplaces

will not have enough draft and that carbon monoxide poisoning could result.

5. After the final all-clear a gassing report in the prescribed form should be completed, in two copies. In particular, it should include:
   a) Volume of space gassed,
   b) Quantity of Zyklon used,
   c) Name of the gassing team leader,
   d) Names of the other personnel involved,
   e) Duration of treatment,
   f) The date and hour of the final all-clear for the disinfested rooms.

XIV. Final All-Clear:

1. Never before 21 hours after aeration was begun.
2. All objects removed for shaking out should be brought back.
3. Windows and doors should be closed for one hour.
4. Heated rooms should have their temperature restored to at least 15° C.
5. *Trace gas detection.* The paper strips should not be a brighter blue than the bright end of the reference color scale even between sheets or mattresses laid together, and in places difficult of access or difficult to aerate. If this is not the case, the aeration should be continued and *trace gas detection* should be repeated after a few hours.
6. In buildings in which people will soon sleep *trace gas detection* should be done in every room separately. *People should never sleep in a room that has been gassed the night following the gassing.* The windows should remain open the first night the room is in use again.
7. The leader of the gassing team or his deputy should not leave the building until the final all-clear has been given for the last room.

Published by the Health Authority
of the Protectorate of Bohemia and Moravia in Prague

9. Three Further Notes to my Reply to Jean Claude Pressac

9.1. Jean Claude Pressac and Robert Jan van Pelt

Jean-Claude Pressac's work on Auschwitz[79] has just been translated successively into German[80] and English.[81] These two translations are rich in revelations as to both the work and the personality of J.-C. Pressac, pharmacist of La-Ville-du-Bois (*département* of Essonne, France).

In the German translation, the author once more revises downwards his estimation of the number of dead at Auschwitz. In 1989, he evaluated the number of the *gassed alone* at a figure between "1,000,000 and 1,500,000,"[82] which let it be assumed that, for him, the total number of *dead* must be somewhere from 1,500,000 to 2,000,000. In 1993, in the book to which I wrote a reply, Pressac reduced the total of *dead* to 775,000 (rounded up to 800,000), of whom, he specified, 630,000 Jews *gassed* (*Les Crématoires…*, p. 148). In my *Réponse*, I announced that this downward revision would probably be followed by another downward revision. I wrote in a footnote:

> *"I have been informed by a reliable source, which I cannot disclose, that Pressac intends, when he can, to reduce the total of deaths at Auschwitz to 700,000, if and when the disposition of the public seems ready for this new reduction."* (note 4 at the bottom of pages 13-14.)

However, in the German translation Pressac sets the number of *dead* at Auschwitz at 630,000 to 710,000 – in round numbers – of whom, he specifies, 470,000 to 550,000 Jews *gassed*. (*Die Krematorien…*, p. 202).

The English translation is more interesting still. To begin with, the text no longer contains any estimation of the total number of dead or of the gassed!

I know, but cannot reveal my source here either, that Pressac met with difficulties when seeking to publish his book in English in the United States. He

[80] J.-C. Pressac, *Die Krematorien von Auschwitz/Die Technik des Massenmordes*, Munich/Zurich, Piper Verlag, 1994, xviii-211 p.

[81] J.-C. Pressac with Robert-Jan Van Pelt, "The Machinery of Mass Murder at Auschwitz," chapter 8 (p. 183-245) of the collective work published by Israel Gutman and Michael Berenbaum, *Anatomy of the Auschwitz Death Camp*, published in association with the United States Holocaust Memorial Museum, Indianapolis, Indiana University Press, 1994, xvi-638 pp.

[82] J.-C. Pressac, *Auschwitz: Technique and Operation of the Gas Chambers*, New York, Beate Klarsfeld Foundation, 1989, 553 p.

was, for a time, in delicate discussions with Michael Berenbaum, director for scientific matters at the Holocaust Memorial Museum, which opened in Washington in April 1993. Pressac, who tries to compensate for his frail personality by assuming an attitude of bravado, affirmed that he would not "let himself be trifled with." However, the English translation, issued in July 1994, shows not only that he "let himself be trifled with" but also that he consented to one of the worst humiliations that an author can experience: the imposition of a tutor! He was obliged to cut parts out of his book, rework it and reduce it to the dimensions of a chapter in a collective work, and all under the supervision of a close associate of M. Berenbaum. For a start, he was forbidden to publish his own figures of total dead or gassed. Note the terms in which M. Berenbaum puts the pharmacist back in his place. He writes, in effect:[83]

> *"Robert-Jan Van Pelt has worked closely with Mr. Pressac to ensure that a technical article was clear and lucid as well as precise and informed by the latest scholarship."*

How could one make it any clearer that to M. Berenbaum's taste Pressac's book in French (*Les Crématoires…*) was confused, obscure, imprecise and insufficiently scientific? It must be said that, despite the efforts of R.J. van Pelt, Pressac's text is as abhorrent in English as it was in French.

The same collective work in English (*Anatomy…*) confirms that, from 1982 (!), Pressac, who liked to present himself as an independent researcher, had been receiving money from a rich Jewish organization (the Beate Klarsfeld Foundation). M. Berenbaum writes:[84]

> *"Since 1982, the work of Mr. Pressac has been promoted and supported on a documentary, editorial and financial level by the Beate Klarsfeld Foundation."*

* * *

9.2. Fundamental Questions about Auschwitz

- At the end of Alain Resnais's 1955 film *Nuit et Brouillard* (Night and Fog), which still today is constantly shown in all the schools of France, the number of dead at Auschwitz is said to total 9,000,000: "9,000,000 dead haunt this landscape"!
- However, ten years before, at the Nuremberg trial, a document having "the value of genuine evidence" (*sic*) had set that number at 4,000,000.
- In 1989, Pressac reduced the total of dead to a figure most likely between 1,500,000 and 2,000,000.
- In 1993, he reduced that total to a figure of about 775,000.

---

[83] *Anatomy of the Auschwitz Death Camp*, op. cit. (note 81), p. xv.
[84] Ibid., p. xiii.

– In 1994, he has arrived at a figure somewhere between 630,000 and 710,000. Because of this, he is ordered to keep quiet. And he agrees to keep quiet.

The revisionists, for their part, will not keep quiet. They will persist in posing questions and in offering their answers:

1. *What is the total number of dead at Auschwitz? Is it 9,000,000, as French schools still dare to teach children? Or is it perhaps 630,000, as Pressac now views it?*

   The revisionists propose the figure of 150,000, supported by research.

2. *Why the persistent refusal to provide us with any physical representation of the Nazi gas chamber, that fantastic chemical slaughterhouse using hydrogen cyanide? Why do the authorities now refrain from showing, in a photograph, the alleged homicidal gas chamber of Auschwitz I, which has been visited by millions of tourists to date? Why has the prosecution never dared to present us with a forensic study of the crime weapon?*

The revisionists, for their part, have arguments to say that most deaths at Auschwitz were due to the epidemics there and that it takes only a little common sense to realize that the places "in their original state," "reconstructed" or "in ruins" can never have been homicidal gas chambers but rather… typical morgues for the storage of corpses awaiting cremation. And the revisionists have at their disposal forensic studies (the Leuchter report, the Rudolf report and the Lüftl report, and even the draft of a Polish report) to uphold what they put forward.

Only those who are indifferent to facts and figures can claim that all this is of no importance.

9.3. Ten Years Ago, Jean-Claude Pressac's Capitulation

Ten years ago to the day, on June 15th, 1995, Jean-Claude Pressac capitulated, but the text of that capitulation was made public – discreetly – only in small print at the very end of a book by Valerie Igounet published in Paris in April 2000 under the title *Histoire du négationnisme en France* (éditions du Seuil). It may be feared that a good number of that work's readers have paid but scant attention to these two half-pages (651-652) in a great mass of text, where the author lets J.-C. Pressac have his turn at talking. Nonetheless they are of capital importance for the history of the "Nazi gas chambers" controversy. On them J.-C. Pressac states quite simply that, when all is said and done, the official dossier on the Nazi concentration camps is "rotten." He even adds that the dossier is irremediably "rotten" and that, consequently, it is "bound for the rubbish bins of history"! He draws up a veritable indictment

against "memory" which has "taken precedence over history," against the distortions inspired by "resentment and vengeance," against the communists and their associations, which have set themselves up as the guardians of a false truth (he does not dare, however, to implicate the Jews and Jewish associations). He says: "Approximation, exaggeration, omission and lying characterize the majority of the accounts of that period." He asks: "Can things be put back on an even keel?" and answers: "It is too late. An overall rectification is humanly and materially impossible."

He had taken the term "rotten" from professor Michel de Boüard. A former internee at Mauthausen (he had been convicted of acts of resistance), that historian, at once a Roman Catholic and close to the communists, became after the war dean of the literature and social sciences faculty at the university of Caen (Normandy) and a member of the *Institut de France*. He headed the commission for the history of the deportation within the *Comité de l'histoire de la deuxième guerre mondiale*, directly responsible to the Prime Minister's office. A holder of the decorations *Croix de guerre* and *Médaille de la Résistance*, he was a *commandeur* of the *Légion d'honneur*. For further information about the late Michel de Boüard's sudden declarations of 1986-1987, which were amply revisionist in nature, one may consult the pages listed under his name in the index of my *Ecrits révisionnistes (1974-1998)*.

There is an explanation for J.-C. Pressac's sudden change of mind. On June 15, 1995, the moment when he signed his act of surrender, the man was still feeling the effect of the humiliating blows that he had taken the previous month, on the 9th of May to be precise, in the 17th chamber of the Paris criminal court, presided over by Madame Martine Ract-Madoux. A deafening media clamor had, in September 1993, accompanied the appearance of our man's volume on *The Auschwitz Crematories. The Machinery of Mass Murder*. I had replied with a little book entitled *Réponse à Jean-Claude Pressac sur le problème des chambers à gaz*. That reply led to my prosecution under the Fabius-Gayssot Act prohibiting the disputing of crimes against humanity as defined and punished by the judges at Nuremberg. My barrister, Maître Eric Delcroix, and I had requested the summoning, under pain of arrest, of J.-C. Pressac as a witness. Two articles in my aforementioned *Ecrits* (p. 1674-1682 and 1683-1693) give an account of that session in court relating the witness's increasingly plain discomposure, his evasiveness and inability to answer Maître Delcroix's questions, as well as the consternation of the presiding judge at the sight of one who, arms raised on high, declared that too much was being asked of him, that he had but one life, that he was alone in his struggle.

The legal proceedings brought against us for the offense of revisionism, in France and abroad, have been particularly trying, not to say exhausting. We have at times known discouragement and been tempted to consider pointless any system of defense worthy of the name. But it must be acknowledged that those court cases have greatly strengthened our cause. Our opponents refused

all our offers of debate, all public confrontation. They trumpeted that their dossier, that of the "Holocaust" or "Shoah," was as solid as could be. The only times where we have been able to force them to confront us in any arena before an audience have been those proceedings that they had the temerity to undertake against us. Sometimes they have been able to give the impression of winning at the level of the historical or scientific controversy. Such has been the case more recently with the trial they won in London against David Irving. However, David Irving is at the very most a semi-revisionist, and he does not know the revisionist argumentation well at all. During his lawsuit he did not know how to shut up a certain species of sub-Pressac, a sort of rabbinical visionary, the Jew Robert Jan van Pelt.[85] He had not accepted the offer to come to his aid made by an expert like Germar Rudolf. In all the cases where the revisionists have really known how to stand up for themselves, the opponent's rout has been patent. On this score, Ernst Zündel's two long trials in Toronto in 1985 and 1988 were exemplary. Obviously I am not speaking here of the judicial conclusions but only of the results obtained at the historical or scientific level with, on the one hand, the rout of the opposing party's experts and witnesses and, on the other hand, the significant contributions, on the occasion of those trials, made by revisionist researchers to the advancement of historical science (particularly with the Leuchter report on Auschwitz and Majdanek).

J.-C. Pressac died on July 23rd, 2003, at the age of 59. The man whom the media of the Western world had saluted as a sort of genius who had, allegedly, floored revisionism in general and Robert Faurisson in particular, departed this life in the most complete obscurity: not a single organ of the mainstream press that had so extolled him even announced his death.[86]

Thus June 15th, 1995, with that act of surrender by J.-C. Pressac, constitutes one of the most noteworthy dates in the history of revisionism.

Robert Faurisson

[85] "Robert Jan van Pelt, a scholar who is clearly inferior to Pressac both intellectually as well as regarding his critical attitude," Carlo Mattogno, "My Memories of Jean-Claude Pressac," *The Revisionist*, 1(4) (November 2003), p. 434.

[86] In spite of a persistent rumour, I must, yet once more, make it clear here that J.-C. Pressac was never my "collaborator" or my "disciple."

Auschwitz: The End of a Legend

By Carlo Mattogno

1. Introduction to this New Edition

The first edition of the following work appeared in Italian and then in an English translation in 1994. At that time I had not yet gained access to the archives in Moscow, so that the documentation in my possession was rather limited. It therefore inevitably contained several inaccuracies (particularly the overestimation of deaths of registered inmates in Auschwitz) which I corrected in this new issue. *Auschwitz: The End of to Legend* constituted a sort of synthesis of my knowledge on cremation and on the alleged homicidal gas chambers, which I had acquired until then, but already in 1995, when I was able to visit the Moscow archives for the first time – accompanied by Jürgen Graf and the late Russell Granata – my work changed from the outset. Above all, my study on the cremation ovens of Auschwitz, which I thought to have concluded in 1994, benefited from this. Thanks to the large documentary collection, I was able to develop this work in successive years to an encyclopedic work of more than 1,000 pages. But this documentation also benefited my study of the alleged homicidal gas chambers, which I expanded into three distinct works analyzing the origin and development of stories about the alleged first homicidal gassing in Block 11 of the Auschwitz main camp,[1] the gassings in crematorium I of the same camp,[2] and in the so-called "Bunkers" of Birkenau.[3] As a result of this vast documentation, I also authored numerous separate articles published in the revisionist journals *The Revisionist*[4] and *Viertel-*

jahreshefte für freie Geschichtsforschung.[5] These subsequent developments have fully confirmed the validity of my arguments against the theses of Jean-Claude Pressac, which now appear even less substantial. This is a sufficient reason to reissue this work.

Carlo Mattogno, April 2005

2. Introduction

Jean-Claude Pressac is the author of a large-format book on the Auschwitz-Birkenau complex entitled *Auschwitz: Technique and Operation of the Gas Chambers*, published in 1989 by the Beate Klarsfeld Foundation, 515 Madison Avenue, New York, NY 10022. That work, which was acclaimed at the time of its publication as the definitive proof of the existence of homicidal gas chambers at Auschwitz-Birkenau, brought Pressac praise as *spécialiste incontesté des recherches sur les techniques de l'extermination nazie* ("unquestionable specialist in the research of Nazi extermination techniques") and as *expert incontesté, sinon unique* ("unquestionable expert, if not unique")[6] in this field.

But praise from shallow journalists aside, to the expert eye, Pressac reveals a surprising ignorance of the chemical-physical properties of Zyklon B and its use for the purpose of disinfestation, as well as the structure and functioning of cremation ovens.[7] This double incompetence in the two essential aspects of

---

5 www.vho.org/VffG

6 *L'Express*, September 23-29, 1993, pp. 78 and 80.

7 These examples are sufficient to illustrate the level of technical competence of Jean-Claude Pressac:
He thinks that "the temperature has to be raised to 27°C for hydrocyanic acid to evaporate" (J.-C. Pressac, *Auschwitz: Technique and Operation of the Gas Chambers*, Beate Klarsfeld Foundation, New York 1989, p. 375; http://holocaust-history.org/auschwitz/pressac/technique-and-operation/pressac0375.shtml), ignoring that evaporation of hydrocyanic acid can occur even below its boiling point (25.6°C), even at temperatures below 0°C (see in this connection: G. Peters, *Die hochwirksamen Gase und Dämpfe in der Schädlingsbekämpfung: Sammlung chemischer und chemischtechnischer Vorträge*, Verlag von Ferdinand Enke, Stuttgart 1942, pp. 85-88).
Regarding the cremation ovens, Pressac presents an "Operation plan of a Topf oven with three chambers which was built in two models in Crematories II and III" (J.-C. Pressac, *Auschwitz:...*, ibid., p. 492) based on the deposition of H. Tauber, in which the gases of the gas generators pass *around* the chambers: The *technical* basis of this plan is a translation error! (Pressac's two translators have translated the Polish preposition *przez*, (through), as *around*. The translation error is found on p. 489. The Polish text says: *przez obie boczne retorty* (through the two lateral chambers); Archiwum Państwowego Muzeum w Oświęcimiu, hereafter: APMO, Dpr.-Hd, 11a, p. 133). Even his knowledge about architecture is totally unsufficient. He does no even realize that the way the basements of the crematoria II and III were designed clearly proves that they were built below groundwater level.

the problem inevitably led Pressac to unfounded conclusions in his 1989 work.

Despite this, that book is valuable for its considerable documentation and for a critical spirit uncommon in traditional historiography, where, regarding the sources, a systematized theological dogmatism rules. Pressac should furthermore be acknowledged for his courage in overcoming, or at least attempting to overcome, the traditional historiographic methods in this field, which he justifiably labels as:[8]

> *"a history based for the most part on testimonies, assembled according to the mood of the moment, truncated to fit an arbitrary truth, and sprinkled with a few German documents of uneven value and without any connection with one another."*

That book provided enough arguments for historical revisionism to be considered *crypto-revisionist*, evidently even by its own publisher, since it has been practically impossible to obtain.

Another book by Jean-Claude Pressac, entitled *Les crématoires d'Auschwitz: La machinerie du meurtre de masse* (The Crematoria of Auschwitz: The Machinery of Mass Murder) published in Paris, 1993, should have complemented his earlier book by virtue of the vast amount of documentation he encountered in Moscow, particularly the archives of the *Zentralbauleitung* (the Auschwitz Central Construction Office), which were left *intactes* ("intact") in the hands of the Soviets (p. 1).[9]

But in fact, reading his *Les crématoires d'Auschwitz*, one senses an uncomfortable reversion: Jean-Claude Pressac returned to the worst clichés of the worst traditional historiography. This was inevitable: In the 80,000 (eighty thousand!) documents at Moscow, and in the entire archives of the Central Construction Office, Pressac found *not a single proof* for the existence of one single homicidal gas chamber at Auschwitz-Birkenau.

Pressac states that these archives were left intact because the second and last director of the Central Construction Office, SS-Obersturmführer Werner Jothann, ignored the "'explosive' contents of the documents" since "the crematories were equipped for homicide" under the direction of SS-Sturmbannführer Karl Bischoff, Jothann's predecessor (p. 1). But on page 88, Pressac contradicts himself, stating that Bischoff "was promoted to the inspection of 'Silesia' constructions, *but kept control over the Central Construction Office of Auschwitz.*" (my italics).

Concerning Crematory II at Birkenau, for example, no "criminal trace" (Pressac's term) is dated prior to March 31, 1943, the date of the official consignment of the crematory to the administration of the camp. Now that is, to

---

[8] Pressac, *Auschwitz:...*, op. cit. (note 7), p. 264.

[9] Page numbers with no other indications refer to: J.- C. Pressac, *Les crématoires d'Auschwitz: La machinerie du meurtre de masse*, SNRS, Paris 1993.

say the least, just a little bit strange for an extermination plant that was supposed to have functioned:[10]

> *"as a homicidal gas chamber and incineration installation from* [the] *15th of March 1943, before its officially coming into service on* [the] *31st of March, to* [the] *27th of November 1944, annihilating a total of approximately 400,000 people, most of them Jewish women, children and old men."*

Thus, for over twenty months of alleged extermination activity in this supposedly homicidal crematory, for an extermination of 400,000 people, the archives of Moscow do not even contain one single "criminal trace"! And the same goes for the other crematories at Auschwitz-Birkenau.

This must have disturbed Pressac, who must have found himself in the difficult position of *making* these documents say what they do not say. This need explains Pressac's cranky method, which is characterized by his indiscriminate use of sources, and by arbitrary and unfounded deductions. These are inserted into the body of the text within a dense web of notes, which are supposed to give the impression that Pressac's deductions are supported by the documents quoted. The connection between the various documents appears forced, and the interpretation of those documents is contorted to make it seem as if they support the existence of homicidal gas chambers.

Pressed by revisionist research, which demonstrates the impossibility of mass extermination at Auschwitz-Birkenau from the technical point of view, Pressac downplays not only the numbers of victims, but also the intentions of the SS. The number of presumed homicidally gassed victims, which in 1989 was "about 900,000,"[11] of whom 750,000 were supposedly killed at Crematories II and III alone,[10] is here reduced to only 630,000 (p. 148) and in the German edition even further down to 470,000 to 550,000.[12] All these figures are completely arbitrary. Furthermore, even the gas chambers are shrinking: they have suddenly become "little," which means that their extermination capacity must have been small. In effect, Pressac has been forced to "balance" the capacity of the homicidal gas chambers to that of the cremation ovens. According to his 1989 work, more victims had been gassed then there was capacity to cremate.

All these changes have naturally required jarring contradictions with respect to his earlier *Auschwitz: Technique and Operation of the Gas Chambers.* But this is unimportant to an author, who seems to accept or reject figures and arguments depending on his whim.

---

[10] Ibid., p. 183.
[11] Ibid., p. 97.
[12] *Die Krematorien von Auschwitz. Die Technik des Massenmordes*, Piper, Munich 1994, p. 202.

To complete the picture, Pressac has again enormously exaggerated the capacity of the crematories of Auschwitz-Birkenau as he did in 1989, arriving at conclusions which are technically and thermotechnically senseless, due to his apparent ignorance of essential aspects of cremation.

The subject of homicidal gas chambers has caused Pressac no less difficulties, not only due to the absolute lack of proof on this subject in the Moscow documents, but above all, because the documentation on ventilation installations in the basement of Crematories II and III show undeniably that homicidal gas chambers were not planned, and were not installed. We shall subsequently see by what means Pressac has attempted to overcome this difficulty.

The critique presented here is essentially based upon a scientific study of the cremation ovens, and of the presumed homicidal gas chambers at Auschwitz-Birkenau, which has involved several years of research, initially with the very valuable collaboration of Engineer Dr. Franco Deana of Genoa, and Engineer H.N. of Danzig. That work originally consisted of two volumes entitled *Auschwitz: The Cremation Ovens* and *Auschwitz: The Gas Chambers*. However, due to the increased documentation from Moscow archives, the first volume subsequently developed into a work of two volumes itself with the Title *The Cremation Ovens of Auschwitz. A Historical and Technical Study*, which is currently being published in Italy.[13] A summary of this work appeared in the anthology *Dissecting the Holocaust*.[14] The present work is a synthesis of these studies. The interested reader can find many references in those detailed studies, which are not included in this critique.

3. The Cremation Ovens of Auschwitz-Birkenau According to Jean-Claude Pressac

A scientific study of the cremation ovens of Auschwitz-Birkenau must confront and resolve two fundamental thermotechnical problems: that of capacity, and that of efficiency. Capacity is the number of corpses cremated within a time frame (reference: one day of activity). Efficiency is the relation between heat produced and heat used: specifically, fuel consumption. Jean-Claude Pressac does not confront either of these two problems scientifically, limiting himself simply to a series of statements as to the capacity of the ovens (which he erroneously calls "efficiency"), sprinkled here and there throughout his book. These statements, under analysis, yield the following argument:

---

[13] *I forni crematori di Auschwitz. Studio storico-tecnico con la collaborazione del dott. ing. Franco Deana.* An English translation is planned to be published by Theses & Dissertations Press.

[14] C. Mattogno, "The Crematoria Ovens of Auschwitz and Birkenau," in: G. Rudolf (ed.), *Dissecting the Holocaust*, 2nd ed., Theses & Dissertations Press, Chicago 2003, pp. 373-412.

1. The mobile oil-heated Topf two-muffle oven, which was installed in Dachau at the end of 1939, had a capacity of two corpses per hour (p. 7). Thus, the cremation of one corpse in one muffle lasted one hour.

2. The Topf two-muffle "Auschwitz model" oven heated by coke was of a design different from that of the Dachau oven. This was the result of a change in the first two-muffle Topf oven at Buchenwald, which was originally heated with combustible oil, into a coke-fired oven via the installation of two gas generators in the rear (p. 12). Thus, the above-mentioned capacity of two corpses per hour does not apply to this oven.

3. The installation of forced air blower (*Druckluftgebläse*) reduced the duration of cremation (pp. 13 and 68).

4. The "Auschwitz model" oven had an actual capacity of 30 to 36 corpses in ten hours (p. 13).

5. The ovens were used 21 hours a day, because their functioning required three hours rest (p. 13).

6. The three two-muffle ovens of Crematory I at Auschwitz had a capacity of 200 to 250 corpses per day (pp. 49, 80).

7. The two Topf three-muffle ovens heated by coke at Buchenwald (of which one was also adaptable for heating with combustible oil) resulted in "an incineration capacity of one-third higher than the results gained by experience with the double-muffle ovens."

8. The capacity of the five three-muffle ovens of this model installed in Crematories II/III in Birkenau was 800 corpses per day (p. 39) or 1,000 per day (p. 80).

9. The capacity of each of the two eight-muffle ovens installed in Crematories IV and V at Birkenau was 500 corpses per day (p. 80).

10. During the first experimental cremation in Crematory II on March 4, 1943, 45 corpses of "fat men" were cremated; three for every muffle, and the cremation lasted 40 minutes (p. 72).

11. The "official" capacity of the crematories was as follows:

Crematory I :	340 corpses daily
Crematory II :	1,440 corpses daily
Crematory III :	1,440 corpses daily
Crematory IV :	768 corpses daily
Crematory V :	768 corpses daily

Pressac comments:

"These official figures derive from false propaganda but are nevertheless valid. Their apparent validity rests on the fact that the duration of the incineration of two children weighing 10 kg each and of a woman weighing 50 kg is equal to that for a man weighing 70 kg, which introduces a factor of multiplication varying from 1 to 3. This turns all figures on the crematory capacity into futile speculations."

3.1. Capacity: The Facts

This reasoning is completely unfounded from both the technical and the documentary points of view. In this regard, we note the following:

On 1: The reference cited by Pressac is a letter from the Topf firm dated November 1, 1940, to the SS *Neubauleitung* (New Construction Office) of the Mauthausen camp (note 9 on page 97). This document is a letter attached to a "cost estimate" of:[15]

> *"One Topf two-muffle coke-fired cremation oven equipped with a forced air blower, one Topf draught booster system."*

The oven offered is not the Dachau oven but rather the one installed in Crematory I at Auschwitz. This is evident not only from the "cost estimate" mentioned above but also from Topf technical design D57253 attached to the letter dated June 10, 1940, concerning precisely the first two-muffle oven of Crematory I at Auschwitz. This drawing is published by Pressac as Document 6.

Concerning the capacity of this model oven, one reads in the above letter:

> *"Our Mr. Prüfer had already communicated to you that in <u>the oven presented above</u> it is possible to cremate two corpses per hour."* (My emphasis)

On 2: As stated above, it is evident that the capacity of two corpses per hour refers not to the Dachau oven but to the "Auschwitz model" oven since "the oven presented above" is precisely that model.

On 3: The source cited by Pressac is the Topf letter of January 6, 1941, to the SS-*Neubauleitung* of the Mauthausen camp (note 25 on page 98). That the installation of forced air blowers reduced the duration of cremation is an arbitrary assumption by Pressac without any foundation in the text (or in reality). The text states:[16]

> *"In both ovens we arranged it that the generator gases attack the item to be incinerated from above and below, thereby effecting a rapid cremation."*

This letter refers to the two-muffle oven of the Auschwitz model, mentioned in technical drawing D57253, and to the coke-fired oven (drawing D58173), which was never installed, so that the "rapid cremation" (with respect to the civilian ovens) is nothing but the duration of one hour indicated by Prüfer in the letter of November 1, 1940. This "rapid cremation" depended upon the relative arrangement of the grate, made of fire-resistant clay, with respect to the opening connecting the muffle to the gas generator.

---

[15] *Kostenanschlag* of Topf for KL Mauthausen of November 1, 1940. Bundesarchiv Koblenz (hereafter: BK), NS4 Ma/54.

[16] Letter from Topf to SS-Neubauleitung KL Mauthausen of January 6, 1941. BK, NS4 Ma/54.

On 4: Pressac's citation from the Topf letter of July 14, 1941, to the SS-*Neubauleitung* of Mauthausen camp is correct, but Pressac apparently hasn't the slightest idea of the meaning of this document.[17] This letter speaks of the incineration of 30 to 36 corpses in about ten hours in a two-muffle oven, corresponding to an incineration time of 33 to 40 minutes per corpse. These results could only be obtained under optimal conditions with the aid of an forced draft system (*Saugzuganlage*). The installation's typical time limit for the cremation of one adult corpses was 40 minutes for the main combustion in the muffle, plus another 20 minutes of post-combustion in the ash compartment underneath the muffle. This was altogether one hour, which even in the 1970s represented the minimum duration obtainable in gas ovens, as resulted from cremation experiments conducted in England.[18] The duration of 33 minutes (plus 20 minutes of post-combustion) could only be obtained in exceptional cases, and only for a short time. These times, however, applied in actuality only to the oven at Gusen, a Topf two-muffle mobile oven, which was originally oil-heated and then transformed into a coke-fired oven like the first oven at Dachau with the installation of two lateral gas generators (illustrated in Document 7 of Pressac). Because of local technical difficulties, these short times apply only theoretically to the ovens in Crematory I at Auschwitz.

In Auschwitz, the first cremation occurred on August 15, 1940 (p. 13). After only three months, on November 22, the Central Construction Office sent a letter to the SS Main Office Budget and Construction (*Hauptamt Haushalt und Bauten*) in Berlin which stated:[19]

> *"The past operation of the crematory has shown that even in the relatively favorable times of the year, the oven with two muffles is too small."* (Therefore insufficient – Author)

According to Pressac, from May to December 1940 there were 2,000 deaths at Auschwitz (p. 146), an average of eight per day. According to an official Polish report,[20] 1,600 deaths occurred in Auschwitz between June 1940 and January, again in average some eight per day. From February to March 1941, 1,400 deaths were reported, which

[20] Report on Auschwitz of The Polish War Crimes Office, 1945. Archiwum Głównej Komisji Badania Zbrodni Przeciwko Narodowi Polskiemu Instytutu Pamieci Narodowej (Archive of the Central Commission for the Investigation of Crimes against the Polish People – National Memorial, Warsaw), MSW Londyn, 113, p. 518.

amounts to an average of some 23 per day. If we assume the latter average for November 1940 as well, the first double-muffle oven would have been insufficient to cremate this low quantity of bodies. The letter in question is part of the Moscow documents from the Central Construction Office of Auschwitz, but Pressac does not even mention it. His motive in excluding it is easily understandable.

On 5: The gas-generating ovens heated with coke required a daily interruption for cleaning the gas generators, since cinder, the residue from coke, melted and adhered to the grates. If cinder accumulated there over a long period of time, it would impede the passage of primary combustion air through the bars of the grill, causing poor operation of the cremation ovens. From a letter by Engineer H. Kori at the Lublin camp of October 23, 1941,[21] one deduces that the cremation ovens in the concentration camps were used only twenty hours at a stretch.

On 6: Accepting the data in the Topf letter dated July 14, 1941, the capacity of a two-muffle oven over 21 hours of activity would be:

30 corpses ÷ 10 hours × 21 hours = 63 corpses;
36 corpses ÷ 10 hours × 21 hours = 76 corpses.

so that the capacity for three ovens would be 63 × 3 = 189 and 76 × 3 = 228 corpses per day. Pressac unjustifiably estimates an excess of 200 to 250 corpses per day. I say unjustifiably, since the data supply a maximum capacity for an oven with two muffles from the very beginning.

On 7: In a letter sent to Ludwig and Ernst-Wolfgang Topf dated November 15, 1942,[22] Engineer Prüfer indicates that the three-muffle ovens he designed, which were installed in the crematory at Buchenwald, had an efficiency greater by one-third than what he had expected. Here Pressac, who normally confuses capacity with efficiency, commits the opposite error by confusing efficiency – that is, reduced coke consumption per cremation – with capacity – that is, cremations per time. In effect, the greater efficiency depended upon a thermotechnical advantage, of which Prüfer himself was not aware (maybe because he had designed the three- and eight-muffle ovens during his "spare time," as he wrote in a letter to Topf dated December 6, 1941[23]): The higher efficiency was the result of the fact that the three-muffle oven had only two gas generators – just like the two muffle oven. The third muffle in the middle was fed with the hot gases coming out of the lateral muffles. This reduced the fuel consumption by $^1/_3$.

---

[21] Letter of H. Kori G.m.b.H. to SS-Sturmbannführer Lenzer, Lublin, of October 23, 1941. Archiwum Państwowego Muzeum na Majdanku, sygn. VI-9a, vol.1.

[22] APMO, BW 30/46, p. 18.

[23] APMO, BW 30/46, p. 6.

This advantage in reduced fuel consumption had its price, though, because the third muffle had to accommodate the gases of two gas generators. Thus, the volumetric velocity of the gases passing through the central muffle was roughly twice as high as in the outer muffles. As a result, some of the flammable gases reached the flue. This, along with a careless use of the forced draft systems, caused the damage of the flues and chimney of Crematory II at the end of March 1943

But this has nothing to do with capacity. Instead, Pressac interprets this by claiming that the duration of a cremation in the three-muffle oven was reduced by one-third as compared to the two-muffle oven, which is technically absurd, since the heat theoretically available in each of the muffles was greater in the two-muffle oven than in the three-muffle oven (about 210,000 kcal/h/muffle as opposed to 163,000 kcal/h/muffle; or given in amount of coke per muffle: 30 kg/h/muffle as opposed to 23.3 kg/h/muffle).

On 8: But even if, for the sake of argument, Pressac's interpretation were correct, then it would follow that the maximum capacity of a three-muffle oven would be twice as high as that of the double-muffle oven ($^3/_2$ (relation of muffles) × $^4/_3$ (relation of capacity) = 2):

36 corpses ÷ 10 hours × 21 hours × 2 = 151.2 corpses per day,

therefore the capacity of five ovens would be:

Therefore the maximum capacity of five three-muffle ovens would be (5×151.2) = 756 corpses per day. But Pressac mentions an effective capacity of 800 corpses per day, which is then magically transformed into 1,000. Thus Pressac is not even consistent with his own technically errant presuppositions.

On 9: Pressac does not even attempt to justify in some way the capacity that he attributes to the eight-muffle oven, which is as technically unfounded as the capacity he attributes to the three-muffle oven.

On 10: The cremation of 45 fat adult corpses – three per muffle – in the five ovens of Crematory II at Birkenau in 40 minutes (reference from the witness H. Tauber) can be taken seriously only by those who have not the vaguest idea of the structure and operation of these ovens. First of all, the cremation time of *one* adult male corpse was an average of 60 minutes; secondly, the maximum amount of heat that the two gas generators could produce, which was designed for the cremation of only one corpse at a time in each muffle, would have been insufficient to maintain a muffle temperature of 600°C when assuming the simultaneous cremation of two corpses in each muffle. 600°C is less a temperature than required for a complete combustion of the heavy hydrocarbons, which develop during the cremation of a corpse. 700°C is a minimum required. This means that not even the simultaneous crema-

tion of two corpses in one muffle is *a fortiori* thermotechnically impossible – not to mention three or even more corpses.

On 11: Pressac's reasoning, according to which all the capacity figures from the ovens at Auschwitz-Birkenau are futile speculations due to the presumed presence of small-sized corpses, is in reality a simple anticipated alibi: Not able to understand thermotechnical phenomena, with which he is forced to deal, he does not want others to understand, and therefore decrees that any calculation to the problem of capacity of the ovens is "futile speculation." Even here, Pressac is profoundly mistaken. We have confronted and resolved the problem on the basis of the percentage of infants and children presumed homicidally gassed at Birkenau, by their age and average weight. The result is that the capacity of the ovens, for the assumed presence of infant and child corpses, would have been increased by twenty percent.

Moreover, Pressac contradicts his own assertion, since he accepts H. Tauber's story as true. Henryk Tauber declares, the plans of the SS men thwarted, because:[24]

> *"according to the calculation and plans for this crematory, five to seven minutes were allotted to burn one corpse in a chamber!"*

The testimony of H. Tauber is full of thermotechnically unfounded statements of this type. And besides, the cremation of nine adult corpses within 40 minutes would correspond to a capacity of 1,417 *adult* corpses per 21-hour working day.

3.2. The Coke

Pressac mentions absolutely nothing about the consumption of coke at Auschwitz-Birkenau.

3.3. The Ovens

Before explaining the question of the cremation ovens, it is opportune to rapidly examine Pressac's historical and technical assertions on this subject to furnish other elements, with which to judge his competence and the value of his conclusions.

Pressac's claim: The Volckmann-Ludwig system cremation oven went off the German market toward the end of 1934 (p. 4). Pressac begins his "recapitulative chronology" with the Volckmann-Ludwig patent (p. 110). He even presents a technical drawing as Document 2, which has nothing to do with the

[24] J-C. Pressac, op. cit. (note 7), p. 489.

theme he has developed, evidently only to impress those who exalt him as unopposed expert on the subject of cremation.[25]

In fact: The H. R. Heinicke company, holder of the Volckmann-Ludwig patent, at that time had its headquarters at Chemnitz. They installed fifteen other ovens of this type in Germany between 1935 and 1940.[26]

Pressac's claim: From the W. Müller oven of Allach, the SS deduced that a cremation without casket permitted a cremation time reduction to half an hour, and that 100 kg of coke were enough to cremate twenty corpses in one day (p. 6).

In fact: In a gas generator oven, heated with coke, the casket delayed corpse-water vaporization by 5 to 6 minutes, acting in a way as a thermal shield until breaking apart by the effect of the flames. Simultaneously, the heat produced by the casket, which raised the temperature of the muffle to 1,100°C, accelerated the vaporization process, therefore cremation without a casket did not take less time than cremation with a casket.

Regarding the consumption of coke in the gas generator ovens, incomparably the most important fact to be found in the specialized German literature of the time is the cremation experiment conducted by Engineer Richard Kessler, one of the top specialists on cremation during the 1920s and 1930s. This experiment occurred on January 5, 1927, in the Gebrüder Beck, Offenbach system oven, at the crematory of Dessau.[27] The results of the experiment, displayed in two thermotechnical diagrams, for each of the eight corpses cremated one after the other, were an average consumption of 29.5 kg of coke, plus the casket. These diagrams are of exceptional importance in understanding the operation of the gas generator cremation ovens. With the oven at thermal equilibrium (this state would have been reached in theory after twenty consecutive cremations), the consumption of coke would have been reduced to 23 kg, plus the casket. A wooden casket averaging 40 kg produced an actual quantity of heat equal to that produced by 15 kg of coke, therefore a cremation

---

Eine Entgegnung," *Die Flamme*, 40 (1931); Richard Kessler, "Der neue Einäscherungsofen System Volckmann-Ludwig," *Zentralblatt für Feuerbestattung*, 1931; Friedrich Helwig, "Vom Bau und Betrieb der Krematorien," *Gesundheits-Ingenieur*, 54(24) (1931); H. Wolfer, "Der neue 'Volckmann-Ludwig' – Einäscherungsofen im Stuttgarter Krematorium," *Gesundheits-Ingenieur*, 55(13) (1932).

[26] H.R. Heinicke, *VL-Kremationsofen Bauart Heinicke.* Summary of the sales kindly furnished by the H.R. Heinicke company of Stadthagen.
The two Volckmann-Ludwig ovens installed in the crematory of Dortmund in 1937 are described in Herman Kamper, "Der Umbau der Leichenverbrennungsöfen und die Einrichtung von Leichenkühlräumen auf dem Hauptfriedhof der Stadt Dortmund," *Gesundheits-Ingenieur*, 64. Jg., Heft 12, 1941.

[27] R. Kessler, "Rationelle Wärmewirtschaft in den Krematorien nach Massgabe der Versuche im Dessauer Krematorium," *Die Wärmewirtschaft*, 4(8-11) (1927).

without a casket required about 38 kg of coke, and with 100 kg of coke three corpses could be cremated, not twenty. The "deduction" is evidently not that of the SS, but rather that of Pressac, and it is a very poor deduction.

Pressac's claim: For him, the function of the forced draft blower was:

> *"to increase the quantity of combustion gas and thus avoid the waste of additional fuel when incinerating 'frozen' corpses."* (p. 29)

In fact: Here our author confuses the abilities of the Volckmann-Ludwig *gas* oven with the *coke* ovens of Auschwitz-Birkenau. Actually, in the gas generator oven heated by coke, the forced draft blower, impacting directly on the draft of the gas generator, caused an increase in the combustion capacity of the firing grate, and consequently an increase in the consumption of coke.

Pressac's claim: In Crematory I at Auschwitz, which had a chimney 15 meters high,

> *"Köhler added an exterior flue twelve meters long to obtain a draft length of twenty-seven meters."* (p. 40)

In fact: In reality, the draft force of a chimney is determined by the height and cross-section of the exhaust gas ducts above the grate. The working formula given by Engineer W. Heepke in his classic work on crematories[28] is precisely $Z = 0.6 \times H$ (for a fume temperature of 250°C), where Z is the force of the draft and H the height of the flue above the furnace grate. The length of the smoke conduit can only have a negative influence on the intake because too long a conduit would cool the fumes excessively.

Pressac's claim: Pressac attributes the last page of a cost estimate by Topf for Auschwitz dated April 1, 1943, in the amount of 25,148 Reichsmark, published by R. Schabel,[29] to the planned Crematory VI, "based on the principle of open air incineration." (p. 69)

In fact: Pressac's interpretation is unsustainable since the document in question mentions:

> *"one smoke flue gate valve made of cast iron with pulleys, steel cable, and hand winch,"*

and a smoke flue infers a closed combustion muffle on one side and on the other a chimney; installations that would not be recommended for an open air combustion.

[29] R. Schnabel, *Macht ohne Moral: Eine Dokumentation über die SS*, Röderberg-Verlag, Frankfurt/Main 1957, p. 351.

3.4. The Flames

Pressac's claim: Pressac has the audacity to accept the story told by various eyewitnesses of flames coming out of the chimneys (of Crematories II and III) (p. 91).

In fact: This is technically impossible. Any uncombusted gas emitted from the muffles would either be burned in the smoke flues if there were the necessary ignition temperature and combustion air, or, should these two conditions not exist, they would emerge from the oven uncombusted. In the first case, completely combusted gas would be emitted from the chimney (particularly nitrogen, carbon dioxide, water vapor, and a minimum amount of sulfur dioxide); in the second case, only smoke would emerge.[30]

3.5. The Pits

Pressac's claim: Even the story of the cremation pits, similarly accepted by Pressac, is technical nonsense.[31]

In fact: The cremation of corpses in pits by the process described by the eyewitnesses is impossible due to the lack of oxygen in the lower portion of the pit. In 1871, the attempt to cremate the dead soldiers from the Battle of Sédan, by opening mass graves, filling them with tar and setting them on fire, resulted in charring of the uppermost layer of corpses, the baking of the intermediate layer, and no effect on the bottom layer.[32]

Pressac's claim: The Pressac technical drawings of the cremation ovens contain structural errors due to his lack of thermotechnical knowledge.

In fact: We have to restrict ourselves to a few examples:

– Plan of the modified Dachau oven (p. 14): The connection of the two gas generators to the muffles is incorrect (the products of combustion of the gas generators were emitted in the posterior part of the muffles and discharged directly into the smoke conduit).
– Plan of the three-muffle oven at Buchenwald (p. 28): The connection system of the gas generators to the muffles is wrong (the two gas generators were connected only to the two lateral muffles; the products of combustion entered into the central muffle through the three inter-muffle openings that were found in the inner wall of the lateral muffles).

---

31 For this see C. Mattogno, "Combustion Experiments with Flesh and Animal Fat. On cremations in pits in the alleged extermination camps of the Third Reich," *The Revisionist* 2(1) (2004), pp. 64-72.

32 Dr. H. Fröhlich, "Zur Gesundheitspflege auf den Schlachtfeldern," *Deutsche Militärärztliche Zeitschrift*, I, 1-4, 1872, pp. 109f.

– The plan of the "rustic" three-muffle oven (p. 37) and plan of the presumed arrangements of the two simplified three-muffle oven (p. 50): The oven only had one gas generator. The cost estimate of February 12, 1942, mentions only one horizontal firing grate,[33] not two. The connection system of the two gas generators to the three muffles through three connection apertures is wrong; the discharge system of the combusted gases is wrong. Due to the draft of the chimney, most of the combusted gases would have passed through the point of least resistance, that is, through the muffle closest to the smoke conduit.
– Plan of the initial eight-muffle oven (p. 78): The discharge system of the combustion gases is wrong; the external muffle of every couple of muffles was connected to the horizontal smoke conduit through a vertical conduit placed in the wall of the posterior part of the muffle. Pressac places this conduit between the two muffles.
– Plan of the reinforced eight-muffle oven (p. 78): The discharge system of the combusted gases is wrong; the discharge conduit situated by the gas generators (at the right of the plan) did not exist.

4. The Cremation Ovens of Auschwitz-Birkenau According to Cremation Technology

Here we briefly review the results of our thermotechnical study on the Auschwitz-Birkenau cremation ovens.

4.1. Coke Consumption

The coke consumption results from the actual average consumption of the Topf double-muffle ovens in Gusen (30.6 kg of coke for each corpse), according to the method calculated by Engineer W. Heepke[34] – the most thorough to be found in the German technical literature of the period – which permits to establish the heat balance of the oven.[35]

The heat balance of the Topf double, triple, and eight-muffle ovens at Auschwitz can be calculated by taking into consideration the different operating temperatures, cremation times, firing grates per muffle, and surface area of

---

[33] *Kostenanschlag auf Lieferung von 2 Stück Dreimuffel Einäscherungs-Öfen und Herstellung des Schornsteinfutters mit Reinigungstür* of Topf, February 12, 1942. APMO, BW 30/34, pp. 27-33.

[34] W. Heepke, "Die neuzeitlichen Leicheneinäscherungsöfen mit Koksfeuerung, deren Wärmebilanz und Brennstoffverbrauch," *Feuerungstechnik*, 21(8/9) (1933).

[35] See in this regard C. Mattogno, "The Crematoria Ovens…," op. cit. (note 14), p. 391.

the ovens. Our calculations for the coke required for a single cremation in these type of ovens in thermal equilibrium resulted in the following:[36]

AUSCHWITZ CREMATORIA: COKE CONSUMPTION PER CORPSE		
Type of oven	Emaciated Corpse	Normal Corpse
Two-muffle Oven	32.5 kg	23.5 kg
Three-muffle Oven	22.0 kg	16.0 kg
Eight-muffle Oven	16.0 kg	12.0 kg

4.2. Capacity

The average cremation time of a continuously operating oven was about forty minutes of principal combustion (in the muffle), obtainable with the aid of the installation of an intake draft system (data relative to the Gusen oven).

The average time of a cremation without an intake draft system (taking into account the combustion capacity of the furnace grill) was sixty minutes, as is evident from the statement by Engineer Prüfer (in the November 1, 1940, letter), as well as from the diagrams published by Engineer R. Kessler concerning the principal combustion in the muffle (considering the structural differences of the Gebrüder Beck oven compared to those at Auschwitz-Birkenau). Since the Auschwitz-Birkenau ovens lacked draft intake installations (p. 81), the average time for a cremation (principal combustion in the muffle) was one hour. The continuous operation of the ovens was 20 hours per day, at the most. Therefore, the capacity of the single crematories was as given in the following table. This is the maximum theoretical capacity. The existing documents show that the effective capacity was much less.

MAXIMUM CAPACITY OF THE CREMATORIA OF AUSCHWITZ			
Crematory	Corpses per day	Faktor 1.2	Pressac's Claim
Crematory I	120	144	340
Crematory II	300	360	1,440
Crematory III	300	360	1,440
Crematory IV	160	192	768
Crematory V	160	192	768
Totals:	1,040	1,248	4,756

Supposing the reality of homicidal gassings, and when considering the percentage of small-sized bodies among the corpses, as well as average weight as a function of age, the daily capacity would have increased by a factor of 1.2

[36] It is assumed: for normal corpses a weight of 70 kg; for moderately thin corpses a weight of 55 kg, with loss of 25% of protein and 30% of body fat; for the emaciated corpse 40 kg, with loss of 50% of protein and 60% of body fat.

(third column). The forth column gives the data from the letter of June 28, 1943, which Pressac considers "credible."

Since in twenty hours the ovens altogether could burn (based on the combustion capacity of the single oven's grill) 23,200 kg of coke,[37] the average coke consumption for each corpse according to Jean-Claude Pressac would be (23,200÷4,756 =) 4.88 kg, which is thermotechnically impossible.

4.3. The Reason For Constructing Large Crematories

The decision to build three more crematories at Birkenau was made on August 19, 1942 (p. 49), *after* Himmler, during his inspection of Auschwitz on July 17 and 18, 1942, had ordered that the actual forecast for the KGL (prisoner of war camp) at Birkenau be increased from 125,000 to 200,000 prisoners (p. 44). It also came *during* the terrible typhus epidemic in the summer of 1942, which caused decimation in the Auschwitz-Birkenau camp: In the male sector alone, from August 1 to 19, 4,113 deaths were registered,[38] on the average 216 per day. In the third trimester of 1942, the mortality was 20.5% of the average camp population,[39] which did not exceed 25,000 inmates. The capacity of the crematories was therefore quite adequate for the camp population established by Himmler, and provided for a possible future typhus epidemic.

4.4. Number of Cremations in 1943: Estimate of the SS.

The *Aktenvermerk* (file memo) of March 17, 1943,[40] (mentioned by Pressac on p. 119) shows the coke consumption estimate for the four crematories at Birkenau. The operational time of the crematories is estimated at 12 hours. The letter indicates the combustion capacity of the firing grates; therefore one is able to calculate the number of corpses that could possibly be cremated, namely, about 362 emaciated adult corpses per day.

From January 1 to March 10, 1943, ca. 14,800 inmates died in Auschwitz, an average of 207 per day. In February 1943, the mortality was approximately 7,400 inmates, an average of 264 per day.

In the same period, according to the *Kalendarium* of Danuta Czech, the number of the alleged gassing victims was appr. 72,700, an average of 1,054

---

[37] Crematorium I: 30 kg/h of coke × 6 fire places = 180 kg/h; crematoria II & III: 35×10×2 = 700 kg/h; crematoria IV & V: 35×4×2 = 280 kg/h; total: 1,160 kg/h × 20 hours = 23,200 kg of coke.

[38] D. Czech, *Kalendarium der Ereignisse im Konzentrationslager Auschwitz-Birkenau 1939-1945*, Rowohlt Verlag, Reinbeck 1989, p. 281.

[39] H. Langbein, *Menschen in Auschwitz*, Europaverlag, Vienna 1987, p. 74.

[40] APMO, BW 30/7/34, p. 54.

per day. From March 14 to 31, 1943, the number of the alleged gassing victims was appr. 15,300, an average of appr. 900 per day.

Based on these figures, the minimal coke consumption would have to have been 21,420 kg,[41] but the file memo mentioned above expects a coke consumption of only 7,840 kg for a daily operation time of the ovens of 12 hours.

This estimate therefore refers exclusively to deceased *registered* inmates of the camp.

4.5. Number Cremated in 1943: Coke Consumption

From March 15 to October 25, 1943, a total of 607 tons of coke was supplied to the crematories of Auschwitz-Birkenau. Furthermore, a total of 96 m^3 (3,390 cu. ft.) of wood was delivered in September and October 1943,[42] which correspond to about 21.5 metric tons of coke. In terms of energy, this amounts to a total of 628.5 tons of coke.

In this period, the number of natural deaths among the prisoners was about 16,000, that of the presumed gassed about 116,800,[43] thus altogether allegedly about 132,800. For the prisoners deceased of natural causes, there results an average coke availability of (628,500÷16,000=) 39.3 kg per corpse, a figure which is quite compatible with the consumption of the ovens, if considering the coke required to reheat the ovens each day. For the presumed homicidally gassed *plus* the prisoners deceased of natural causes, however, there results an availability of (628,500÷132,800=) merely 4.7 kg, which is thermotechnically impossible.

The estimate of the SS of March 17, 1943, and the quantity of coke supplied to the crematories from March to October 1943 demonstrate that the crematories cremated *only* the corpses of the registered prisoners deceased of natural causes and that, consequently, there was no mass homicidal gassing.

4.6. Cremation Capacity of the Crematories in 1943

From March 14 to October 25, 1943, the crematories at Birkenau were operable only for a total of 421 days. The maximum number of cremations theoretically possible (taking into account the corpses of babies and children) is about 105,000 corpses,[44] but the number of corpses to be cremated (presumed

---

[41] Appr. 200 inmates + appr. 900 presumed gassing victims = 1,100 corpses per day, of which appr. (1,100×30÷46=) 720 were to be cremated in crematoria II & III and the rest of 380 in crematoria IV & V, with a consumption of (720×22+380×16=) 21,420 kg coke.

[42] APMO, D-Au-I-4, segregator 22, 22a.

[43] This number is derived from the *Kalendarium*, op. cit. (note 38).

[44] C. Mattogno, "The Crematoria Ovens…," op. cit. (note 14), p. 404. For the crematoria II & III, 67 days of activity (from october 26 to december 31, 1943) have to be deducted from the 356 days of activity of that year, thus 222 days remain, × 360 cremations per day = 79,920

homicidally gassed plus registered prisoners) is claimed to have been about 142,000. Thus, the cremation capacity of the crematories rendered the cremation of presumed homicidally gassed prisoners impossible; therefore, there was no mass homicidal gassing.

In his gigantic work *Auschwitz: Technique and Operation of the Gas Chambers*, published in 1989, Jean-Claude Pressac states that from April to October 1943 the crematories at Birkenau cremated 165,000 to 215,000 corpses with 497 tons of coke,[45] which means that for him it was possible to cremate a corpse with an average of 2.6 kg of coke!

According to Rudolf Höss, Crematories II and III could cremate 2,000 corpses per day, and the Crematories IV and V 1,500 per day.[46] Hence the average consumption of coke per corpse was respectively 3.5 kg and 1.8 kg!

4.7. The Duration of the Fireproof Brick of the Cremation Ovens

In his 1989 book, Jean-Claude Pressac furnishes the following numbers of corpses cremated at Auschwitz-Birkenau:

Cremation Site	No. of Cremations	Page *A.T.O*
Crematory I	10,000	132
Crematory II	400,000	183
Crematory III	350,000	183
Crematory IV	6,000	236
Crematory V	15,000	236
Cremation Pit 1942	107,000	162, 213
Cremation Pit 1944	50,000	236, 390
Total:	938,000	

These numbers refer exclusively to those presumed homicidally gassed and do not include the corpses of the registered prisoners who died of natural causes.

In his 1993 book, Jean-Claude Pressac reduced the number of presumed homicidally gassed to 630,000 and in the 1994 German edition to 470,000 to 550,000. He claims a total general death toll of 775,000, rounded up to approximately 800,000 (p. 148), and reduced this in the German edition to 631,000 to 711,000 inmates (p. 202).

---

bodies cremated; the crematoria IV & V had altogether 132 days of activity, × 192 cremations per day = 25,244 cremated bodies; total: 105,264 cremated bodies.

45 J.-C. Pressac, *Auschwitz:...*, op. cit. (note 7), p. 227.

46 Martin Broszat (ed.), *Kommandant in Auschwitz. Autobiographische Aufzeichnungen des Rudolf Höss*, Deutscher Taschenbuch Verlag, Munich 1981, p. 171 (Engl.: Steven Paskuly (ed.), *Death Dealer. The Memoirs of the SS Kommandant at Auschwitz*, Da Capo Press, New York 1996).

This revision of the number of those alleged to have been homicidally gassed has no relation to the Moscow documents studied by Pressac. The reduction is dictated exclusively by his realization that the Birkenau crematories in 1943 and especially in spring and summer of 1944 (see next chapter, 4.8.) could not have cremated the corpses of the presumed homicidally gassed even with the inflated capacity numbers he adopted. To eliminate the contradiction, he decreed that the number of the deported brought to Auschwitz-Birkenau at this time according to the *Auschwitz Kalendarium* (about 53,000) and, consequently, of those alleged killed with gas (about 42,000) is exaggerated (p. 147). Thus, on the basis of simple conjecture, Pressac expects to "correct" on one little page the recent study by Franciszek Piper on the number of victims of Auschwitz-Birkenau,[47] which is the most in-depth and documented work of established historiography, compiled with the help of the documents in possession of the Auschwitz museum. From the point of view of the supporters of the reality of homicidal gas chambers, the reference work therefore remains that of Piper, and the affirmations of Pressac are mere unfounded conjectures.

All the same, even the new number of cremations adopted by Pressac is technologically impossible. He reduces the number of those allegedly cremated in the open air in 1942 from 107,000 to 50,000, and has them no longer incinerated in "cremation pits," but on pyres. For 1944, he does not furnish any numbers. We therefore take those given in his 1989 book: 50,000. Therefore, of the 775,000 cremated claimed by Pressac, about 100,000 were allegedly cremated in the open, and the remaining 675,000 in the crematories.

Engineer R. Jakobskötter, speaking in 1941 of the Topf ovens heated with electricity in the crematory of Erfurt, stated that the second oven was able to perform 3,000 cremations, while the normal duration of the fireproof bricks of the ovens was 2,000 cremations.[48] The Gusen oven lasted for 3,200 cremations,[49] after which it was necessary to dismantle it and replace the fire-resistant walls.[50] The duration of one muffle was therefore about 1,600 cremations. Even if supposing that the ovens of Auschwitz-Birkenau were used to the extreme limit of 3,000 cremations per muffle, they altogether would have been able to cremate about 156,000 corpses. According to Pressac, the total

[49] The cremation oven of Gusen went into operation on January 29, 1941. From February to October 1941 in the Gusen camp, 3,179 prisoners died. H. Marsalek, *Die Geschichte des Konzentrationslager Mauthausen. Dokumentation*, Österreichische Lagergemeinschaft Mauthausen, Vienna 1980, p. 156.

[50] "*Bescheinigung über besondere Berechnung geleistete Tagelohn-Arbeiten*," October 12 - November 9, 1941. BK, NS4 Ma/54.

number of the victims among the registered prisoners was 130,000 (p. 146). Hence, the cremation of 675,000 corpses would have required at least four complete replacements of the fire-resistant bricks of all the muffles. This means that for Crematories II and III alone 256 tons of fire-resistant wall material would have been necessary (not counting that for the gas generators), with a labor time of about 7,200 hours (based on that required at Gusen).

However, in the archives of the Central Construction Office that were left "intact" by the SS of Auschwitz, which Pressac and I have examined in their entirety, there is not a trace of these enormous projects. This means that they were never carried out.

Once more we conclude that the cremation of 675,000 corpses was technologically impossible. Consequently no mass extermination was perpetrated at Auschwitz-Birkenau.

4.8. The Deportation and "Extermination" of the Hungarian Jews[51]

Jean-Claude Pressac, embarrassed by the technical impossibility of a mass cremation of the Hungarian Jews alleged to have been gassed, plays at reduction by declaring that of the approximately 438,000 deportees to Auschwitz-Birkenau, 146,000 were able to work and therefore were saved; the 292,000 remaining were incapable of work, and were gassed (p. 147). He also mentions the estimates of G. Wellers, who represents the orthodox view on the matter. Wellers claims that 410,000 Hungarian Jews had been gassed (p. 147).

From these, Pressac calculates that with a total capacity of Crematories II, III, and IV, and of the "cremation pits" of 3,300 corpses per day, with the possibility of an extension to 4,300 (Pressac does not say how), "the SS could annihilate up to 300,000 people in seventy days" (p. 148).

Regarding the first point, Pressac does not furnish any proof of the transfer of (146,000 – 28,000 registered prisoners =) 118,000 Hungarian Jews from Auschwitz. With the same "logic" one could claim that (438,000 – 28,000 =) 410,000 Hungarian Jews were transferred from Auschwitz, and thus did not undergo extermination.

Nevertheless, the deportation of the Hungarian Jews took place from May 15 to July 8, 1944, in a time frame of 54 days, not 70; therefore, even assuming the maximum capacity of 4,300 corpses per day (54 × 4,300), it would have been possible to cremate 232,200 corpses, not 292,000. As a matter of fact, after eliminating the pauses between the various waves of deportation and the actual days of deportation and arrival of deportees to Auschwitz,

[51] For this see C. Mattogno, "Die Deportation der ungarischer Juden von Mai bis Juli 1944. Eine provisorische Bilanz," *Vierteljahreshefte für freie Geschichtsforschung*, 5(4) (2001), pp. 381-395.

which were 39,[52] the installations at Birkenau would have been capable of cremating 39 × 4,300 = 167,700 corpses.–And where would the remaining 124,300 corpses have been put?

I may also point out that the aerial photographs taken by Allied airplanes on May 31, 1944,[53] were made exactly at the crucial time of presumed extermination. On that day at least 9,050 deportees arrived at Birkenau, and this after 15 days of intense arrivals (184,000 deportees, averaging 12,300 per day) and with an extermination toll of $^2/_3$ of them – according to Pressac's hypothesis – or at least 122,700 killed with gas.

The highest theoretical capacity of the Birkenau crematoria, considering the presence of children among the cremated, would have been 1,104 bodies per day.[54] Therefore, from May 17 to 31 not more than (15×1,104=) appr. 16,600 bodies could have been cremated, so the "cremation pits" had to deal with the rest of about 106,000 bodies within 15 days, or in average about 7,100 per day. But the aerial photograph of Birkenau of May 31, 1944, shows only one small column of smoke corresponding to a surface on the ground of perhaps 50 m^2, which would be sufficient for the cremation of some 50 bodies at best.[55]

These photographs[56] constitute irrefutable proof that the story of extermination of the Hungarian Jews is historically unfounded.

5. Genesis and Development of the "Final Solution"[57]

5.1. Choosing Auschwitz as Extermination Center

Jean-Claude Pressac states that the last stage of the "final solution"

> *"was not decided on by the SS authorities in Berlin until after May-June 1942. Its actual technical implementation was the task of the SS men of the Construction Office of Auschwitz and the engineers of the firm J.A. Topf and Sons of Erfurt."* (p. 2)

Regarding this, Pressac reports:

"at the beginning of June 1942, Himmler summoned Höss to Berlin and informed him of the choice of his camp as center for the mass annihilation of the Jews. The chief of the SS had chosen Auschwitz because of its favorable situation close to the railway, and because the camp would soon be provided with a powerful crematory capable of cremating 1,400 bodies per day (an episode that Höss wrongly places in the summer of 1941, which Eichmann also did after having read Höss's writings). The action would begin July 1, and everything would have to be ready to execute it by this date." (p. 41, my emphases)

In reality, it is Pressac who *wrongly* places in 1942 an event which, according to the chronological and logical developments of the events referred to by Höss, could only have taken place in 1941.

Let me summarize the chronology. In the memoirs which Höss wrote while in a Polish prison, he wrote:[58]

"In the summer of 1941 – at the moment I am not able to cite the exact date – I was suddenly summoned to Berlin to the Reichsführer [Himmler]*, by his aide. Contrary to his usual habits he revealed to me in absence of his aide the following: The Führer has ordered the final solution of the Jewish question, and we SS must execute this order. I chose Auschwitz, both for its optimal communications position and because the adjacent land can be easily isolated and camouflaged. You will learn further details from Sturmbannführer Eichmann, of the RSHA, whom I will send to you shortly. Soon thereafter, Eichmann came to me at Auschwitz, where he revealed to me the plan of action for the various countries. Hence, we went on to discuss the means of effecting the extermination plan. The means could only be gas."*

Höss continued:

"Eichmann promised that he would inform himself on the existence of an 'easily produced gas which would not require any particular installations, and that he would later inform me on the matter. We went to inspect the area to establish the best location, and ascertained that it was the farm [the future Bunker 1] *situated at the northwest corner of the future third sector of buildings, Birkenau.*[59] *Eichmann then returned to Berlin, to report to him* [Himmler] *the content of our conversation. At the end of November in Eichmann's office in Berlin a conference was held on the entire Jewish Section, at which I was invited to participate.* […] *We were not told when the action would begin, nor had Eichmann been able to find the appropriate gas. In the autumn of 1941, by means of a secret order given to the prisoner of war camps, the Gestapo separated all the politruks, the commissars and some political officials and sent them to the closest con-*

[58] *Kommandant in Auschwitz*, op. cit. (note 46), pp. 157-159.
[59] The future section BIII at Birkenau.

centration camp, to have them liquidated. At Auschwitz small transports of these men were continuously arriving; they were then shot in the gravel pit by the buildings of the [tobacco] *monopoly, or in the courtyard of Block II* [Block 11]. *On the occasion of one of my service trips, my substitute, Hauptsturmführer Fritzsch, on his own initiative, used gas to exterminate these prisoners of war; he filled the cells located in the basement to overflowing with Russians and, protecting himself with a gas mask, had Cyklon B* [Zyklon B] *infused, which provoked the immediate death of the victims. On Eichmann's next visit, I reported to him on the use of Zyklon B, and we decided that it would be the gas used for the imminent mass slaughter. The killing of the Russian prisoners of war with Cyklon B, which I referred to above, continued, but no longer in Block II, because after the gassing, the entire building would have to be aired out for at least two days. As a result, the mortuary room of the crematory near the hospital was used, after the doors were rendered gas proof, and gas emission holes were opened in the ceiling. I wouldn't know at what period exactly the extermination of the Jews began; probably already in September 1941, but perhaps only in January 1942."*

It is thus clear that the presumed summons of Höss to Berlin came *before* the first alleged homicidal gassing in the Bunker of Block 11 (and before the successive gassings in the morgue of Crematory I at Auschwitz); but since Pressac places this event "between the fifth and the end of December 1941" (p. 34), it is just as clear that the summons dates back to the summer of 1941, not to 1942.

Himmler's second motive for choosing Auschwitz – the planned extraordinary cremation capacity – does not find any verification in the "memoirs" and in the sworn testimonies of Rudolf Höss, but is the simple fruit of the fantasy of Jean-Claude Pressac. This is equal true for both the alleged precise date of the presumed summons (at the beginning of June) and for the date of the beginning of extermination (July 1). Both are Pressac's invention.

One may ask why Pressac would begin his book with these manipulations. The answer is simple: Not having found any evidence in Moscow of criminal aims in the plans of the crematories of Birkenau, and being forced to admit that these crematories were initially planned "without homicidal gas chambers" (p. 53), he had to postpone the alleged decision to exterminate the Jews by one year, since otherwise the planning of four crematories without gas chambers in the very place destined to be the principal center of such an extermination would have appeared too unlikely. Yet still, Pressac contradicts himself, because he places the beginning of the homicidal activities in Bunker 1 at the end of May 1942 (p. 39), that is, before R. Höss allegedly knew or received the alleged extermination order from Himmler according to Pressac (beginning of June 1942).

It is opportune to remember that the beginning of the activity at Bunker 1 was placed in January 1942 in the first edition of *Kalendarium of Auschwitz*;[60] in the second edition, it was moved to March.[61] Pressac finally moves it to the end of May. In all three cases this was done without any proof of any kind. In addition, since the second edition of *Kalendarium of Auschwitz* places the beginning of the activity in Bunker 2 at June 30, 1942,[62] it is evident that Höss theoretically must have been summoned to Berlin at the beginning of June, and it matters little that Höss never specifies it: Jean-Claude Pressac decrees it authoritatively.

Finally, the declaration of Rudolf Höss himself on the presumed summons to Berlin by Himmler in June 1941 upsets Pressac's reasoning from the very beginning.

5.2. Auschwitz: The First Gassing

Granting this, let us now follow this reasoning in its successive illogical and anachronistic development.

As indicated, Pressac places the first homicidal gassing in Auschwitz between December 5, 1941, and the end of that month (p. 34). Regarding this, Pressac writes:

> *"According to Höss (who was not present), death would have been immediate. Others speak of the gassing having lasted two days, with the introduction of a second toxic quantity, because the first did not kill everyone. Hydrocyanic acid, vaporizing at 27°C, used in an as yet unheated basement in full Silesian winter and a misreading of the lethal dose could explain the abnormal duration of this gassing."* (p. 34, my emphases)

According to the *Auschwitz Kalendarium* and based upon various eyewitnesses, this presumed event was supposed to have occurred between September 3 and 5, 1941.[63] Polish historian S. Klodziński sent a questionnaire on the alleged first gassing to 250 former prisoners of Auschwitz who were registered before September 1941. With the help of their responses, Klodziński alters the date of this gassing to a time frame between September 5 and 9, 1941.[64] Pressac, who in 1989 still followed the *Auschwitz Kalendarium* literally,[65] now moves the date by at least three months. On what basis? On the ba-

sis of my study *Auschwitz: The First Gassing*,[66] in which I demonstrated that this event has no historic foundation, because it is not only unsupported by any document, but even contradicted by available documents, and finally, because all the testimonies on this subject contradict each other in all essential points. Instead of accepting the inevitable conclusion, Pressac accepts merely one of my observations as correct,[67] but then he decrees that this supposed event did not only occur, but also that "at the present time" its official date is that which he indicates (p. 34).

Here Pressac gives one of many examples of his captious method. The story of the introduction of a second batch of Zyklon B, which killed those still alive, comes from the testimony of Michał Kula (deposition of June 11, 1945),[68] who, however, places the first homicidal gassing with absolute certainty in August 1941:[69]

> *"According to my information, the first gassing took place the night of the 14-15 and the day of the 15th of August 1941, in the Bunkers of Block 11. I remember this date exactly, because it coincides with the anniversary of my arrival at the camp, and because then the first Russian prisoners of war were gassed."*

Michał Kula is the witness from whom Pressac takes the story of the four wire-mesh columns for the introduction of Zyklon B into the supposed gas chambers of Crematories II and III (p. 74).[70]

Pressac's explanation for the "abnormal" duration of the supposed gassing is the cold temperature and executioners' alleged ignorance of the lethal dose. These claims have already been discredited in my book both on the basis of testimonies from witnesses (witness Glowacki: "there was a tremendous heat"; witness Kielar: "the air was muggy and hot") and by practical experiences during disinfestation of the military barracks with Zyklon B during the years 1940 to 1941. During these experiments local temperatures were at times between -4°C and -8°C, during which the major part of the gas had evaporated after just one or two hours.[71] Finally, in the work mentioned I have also shown that the lethal dose of hydrocyanic acid for human beings was per-

---

[66] Carlo Mattogno, *Auschwitz: La prima gasazione*, Edizioni di AR, Padua 1992. Revised and expanded Engl. edition see note 1.

[67] Ibid., Italian version, p. 159: "Since moreover the first gassing, according to the judge Jan Sehn, was an execution of condemnees to death selected by the commission presided over by Mildner, which arrived at Auschwitz 'in November 1941' and concluded its work 'after a month,' the first gassing in any case could not have occurred before December."

[68] Ibid., p. 85.

[69] Ibid., p. 84.

[70] Pressac even presents his own drawing of such columns, J.-C. Pressac, *Auschwitz:...*, op. cit. (note 7), p. 487.

[71] C. Mattogno, op. cit. (note 66), pp. 131f. The reference is to the article by G. Peters and W. Rasch, "Die Einsatzfähigkeit der Blausäure-Durchgasung bei tiefen Temperaturen," *Zeitschrift für hygienische Zoologie und Schädlingsbekämpfung*, 1941.

fectly known since the 1930s, on the basis of the book *Schädliche Gase, Dämpfe, Nebel, Rauch und Staubarten* (Verlag von Julius Springer, Berlin 1931), the classic by Ferdinand Flury and Franz Zernik. This is in direct contradiction to the statements of Jean-Claude Pressac (see above).[72]

Pressac's thesis includes another contradiction, because this supposed event, predating by at least five months the alleged decision to exterminate the Jews (according to Pressac) evidently has no connection with this any more than do the successive gassings in the morgue of Crematory I of Auschwitz, starting in January 1942. All the same, Pressac affirms that at the end of April 1942, it was decided due to difficulties to "transfer the activity to Birkenau" (p. 35). In other words, it was decided to put Bunker 1 into operation, although it was linked to the extermination of the Jews.

Here Pressac destroys the logically sound, though historically false argument, which he put forth in his 1989 book:[73]

> *"Because the lethal dose for humans was not known, the SS had made a botched trial gassing in the basement of Bunker 11 of the Stammlager on 3, 4, and 5 September 1941, the victims being 850 Soviet POWs and other prisoners.*
>
> *It was subsequently seen to be more convenient to gas people as required in the very place where all corpses inevitably had to go eventually: the morgue of Krematorium I.*
>
> *But trials to perfect the technique could not be carried out in this crematory attached to the camp, hence the idea of establishing Bunker 1 in an isolated location on the edge of Birkenau wood."*

Regarding the "final solution," Pressac inflicts the final blow to the traditional interpretation of the Wannsee conference declaring in this connection:

> *"January 20, 1942, the so-called Wannsee conference was held in Berlin. If an operation to 'expel' the Jews towards the East was indeed anticipated with the evocation of a 'natural' elimination by work, no one spoke then of industrial liquidation. In the days and weeks that followed, the Bauleitung of Auschwitz received neither appeal, nor telegram, nor letter calling for an installation adapted to this end."* (p. 35, my emphasis)

The story of this supposed "final solution," begun with a *verbal* order from Himmler, could only have been concluded with another *verbal* order:

> *"The end of November* [1944]*, on the verbal order of Himmler, the homicidal gassings were stopped."* (p. 93)

Needless to say, there is no proof of the existence of this "verbal order."[74]

[73] J.-C. Pressac, op. cit., (note), pp. 184.

[74] The *Kalendarium* places this alleged order under November 2, 1944, op. cit. (note 38), p. 921.

6. Crematories II and III

6.1. The Originally Intended Use of the Crematories

Jean-Claude Pressac affirms that a capacity of 1,440 corpses per day was planned for the new crematory destined for the main camp, which later became the prototype for Crematories II and III at Birkenau (p. 28). As we have seen, that is what – according to Pressac – induced Himmler to choose Auschwitz for carrying out the extermination of the Jews, in addition to the good railway connection (p. 41). He nevertheless specifies that:

> *"Although Crematory II has served as a catalyst for the choice of Auschwitz in the liquidation of the Jews, it is not linked directly to this extermination, but is considered as an occasional supplementary means; Crematory III is planned only as an extension of II, to deal with an effective 200,000 prisoners, and is only 'criminalized' for the needs of the SS bureaucracy."* (pp. 54f.)

Crematory III had a "sanitary orientation" (p. 50), equal to Crematory II, of which it was naturally the extension; the structures of Crematory II and III were not planned with the intention of homicidal gassing (p. 63), and none of the four crematories at Birkenau initially anticipated homicidal gas chambers (p. 53). Crematories IV and V instead "belonged to Bunkers 1 and 2" (p. 50); they were "destined to Bunkers 1 and 2" (p. 52), "connected directly to Bunkers 1 and 2" (p. 54).

So according to Pressac, Crematories II and III initially had a normal hygienic-sanitary purpose, while Crematories IV and V (which were not equipped with homicidal gas chambers) had a criminal function because they were supposed to have cremated corpses form alleged homicidal gassings in the Bunkers 1 and 2.

This results in the nonsensical conclusion that the technicians of the Auschwitz Central Construction Office assigned thirty muffles with a presumed capacity of 2,880 corpses per day to the normal health measures of the camp (i.e., for the incineration of victims of epidemics), but only sixteen muffles with a claimed capacity of 1,536 corpses per day to mass extermination. In other words, they expected more corpses from natural mortality than from mass extermination!

Another Pressac conclusion, even more revealing is that Auschwitz was chosen by Himmler to commence extermination of Jews because of the design of the new crematory, which Pressac presumes could cremate 1,440 corpses per day. However, instead of making this crematory and its twin Crematory III the fulcrum of the extermination, the technicians of the Central Construction Office turned to two other crematories of distinctly lower capacity!

Regarding the genesis of the other three Crematories (III, IV and V), Pressac writes:

> *"The 19th* [August] *is to be considered the date when the decision to build three other crematories at Birkenau was ratified, of which two were linked directly to the criminal process of annihilation of the Jews."* (p. 49)

But August 19 is also the date, on which a terrible typhus epidemic raged at Auschwitz-Birkenau that decimated the prisoners of the camp. Pressac himself admits that:

> *"the pressure of the typhus epidemic, with its 250 to 300 deaths daily among the prisoners as well as among the civilians and the SS men, plus the incessant arrivals of Jewish convoys, pushed Bischoff, on Höss's orders, to expedite the crematory program and to double it."* (p. 50)

Actually, the decision to construct four crematories at Birkenau resulted exclusively on the terror, which the typhus epidemic spread among the SS in light of the proposed expansion of the camp's population by about ten times.

6.2. The Term "Special"[75]

Pressac shows that the installations and the precautions of the SS aimed at halting the typhus epidemic bore the designation "special" (*Sonder*-) in the SS terminology. Doctor Wirths:

> *"foresaw a return of the typhus if some 'special measures' (Sondermassnahmen) to improve the sanitary situation were not taken urgently."* (p. 82, my emphasis)

Pressac explains correctly that:

> *"the terms 'special measures/Sondermassnahmen' and 'special measures of construction/Sonderbaumassnahmen' designate the dispositions relating to the sanitary issues or to the buildings if involved (for example, water supply, hygienic measures applied to the prisoners, etc."* (p. 107, note 256, my emphasis)

With the construction of the disinfection and disinfestation installation of the *Zentralsauna:*

> *"the SS wanted to 'definitively' counter any resurgence of the typhus at Birkenau."* (p. 69)

The *Zentralsauna* was in fact part of the *Sonderbaumassnahmen* (p. 107, note 256) and, as with the crematories, was involved in the *Durchführung der Sonderbehandlung* (implementation of the special treatment) (p. 61).

If, therefore, the construction of the new crematory had a purely sanitary purpose (by Pressac's admission), and if its construction was to be accelerated "due to the situation created by the 'special actions,'" as is stated in a document of the end of July 1942 (p. 47) – written at a time when the typhus epi-

---

[75] See C. Mattogno, *"Sonderbehandlung" ad Auschwitz. Genesi e significato.* Edizioni di Ar, Padova 2001; Engl.: *Special Treatment in Auschwitz*, Theses & Dissertations Press, Chicago 2004.

demic reaped a rich harvest – it is clear that these "special actions" *(Sonderaktionen)* were linked to the fight against the epidemic and had no criminal connotation.

And if the same document mentions "4 barracks for the special treatment *of prisoners* at Birkenau" (p. 46, my emphasis), it is equally clear that even this "special treatment," reserved for registered *prisoners* of the camp, referred simply to the "sanitary measures applied to the prisoners," to use the words of Jean-Claude Pressac.

And if finally on August 26, 1942, during a massive typhus epidemic, Zyklon B was picked up at Dessau "for special treatment," it is still clear that it served disinfestation purposes (p. 47).[76]

It should be pointed out that an Auschwitz construction plan from Oct. 28, 1942, shows a disinfestations building with a floor area of 1,000 m² destined "for special treatment," that is, for the hygienic-sanitary treatment of inmates. This building included a heating facility, showering facilities, and a disinfestations facility and was estimated to cost 73,680 Reichsmark. A second smaller disinfestations facility was planned for the guards.[77]

Contradicting himself once more, Pressac claims that the term "special treatment" was an agreed-upon term that designated "the liquidation by gas of the unfit Jews at Birkenau." (p. 46) He further specifies that:

> *"the killing itself was called 'special treatment' or 'transfer of Jewish population,' whereas the entire operation, including selection, transport of the unfit, and homicidal gassing, was termed 'special action,' a term not specifically criminal, since it could apply to a non-criminal operation as well."* (p. 46)

Pressac himself mentions a case in which the term "special action" had no criminal meaning at all. After a strike (in an extermination camp!) of the civilian workers on December 17 and 18, 1942, the Gestapo made a "special action" consisting of the interrogation of these workers in order to find out what had produced the refusal to work (p. 63).

In brief: neither "special measure," "special construction measure," "special treatment," nor "special action" had a criminal significance, and Jean-

---

[76] In the Auschwitz construction plan of October 28, 1942, a disinfestation facility *Entwesungsanlage* of 1,000 m^2 *für Sonderbehandlung* was foreseen and planned specifically for the hygienic-sanitary treatment of the prisoners; it was endowed with heat, showers, and disinfestation installations *(Heiz-Brause- u. Desinfektionsanlage)* and had a cost of 73,680 RM. Another *Entwesungsanlage* smaller (262.84 m^2) was destined for the guard troops *(für die Wachtruppe)*. *Zusammenstellung des Bauvorhaben Kriegsgefangenenlager Auschwitz (Durchführung der Sonderbehandlung*, *28. Oktober 1942.* Photocopy in: Florian Freund, Bertrand Perz, Karl Stuhlpfaffer, "Der Bau des Vernichtungslager Auschwitz-Birkenau," *Zeitgeschichte*, no. 5/6, May-June 1993, p. 207).

[77] "*Zusammenstellung des Bauvorhabens Kriegsgefangenenlager Auschwitz (Durchführung der Sonderbehandlung)*," October 28, 1942; cf. F. Freund et al. ibid.

Claude Pressac does not produce a single document to support the contrary. Therefore, his claims are completely unfounded.

6.3. The Purpose of Zyklon B Deliveries

What Pressac writes about the supply of Zyklon B to Auschwitz is absolutely unbelievable. He pretends that the SS Economic Administrative Main Office (Wirtschafts-Verwaltungshauptamt, WVHA) knew nothing about the typhus epidemic that raged at Auschwitz-Birkenau in 1942. This epidemic required enormous quantities of Zyklon B for the purpose of disinfestation. He maintains that the camp administration, which did not want the WVHA to know of the epidemic, could not request Zyklon B without revealing the true, horrific conditions prevailing in the camp to its superiors in Berlin. This is how the camp administration extricated itself, according to Pressac:

> *"A ruse was devised. The blame for the bewildering quantities of gas used was placed on the Jews. The shipment authorization given on August 26 was for 'special treatment.' Although the authorities of the SS-WVHA of Berlin knew the end result of the 'treatment,' they were unaware of the specifics, that is, the quantities of toxin used. Since 2% to 3% was enough, this allowed to make the WVHA think that the majority of the Zyklon B delivered was needed for homicidal gassings in Bunker 1 and 2. In this manner, 97% to 98% of the gas could be used for delousing."* (p. 47)

The goal of this reasoning is quite clear. The purpose for ordering Zyklon B are allegedly twofold: On the one hand the "special treatment" (procurement of August 26) and the "resettlement of Jews" (October 2), terms that Pressac interprets in the criminal sense. On the other hand, the disinfestation ("gas for disinfesting of the camp" July 29).[78] There would therefore exist two types of procurements, bureaucratically defined: one for gassing Jews, the other for disinfestation of the camp. But in this case, the quantity of Zyklon B for a homicidal purpose would be enormous, because the request of October 2 alone refers to 5 tons gross. This contradicts the thesis advanced by Pressac in his 1989 book that only 2-3% of the Zyklon B supplied to Auschwitz was used for the purpose of homicide.[79] To overcome this contradiction, Pressac has found nothing better than to assert that the request for Zyklon B, supposedly for the purpose of homicide ("special treatment," "resettlement of Jews") was in reality only a camouflage for requests with a sanitary purpose! Just how far the WVHA was unaware of the epidemic of typhus that raged at Auschwitz can be deduced from the fact that Doctor Wirths, who on September 6, 1942, had been

---

[78] NO-2362, NO-2363; D. Czech, op. cit. (note 38), p. 259.
[79] J.-C. Pressac, *Auschwitz:...*, op. cit. (note 7), p. 188.

> *"appointed chief garrison physician of the Auschwitz camp in order to stem the epidemic of typhus,"* (p. 116)

came from the Inspectorate of the Concentration Camps,[80] that is, from Office Group D of the WVHA.

Realizing the naiveté of his reasoning, Pressac seeks to render the picture he has drawn more credible by falsifying the purpose of Pohl's visit of September 23, 1942, to Auschwitz:

> *"The Chief of the SS-WVHA, General of the SS Army Corps Pohl, appeared unexpectedly in the morning of September 23 at Auschwitz in order to find out what was going on and where the allotted tons of Zyklon B were vanishing. Pohl went first to the Bauleitung, had the general layout of the camp explained and the buildings that had been erected, those under construction (including the four crematories of Birkenau), and those planned described to him. His question on Zyklon B was answered that with this product Jews and lice were destroyed at the same time."* (p. 59, my emphasis)

Pressac's source for the above is the diary of Johann Paul Kremer[81] (Pressac's notes 182f on p. 105). In reality, Kremer's diary entry reads as follows:

> *"In the morning, Obergruppenführer Pohl arrived with his entourage at the residence of the Waffen SS. In front of the door a sentinel. For the first time I am presented arms. The evening at 20 hours; dinner at the SS Officers Club in the company of Obergruppenführer Pohl: a real feast. We were served fried pike made to order, real coffee, an excellent beer, and some sandwiches."*

That is all. The rest is the product of Pressac's imagination. On p. 117 Pressac contradicts himself twice by writing that Pohl had gone to Auschwitz:

> *"above all concerned with constructing a large water purification station at Broschkowitz (north of the town of Auschwitz) to reduce the risk of typhus."* (p. 117, my emphasis)

Therefore the WVHA knew very well about the typhus epidemic, and Pohl did not inspect Auschwitz to ask "where the allotted tons of Zyklon B were vanishing."[82]

---

[80] *Auschwitz vu par les SS*, Oświęcim State Museum, 1974, p. 337.
The WVHA was informed monthly of the number of prisoner deaths in all the concentration camps, including Auschwitz (PS-1469).

[81] Ibid., pp. 233f.

[82] I have been accused of having misrepresented Pressac's thoughts on that issue; I refer the reader in this regard to my study *Olocausto: dilettanti nel web*. Effepi, Genova 2005 (also to appear in *The Revisionist*).

6.4. Structural Changes of the Crematories

Jean-Claude Pressac's fundamental thesis is that Crematories II and III, planned and constructed as simple sanitary installations, were subsequently turned into instruments of crime:

> *"Towards the end of October 1942, the obvious idea prevailed to transfer the 'gassing' activity of Bunkers 1 and 2 into a room of the crematory, equipped with artificial ventilation, as had been practiced in 1941 in the morgue of Crematory I."* (p. 60)

That is an arbitrary statement by Pressac, not supported by any document. He adds an equally unfounded assertion, that

> *"in November 1942, the SS of the Bauleitung was determined to equip the crematories with homicidal gas chambers."* (p. 66)

According to Pressac, initially the intentions of the SS were to

> *"use the 'morgue 1' of Crematory II for the gassings as soon as it was operational, Or, if shipment of the required material was delayed, to fall back on the 'Leichenhalle'* [morgue] *of Crematory I after having installed the final ventilation system already delivered. This ventilation system was capable of extracting 8,300 m^3 of air per hour from all the rooms of the building, and about 3,000 m^3 per hour from its 'Leichenhalle.'"* (p. 61)

This appears clearly irrational even from Pressac's perspective. After all, the Central Construction Office could have continued to use Bunkers 1 and 2 as it had done until then for mass extermination of the Jews while they were waiting for the requested materials to arrive for the homicidal transformation of morgue 1 of Crematory II. According to Pressac, the gassings in Crematory I had already been transferred to Birkenau at the end of April 1942 because

> *"gassings required the total isolation of the crematory zone, which disturbed the activity of the camp,* […] *while* [the crematorium was] *in operation, gassings could not be performed."* (p. 35)

… and the crematorium was operating quite often!

The idea that the SS were thinking to move the supposed homicidal gassings back to Crematory I, occurred to Pressac probably because a note dated November 27, 1942, gives the order to install the ventilation system in the morgue of Crematory I (p. 60). But at the same time Pressac writes with reference to the installation of a temporary ventilation system in crematory I, which was performed by the Boos firm between February 23 and March 1, 1941 (p. 18), that

> *"homicidal gassings with a toxic agent could be carried out there because its morgue was mechanically ventilated."* (p. 23)

Therefore, if the temporary ventilation system already allowed homicidal gassings, why install a permanent system? If instead the permanent system was indispensable for homicidal gassings, why wasn't it installed immediately

instead of being left in a storage room? It had been shipped by Topf on April 16, 1942.

Then Pressac claims, the idea to use Crematory I for mass gassings was discarded by the Construction Office. They instead concentrated their efforts on the criminal transformation of Crematory II and III:

> *"Transferring the homicidal gassings to Crematories II and III seemed easy on paper, but was much less so because the building, planned by Prüfer and improved by Werkmann, had not been envisioned for this purpose. The ground floor with its oven room and service rooms, did not need to be modified. But the basement had to be amended so that the 'special actions' could be carried out there."* (pp. 63f., my emphasis)

There is no doubt that starting at the end of 1942, the basement of Crematory II underwent various changes if compared with the initial layout. There is also no doubt that the oven room had not undergone any modification in number or capacity with respect to the initial plan. How to explain this inconsistency? If Crematory II had been planned as a simple sanitary installation, adequate for the natural death toll of the camp, its transformation into an instrument of mass extermination would have required a corresponding increase in the capacity of the ovens: in other words, the installation of additional ovens. But that did not happen. Therefore, all that can be done to support the extermination thesis in this regard is to excessively inflate the real capacity of the ovens and, contradictingly, to infer that the ovens could handle even a mass extermination without difficulty although they were designed for hygienic purposes. To overcome the contradiction, Pressac simply declared that Crematory II could *really* cremate 1,440 corpses in 24 hours (a figure which would make experts wonder).

The reality is quite different. The installation in Crematory II and III of a 210 m^2 gas chamber (the area of morgue 1), in which it would have been possible to gas 1,800 victims without difficulty (the eyewitnesses speak even of 3,000), would have required 75 muffles for the cremation of all the corpses in one day – instead of the existing 15. The time required to cremate the bodies of the victims would have taken five days, presenting a serious obstacle to an extermination process. The mere fact, therefore, that the oven room was *not* transformed, demonstrates that the changes made in the basement were not of a criminal nature.

The changes made in the basements of Crematories II and III are once more visible from plan no. 2003 of December 19, 1942, which Pressac considers a "*bavure architecturale*"[83] (architectural glitch), in which the slide for the corpses no longer appears:

[83] With the term "*bavure*" Pressac means:

> *"The north stairway becomes the only possible access to the morgues, which implies that the dead will have to descend the stairs walking."* (pp. 64f.)

Actually, Plan 2003 was nothing more than a proposal to transfer the basement access to the street side[84] and not a plan to eliminate the slide. Therefore, the absence of the slide is basically a simplification of a part of the drawing, which is technically irrelevant. The elimination of the slide would have been technically irrational (unless the lift were used to transport the corpses to the mortuary rooms), since the natural mortality at the camp continued. In fact, the slide was constructed according to the original plan both in Crematory II and in Crematory III. This was independent of the fact that:

> *"Plan 2003 arrived too late at construction sites 30 (Crematory II) and 30a (Crematory III),"* (p. 65)

as Pressac claims. That, however, could not be valid for Crematory III (which was in a less advanced construction stage) but, more precisely, depended on the logical necessity of an easy access for the corpses to the mortuary chambers.

The initial plan of the SS (November 1942) was, according to Pressac, to install in Crematories II and III two homicidal gas chambers operating alternately:

> *"The SS had also envisioned that both morgues be used as gas chambers, at that time wrongly believing that the large capacity expected for the five three-muffle ovens would permit an alternating operation. In this configuration, an exterior undressing room was indispensable, opening directly to the access stairway that connected the two rooms through the central vestibule. Moreover, it was further essential to improve the ventilation of morgue 2 by adding an air intake fan. At the time it had only an duct that drew out air from the room. <u>After the ovens had been tested and their capacity could be estimated more accurately</u>, this solution was rejected because it ended up producing a heap of corpses in the basement, which the ovens on the ground floor would have taken too long to incinerate."* (p. 66, my emphasis)

Here Pressac gets entangled in another series of insurmountable contradictions. On one hand, the plan of the double homicidal gas chamber, which depended on an overestimate of the capacity of the ovens, could not have been done in November 1942, because the two three-muffle ovens of the crematory of Buchenwald that were of the same model as the ovens in Crematories II and III of Birkenau went into operation on August 23 and on October 3, 1942,

---

> "*Any indication noted in any document whatsoever (writing, plan, photo) relating to an abnormal use of the crematories that could only be explained by the massive gassing of human beings."* (p. 60)

[84] "*Verlegung des Kellerzuganges an die Strassenseite*," J.-C. Pressac, *Auschwitz:...*, op. cit. (note 7), p. 302.

respectively (p. 39). In November, therefore, the oven's real capacity was perfectly known, having already been in activity a total of four months. Furthermore, the plan of the double homicidal gas chamber could not have been abandoned in November 1942 in consequence of the real capacity resulting from the testing of the ovens, because the *first* test of the ovens in Crematory II took place, according to Pressac, on March 4, 1943 (p. 72).

What is certain, however, is that Jean-Claude Pressac admits the irrationality of a plan which envisioned a capacity of corpses in the basement of the crematories, which would have been enormously greater than that of the ovens on the ground floor. In fact, he even states that these alleged homicidal gas chambers were divided in two in order to balance the process of extermination. And because the capacity of the ovens was in his opinion – which lacks any technical basis – still inferior to that of the gas chambers:

> *"The search for a better arrangement continued even after the start of operation. Thus, at the end of 1943, so as to 'standardize' the operation of Crematories II and III, the administration of the camp had their gas chambers divided in two, devoting no more than 100 m^2 for gassing, to kill and incinerate 500 to 700 unfit arrivals (including many children) in twenty-four hours."* (p. 67, my emphasis)

The source of this information is the deposition of H. Tauber, which, however, speaks only of Crematory II. Therefore, Pressac's attribution of this supposed modification to Crematory III is unwarranted as well. In his book of 1989, Pressac comments regarding H. Tauber's story concerning the division of the gas chamber and of the successive gassings as follows:[85]

> *"One of the very few contestable points in the deposition."*

Needless to say that there is no proof of this supposed division, neither documentary nor architectural.

To summarize: Since the maximum real capacity of Crematories II and III of 360 corpses per day (considering the presence of the corpses of children), Pressac admits *a fortiori* the pointlessness of a supposed extermination plan by the Construction Office.

The final project of the SS effectively accomplished, according to Pressac, was the transformation of morgue 1 into a homicidal gas chamber, and of morgue 2 into an undressing room. That would mean that Crematories II and III were no longer provided with mortuary rooms. So, one may ask, where did the SS expect to deposit the corpses of the registered prisoners deceased of natural causes, which had to be cremated? The question is even more legitimate, because for each of the planned Crematories II and III originally three(!)

---

[85] Ibid., p. 484.

mortuary rooms were planned, exclusively for sanitary purposes, with a total floor area of 671 m^2.[86]

6.5. Ventilation System

In support of his thesis, Pressac quotes a series of "glitches," which we shall deal with subsequently. Nevertheless, the "definitive" proof is connected to the ventilation system of the crematories.

The initial ventilation project of the new crematory included:

– An intake ventilator no. 450 for the *B-Keller* (the future morgue 1) with a capacity of 4,800 m^3/h;
– An outlet ventilator no. 450 for the *B-Keller* with a capacity of 4,800 m^3/h;
– An outlet ventilator no. 550 for the *L-Keller* (the future morgue 2) with a capacity of 10,000 m^3/h;
– An outlet ventilator no. 550 for the oven room with a capacity of 10,000 m^3/h;
– An outlet ventilator no. 375 with a capacity of 3,000 m^3/h for the autopsy room (p. 30).

Since Pressac indicates even the volume of the respective rooms (p. 30), it is possible to calculate the number of air exchanges estimated within one hour:

– (4,800÷483) = 9.93 exchanges for the B-Keller;
– (10,000÷966) = 10.35 exchanges for the L-Keller;
– (10,000÷1,031) = 9.69 exchanges for the oven room;
– (3,000÷300) = 10 exchanges for the autopsy room.

Subsequently, the capacity of the fans was allegedly increased as follows (p. 38):

– intake fan for *B-Keller*: 8,000 m^3/h (=16.56 air exchanges per hour);
– outlet fan for *B-Keller*: 8,000 m^3/h (= 16.56 air exchanges per hour);
– outlet fan for *L-Keller* 13,000 m^3/h (=13.45 air exchanges per hour);
– outlet fan for oven room: 12,000 m^3/h (= 11.64 air exchanges per hour);
– outlet fan for autopsy room: 4,000 m^3/h (= 13.33 air exchanges per hour);

The capacity of the ventilators mentioned by Pressac is not certified by any document. He obviously calculated them on the basis of the power of the motors. These are shown in the D59366 Topf plan of March 10, 1942 (Pressac's Documents 13-15) which, by its own date, refers to a period, in which the crematory was being planned exclusively for hygienic purposes.

---

[86] Ibid., p. 286. See in this regard also C. Mattogno, "The Morgues of the Crematoria at Birkenau in the Light of Documents," *The Revisionist*, 2(3) (2004), pp. 271-294, especially part II, "The Use of the Morgues of the Crematoria at Birkenau in 1943-1944," pp. 279-283.

Pressac states that the morgues 1 of Crematories II and III were actually equipped with ventilators with a capacity of 8,000 m^3/h of air (p. 74 and 118), and he even mentions the invoice of the ventilation system for Crematory III: invoice No. 729 of March 27, 1943 (p. 105, note 184).

He suggests that the increase of ventilator capacity from 4,800 to 8,000 m^3/h was meant to compensate for the arrangement of the ventilation system planned and built for a normal mortuary room. In fact he states, in relation to the "gas testers," which we will deal with later:

> *"The SS wanted to verify if the power of the ventilation of morgue 1 would compensate for its original disposition, that is, air intake at the top and outlet at the bottom* [of the morgue]*, which was designed for a mortuary, but which would have to be inverted for gas chamber, requiring air intake at the bottom and the outlet at the top."* (pp. 71f.)

And because by this time morgue 2, having become a changing room, no longer required a ventilation system – Pressac claims – the ventilation systems were installed in Crematories II and III but the ventilators' motors were not. (pp. 79f.)

The study of the ventilation systems of Crematories II and III actually provides definite proof that morgue 1 was ***NOT*** transformed into a homicidal gas chamber. First of all, the Topf invoice No. 729 dated March 27, 1943,[87] cited by Pressac mentions that a ventilator with a capacity of 4,800 m^3/h was required for the *B-Raum*, the supposed homicidal gas chamber, and that a ventilator with a capacity of 10,000 m^3/h was needed for the *L-Raum*, the supposed changing room. The same capacities are indicated by the invoice No. 171 of February 22, 1943, for Crematory II.[88]

In his preceding 1989 work, Pressac publishes a table which summarizes "Dimensions and volumes of the Krematorium II and III Leichenkeller" on the basis of the plans of the crematories:

Morgue 1 measured 30 m in length, 7 in width, and 2.41 in height; it therefore had an area of 210 m^2 and a volume of 506 m^3.

Morgue 2 was 49.49 m long, 7.93 m wide, and 2.30 m high, so its area was 392.5 m^2, its volume 902.7 m^3.[86]

Consequently, for the supposed homicidal gas chamber, the SS had foreseen (4,800÷506=) 9.48 air exchanges per hour, while the supposed changing room (10,000÷902.7=) 11 air exchanges per hour: Thus the gas chamber was less ventilated than the changing room! But that's not all. In Engineer W. Heepke's classic work on the planning of crematories, one reads that for morgues/mortuaries it was necessary to provide a minimum of five air changes per hour, and in case of intense utilization, up to ten exchanges.[89] It is

---

87 APMO, D-Z/Bau, nr. inw. 1967, pp. 246f. (see appendix, Document No. 2).
88 Ibid., pp. 231f. (see appendix, Document No. 3).
89 W. Heepke, op. cit. (note 28), p. 104 (see appendix, Document No. 4).

therefore evident that the ventilation system of morgue 1 was planned and built for a morgue. As a means of comparison, the Zyklon B disinfestation gas chambers with the DEGESCH circulation system, the plans of which Pressac publishes in documents 16 and 17, were designed with seventy-two air exchanges per hour.[90]

Additionally, we notice that seventeen air exchanges per hour were planned for the first ventilation system by the Topf firm for Crematory I of Auschwitz (p. 18). This was almost twice that of the alleged homicidal gas chamber of Crematories II and III! These plans were for the autopsy room and morgue, without any homicidal purposes, with a purely hygienic goal.

Concerning the ventilation of morgue 2, it is true that the motor destined for this area does not figure in Plan 2197 of March 19, 1943, but that does not mean that it was decided not to install it at all. The work done in the crematories demonstrate the contrary. In Crematory II, the ventilation system of the alleged homicidal gas chamber in morgue 1 was installed between February 22 and April 14, 1943; the ventilation system of morgue 2, the alleged changing room, was installed between March 15 and 28; the ventilation system of morgue 2 of Crematory III was installed between April 12 and 22, as Pressac informs us in his 1989 book.[91] If the absence of ventilator motors had been based on the SS decision to convert morgue 2 into a homicidal gas chamber, it is difficult to understand why they later had the ventilation systems installed in the two crematories of morgue 2 after all, *after* they had allegedly decided that morgue 2 did not need a ventilation system! It is therefore evident that the SS had the ventilation system of morgue 2 installed because they intended to use it. That the motors were not installed immediately was solely coincidental.

What has been presented here is already more than sufficient to give the lethal blow to Jean-Claude Pressac's thesis about the criminal character of the "glitches" listed by him. They all have a completely different background if put into their proper context.

---

[90] This follows, among other things, from the article by G. Peters, E. Wüstiger mentioned by Pressac on pages 41 and 103, from which he also draws Documents 16-17. The title indicated by J.-C. Pressac: "Entlausung mit Zyklon Blausäure in Kreislauf-Begasungskammern," (*Zeitschrift für hygienische Zoologie und Schädlingsbekämpfung*, Heft 10/11, 1940; note 134 on p. 103) is wrong; the exact title is: "Sach-Entlausung in Blausäure-Kammern" (*Zeitschrift für hygienische Zoologie und Schädlingsbekämpfung*, 1940, pp. 191-196; see appendix, Documents No. 5 and 6). On page 195 one reads:

> *"Ventilator with motor. For this a capacity of 12 m^3 per minute with a static pressure of 80 mm of water column is sufficient to produce a very rapid development of the gas as well as a sufficiently rapid ventilation (72 air exchanges per hour) of the contents of the gassed chamber."*

[91] J.-C. Pressac, *Auschwitz:...*, op. cit. (note 7), p. 370.

6.6. "Gassing Cellar" and other "Glitches"[92]

Pressac correctly states that the struggle against typhus at Auschwitz was aided by the disinfestation systems (p. 84). Since the appearance of the first cases of typhus, the SS had begun to think of expanding the existing systems and to also use new technologies. This was the topic of a meeting on June 30, 1942 (p. 83). The compelling necessity of new disinfestation systems is confirmed by the design of the *Zentralsauna* (November 24, 1942),[93] which, because of its importance in the fight against the typhus epidemic, was part of the "special construction measures." Its construction was part of the category "implementation of special treatment." There is circumstantial evidence indicating that in the meantime, at the end of 1942, the SS had decided to install several temporary disinfestation gas chambers in the Crematories II and IV,[94] which were in a more advanced phase of construction. That would explains in a historical and logical manner all the "glitches" mentioned by Pressac, which we shall address shortly.

- The term "special cellar" (*Sonderkeller*) applied to morgue 1 (p. 60) matches other similar terms beginning with "special," which are all linked to the fight against typhus.
- The term "gassing cellar" (*Vergasungskeller*) designates a disinfestation basement. In the explanatory report on the construction of the POW camp Birkenau dated October 30, 1941, the two Zyklon B disinfestation buildings subsequently built, BW5a and 5b, are equipped with a "gassing room" (*Vergasungsraum*).[95]
- The plan to preheat morgue 1 (p. 73) makes sense for a disinfestation gas chamber, because it would permit shorter gassing times (the duration of a gassing using 20 g of hydrocyanic acid per square meter required 45 minutes at a temperature of 25°C to 35°C, but three hours at a temperature of 0 to 5°C).[96] In contrast to that, the temperature in a homicidal gas chamber packed with human beings would be raised quickly by the vic-

tims' body heat. A preheating would therefore not be necessary for a homicidal gas chamber.[97]

– The presence of a gas-proof door (p. 80) is perfectly normal in a disinfestation gas chamber.
– Regarding the presence of 14 showers in morgue 1: According to Pressac, this is a "glitch" because these showers were false (p. 80), and were used therefore to deceive victims of alleged homicidal gas chambers. That these showers were *false* is a simple arbitrary statement by Pressac. There are, in fact, documents proving that the SS did build in a *real* shower for inmates.[92]
– The mention of "a wooden fans" (*Holzgebläse*) destined for morgue 1 (p. 70) is for Pressac yet another "technical glitch" because:

> *"it proved that the air extracted was no longer that of a morgue, permeated by miasmas, but air mixed with a corrosive substance, which could be vented only by a non-corroding fan made entirely of wood (preferably cypress). The gaseous toxin used in the homicidal gas chambers was concentrated hydrocyanic acid (20 g/m³), and acids are corrosive."* (pp. 70f., my emphasis)

yet the above-mentioned wooden fan was later replaced with a metal one, as is clear from the file memo of March 25, 1943,[98] which reads:

> *"Instead of the wooden fan for the exhaust system of morgue I, a wrought-iron-type fan was adopted into the final design."*

Pressac must therefore explain why, given that hydrocyanic acid (as he says) is corrosive, the engineers of the Central Construction Office replaced a wooden fan with a metal one, and why the *Degesch* engineers proposed a metallic apparatus for the disinfestation gas chamber with their circulation system, like those that appear on Documents 16 and 17 of Pressac's book. Why would they have done this – so that they could have been "corroded" by hydrocyanic acid?

In these standard gas chambers (also referred to as "normal gas chambers"), which had a volume of 10 m^3, one can of Zyklon B of 200 g (HCN contents) was used in order to produce a gas concentration of 20 g/m^3. Pressac states, as always without any proof, that this was the concentration of the alleged homicidal gas chambers. But previously he claimed that the concentration of gas used in homicidal gas chambers of

---

[97] The body of a normal adult, standing, produces 1.72 kcal per minute (a). 1,800 bodies produce therefore 3,096 kcal per minute. The heat of vaporization of hydrocyanic acid is 6.67 kcal/mole; since its molecular weight is 27.03, the vaporization heat of 6 kg of hydrocyanic acid is (6,000×6.67)/27.03 = 1,480 kcal, less than half of the heat produced by 1,800 bodies in one minute.

a) F. Flury, F. Zernik, *Schädliche Gase, Dämpfe, Nebel, Rauch und Staubarten*, Verlag von Julius Springer, Berlin 1931, p. 29.

[98] APMO, BW 30/25, p. 8.

Birkenau was 12 g/m^3.[99] We shall later learn Pressac's reason for this increase.

– "Drahtnetzeinschiebvorrichtung" – wire mesh push-in device – does not mean "introduction devices made of wire netting" (*dispositifs d'introduction en treillis de fil de fer*, p. 79). The German verb "*einschieben*" means to insert, to slide into, to push in, for example, to insert or push a drawer into a cabinet.
The alleged device for the *introduction* of Zyklon B in the alleged homicidal gas chambers would be called "*Einwurfvorrichtung*" (throw in device). Pressac himself speaks in fact of *déversement*, "pouring out," of the Zyklon B in the alleged homicidal gas chambers (p. 89). The wooden blinds (*Holzblenden*, p. 79) cannot be what Pressac maintains either, i.e. wooden covers or lids of the alleged introduction devices for the Zyklon B. These devices would be called "*Holzdeckel*," precisely *covers*, not blinds.
Pressac states that the above-mentioned devices were found in "morgue 1" (p. 79), that is, the alleged homicidal gas chamber. But in reality, in the inventory of Crematory II,[100] these devices are attributed to morgue 2, the alleged changing room (for the supposed homicidal gas chamber). Did the SS want to gas the victims in the "changing room"? But that's not all! These devices do not figure at all in the inventory of Crematory III.[101] Then how did the SS think they could introduce the Zyklon B into the gas chamber? By affably asking the victims to carry in the cans of Zyklon B and open them after the gas-proof door closed behind them?
Therefore, these devices could have been anything but what Jean-Claude Pressac claims.

– The designation "undressing cellar" (p. 74) attributed to morgue 2 is perfectly normal, if we assume that a temporary disinfestation gas chamber was installed in morgue 1.[102]

6.7. The "Normal Gas Chamber"

Jährling's "glitch" shows once again, as if there were any more need for it, with what kind of distorted logic Pressac has fabricated his "criminal traces." The paragrpah merits citation in its entirety. But first, it is necessary to give a brief historical introduction.

Nineteen Zyklon B gas disinfestation chambers with the circulation system were planned for the new reception building of the main camp, where newly

[99] J.-C. Pressac, "Les Carences et Incoherences du 'Rapport Leuchter,'" *Jour J*, 1988, p. III.
[100] Übergabeverhandlung of Crematory II, March 31, 1943. APMO, BW 30/43, p. 12.
[101] Übergabeverhandlung of Crematory III, June 24, 1943. APMO, BW 30/43, p. 24.
[102] See C. Mattogno, "The Morgues of the Crematoria…," part II, op. cit. (note 86).

arriving prisoners would be registered, bathed and disinfested. But these circulation systems were never installed.

At the end of 1943, it was instead decided to transform eight of these rooms into microwave disinfestation chambers, in line with a new process developed by the Siemens company. Work began in February 1944 (p. 88). At the same time, it was decided to put the eleven remaining rooms into operation by installing DEGESCH ciculation system. The Boos company, which should have performed this work, raised objections. The Testa company (Tesch & Stabenow), distributor of Zyklon B, had also taken an interest in the affair, as had chief garrison physician Dr. Wirths, who remembered that according to an ordinance in effect, Zyklon B had to be replaced by another gas: Arginal,[103] the use of which required an adaptation of the Zyklon B gas chambers (pp. 88f.).

> *"On this occasion, the civil employee Jährling committed an extraordinary blunder in a letter destined for the Testa company. He designated the delousing gas chambers as 'Normalgaskammer,' a word underlined and put in quotation marks, as if there existed 'normal' gas chambers and others which were 'abnormal.' The appellation was taken up by the Testa company, which first stated that the conversion to Arginal was only obligatory in the new installations, and insisted that the personnel who handled the normal gas chambers with the hydrocyanic acid should be particularly well trained: implying that their operation was distinctly more complex than the simple pouring of Zyklon B into the 'abnormal' gas chambers."* (p. 89, my emphasis)

If Pressac had familiarized himself even a little with the disinfestation gas chambers using hydrocyanic acid, he would have known that a "normal gas chamber" was a gas chamber according to the German norms established in those years, that is, a standard DEGESCH room with a circulation system. A disinfestation room not conforming to the norm was a simple auxiliary gas chamber (*behelfsmässige Blausäurekammer*).[104]

Therefore, Jährling simply wanted to underline that the planned transformation of the operating system referred to gas chambers planned as hydrocyanic gas chambers with the DEGESCH circulation system, that is, as normal gas chambers, and not to chambers without such a system, that is, abnormal gas chambers, like that in building BW 5b in Birkenau.

---

[103] The gas in question called Arginal (Alkylformiat) was used together with Cartox for the disinfestation of silos against *calandra granaria* (grain weevil), a fearful grain parasite (H.W. Frickhinger, *Schädlingsbekämpfung für Jedermann*, Heilingsche Verlagsanstalt, Leipzig 1942; G. Peters, op. cit. (note 7), pp. 37f. and 55-57).

[104] F. Puntigam et al. (note 96). This work describes with great accuracy two types of gas chambers: the standard ones with the *Kreislauf* system and the *Behelfsmässige Blausäurekammern* (pp. 62-68).

6.8. "10 Gas Testers:" The Definite Proof?[105]

The request for "10 gas testers" (*10 Gasprüfer*; p. 71. See appendix, Documents No. 7 and 8), supposing that it really deals with "indicator devices for prussic acid residue" (*Anzeigegeräte für Blausäure Reste*; p. 72), is perfectly normal for a disinfestation gas chamber.

Instead, Pressac writes, as enthusiastically as naively:

> *"This document constitutes the definitive proof for the existence of a homicidal gas chamber in Crematory II."* (p. 72, my emphasis)

This document can be at best an *indication*, not a *definitive proof*, of the existence of a gas chamber. But that this gas chamber was homicidal, is a simple arbitrary affirmation by Jean-Claude Pressac.

On this subject Pressac adds a very important explanation:

> *"Some experiments with the preliminary introduction of Zyklon-B were made. The measurement of the residual hydrocyanic gas would have been done by a chemical method and not with the ten gas detectors requested too late to be delivered on time."* (p. 73, my emphasis)

Although this document jibes perfectly with my thesis, it raises some serious problems, which neither Pressac nor any other historian ever addressed. To break them down:

a) In German technical terminology, the term "*Gasprüfer*" refers to simple analyzers of combustion gases.[106]
b) To prove the existence of hydrocyanic acid gas residue, there was only a chemical method, and no detectors based on physical properties.[107]
c) The apparatus that was used for this test was called "*Gasrestnachweisgerät für Zyklon"* (gas residue detection device for Zyklon).[108]
d) This apparatus was required equipment at all of the disinfestation installations, including those at Auschwitz.
e) Since these devices were available in the disinfestation installations at the camp, it would not have made sense to request them from a company that did neither produce them nor knew how to get them. They could have been obtained from the above-mentioned disinfestations installations or ordered directly from the companies which made or distributed them (the same ones that distributed the Zyklon B).

---

[105] For a more in-depth study of the topic dealt with in this chapter see C. Mattogno, "The 'Gas Testers' of Auschwitz. Testing for Zyklon B Gas Residues. Documents – Missed and Misunderstood," *The Revisionist*, 2(2) (2004), pp. 140-149; Mattogno, "Auschwitz: 'Gas Testers' and Gas Residue Test Kits," ibidem, pp. 150-155.

[106] *"Hütte" des Ingenieurs Taschenbuch*, Verlag von Wilhelm Ernst & Sohn, Berlin 1931, vol. 1, p. 1013, No. 3, with specific and exclusive reference to the *"Rauchgasanalyse"* (analysis of combustion gases) (p. 1011) (see appendix, Document No. 9 & 12).

[107] F. Puntigam et al. (note 96), p. 21.

[108] Letter of the Tesch & Stabenow company of July 29, 1942, to the *Waffen-SS Kriegsgefangenenlager Lublin, Verwaltung* (see appendix, Documents No. 10 and 11).

f) Since the camp administrations did not request gas masks with the special filter "J" (for hydrocyanic acid) together with the gas testers, it is clear that it was possible to procure them at the camp, where it could also procure the *Gasrestnachweisgeräte für Zyklon.*

My conclusion: the ten gas testers were simple analyzers of the combustion gases. They were meant to be installed either in the ten flues of the crematories II and III or in the chimney ducts of all crematories in Birkenau (II to V).

And this is all Pressac has to offer as homicidal "evidence" for the crematories II and III.

7. Bunkers 1 and 2[109]

Before examining Jean-Claude Pressac's statements on Bunkers 1 and 2, it is important to emphasize that the term "Bunker" like those of "red house" and "white house" cannot be found either in any German document or in any reports of the clandestine Polish resistance movement. It has been created by post-war "eye" witnesses.

Pressac states that Bunker 1, destined for mass extermination, went into operation at the end of May 1942 (p. 39), that is, as we have seen, even before Rudolf Höss – according to Pressac – received from Himmler the alleged order for extermination of the Jews.

There exists no document on the existence of Bunker 1 (and 2) as homicidal installations. What Pressac says on the subject, as if it were certified historical truth, is in reality the simple result of extrapolation of testimonies, which contradict each other on all essential points.[110]

According to Pressac, Bunker 2 began its activity at the beginning of June 1942 (p. 41). Pressac describes the genesis of the installation as follows:

> *"Not far from Bunker 1 arose a second little whitewashed farmhouse with an area of 105 m^2. It was simple to transform it into a gas chamber. The operation had already been implemented at Bunker 1, and it could have held half a thousand people. But Höss wanted to improve the ventilation. He consulted Bischoff, who showed him an article by G. Peters, the director of the Degesch Company (the enterprise producing the Zyklon B),*

[109] For this topic see C. Mattogno, op. cit. (note 3).

[110] On page 59, Pressac writes regarding prisoners working at cremating corpses buried in common graves:

> *"They had become, involuntarily, the only witnesses, apart from SS men, of the outward signs of the massacre of the Jews, for among the prisoners that had participated in this 'cleansing,' none were left alive."* (my emphasis)

How, then, is the fact explained that the *eye witnesses* of the alleged extermination activity of the Bunkers were still left alive?

which described a delousing installation using Zyklon B with eight little gas chambers of 10 m³ arranged side by side." (pp. 41f.)

The article, as Pressac himself informs us, had been requested by the Boos Company:

"in order to use it as a guide for equipping the future prisoner reception building of the main camp with a battery of nineteen similar delousing gas cells." (p. 42)

Therefore the article concerned the nineteen Zyklon B disinfestation chambers with the circulation system planned for the new reception building. The date of the request is July 1, 1942 (p. 103, note 135), that is, one month after the presumed beginning of the alleged activity of Bunker 2. This article included the previously mentioned schematic plan for a DEGESCH circulation gas chamber, as published by Pressac as Document 16f. That this article was shown by Bischoff to Höss for the purpose of furnishing Bunker 2 with a ventilation system, is not attested to by any document. Quite to the contrary: it is the pure fantasy of Jean-Claude Pressac, who states, moreover, that no mechanical ventilation system was installed in Bunker 2.

Finally:

"four little gas chambers of about 50 m³ were constructed in the white farmhouse [Bunker 2]. *These were arranged parallel to each other, without mechanical ventilation, but oriented in the most likely direction of the wind (North-South at Birkenau)."* (p. 42, my emphasis)

The aim of Pressac's pretensions is obvious. One of the criticisms made of his 1989 book regarding the alleged homicidal chambers is that the Germans' alleged homicidal gas chambers were supposed to have been technologically unsophisticated, even though they were at the forefront of technology in Zyklon B disinfestation chambers, thanks to their invention of the DEGESCH circulation system. Pressac must therefore establish in some manner a connection between the two types of systems, which he does in a crafty manner, asserting on the one hand that the transformation of Bunker 2 into a homicidal gas chamber had been done:

"by emulating the delousing facilities installed by the Degesch of Frankfurt/Main (cells placed in parallel)," (p. 115, my emphasis)

and furthermore that the first homicidal gassing in Crematory II had been done with the introduction of 6 kg of Zyklon B, which

"represents a concentration of about 20 g of hydrocyanic acid per m³, identical to that prescribed by the directors of Degesch for their delousing cells." (p. 119, my emphasis)

Thus, the engineers of the Central Construction Office would have drawn the least significant element from the article of G. Peters (and E. Wüstiger): the arrangement of the gas chambers in parallel. Only a foundation of 105 m² remains of the presumed Bunker 2, which, however, shows non-parallel(!) subdivision in seven locations. Nothing is known about the height of these lo-

cations. The volume assumed by Pressac (four chambers of 50 m^3 each) is therefore simply the fruit of his imagination.

Even though it would have been possible to install only one gas chamber in this building (which would have to be expected; after all, this building was supposed to be used for *mass* exterminations), they supposedly installed four chambers with (105 $m^2 \div 4 =$) 26.25 m^2 each, which would have hindered the extermination process considerably.

Concerning the concentration of hydrocyanic acid: since the volume of morgue 1 (506 m^3) would have been reduced to about 406 m^3, after the removal of about 100 m^3 occupied by the 1,492 bodies of the victims and the reinforced concrete pillars, the concentration obtainable with 6 kg of Zyklon B[111] would have been (6,000÷406=) about 14.8 g/m^3, not 20.

But who cares: Pressac states authoritatively that the concentration of hydrocyanic acid in the alleged homicidal gas chamber was 20 g/m^3. Period. By so doing, the second fictitious connection between the DEGESCH disinfestation gas chambers and the alleged homicidal gas chambers is created from thin air.

In the beginning, the SS had not planned undressing rooms for Bunkers 1 and 2; the victims undressed "in the open air," but then:

> *"Bischoff demanded in his second report the construction, close to the two Bunkers, of four wooden huts as undressing rooms for the unfit. The cost of each hut was 15,000 RM. The request was formulated thus: 'four pieces huts for the special treatment of the prisoners at Birkenau.'"* (pp. 45f., Pressac's emphasis)

The report in question was written at the end of July 1942, during a full scale typhus epidemic. As we have explained, the "special treatment *of the prisoners*" did not have a criminal significance, but was a health measure included in the sanitary provisions taken by the SS to stop the epidemic. Needless to say that the connection between these four huts and the Bunkers 1 and 2 is, as usual, based only on Pressac's fantasy and has no documentary basis whatsoever.[112]

The "bathing facilities for special actions" (*Badeanstalten für Sonderaktionen*) mentioned in the file memo of August 21, 1942 (p. 52), had the same function; each had to be equipped with two three-muffle ovens of the simplified models, evidently to cremate infected corpses of prisoners who died of typhus.[113]

---

[111] This figure in reference to the first alleged homicidal gassing in Crematory II is pure invention by Jean-Claude Pressac. There exists no document, and no witness affirms, that on such an occasion 6 kg of Zyklon B were used. Pressac draws this figure from R. Höss, who speaks in general of 5-7 cans of Zyklon B, of 1 kg each (NI-034, NI-036).

[112] On the question of these four huts for special treatment see C. Mattogno, *Special Treatment in Auschwitz*, op. cit. (note 75), pp. 27-28, 36-39.

[113] On this ibidem, Part II, §12, "Bathing Facilities for Special Actions," pp. 67-72.

Pressac believes he has found another "glitch" in a plan of the area of interest at Auschwitz-Birkenau. This plan allegedly

> *"indicates that the zone where Bunkers 1 and 2 and their burying pits were situated was classified a 'prohibited area.'"* (legend of Document 21 and p. 52)

But this document bears the date of June 2, 1943, at which time the two bunkers had ceased their alleged activity two and a half months earlier, and the so-called "cremation pits" (which Pressac transforms for the occasion into "burying pits") had allegedly been covered over and the earth leveled. What, therefore, did the SS want to hide in this zone?

Actually, the "prohibited area" refers to the entire white area within the oblique hatching, and therefore *includes* the entire zone of the camp of Birkenau. The "*prohibited* area" is clearly related to various camp closures decreed by Höss due to typhus: July 10, 1942 (p. 115), July 23 (p. 116), February 8, 1943 (p. 118). In June 1943, typhus still raged in the Gypsy camp at Birkenau, and in Sector BI cases of typhus were reported until the end of July 1943 (pp. 120 and 121).

In May-June 1944, during the deportation of the Hungarian Jews to Auschwitz,

> *"Bunker 2 was reactivated on this occasion for small groups, whose bodies were burned in an incineration pit of 30 m^2."* (pp. 90f.)

This is decidedly irrational. According to this, the SS is supposed to have equipped an extermination installation providing "half a thousand" corpses at a time with a cremation area sufficient at most for 50 corpses. That is only a tenth of the actual needs. Furthermore, it is necessary to add that the "eyewitness" Miklos Nyiszli speaks of two "cremation pits" measuring 50m × 6m (600 m^2 altogether) and consuming 5,000 to 6,000 corpses per day.[114] In his preceding book, Pressac considers this witness credible. His only fault: He multiplied all numbers by 4![115] Yet in this specific case, Pressac claims a cremation pit area 20 times less than that declared by Nyiszli, and a cremation capacity – deduced from the area – that would have been 100 to 120 times lower!

On page 147, a second cremation pit suddenly appears, "much smaller" than the first. Pressac introduces *this* to increase the capacity of Bunker 2 slightly, so as to make the alleged extermination of the Hungarian Jews appear technically somewhat more plausible. This does not change anything we have demonstrated above.

---

[114] M. Nyiszli, *Médecin à Auschwitz: Souvenirs d'un médecin déporté*, Julliard, Paris 1961, pp. 96-98 (Engl.: *Auschwitz: A Doctor's Eyewitness Account*, Arcade Publishing, New York 1993).

[115] J.-C. Pressac, *Auschwitz:...*, op. cit. (note 7), p. 479. Actually M. Nyiszli is a false witness. See in this connection our study *"Medico ad Auschwitz": Anatomia di un falso*, Edizioni La Sfinge, Parma 1988.

8. Crematories IV and V

Pressac states that the Crematories IV and V depended on the homicidal activity of Bunkers 1 and 2 (p. 50) and were thus assigned to them (p. 52).

This logistic arrangement was, to say the least, an unhappy one, given that the distance of the crematories (road distance) from the claimed location of Bunker 1 was about 800 meters, and from the ruins of the supposed Bunker 2 about 900 meters. Therefore, the corpses would have to have been transported to the crematories by truck. If one considers that in Crematory I (according to Pressac) a more rational extermination procedure had already been worked out, one subsequently begun in all four of the other crematories of Birkenau – placing the homicidal gas chamber right in the crematory – the planning of two "criminal" crematories not only without gas chambers, but even 800 to 900 meters away from the alleged homicidal gas chambers, is decidedly nonsensical.

Describing the genesis of these crematories, Pressac writes:

> *"As for Crematory IV (and V), its first drawing of August 1942 showed only the incinerator portion. In mid-October, the Konrad Segnitz company, assigned to do its roofing, depicted the crematory's final dimensions, which showed the oven room as an extension of a huge morgue, 48 by 12 meters (576 m^2), indicating its function 'at the end of the sequence.' The undressing and the gassing of the victims was always situated in Bunker 2, but the corpses thus produced were deposited in the mortuary of Crematory IV to be incinerated. Then the SS tried to place a gas chamber (heated with a stove) at the center of the building, which would have given it the following logical arrangement: Undressing room – gas chamber – airlock – oven room with 8 chambers."* (p. 67, my emphasis)

The drawing of the Segnitz company is Plan 1361, dated October 14, 1942.[116] The claim that the SS "then" tried to install a homicidal gas chamber at the center of the building, heated by a stove, is false because the presence of a stove at the center of the building appears already in Plan 1678 from August 14, 1942, and Pressac comments on this as follows:[117]

> *"The presence of a stove in the uncompleted room of Drawing 1678 is a formal indication that it was used for gassing."*

Thereupon, Pressac expounds the subsequent development of the plans for Crematories IV and V:

> *"But an undressing room was missing. The erection of a hut outside compensated for this absence and created the following sequence: undressing room – gas chamber – mortuary – airlock – oven room with 8 muffles.*

[116] J.-C. Pressac, *Auschwitz:...*, op. cit. (note 7), p. 397.
[117] Ibid., p. 392.

> *Having incineration capacities half of those of Crematories II and III, Crematories IV and V were to have more modest gas chambers as well. The SS combined their need for gas chambers of lower capacity (100 m²) for 'treating' small groups of victims with the proposal for an alternative operation and thus established, on January 11, 1943, the final plan of Crematory IV (and V)."* (p. 67)

The simplified plan laid out by Pressac includes this sequence: an undressing room, which serves two homicidal gas chambers (nos. 1 and 2), each for 500 "unfit," a corridor, a mortuary room, an airlock, and the oven room (p. 67). He adds that:

> *"this conception necessitated the construction of an outdoor undressing room, which was not indispensable during nice weather, when the victims undressing outside (summer 1944), but it was necessary during winter. To avoid constructing it, the SS assigned to the Central Hall a double function as undressing room and mortuary, alternately."* (p. 68)

In summary, the criminal structure of Crematories IV and V, "established by the technicians and engineers of the Construction Office," revealed itself as *"*aberrant*"* (p. 68), because after having furnished Bunkers 1 and 2 with two undressing shacks each (according to Pressac), "the technicians and the engineers of the Construction Office" now inexplicably had to "avoid" building a single shack near Crematories IV and V! For what reason? Impenetrable mystery!

Pressac states that Crematories IV and V were each equipped with *two* gas chambers of 100 m² each, in total *200* m², which could hold altogether *1,000* people, with a density of *five people* per square meter. But in his book *Auschwitz: Technique and Operation of the Gas Chambers*, he wrote:[118]

> *"The floor area of the block of three gas chambers was 240 m² (4,800 m³[119]). 2,400 people could therefore be squeezed in at a density of ten per square meter."* (my emphasis)

In his second book, the third gas chamber, initially discarded, suddenly reappears on page 147. For what reason, we shall see later. In the above-mentioned 1989 book, Pressac admitted that the extermination system of Crematories IV and V was even more "aberrant," even with his forcibly inflated oven capacities:[118]

> *"It would take four* [or] *five days to cremate 2,400 bodies."*

Considering the maximum real capacity of the ovens, the cremation of 2,400 corpses would have required over twelve days. Inversely, to cremate 2,400 corpses in the course of one day would have necessitated 100 muffles instead of the existing eight.

The gassing technique imagined by Pressac is this:

---

[118] Ibid., p. 384.
[119] Printing error for 480 m³.

> *"The first gassing was catastrophic. An SS man, mask on face, had to climb on a little ladder to access a 'window,' open it with one hand, and with the other, pour the Zyklon B. This feat was like a balancing act, and had to be repeated six times."* (p. 76, my emphasis)

Pressac forgets to add that the SS juggler would also have had to plead affably with the victims not to push him backwards, or grab him, or pull him in, while holding himself with one hand on the ladder. He would have had to extend his other hand inside the window (perched at 1.70 meters above the pavement) to pour a can of Zyklon B into the gas chamber!

Pressac's narration continues:

> *"When the air-tight doors were opened to evacuate the gas, it was perceived that the natural ventilation was ineffective and it was urgently necessary to open a door in the north corridor to induce an air current."* (p. 76, my emphasis)

The story of ventilation in Crematories IV and V is one of those tales, which illustrates the silliness of Pressac's argumentation. In his book *Auschwitz: Technique and Operation of the Gas Chambers* Pressac pretends to see this door "urgently" opened in the *north* wall of Crematory IV in a photograph,[120] which shows only the *south* side of Crematories IV and V. Since these two crematories were constructed mirror-symmetrically, Pressac thinks that a door he claims to have discovered in the south side of Crematory V proves that there must be a similar door in the north wall of Crematory IV. But Crematory V is in the background partially obscured by trees. The south wall of Crematory V is so indistinct that one can make out a door in connection to the corridor not based on information in the photo, but only by using a great deal of imagination. A close examination of the original photograph[121] shows that Pressac has mistaken for a door the shade produced by trunks of trees delimited at the bottom by lighter ground.

Prüfer, arriving at Birkenau the 18th or 19th of May,

> *"stated with feigned sadness that the warranty for the oven of Crematory IV had expired, and that it was no longer possible to repair an oven built with second class materials. He judged that the gas chambers were nevertheless still usable, on the condition that they be mechanically ventilated. He pocketed an order for two ventilation systems for Crematories IV and V, amounting to 2,510 RM, and departed on the 20th."* (pp. 79f.)

The source indicated by Pressac in note 247 (p. 107) is a "letter and estimate from Topf of June 9, 1943." But in *Auschwitz: Technique and Operation of the Gas Chambers* he affirms, regarding this same source:[122]

---

[120] Ibid., pp. 416f.
[121] APMO, nr. neg. 20995/465.
[122] J.-C. Pressac, *Auschwitz:...*, op. cit. (note 7), p. 386.

> *"The author would point out that NOTHING in this letter indicates that the air extraction systems proposed for Crematories IV and V were for the gas chambers, and that they could on the face of it, only be for the furnace rooms."* (capital letters by Pressac.)

Given that the ventilation systems were so urgent and essential for the smooth operation of the alleged homicidal gas chambers, one would have expected them to be installed immediately. But this is what happened instead:

> *"Concerning these latter ones, Topf, who had found an adequate electric motor only with difficulty, nevertheless shipped by snail-freight one of the two ventilation systems on December 21. It was put into storage at the construction depot on January 1, 1944, and left there until May 1944."* (p. 88)

Regarding this, Pressac adds:

> *"The ventilation system, which had been in storage since January, was installed in May in Crematory V, whose oven was judged capable of functioning correctly. For the two gas chambers and the corridor, representing a volume of 480 m³, Schultze had anticipated a ventilation of the same capacity, almost equal to that of the morgues of Crematories II and III: A ventilator, no. 450 with a 3.5 CV motor, extracting 8,000 m³ per hour."* (pp. 89f.)

Morgue 1 (the alleged homicidal gas chamber of Crematories II and III) measured, according to Pressac, 483 m^3 (p. 30) and had in his opinion a ventilator capacity of 8,000 m^3 per hour (p. 38), corresponding to 16.56 air changes per hour. Therefore Pressac reasons that Schultze had planned a ventilator for the *three* alleged homicidal gas chambers of Crematory V, which measured 480 m^3, with a capacity of 8,000 m^3/h of air as well, corresponding to 16.66 air exchanges per hour. Therefore, the two systems had the "same power."

I already pointed out that the volume of morgue 1 was 506 m^3,[123] and not 483 m^3, and that the ventilators of its system had a capacity of 4,800 m^3/h, not 8,000, which corresponds to 9.41 air exchanges per hour, and not 16.56. And regarding the rooms in Crematory V, plan 2036 of January 11, 1943,[124] indicates the following floor areas of the three rooms supposedly transformed into homicidal gas chambers:

(12.35 m × 7.72 m =	95.3 m^2) × 2.20 m =	209.6 m^3
(11.69 m × 8.40 m =	98.2 m^2) × 2.20 m =	216.0 m^3
(11.69 m × 3.50 m =	40.9 m^2) × 2.20 m =	90.0 m^3
Totals:	234.4 m^2	515.6 m^3

Here Pressac found himself faced with another difficulty: Since the combined volume of the *two* alleged gas chambers (which he mentions on pages

[123] Theoretical volume including the concrete pillars and beam (appr. 9 m^3).
[124] J.-C. Pressac, *Auschwitz:...*, op. cit. (note 7), p. 399.

67f.) is 425.6 m^3, a fan with a capacity of 8,000 m^3/h of air would correspond to 18.8 air exchanges per hour. In other words, engineering specialists from the Topf company are supposed to have equipped ground-level rooms, provided with doors and windows (and which therefore would have been more easily ventilated then windowless basements), with a ventilating system proportionally more powerful than those of basement rooms, which were more difficult to ventilate! Then Pressac introduces the third gas chamber, and decreases the total volume from 515.6 to 480 m^3, so that he can deceptively obtain two ventilation systems "of the same power."

On page 90, Pressac presents a plan which shows the

> *"ventilation of the gas chambers of Crematory V, designed by Karl Schultze in June 1943, and installed in May 1944."*

The source is not indicated, because it does not exist. This plan is in fact the simple fruit of Pressac's imagination. Furthermore it is a mistaken fruit, because the letter from the Topf company of June 9, 1943, mentions:[125]

> *"the construction of walled ventilation ducts"*

while Pressac's plan shows *bare* pipes.

9. Conclusion

With this, we have reached the end of our critique of Jean-Claude Pressac's last masterpiece.

On February 21, 1979, 34 French historians published a declaration in France's largest daily newspaper *Le Monde*, which closed with the following axiom:[126]

> *"We must not ask ourselves how technically such a mass murder was possible. It was technically possible because it took place. Such is the obligatory point of departure for all historic investigation on this subject."*

Jean-Claude Pressac, however, did not comply with this dogma. He wanted to study the cremation ovens and the alleged homicidal gas chambers of Auschwitz-Birkenau *technically*, although he lacked the required technical competence to undertake such a study. Nevertheless, Pressac had to accept the revisionists' methodic principle, according to which technical arguments must prevail, if they conflict with witness testimonies. He has applied that principle by reducing the number of the alleged victims of homicidal gassing, due precisely to its incompatibility with the capacity of the cremation ovens, which Pressac craftily inflated. In this manner, he has opened an irreparable leak in traditional historiography, because technology reveals the material impossibility of mass extermination at Auschwitz-Birkenau.

---

[125] APMO, BW 30/27, p. 18.
[126] *Le Monde*, February 21, 1979, p. 23.

If Pressac wanted to be coherent in his technical stance, all that would have remained for him was to accept this conclusion. If not accepting it, he could only go backwards, declaring that one must not ask how such alleged mass extermination was technically possible – in acceptance of the 1979 appeal of the French historians.

In any case, one thing is certain: Jean-Claude Pressac's Auschwitz books represent *the end of a legend.*

10. Appendix

10.1. Preface to the Documents

The technical documents included in this appendix refer to two important aspects of the presumed "machinery of mass murder" treated in this study: that of the ventilation of the basement morgues of Crematories II and III, and that of the gas testers.

According to Pressac, morgue 1 is the presumed homicidal gas chamber. Documents 2 and 3 refute the affirmations of Jean-Claude Pressac, according to which the capacity of the ventilators of the ventilating system for Crematories II and III of Birkenau was 8,000 m^3 of air per hour. The actual capacity was 4,800 m^3 of air per hour, corresponding to 9.48 exchanges of air per hour.

These documents show, moreover, that the capacity of the exhaust ventilator of morgue 2 (the presumed undressing room) was 10,000 m^3 of air per hour, corresponding to 11 exchanges of air per hour. The consequence is that, paradoxically, according to the Pressac thesis, the Central Construction Office engineers of Auschwitz and the Topf engineers provided a lower number of air exchanges for the homicidal gas chamber than for the dressing room!

The number of air exchanges planned for these locations is in reality that which Engineer Wilhelm Heepke, one of the most specialized German engineers in the field of crematories, prescribed for morgues planned for intense use (Document 4). Therefore, the morgues were projected and constructed as – morgues.

The warm-air circulation disinfestation chambers constructed by DEGESCH (DEGESCH *Kreislauf-Anlage für Entlausung mit Zyklon-Blausäure*) had in effect a ventilator with a capacity of 12 m^3 of air per minute, corresponding to 72 exchanges of air per hour (Documents 5 and 6).

With this falls also the affirmation of Pressac according to which morgue 1 was supposed to have been transformed into a homicidal gas chamber. The fact that Crematories II and III, which were projected and constructed as plain hygienic-sanitary installations, entered into function with the same number of ovens and with the same capacity of the ventilators of morgue 1 as projected

from the very beginning, demonstrates that they were not transformed into a "machinery of mass murder."

On February 26, 1943, the *Zentralbauleitung* of Auschwitz requested Topf to send ten gas testers (*Gasprüfer*, Document 7). The Topf company supposedly responded with a letter dated March 2, 1943, which speaks of "*Anzeigegeräte für Blausäure Reste*" (Indicator devices for prussic acid residues, Document 8). Jean-Claude Pressac attributes to this document the value of a definite proof of the existence of a homicidal gas chamber in Crematory II.

The gas testers were devices for the analysis of combustion gases, based on physical methods (Document 9). The test kit for Zyklon B residual gas, however, was called "*Gasrestnachweisgerät für Zyklon*" (gas residue indicator device for Zyklon, Document 11). It was based on chemical methods and was distributed by the same company which supplied the Zyklon B. *Gasrestnachweisgerät* came in a small wooden box containing:

1) a bottle with Solution 1 (2.86 g of copper acetate per liter)
2) a bottle with Solution 2 (475 ml at room temperature of a saturated solution of benzidine acetate in 525 ml of water)
3) a mixing utensil with two markers for measuring equivalent room areas
4) a cardboard roll with strips of blotting paper
5) color test pattern (strips of test paper in a test tube)
6) six empty thick-walled test tubes with cork stoppers].

The test for residual gas (*Gasrestprobe*) was accomplished by mixing in the mixing utensil the required proportions of Solutions 1 and 2. In the solution thus obtained, one immersed the lower parts of six strips of blotting paper, each one of which was then introduced into a test tube which was quickly secured with a cork stopper. The person performing the test, wearing a gas mask, entered the testing area with the test tubes which were opened at various locations exposing the strips of blotting paper which were moistened with the test solution. The paper strips reacted in the presence of hydrocyanic acid gas, taking on a blue coloration which becomes more intense with a higher concentration of the gas.[127]

Document 11 is a photograph of a *Gasrestnachweisgerät*, which was found by the Soviets at Auschwitz after the liberation of the camp.

Document 12 shows two gauges (*Anzeigegeräte*) of gas testers (*Gasprüfer*) used for analyzing combustion gasses for CO_2 or CO/H_2

Document No. 1

Table of contents of the first volume of my study *I forni crematori di Auschwitz. Studio storico-tecnico con la collaborazione del dott. ing. Franco Deana* (the second volume contains only document reproductions and photographs).

THE CREMATORY OVENS OF AUSCHWITZ-BIRKENAU

PART ONE: MODERN CREMATION WITH PARTICULAR EMPHASIS ON COKE-FIRED OVENS

Introduction

Chapter I: The Cremation

1. General Principles of Combustion Techniques
2. Chemical Reactions During a Cremation
3. The Process of Cremation

Chapter II: Cremation Technology

1. Coke-Fired Cremation Ovens: Structure and Operation
2. Coke-Fired Cremation Ovens: General Principles of Theory and Design
   a. The Gas Generator
   b. The Cremation Chamber or Muffle
   c. The Recuperator
   d. The Chimney
   e. Drying the Oven
   f. Cremation Experiment

Chapter III: Modern Cremation: Genesis and Development of Cremation Ovens

Chapter IV: Scientific Cremation Experiments in Germany until the 1920s

Chapter V: Technical Development of German Cremation Ovens until the 1930s

Chapter VI: Duration of Cremation

Chapter VII: Heat Balance of a Coke-Fired Cremation Oven

Chapter VIII: Ethical and Legal Norms of Cremation

Chapter IX: Crematories and Cremations in Germany (1878-1939): a Statistical Overview

Chapter X: Mass Cremation for Hygienic-Sanitary Purposes

Chapter XI: Overview of Current Cremation Ovens

PART TWO: THE FIRM J.A. TOPF & SÖHNE OF ERFURT AND THE CREMATORY OVENS OF AUSCHWITZ-BIRKENAU

Chapter I: Brief History of the Firm J.A. Topf & Söhne of Erfurt

Chapter II: Topf Cremation Ovens for Civilian Use

1. Coke-Fired Cremation Ovens
2. Gas-Fired Cremation Ovens
3. Electrically Heated Cremation Ovens

Chapter III: Patents and the Topf Application for a Patent

Chapter IV: The Topf Waste Incinerator

Chapter V: Topf Cremation Ovens for Concentration Camp

1. Single-Muffle Coke-Fired Cremation Oven
2. Mobile Double-Muffle Nafta-Fired Cremation Oven (Transformed to a immobile Coke-Fired Oven)
3. Double-Muffle Nafta- or Coke-Fired Cremation Oven

Chapter VI: The Topf Firm and the Construction of the Cremation Ovens of Auschwitz-Birkenau
1. The Ovens of Crematorium I in Auschwitz
2. The Ovens of Crematorium II and III in Birkenau
3. The Ovens of Crematorium IV and V in Birkenau

Chapter VII: Structur and Operation of the Cremation Ovens of Auschwitz-Birkenau
1. The Double-Muffle Coke-Fired Cremation Oven
2. The Triple-Muffle Coke-Fired Cremation Oven
3. The Eight-Muffle Coke-Fired Cremation Oven
4. Projects of Mass Cremation at Auschwitz-Birkenau
   a. The Oven Project of Fritz Sander
   b. "Crematorium VI"
   c. Circular Incineration Oven
   d. The Oven of Cost Estimate Of April 1, 1943

Chapter VIII: The Duration of the Cremation Process of the Topf Ovens at Auschwitz-Birkenau
1. The Documents
2. Scientific Cremation Experiments by Engineer R. Kessler
3. The Cremation List of the Gusen Crematorium
4. The Cremation List of the Westerbork Crematorium
5. Conclusions

Chapter IX: The Capacity of the Cremation Ovens at Auschwitz-Birkenau
1. Continuous Operation of the Ovens
2. Simultaneous Cremation of Several Corpses in one Muffle
   a. Experience with Animal Carcass Cremation Ovens
   b. Experiences with the Crematoria at Westerbork and Gusen
   c. Il carico termico delle muffole
3. Soviet and Polish Technical Reports on the Kori Cremation Ovens of Lublin-Majdanek, Sachsenhausen, and Stutthof:
   a. The Soviet Report on the Cremation Ovens of Lublin-Majdanek

Document No. 3, continued.

— 104 —

Verschlossen kann q_1 durch eine Jalousieklappe werden. Die Frischluft lässt sich durch Öffnen eines Fensters, welches in Höhe von q_1 liegt, genügend einleiten.

Auf eine kräftige Lüftung ist ferner in den Leichenhallen Wert zu legen, um die Fäulnisvorgänge in den Leichen möglichst zurückzuhalten. Auch hier kommt es an erster Stelle mehr auf eine Entlüftung als auf eine Belüftung an. Die Leichen, bezw. die Särge sind nicht direkt auf den Fussboden zu legen, sondern hohl auf Böcken über denselben zu lagern, damit die Luft unterhalb der Leichen aus dem Raume abgezogen werden kann. Eine Zuführung frischer Luft erfolgt von oben. Man hat hier mindestens mit einem 5fachen stündlichen Luftwechsel zu rechnen; unter Umständen kann man sogar bei starker Benutzung des Raumes bis auf das 10fache gehen, welch hohe Luftabfuhr mit Hilfe eines Ventilators erreicht wird; vielleicht empfehlen sich gerade für diese Räume die neu aufgekommenen Uhrfeder-Ventilatoren. Die Luftkanalmündungen sind zur Abwehr der Insekten mit kleinmaschigen Drahtgittern zu versehen. Selbst bei höheren Aussentemperaturen ist eine künstliche Kühlung wegen der dann eintretenden starken Schwitzwasserbildung kaum nötig; im anderen Falle können den Leichen beigelegte Eisstücke den Zweck wohl ausreichend erfüllen. Bei der Bauausführung ist gerade bei diesen Leichenhallen auf eine Trockenlegung des Fussbodens, Abwaschbarkeit der Wände und guter Kanalisation bedacht zu sein. Gehört dieser Silo einem öffentlichen Kanalnetz an, so sind die Abwässer vor Eintritt in letzteres zu desinfizieren.

Im übrigen gelten hier dieselben Beziehungen wie bei den allgemeinen Lüftungsanlagen.

Die Beleuchtung kommt vorläufig noch als natürliche in Betracht, da die Benutzung der Krematorien infolge der geringen Zahl von Verbrennungen auf die Tageszeit beschränkt werden kann. Die Anordnung der Fenster, durch welche das Tageslicht in die Halle fällt, wie auch der Fenster der übrigen Räume, ist lediglich Sache des Architekten. Da in der Halle und in den zugehörigen Neben-

Document No. 4: Wilhelm Heepke, *Die Leichenverbrennungs-Anstalten (die Krematorien).* Verlag von Carl Marhold, Halle a.S. 1905, p. 104.

öffner betätigt, sodaß bei Beginn des Kreislaufes automatisch die in den Öffner eingesetzte Zyklondose entleert wird und deren Inhalt auf eine Unterlage fällt, die von der im Kreislauf geführten warmen Luft bestrichen wird.

Bei Einstellung des Vierwegeschalters auf „Lüftung" wird bei geschlossenen Kammertüren bei (D) vorgewärmte Frischluft angesaugt, mit der die ganze Kammer durchspült wird, bevor sie bei (A) zusammen mit der ausgespülten Blausäure wieder abgesaugt wird.

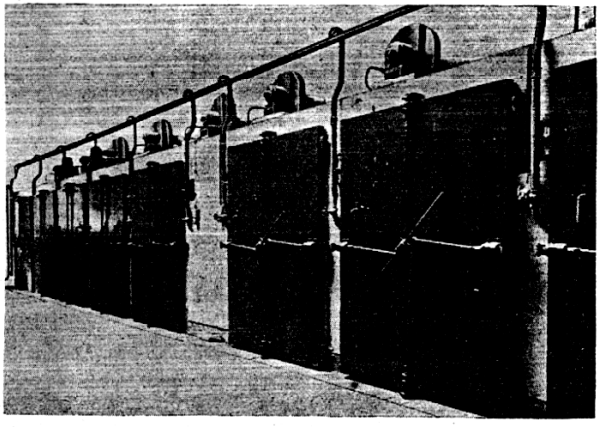
Ventilator mit Motor (2)

Für diesen ist eine Leistung von 12 cbm je Minute bei einem stat. Druck von 80 mm WS ausreichend, um sowohl eine äußerst rasche Gasentwicklung als auch eine genügend rasche Lüftung (72-facher Luftwechsel je Stunde) des begasten Kammerinhalts zu bewirken.

Heizaggregat (9)

Dieses Heizaggregat erhält eine verschieden hohe Leistung je nachdem, ob es nur zur Beschleunigung der Gasentwicklung und Vorheizung der angesaugten Frischluft oder auch zur Erwärmung des gesamten Kammerinhaltes dienen soll.

Im letzteren Falle hat es 10 000 WE zu liefern, die zu einer Erwärmung des Kammerinhaltes auf 30 bis 35° C innerhalb einer halben Stunde führen, auch wenn das Gut mit einer Temperatur von nur 5 bis 10° C in die Kammer hineingebracht worden ist. Bei der Lüftung erwärmt das Heizaggregat die angesaugte Frischluft auf mindestens die gleiche Temperatur, die der Kammerinhalt inzwischen angenommen hat, sodaß ein Niederschlag der Blausäuredämpfe vermieden und eine äußerst rasche Lüftung der Kleidungsstücke bewirkt wird.



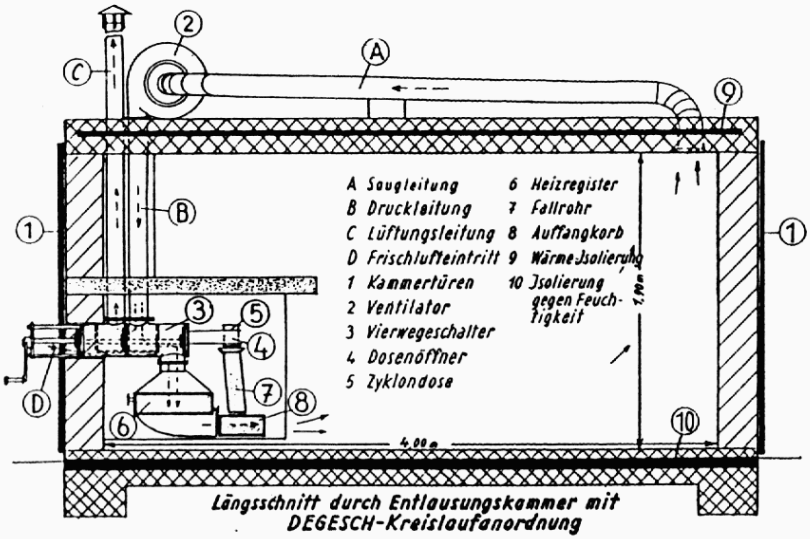


Abb. 4.
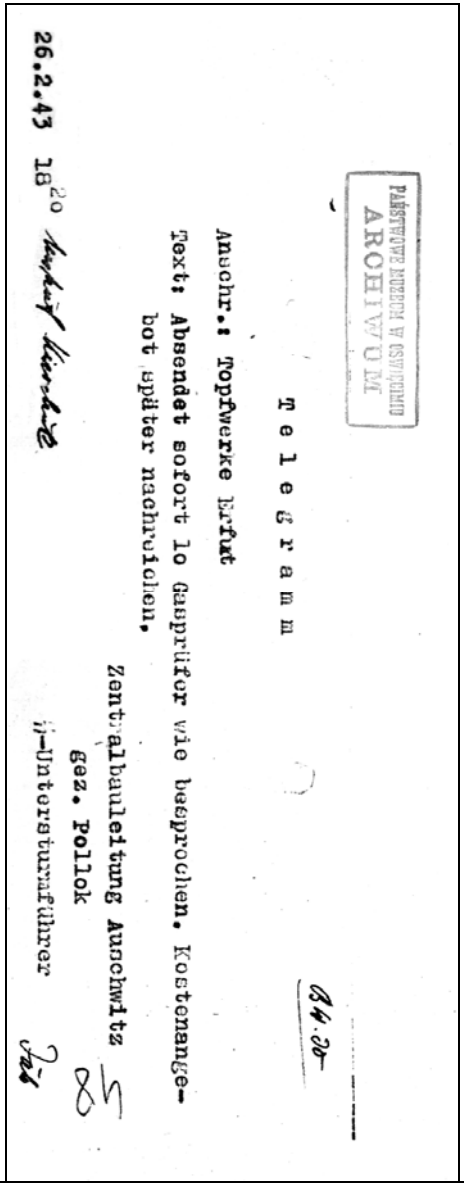
Blausäurebegasungsanlage mit Kreislaufanordnung in Betrieb (8 Kammern).

Die etwa 70 bis 75 Minuten beanspruchende Gesamtbehandlung der Kleidungsstücke geht wie folgt vor sich:

Nach Einfahren der beladenen Wagen und Verschließen der Kammer (Abb. 4) wird der Ventilator (2) eingeschaltet und damit automatisch auch das Heizaggregat in Wirkung gesetzt. Der Vierwegeschalter (3), der bis dahin auf „Lüftung" gestanden hat und in dessen Dosenöffnungs-Einrichtung vor Verschließen der Kammer eine Zyklondose eingesetzt worden ist, wird nun auf „Kreislauf" gestellt. Mit dem dabei erforderlichen Drehen der Handkurbel wird die Zyklondose dadurch geöffnet, daß sich das Messer des Dosenöffners (4) vorschiebt und den Boden der Zyklon-

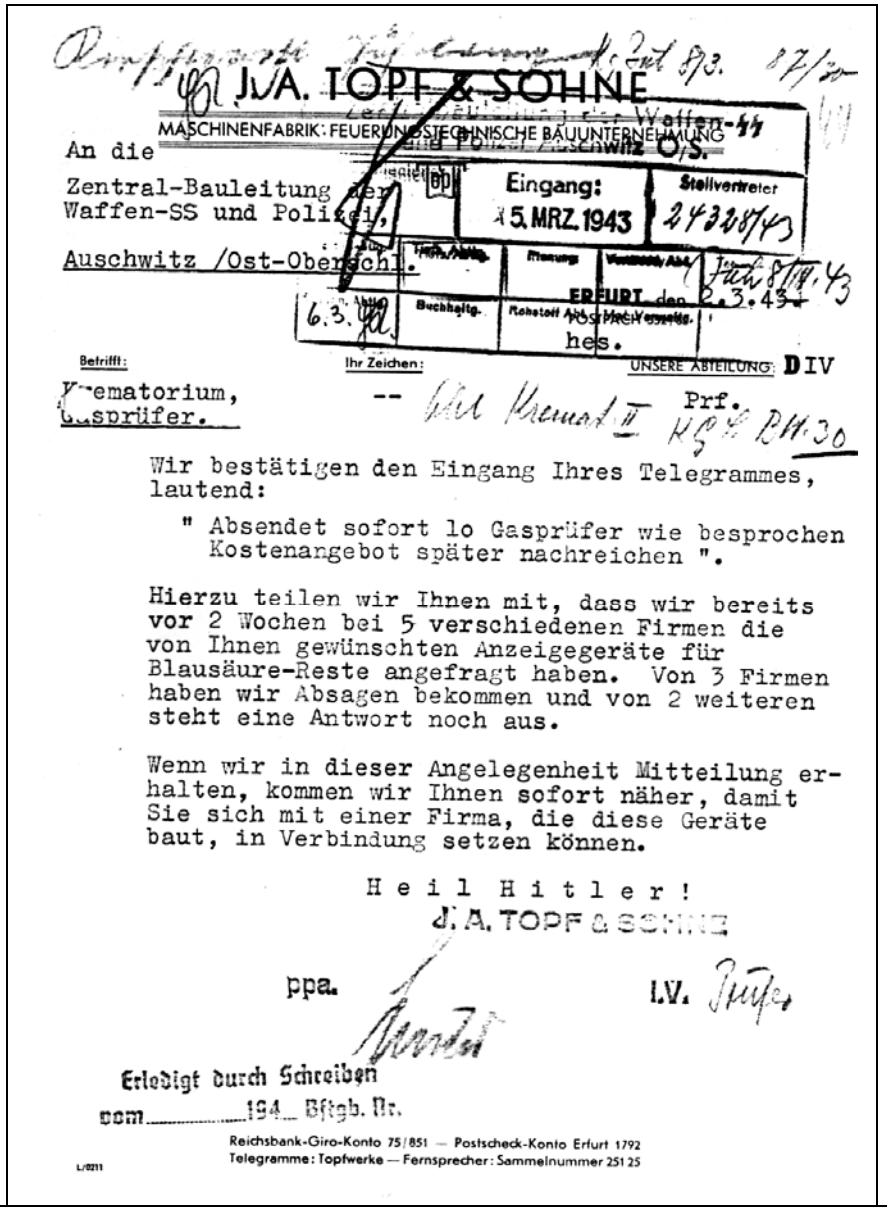
Document No. 5: G. Peters, E. Wüstiger, "Entlausung mit Zyklon-Blausäure in Kreislauf-Begasungskammern. Sach-Entlausung in Blausäure-Kammern," special reprint from *Zeitschrift für hygienische Zoologie und Schädlingsbekämpfung*, issue 10/11, 1940, p. 6.

50



Längsschnitt durch Entlausungskammer mit DEGESCH-Kreislaufanordnung

Abb. 16.



Minutenleistung stammt, vermag innerhalb von 5 Minuten 60 v. H. des Blausäuregehaltes einer großen Zyklondose auszutreiben. Der restliche Doseninhalt von 40 v. H. ist in weiteren 10 bis 15 Minuten ausgetreten. Günstiger gestalten sich die Blausäureentbindungsverhältnisse bei Verwendung vorgewärmter Luft. Es ist verständlich, daß die über das Zyklon streichende Luft entsprechend der Blausäureverdunstung stark abkühlt. Während der Verdunstungsperiode sinkt die Lufttemperatur um 5 bis 10° C (Peters).

2. einem Ventilator mit Motor (2).
   Der Ventilator hat eine Leistung von 12 m³ pro Minute bei einem statischen Druck von 80 mm WS und ist in seiner Leistung so gewählt, daß sowohl eine äußerst rasche Gasentwicklung als auch eine genügend rasche Lüftung (72facher Luftwechsel je Stunde) des begasten Kammerinhaltes damit erfolgt.
3. einer Kreislaufleitung (A-B);
4. einer Lüftungsleitung (A-C);
5. einer Frischluftzufuhr (D), kombiniert mit dem Vierwegeschalter.
   Bei Einstellung des Vierwegeschalters auf »Lüftung« wird bei geschlossenen Kammertüren bei D Frischluft angesaugt, mit der die ganze Kammer durchspült wird, bevor sie bei A zusammen mit der ausgespülten Blausäure wieder abgesaugt wird.
6. einem Heizaggregat (6).

UNSERE ABTEILUNG: D IV

Prf.

Wir bestätigen den Eingang Ihres Telegrammes, lautend:

" Absendet sofort lo Gasprüfer wie besprochen Kostenangebot später nachreichen ".

Hierzu teilen wir Ihnen mit, dass wir bereits vor 2 Wochen bei 5 verschiedenen Firmen die von Ihnen gewünschten Anzeigegeräte für Blausäure-Reste angefragt haben. Von 3 Firmen haben wir Absagen bekommen und von 2 weiteren steht eine Antwort noch aus.

Wenn wir in dieser Angelegenheit Mitteilung erhalten, kommen wir Ihnen sofort näher, damit Sie sich mit einer Firma, die diese Geräte baut, in Verbindung setzen können.

H e i l H i t l e r !

Translation: "[…] We confirm the receipt of your telegram, saying: 'Send off immediately 10 gas detectors as discussed. Hand in estimate later.' In this regard, we let you know that already two weeks ago we asked 5 different firms about the display devices for hydrocyanic acid residues requested by you. […]

B. Technische Gasanalyse [1]

Aus O_2 der Luft wird beim Durchgang durch Koks zunächst CO_2, bei längerem Weg (höherer Schicht) auch CO; Ergebnis: Rauchgase aus CO_2, O_2, CO, N_2, bezeichnet prozentisch mit k, o, c, n %. Bei Verbrennung von Kohle werden während der Entgasungszeit Kohlenwasserstoffe frei, die mit Luft zu CO_2 und H_2O verbrennen sollen; prozentische Menge des letzteren sei w %.

Rauchgasanalyse liefert k, o und c in Hunderteilen der trocken gedachten Gase; also ist $k + o + c + n = 100$ %; Gesamtvolumen der heißen Rauchgase, in denen H_2O noch dampfförmig ist, ist $100 + w$ gesetzt. Weil das durch Verbrennung von H gebildete H_2O volumetrisch beim Abkühlen verschwindet, steigt n über 79 % hinaus, N_2 nimmt scheinbar zu; am meisten, wenn bei vollkommener Verbrennung ohne Luftüberschuß das Rauchgasvolumen das kleinstmögliche ist und Rauchgase nur CO_2 und N_2 enthalten, wobei ebenso wie n auch k den größtmöglichen Wert annimmt, abhängig vom Gehalt an freiem, d. h. nicht durch Sauerstoffgehalt ausgeglichenem H_2, genauer vom Verhältnis C : H_2 (andere Bestandteile wie S vernachlässigt). Diese größtmöglichen Werte sind (Abb. 17) für:

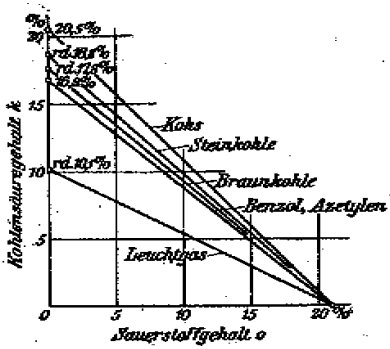

Abb. 17. Nachprüfung der Rauchgasanalysen.

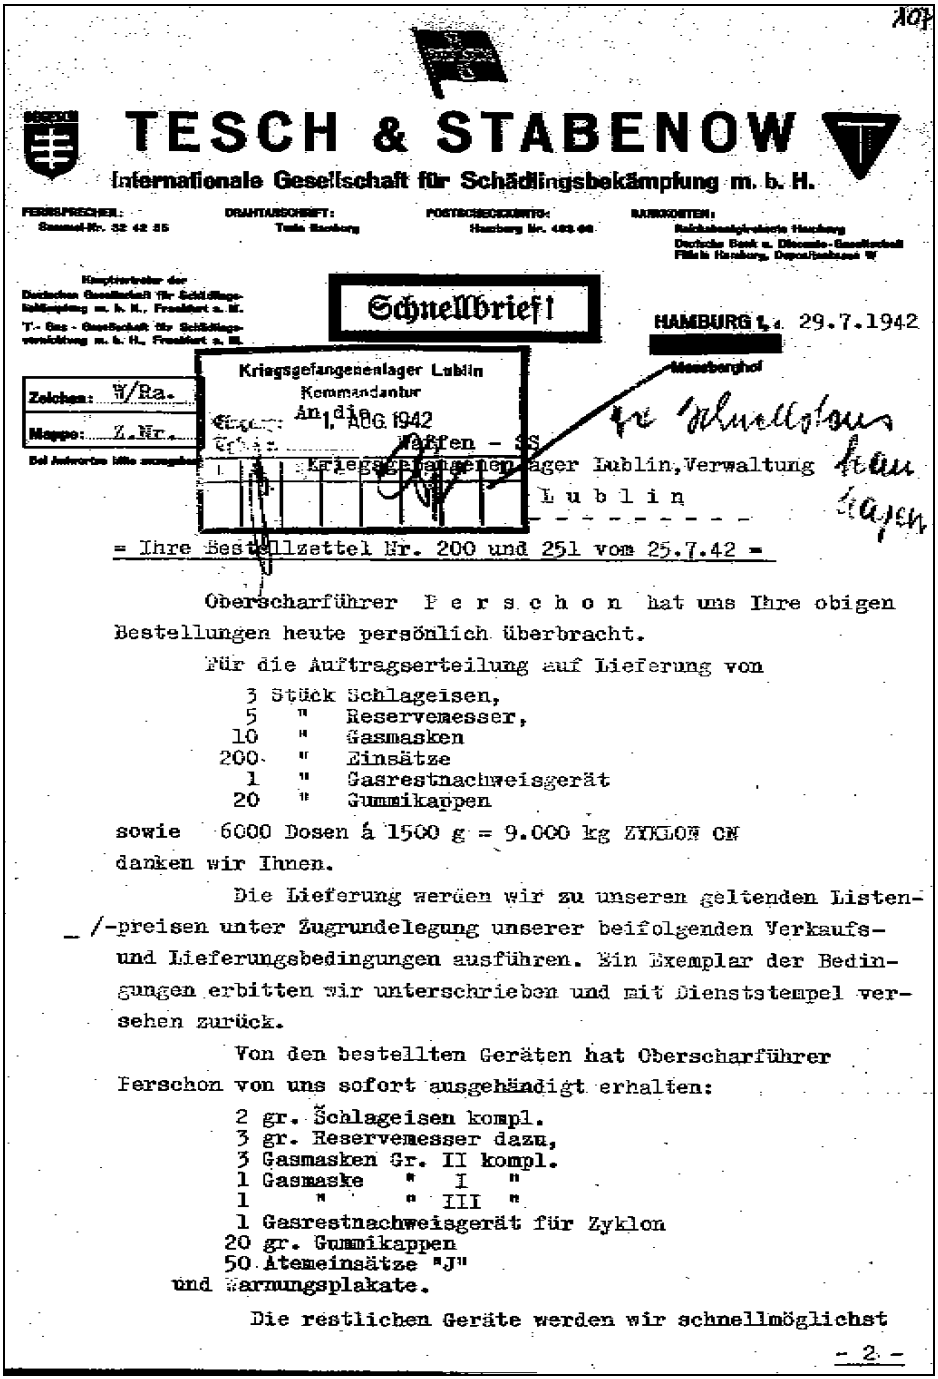
Kohlenstoff mit C : H_2 =	∞	max n = 79	max k = 21
Koks	94	79,5	20,5
Steinkohle	21	81,9	18,8
Braunkohle	16	82,2	17,8
Acetyten, Benzol	12	83,1	16,9
Leuchtgas	2,2	9,9 %	10,1 %

max k entsteht, wenn die stöchiometrisch erforderliche Luftmenge L_0 zur Verbrennung zugeführt wird, besser gesagt, wenn die durchgesaugte Luft so lange (Schichthöhe!) an Kohlenstoff vorbeigeführt wird, bis gerade aller O_2 in CO_2 verwandelt ist. Unter anderen Umständen, z. B. bei niedrigerer Schicht, bleibt O_2 neben CO_2 in den Gasen, es ist mehr Luft durchgesaugt, als für die verbrannte Kohle erforderlich, nämlich L statt L_0; das Verhältnis $L : L_0 = l$ heißt Luftüberschußzahl; man berechnet sie aus Analysenergebnissen nach den Formeln

$$l = n : \left[n - \frac{79}{21} \left(o - \frac{c}{2} \right) \right]$$



(genau, sofern Brennstoff keinen N_2 enthält; für Luftgas unbrauchbar)

$$l = \max k / k = 21 / [21 - o]$$

(genau für reinen C, für Koks und Steinkohle noch brauchbar)

3. Gasprüfer nach physikalischen Methoden nutzen Eigenschaften der Gase, die vom CO_2-Gehalt abhängen: RelGw (CO_2 = 1,52 gegen Luft = 1), Wärmeleitfähigkeit (60 gegen 100), Zähigkeit (1,5 gegen 1,7), Verhältnis spez. Gw zu Zähigkeit (etwa 2 zu 1), Brechungszahl (450 gegen 295). Vorteil gegen Analysatoren: keine Kalilauge, Anzeige sofort, vielfach bequeme Fernübertragung (zum Heizerstand); Nachteil: Beeinflussung durch Anwesenheit weiterer Gase, besonders H_2 und CH_4, sowie durch Temperatur und Feuchtigkeit. Gasprüfer von S & H (Leitfähigkeit), Ranarex der AEG, Unograph der Union Apparatebau-Gesellschaft Karlsruhe (Zähigkeit). Einfluß der Feuchtigkeit muß durch Trocknen oder durch Sättigen beseitigt werden.

= Ihre Bestellzettel Nr. 200 und 251 vom 25.7.42 =

Oberscharführer P e r s c h o n hat uns Ihre obigen Bestellungen heute persönlich überbracht.

Für die Auftragserteilung auf Lieferung von

3 Stück Schlageisen,
5 " Reservemesser,
10 " Gasmasken
200 " Einsätze
1 " Gasrestnachweisgerät
20 " Gummikappen

sowie 6000 Dosen á 1500 g = 9.000 kg ZYKLON CN

danken wir Ihnen.

Die Lieferung werden wir zu unseren geltenden Listen-/-preisen unter Zugrundelegung unserer beifolgenden Verkaufs- und Lieferungsbedingungen ausführen. Ein Exemplar der Bedingungen erbitten wir unterschrieben und mit Dienststempel versehen zurück.

Von den bestellten Geräten hat Oberscharführer Perschon von uns sofort ausgehändigt erhalten:

2 gr. Schlageisen kompl.
3 gr. Reservemesser dazu,
3 Gasmasken Gr. II kompl.
1 Gasmaske " I "
1 " " III "
1 Gasrestnachweisgerät für Zyklon
20 gr. Gummikappen
50 Atemeinsätze "J"
und Warnungsplakate.

Die restlichen Geräte werden wir schnellmöglichst

11.3. Glossary

Aide: A military officer acting as assistant to a superior
AL: Arbeitslager, work camp
Aktenvermerk: File memo
Alimentation: Allowance
Aleatorie: Coincidental
Amtsgruppe: Office group
Anzeigegeräte: Indicator device
APMO: Archives of the Polish Museum at Oświęcim [Auschwitz]
Arginal [Areginal]: A Gas
Aspiration: Exhaust process
Aufnahmegebäude: Admittance building
Aufzeichnungen: Notes, records
Auschwitz: German spelling for the Upper Silesian town with the Polish name Oświęcim, appr. 45,000 inhabitants, located 2 km Southwest from the former large complex known as Auschwitz-Birkenau
Auskleidekeller: Undressing basement
Badenanstalten: Swimming, bathing facilities
Baracken: Barracks, huts
Bauhof: Construction depot
Bauleitung: Construction Office
Bavure: Trace, Glitch
Behelfsmässig: Temporary, makeshift, improvised
Berücksichtigt: considered
Bescheinigung: Receipt, certificate
Blausäure: Hydrocyanic acid
Blausäuregaskammern: Hydrocyanic acid gas chambers
Blausäurekammern: Hydrocyanic acid chambers
Boos: Name of a German manufacturer (Friedrich Boos)
Brennstoffverbrauch: Fuel consumption
Buchenwald: Location of a German concentration camp
Bundesarchiv: German federal archives
Bunker: Shelter
Chemischtechnischer: Chemical-technical
Crypto-revisionist: Secret, or underground revisionist
Czech (Danuta): Author of Kalendarium der Ereignisse im Konzentrationslager Auschwitz-Birkenau 1939-1948
Degesch-Kreislauf: Circulatory system type Degesch
Drahtnetzeinschiebvorrichtung: Meshed-wire push-in device
Drahtseil: Wire rope
Dreimuffel-Einäscherungs-Öfen: Three-muffle cremation ovens
Druckluftgebläse: (pressing) air blower
Druckluft-Anlage: (pressing) air installation
Einäscherungsofen: Crematory oven
Einäscherungsverfahren: Cremation procedure
Einsatzfähigkeit: Operational capability
Einwurfvorrichtung: Insertion installation
Entlausungsbaracken: Delousing barracks
Entlüftungsanlage: Exhaust equipment

Entlüftungskanäle: Exhaust channels
Erfurt: A German city
Europaverlag: A German publishing establishment
Feuerbestattung: Cremation
Feuerungstechnik: Cremation techniques
Fleckfieberabwehr: Typhus prevention
Gasentwicklung: Gas development
Gas generator: An apparatus producing gas for fuel by burning coke, charcoal, or wood
Gasprüfer: Gas tester, analyzer of combustion gases
Gasrestnachweisgeräte: Residual gas indicators (indicating instruments)
Generatorgase: Generator gases
Gestapo: Geheime Staatspolizei - Secret State Police, later incorporated into the Reich Main Security Office, headed by Heinrich Müller
Gesundheitspflege: Health care
Gesundheits-Ingenieur: Health engineer
Gleichschaltung: Co-ordination
Gusseisern: Wrought iron
Hamburg: Northern German port city
Handwinde: Hand winch
Hauptamt: Main office
Hauptfriedhof: Main cemetery
Hauptsturmführer: Captain of SS
Häftlinge: Prisoners
HCN: Hydrocyanic acid
Heisslufteinäscherungsofen: Hot air cremation oven
Holzblenden: Wooden blinds
Holzdeckel: Wooden lid(s)
Holzgebläse: Wooden blowers
HUTA: Acronym for Hoch und Tiefbau AG (a construction firm)
Judenumsiedlung: Jewish resettlement
Kammerinhalts: Room contents
Kellerzugang: Cellar or basement entrance
KGL: Prisoner of war camp
KL: Concentration camp
Koblenz: A German city
Koksbeheizt: Heated by coke
Koksfeuerung: Coke burner
Konzentrationslager: Concentration camp
Kori: A German manufacturer of combustion plants
Kostenanschlag: Cost estimate
Kostenvoranschlag: Preliminary cost estimate
Krakow: A Polish city
Kreislauf: Circulation
Kreislauf-Begasungskammern: Circulatory gas chambers
Kriegsgefangenenlager: Prisoner of war camp
Lagergemeinschaft: Camp community
Leicheneinäscherungsöfen: Corpse cremation ovens
Leichenhalle: Mortuary hall
Leichenhallenbuch: Mortuary book or register
Leichenkeller: Mortuary basement
Leichenkühlräume: Corpse cooling rooms
Leichenverbrennungsöfen: Corpse cremating ovens

Leichenverbrennungs-Anstalten: Corpse cremating facilities
Luftwechsel: Air exchange
Miasma: Noxious
Militärärztliche: Of a military physician nature
Nazi: Acronym for Nationalsozialistisch (National Socialist)
Nord-süd: North-South
Obergruppenführer: SS rank of General
Ofenanlage: Oven installation
Offenbach: A German city
Öfen: Ovens
Öffentlich: Public
Österreichisch: Austrian
Planrost: Level grate
Politruk: Soviet political officer charged with a number of functions among the troops, including political supervision and agitation. Commonly translated as "Commissar"
POW: Prisoner of war
Propaganda: Any organized movement to spread particular doctrines, information, etc.
Rauchgasanalyse: Smoke gas analysis
Rauchkanalschieber: Smoke channel slider (control mechanism)
Refractory: Fire retardant or resistant
Reichsarbeitblatt: German government labor news magazine
Reichsführer: Reich leader. Position occupied by Heinrich Himmler from 1929 to 1945
Reichsmark: Traditional German monetary unit
Revisionists: Those who look again in order to correct or improve
RM: Reichsmark
RSHA: Reichssicherkeitshauptamt. Reich Security Main Office formed in 1939. Departments: Intelligence, Gestapo, Criminal Police and the SD (Sicherheitsdienst)
Sach-Entlausung: Material delousing
Saugzuganlage: Forced draft installation
Schädlingsbekämpfung: Pest control
Schlachtfeld: Battlefield
Schmiedeeisengebläse: Wrought-iron blower
Schornsteinfutter: Chimney casing
SD: Sicherheitsdienst, Security Service
Sonder: Out of the ordinary routine, special
Sonderbaumassnahmen: Special construction measure
Sondermassnahmen: Special undertaking and procedures
Sonderveröffentlichung: Special publication
SS: Schutzstaffel, protective echelon
SS-Neubauleitung: SS Office for new construction
SS-Obersturmführer: SS rank of Lieutenant
SS-Sturmbannführer: SS rank of Major
SS-WVHA: SS Wirtschaftsverwaltungshauptamt, SS Economic Administrative Main Office
Staatsarchiv: State archives
Stammlager: Original camp (Auschwitz) "Main Camp"
Sterbebücher: Death records
Sturmbannführer: SS rank of Major
Tagelohn-Arbeiten: day-labor jobs
Taschenbuch: Pocket book (notebook)
Tesch: Bruno Tesch, engineer
Testa: Acronym for Tesch und Stabenow, German engineering firm
Topf: A German engineering and manufacturing firm

Topf-Doppelmuffel-Einäscherungs-Ofen: Topf two-muffle cremation oven
Topf-Zugverstärkungs-Anlage: Topf facility for increased draft
Übergabeverhandlung: Transfer negotiations or proceedings of transfer
Wärmebilanz: Heat balance
Wärmewirtschaft: Heat distribution
WVHA: see SS-WVHA
Zyklon B: chemical disinfestant, hydrogen cyanide absorbed in gypsum.

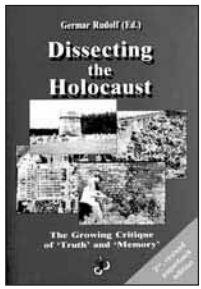
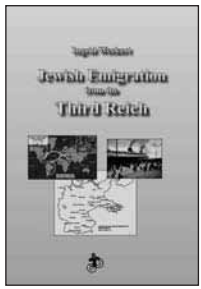
THE HOLOCAUST HANDBOOK SERIES . . .

This ambitious series of scholarly books addresses various topics of the so-called Jewish "Holocaust" of the WWII era. They all have a highly critical, if not skeptical attitude toward the commonly held views on this topic and are usually referred to as "revisionist" in nature. These books are designed to have the power to both convince the common reader as well as academics in this field. The following books have appeared so far:



Lectures on the Holocaust. Controversial Issues Cross Examined—updated and revised Second Edition. By Germar Rudolf. Between 1992 and 2005 German scholar Germar Rudolf has lectured to various audiences about the Holocaust in the light of new findings. Rudolf's sometimes astounding facts and arguments fell on fertile soil among his listeners, as they were presented in a very sensitive and scholarly way. This book is the literary version of Rudolf's lectures, enriched with the most recent findings of historiography. It is a dialogue between the lecturer and the reactions of the audience. Rudolf introduces the most important arguments for his findings, and his audience reacts with supportive, skeptical, and also hostile questions. The Lectures read like an exciting real-life exchange between persons of various points of view. The usual arguments against revisionism are addressed and refuted. This book resembles an entertaining collection of answers to frequently asked questions on the Holocaust. It is the best introduction into this taboo topic for both readers unfamiliar with the topic and for those wanting to know more. Softcover, 566 pages, B&W illustrations, bibliography, index, #538, ***$30*** minus 10% for TBR subscribers.



The Hoax of the Twentieth Century. By Arthur R. Butz. With this book Dr. Butz, Professor of Electrical Engineering and Computer Science, has been the first writer to treat the entire Holocaust complex from the revisionist perspective in a precise scientific manner. The Hoax exhibits the overwhelming force of historical and logical arguments which revisionism had accumulated by the middle of the 1970s. It was the first book published in the U.S. which won for revisionism the academic dignity to which it is entitled. It continues to be a major revisionist reference work, frequently cited by prominent personalities. This new edition comes with several supplements adding new information gathered by the author over the last 25 years. It is a "must read" for every revisionist and every newcomer to the issue who wants to learn about revisionist arguments. Softcover, 506 pages, 6"×9", B&W illustrations, bibliography, index, #385, ***$30*** minus 10% for TBR subscribers.

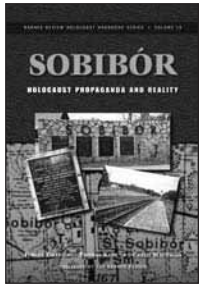
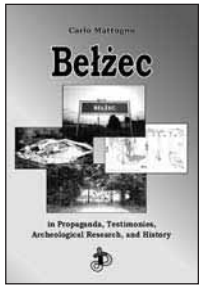
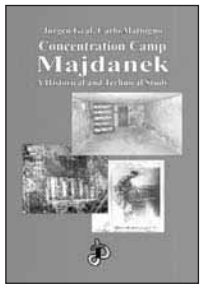
Dissecting the Holocaust. The Growing Critique of 'Truth' and 'Memory.' Edited by Germar Rudolf. *Dissecting the Holocaust* applies state-of-the-art scientific technique and classic methods of detection to investigate the alleged murder of millions of Jews by Germans during World War II. In 22 contributions—each of 30 pages—the 17 authors dissect generally accepted paradigms of the "Holocaust." It reads as exciting as a crime novel: so many lies, forgeries and deceptions by politicians, historians, and scientists. This is the intellectual adventure of the 21st century. Be part of it! "There is at present no other single volume that provides a serious reader with a broad understanding of the contemporary state of historical issues that influential people would rather not have examined." —Prof. Dr. A. R. Butz, Evanston, IL. "Read this book and you will know where revisionism is today. . . . Revisionism has done away with the exterminationist case." —Andrew Gray, THE BARNES REVIEW. Second revised edition. Softcover, large format, 616 pages, B&W illustrations, bibliography, index, #219, ***$30*** minus 10% for TBR subscribers.



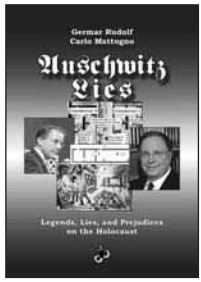
Jewish Emigration from the Third Reich. By Ingrid Weckert. Current historical writings about the Third Reich paint a bleak picture regarding its treatment of Jews. Jewish emigration is often depicted as if the Jews had to sneak over the German border, leaving all their possessions behind. The truth is that the emigration was welcomed and supported by the German authorities and occurred under constantly increasing pressure. Weckert's booklet elucidates the emigration process in law and policy, thereby augmenting the perceived picture of Jewish emigration from Germany. Softcover, 72 pages, index, #539, ***$8*** minus 10% for TBR subscribers.



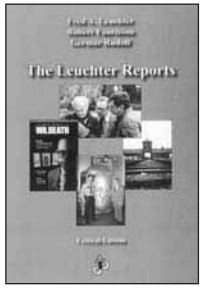
The First Holocaust. Jewish Fundraising Campaigns With Holocaust Claims During and After World War One. By Don Heddesheimer. Six million Jews in Europe threatened with a holocaust: this allegation was spread by sources like *The New York Times*—but the year was 1919! Don Heddesheimer's compact but substantive *First Holocaust* documents post-WWI propaganda that claimed East European Jewry was on the brink of annihilation (regularly invoking the talismanic six million figure). It details how that propaganda was used to agitate for minority rights for Jews in Poland, and for Bolshevism in Russia. It demonstrates how Jewish fundraising operations in America raised vast sums in the name of feeding suffering Polish and Russian Jews, then funneled much of the money to Zionist and Communist "constructive undertakings." *The First Holocaust* is a valuable study of American Jewish institutional operations at a fateful juncture in Jewish and European history; an incisive examination of a cunningly contrived campaign of atrocity and extermination propaganda two decades before the alleged WWII Holocaust—and an indispensable addition to every revisionist's library. Softcover, 144 pages, B&W illustrations, bibliography, index, #386, ***$10*** minus 10% for TBR subscribers.



Treblinka. Extermination Camp or Transit Camp? By Carlo Mattogno and Juergen Graf. It is alleged that at Treblinka in East Poland between 700,000 and 3,000,000 persons were murdered in 1942 and 1943. The weapons used were said to have been stationary and/or mobile gas chambers, fast-acting or slow-acting poison gas, unslaked lime, superheated steam, electricity, diesel exhaust fumes etc. Holocaust historians alleged that bodies were piled as high as multi-storied buildings and burned without a trace, using little or no fuel at all. Graf and Mattogno have now analyzed the origins, logic and technical feasibility of the official version of Treblinka. On the basis of numerous documents they reveal Treblinka's true identity: it was a transit camp. Even longtime revisionism buffs will find a lot that is new in this book, while Graf's animated style guarantees a pleasant reading experience. The original testimony of witnesses enlivens the reader, as does the skill with which the authors expose the absurdities of Holocaust historiography. Softcover, 365 pages, B&W illustrations, bibliography, index, #389, ***$25*** minus 10% for TBR subscribers.



Sobibor. Holocaust Propaganda and Reality. By Juergen Graf, Thomas Kues and Carlo Mattogno. Between 25,000 and 2,000,000 Jews are said to have been killed in gas chambers in the Sobibór camp in eastern Poland in 1942 and 1943. The corpses were allegedly buried in mass graves and later incinerated on pyres. This book investigates these claims and shows that they are not based on solid evidence, but on the selective use of absurd and contradictory eyewitness testimonies. Archeological surveys of the camp in 2000-2001 are analyzed, with fatal results for the extermination camp hypothesis. The book also thoroughly documents the general NS policy toward Jews, which never included an extermination plan. Softcover, 434 pages, B&W illustrations, bibliography, index. #536, ***$25*** minus 10% for TBR subscribers.

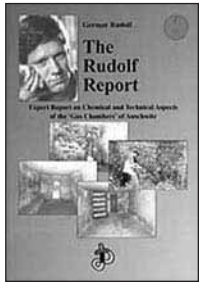


Belzec in Propaganda, Testimonies, Archeological Research, and History. By Carlo Mattogno. Witnesses report that at least 600,000, if not as many as three million, Jews were murdered in the Belzec camp, located in eastern Poland, between 1941 and 1942. Various murder weapons are claimed to have been used: diesel gas chambers; unslaked lime in trains; high voltage; vacuum chambers etc. According to witnesses, the corpses were incinerated on huge pyres without leaving any traces. For those who know the stories about Treblinka this all sounds too familiar. The author therefore restricted this study to the aspects which are different and new compared to Treblinka, but otherwise refers the reader to his Treblinka book. The development of the official image portrait about Belzec is explained and subjected to a thorough critique. In contrast to Treblinka, forensic drillings and excavations were performed in the late 1990s in Belzec, the results of which are explained and critically reviewed. These findings, together with the absurd claims by "witnesses," refute the thesis of an extermination camp. Softcover, 138 pages, B&W illustrations, bibliography, index, #540, ***$15*** minus 10% for TBR subscribers.

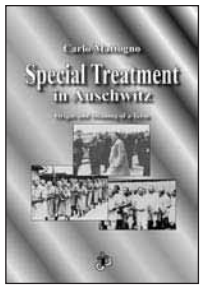
Concentration Camp Majdanek. By Carlo Mattogno and Juergen Graf. Little research had been directed toward concentration camp Majdanek in central Poland, even though it is claimed that up to a million Jews were murdered there. The only information available is discredited Polish Communist propaganda. This glaring research gap has finally been filled. After exhaustive research of primary sources, Mattogno and Graf created a monumental study which expertly dissects and repudiates the myth of homicidal gas chambers at Majdanek. They also critically investigated the legendary mass executions of Jews in tank trenches ("Operation Harvest Festival") and prove them groundless. The authors' investigations lead to unambiguous conclusions about the camp which are radically different from the official theses. Again they have produced a standard and methodical investigative work, which authentic historiography cannot ignore. Softcover, second edition, 320 pages, B&W illustrations, bibliography, index, #380, ***$25*** minus 10% for TBR subscribers.

Auschwitz Lies: Legends, Lies and Prejudices on the Holocaust. By Carlo Mattogno and Germar Rudolf. "French biochemist G. Wellers exposed "The Leuchter Report" as fallacious," but he exposed only his own grotesque incompetence. "Polish researcher Prof. J. Markiewicz proved with analysis that Zyklon B was used in the gas chambers of Auschwitz," but Markiewicz fabricated his results. "Chemist Dr. Richard Green showed that the revisionists' chemical arguments are flawed," yet Green actually had to admit that the revisionists are right. "Prof. Zimmerman proved that the crematories in Auschwitz could cremate all victims of the claimed mass murder." As an accountant, Zimmerman proved only his lack of knowledge. "Profs. M. Shermer and A. Grobman refuted the entire array of revisionist arguments." In truth they covered only a tiny fraction of revisionist arguments, and botched their attempt at refutation. "Keren, McCarthy and Mazal found the 'Holes of Death' proving the existence of the Auschwitz gas chambers." No, they twisted evidence to support their case and suppressed facts. These and other untruths are exposed for what they are: political lies created to ostracize dissident historians and keep the Western world in Holocaust servitude. Softcover, 398 pages, B&W illustrations, index, #541, ***$25*** minus 10% for TBR subscribers.

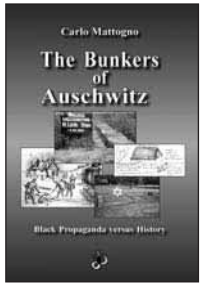
The Leuchter Reports: Critical Edition. By Fred Leuchter, Robert Faurisson and Germar Rudolf. Between 1988 and 1991, U.S. expert on execution technologies Fred Leuchter wrote four expert reports addressing whether the Third Reich operated homicidal gas chambers. The first report on Auschwitz and Majdanek became world famous. Based on chemical analyses of wall samples and on various technical arguments, Leuchter concluded that the locations investigated "could not have then been, or now, be utilized or seriously considered to function as execution gas chambers." Subsequently, this first "Leuchter Report" was the target of much criticism, some of it justified. This edition republishes the unaltered text of all four reports and accompanies the first one with critical notes and research updates, backing up those of Leuchter's claims that are correct, and correcting those that are inaccurate. Softcover, 227 pages, B&W illustrations, #431, ***$22*** minus 10% for TBR subscribers.



Auschwitz: Plain Facts—A Response to Jean-Claude Pressac. Edited by Germar Rudolf. French pharmacist Jean-Claude Pressac tried to refute revisionists with their own technical methods. For this he was praised by the mainstream, and they proclaimed victory over revisionists. In *Auschwitz: Plain Facts,* Pressac's works are subjected to a detailed critique. Although Pressac deserves credit for having made accessible many hitherto unknown documents, he neither adhered to scientific nor to formal standards when interpreting documents. He made claims that he either could not prove or which contradict the facts. Documents do not state what he claims they do. He exhibits massive technical incompetence and he ignores important arguments. *Auschwitz: Plain Facts* is a must read. Softcover, 197 pages, B&W illustrations, bibliography, index, #542, ***$20*** minus 10% for TBR subscribers.



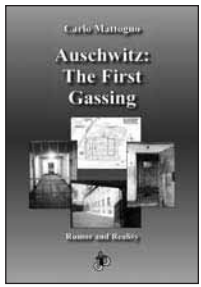
The Giant with Feet of Clay: Raul Hilberg and His Standard Work on the "Holocaust." By Juergen Graf. Raul Hilberg's major work *The Destruction of European Jewry* is generally considered the standard work on the Holocaust. The critical reader might ask: what evidence does Hilberg provide to back his thesis that there was a German plan to exterminate Jews, to be carried out in the legendary gas chambers? And what evidence supports his estimate of 5.1 million Jewish victims? Juergen Graf applies the methods of critical analysis to Hilberg's evidence and examines the results in light of revisionist historiography. The results of Graf's critical analysis are devastating for Hilberg. Graf's *Giant With Feet of Clay* is the first comprehensive and systematic examination of the leading spokesperson for the orthodox version of the Jewish fate during the Third Reich. Softcover, 128 pages, B&W illustrations, bibliography, index, #252, ***$11*** minus 10% for TBR subscribers.



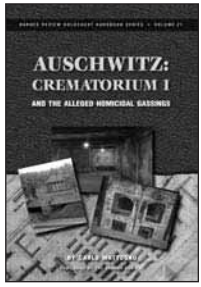
The Rudolf Report. Expert Report on Chemical and Technical Aspects of the 'Gas Chambers' of Auschwitz. By Germar Rudolf. In 1988, Fred Leuchter, American expert for execution technologies, investigated the alleged gas chambers of Auschwitz and Majdanek and concluded that they could not have functioned as claimed. Ever since, Leuchter's claims have been massively criticized. In 1993, Rudolf, a researcher from the prestigious German Max Planck Institute, published a thorough forensic study about the alleged gas chambers of Auschwitz that irons out the deficiencies and discrepancies of "The Leuchter Report." *The Rudolf Report* is the first English edition of this sensational scientific work. It analyzes all existing evidence on the Auschwitz gas chambers. The conclusions are quite clear: The alleged gas chambers of Auschwitz could not have existed. In the appendix, Rudolf describes his unique persecution. Softcover, 455 pages, B&W & color illustrations, bibliography, index, #378, ***$33*** minus 10% for TBR subscribers.

Box 15877, Washington, D.C. 20003, call 1-877-773-9077 toll free to charge to major credit cards or visit www.barnesreview.com.

Special Treatment in Auschwitz: Origin and Meaning of a Term. By Carlo Mattogno. When appearing in German wartime documents, terms like "special treatment," "special action," and others have been interpreted as code words signifying the murder of inmates. While the term "special treatment" in many such documents did indeed mean execution, the term need not always have had that meaning in German records. This book is the most thorough study of this textual problem to date. Publishing and interpreting numerous such documents about Auschwitz—many of them hitherto unknown—Mattogno shows that, while "special" had many different meanings, not a single one meant "execution." This important study demonstrates that the practice of deciphering an alleged "code language" by assigning homicidal meaning to harmless documents is no longer tenable. Softcover, 151 pages, B&W illustrations, bibliography, index, #543, ***$15*** minus 10% for TBR subscribers.



The Bunkers of Auschwitz: Black Propaganda vs. History. By Carlo Mattogno. The so-called "Bunkers" at Auschwitz are claimed to have been the first homicidal gas chambers at Auschwitz specifically equipped for this purpose in early 1942. With the help of original German wartime files, this study shows that these "bunkers" never existed; how the rumors about them evolved as black propaganda created by resistance groups within the camp; how this propaganda was transformed into "reality" by historians; and how material evidence (aerial photography and archeological research) confirms the publicity character of these rumors. Softcover, 264 pages, illustrations, bibliography, index, #544, ***$20*** minus 10% for TBR subscribers.



Auschwitz: The Central Construction Office. By Carlo Mattogno. Based upon mostly unpublished German wartime documents from Moscow archives, this study describes the history, organization, tasks and procedures of the Central Construction Office of the Waffen-SS and Auschwitz Police. Despite a huge public interest in the camp, next to nothing was really known about this office, which was responsible for the planning and construction of the Auschwitz camp complex, including those buildings in which horrendous mass slaughter is erroneously said to have occurred. Softcover, 182 pages, B&W illustrations, glossary, #545, ***$18*** minus 10% for TBR subscribers.

Distribution in the United States: Prices do not include S&H. Inside the U.S. add $5 on orders up to $50. Add $10 S&H on orders from $50.01 to $100. Auschwitz: The First Gassing—Rumor and Reality. By Carlo Mattogno. The first gassing of human beings in Auschwitz is claimed to have occurred on Sept. 3, 1941, in a basement room. The accounts reporting it are the archetypes for all later gassing accounts. This study analyzes all available sources about this alleged event. It shows that these sources contradict each other in location, date, preparations, victims etc, rendering it impossible to extract a consistent story. Original wartime documents inflict a final blow to the tale of the first homicidal gassing. Softcover, 157 pages, B&W illustrations, bibliography, index, #515, ***$16*** minus 10% for TBR subscribers.

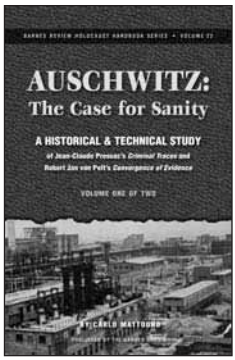
Auschwitz: Crematorium I and the Alleged Homicidal Gassings. By Carlo Mattogno. The morgue of Crematorium I in Auschwitz is claimed to have been the first homicidal gas chamber in that camp. This study thoroughly investigates all accessible statements by witnesses and analyzes hundreds of wartime documents in order to accurately write a history of that building. Mattogno proves that its morgue was never used as a homicidal gas chamber, nor could it have served as such. Softcover, 138 pages, B&W illustrations, bibliography, index, #546, ***$18*** minus 10% for TBR subscribers.

Auschwitz: Open Air Incinerations. By Carlo Mattogno. Hundreds of thousands of corpses of murder victims are claimed to have been incinerated in deep ditches in the Auschwitz concentration/work camp complex. This book examines the many testimonies regarding these incinerations and establishes whether these claims were technically possible. Using aerial photographic evidence, physical evidence and wartime documents, the author shows that these claims are untrue. A must read. Softcover, 132 pages, B&W illustrations, bibliography, index, #547, ***$12*** minus 10% for TBR subscribers.



Concentration Camp Stutthof and its Function in National Socialist Jewish Policy. By Carlo Mattogno and Juergen Graf. The concentration camp at Stutthof near Danzig in western Prussia has never before been scientifically investigated by Western historians. Polish authors officially sanctioned by their Communist government long maintained that Stutthof was converted to an "auxiliary extermination camp" in 1944 with the mission to murder as many Jews as possible. This book subjects this concept to rigorous critical investigation based on literature and documents from various archives. It shows that extermination claims contradict reliable sources. Second edition, 128 pages, B&W & color illustrations, bibliography, index, #379, ***$15*** minus 10% for TBR subscribers.

NEW TWO-VOLUME SET

Auschwitz: The Case for Sanity:

A Historical & Technical Study of Jean-Claude Pressac's 'Criminal Traces' and Robert Jan van Pelt's 'Convergence of Evidence'

By Carlo Mattogno. Because Jewish theologian Deborah Lipstadt had called British historian David Irving a "Holocaust denier," he sued her for libel. In her defense Lipstadt presented Prof. Robert van Pelt as an expert to refute revisionist assertions about Auschwitz. Ever since van Pelt has been praised as the defeater of revisionism and foremost expert on Auschwitz. This book is the revisionist response to Prof. van Pelt and Pressac. It shows that van Pelt's study is "neither a scholarly nor a historical work; it is only a biased journalistic assemblage of poorly understood and poorly interpreted historical sources." This is a book of prime political and scholarly importance! 2 vols. (370 + 390 pages), softcover, B&W illustrations, glossary, bibliography, index. #551, ***$45*** minus 10% for TBR subscribers. Add $25 for a sturdy leatherette case to house the two volumes.

CURRENTLY IN PREPARATION:

Carlo Mattogno: ***Healthcare in Auschwitz***—An overview of the vast measures taken by the Auschwitz camp authorities to save the lives of their inmates. Irrefutably proven facts, incredible only for those who still believe in the establishment version. Softcover, estimated at 350 pages, softcover, 6"×9", B&W illustrations, bibliography, index.

Carlo Mattogno: ***The Crematory Ovens of Auschwitz***—An exhaustive technical study of the "core" buildings of the alleged "Holocaust"—and a refutation of mass murder claims based upon false concepts of those crematoria. Projected at two volumes. (Volume I: 550 pages; Volume II: 350 pages), softcover, 6"×9", B&W illustrations, bibliography, glossary, index.

Carlo Mattogno: ***Chelmno. Myth and Reality***—An overview of the mostly unsubstantiated claims and their juxtaposition to provable facts about this camp where thousands are said to have been murdered, mostly by noxious exhaust gases in trucks. Projected at 200 pages, 6"×9", B&W illustrations, bibliography, index.

Distribution in the United States: Prices do not include S&H. Inside the U.S. add $5 on orders up to $50. Add $10 S&H on orders from $50.01 to $100. On orders over $100 add a flat $15 no matter the order size. Subscribers to The Barnes Review magazine may take 10% off book prices. Send order to TBR Book Club, P.O. THE BARNES REVIEW:

In the maverick tradition of one of the great historians of the modern era . . .

No topic is "too controversial" for The BARNES REVIEW, the most interesting history magazine published anywhere today. Commemorating the trailblazing path of the towering 20th Century revisionist historian, the late Harry Elmer Barnes, TBR's mission is to separate historical truth from propaganda and to bring history into accord with the facts. Founded in 1994 by veteran American nationalist Willis A. Carto—a personal friend of Barnes—*The Barnes Review* concurs with Rousseau's maxim that "Falsification of history has done more to impede human development than any one thing known to mankind." TBR covers all aspects of history from the dawn of man to recent events and also places a special focus on the philosophy of nationalism. As such, TBR proudly describes itself as a "journal of nationalist thought" and dares to be politically incorrect in a day when Cultural Marxism prevails in the mass media, in academia and in day-to-day life. TBR's editorial board of advisors encompasses historians, philosophers and academics from all over the face of the planet, intellectuals united in their desire to bring peace to the world by exposing the lies and prevarications of the past that have brought us to where we are today. If you believe everything you see in the "responsible" media or think that absolutely everything that appears in most college-level history texts is true, you might be shocked by

what you see in TBR—but if you are shocked by what you see in TBR, then that's all the more reason you need to join the growing ranks of independent-minded free-thinkers from all walks of life and all over the world who are longtime TBR subscribers.

The Barnes Review $46 for ONE year (six bimonthly issues—64 pages each); Including this special free bonus: A FREE COPY OF Michael Collins Piper's blockbuster book *The New Jerusalem*. That's a $20 gift free for a one-year domestic subscription. Subscribe for two years at $78 and get *The New Jerusalem* PLUS Mark Glenn's *No Beauty in the Beast: Israel Without Her Mascara*. Outside the U.S. email TBRca@aol.com for international rates and for S&H to your nation.

SPECIAL! Take advantage of TBR's simple, automated monthly subscription plan. Every month your credit card account is automatically charged $4. No hassle. No renewal notices. No missed issues. Canada and Mexico are $5.50 per month. All other foreign nations are $7 per month sent via air mail. No additional charges. Just call 1-877-773-9077 toll free or write "automated payment plan" on the ordering form at the end of this book to subscribe.

BARNES REVIEW HOLOCAUST HANDBOOK SERIES • VOLUME 18

AUSCHWITZ LIES

LEGENDS, LIES & PREJUDICES ON THE HOLOCAUST

Untruths and mainstream propaganda abound when it comes to the Auschwitz WWII German labor camp. Here are just a few: 1) French biochemist G. Wellers claimed he exposed *The Leuchter Report* as fallacious, but in truth he exposed only his own grotesque incompetence; 2) Polish researcher Prof. J. Markiewicz said he proved that Zyklon B was used in the gas chambers of Auschwitz, but Markiewicz was found to have fabricated his results; 3) Chemist Dr. Richard Green declared that Revisionists' chemical arguments were flawed, yet Green was forced to admit that Revisionists were right after all; 4) Prof. Zimmerman alleged that the crematories in Auschwitz could cremate all victims of the claimed mass murder. But in truth, accountant Zimmerman proved only his lack of expertise on the subject; 5) Profs. M. Shermer and A. Grobman said they could refute the entire array of Revisionist arguments. But in reality they covered only a tiny fraction of Revisionist arguments—and botched their attempts at refutation; 6) Keren, McCarthy and Mazal found the "Holes of Death," saying they proved the existence of the Auschwitz gas chambers. But no, they twisted evidence to support their case and suppressed the facts. These and many other untruths about Auschwitz are exposed for what they are: political lies created to ostracize dissident historians and keep the Western world in Holocaust servitude.

AUSCHWITZ LIES (softcover, 398 pages, indexed, illustrated, #541, **$25** minus 10% for TBR subscribers) can be ordered from TBR Book Club, P.O. Box 15877, Washington, D.C. 20003. Set in Times New Roman

ON THE COVER: Background: Auschwitz Crematorium II. Top photo: a fanciful illustration by Auschwitz inmate David Olere whose sketches, though laden with massive exaggeration and error, are accepted as accurate by mainstream historians. Bottom left: One of the alleged "holes of death." Bottom right: One of the reconstructed holes in the ceiling through which Zyklon-B gas pellets allegedly were dropped into this "gas chamber." The room was reconstructed in 1947 to include details such as this that were not in the original plans, obviously to make it look like the room was used for gassing Jews to death.

Introduction

By Germar Rudolf

End of 1991, U.S. citizen Bradley R. Smith with his "Committee for Open Debate on the Holocaust" (CODOH) caused a storm in a teapot with ads placed in student newspapers at various colleges and universities. These ads challenged the mainstream opinion on "the Holocaust."[1] The editors of the student newspapers which ran Smith's ads were massively attacked for allegedly "spreading hate." Even two of the leading daily newspapers of the United States commented on Smith's advertisement campaigns. An analysis of these articles may serve as an introduction to the topic of this book.
Here is what *The Washington Post* had to say about Smith's ad:[2]

> *"The ad copy is just the sort that puts people's free-speech convictions to flight: vile, straight-faced fabrications about 'the good news of Holocaust Revisionism' in full-page ads submitted recently to a wide range of college newspapers. In the ads, yet another group of haters presents artfully pseudo-academic assurances that no mass murder took place at Auschwitz, that eyewitness accounts are 'ludicrously unreliable,' that 'it is now well documented' (a lie) that confessions at war crimes trials were obtained through torture. Most insidious, the ad's author attributes any dissension from the 'Holocaust Story' to 'political correctness' and 'campus Thought Police,' adroitly appropriating political symbols of the moment.*
>
> *College newspapers have no obligation to accept these ads, of course, and some editors haven't. Some, however, including those at Duke and Rutgers, have run them with rebuttals and discussion. This has brought an outcry from adults calling for an across-the-board ban on such material under existing guidelines that ban racist or antisemitic copy. The catch, though, is the false dispassionate and pseudo-scholarly tone of the ads, which studiously avoid code words and ethnic invective. Their offensiveness lies solely in their message.*
>
> *Statements that the Holocaust never happened have surfaced in a variety of semi-public contexts lately – computer networks, talk radio – and, whether from the efforts of a small band of poisonous thinkers or from the gradual erosion of a taboo, it's clear that such talk is becoming gradually*

---

1 Bradley R. Smith, "The Holocaust Story: How Much is False? The Case for Open Debate" www.vho.org/GB/c/BRS/adscasefor.html; updated: www.vho.org/Intro/GB/Flyer.html; also available as a flyer (download: www.vho.org/Intro/GB/Flyer.pdf; purchase: vho.org/store/USA/bresult.php?ID=87)

2 "College Ads and the Holocaust," *Washington Post*, Dec. 21, 1991, A18.

more audible in public discourse. As a social development, this is not good news. But the idea that the way to combat these ads is to suppress them – automatically and in every case – is bad strategy. It plays into a key part of the offenders' argument: that evidence of the Holocaust is somehow sparse or hard to come by and that the truth has anything to fear from scrutiny.

The opposite is true. Poland is open now. Anyone can go to Auschwitz and see the roomfuls of grisly, literal evidence. Anyone can read not one, or 10, but hundreds of volumes of documents. Anyone can demolish the supposedly academic 'rise' laid out in these ads without half trying – and everyone has a responsibility to do so, given the chances. The student editors at Duke and Rutgers did this. The impulse to push away the creeping revisionist insinuation, to protect it from the bracing blast of refutation, is shortsighted. Ironically, one sole sentence near the beginning of the ad copy is in fact correct: 'Students should be encouraged to investigate the Holocaust story the same way they are encouraged to investigate every other historical event."

Anyone reading Bradley Smith's books *Confessions of a Holocaust Revisionist*[3] or *Break my Bones*[4] can easily find out that he is anything else but a hater. These books also prove that Smith's dispassionate style is not at all "false." Furthermore, he never claimed himself or his ads to be "scholarly" or "academic," which is why he cannot be a "pseudo-" either.

In addition, why should it be deplorable that a historical taboo is challenged or eroding? Isn't it one of the main characteristics of tyrannies that they try to shield certain historical and political issues from criticism by declaring them a taboo? And what exactly is it that makes a thinker "poisonous"? Just the fact that he thinks the unthinkable, the unwanted? Isn't it exactly that which made Socrates a great philosopher?

Also, the claim that what Smith wrote are "vile, straight-faced fabrications," "creeping insinuations," and "a lie" is not only unsupported, but a lie in itself. In a 1986 book the captors of Rudolf Höss, former commandant of Auschwitz, admitted how they tortured him in order to receive confessions from him intended to be used during the post-war trials.[5]

---

Or simply read what British journalist Alan Moorehead reported on what was going on in allied prisons in Germany after the war in preparation of the infamous war crimes trials:[6]

> *"As we approached the cells of the SS guards, the* [British] *sergeant's language become ferocious. 'We had had an interrogation this morning,' the captain said. 'I am afraid they are not a pretty sight.'* […] *The sergeant unbolted the first door and* […] *strode into the cell, jabbing a metal spike in front of him. 'Get up,' he shouted. 'Get up. Get up, you dirty bastards.' There were half a dozen men lying or half lying on the floor. One or two were able to pull themselves erect at once. The man nearest me, his shirt and face spattered with blood, made two attempts before he got on to his knees and then gradually on to his feet. He stood with his arms stretched out in front of him, trembling violently.*
>
> *'Come on. Get up,' the sergeant shouted* [in the next cell]. *The man was lying in his blood on the floor, a massive figure with a heavy head and bedraggled beard* […] *'Why don't you kill me?' he whispered. 'Why don't you kill me? I cannot stand it any more.' The same phrases dribbled out of his lips over and over again. 'He's been saying that all morning, the dirty bastard,' the sergeant said."*

And if that is still not enough, here is what Edward L. van Roden and Gordon Simpson had to say about these procedures. Van Roden served in World War II as Chief of the Military Justice Division for the European Theater. Together with Justice Gordon Simpson of the Texas Supreme Court, van Roden was appointed in 1948 to an extraordinary commission charged with investigating the claims of abuse during U.S. trials in Germany. Here is an excerpt of what van Roden wrote:[7]

> *"AMERICAN investigators at the U. S. Court in Dachau, Germany, used the following methods to obtain confessions: Beatings and brutal kickings. Knocking out teeth and breaking jaws. Mock trials. Solitary confinement. Posturing as priests. Very limited rations. Spiritual deprivation. Promises of acquittal.* […] *We won the war, but some of us want to go on killing. That seems to me wicked.* […] *The American prohibition of hearsay evidence had been suspended. Second and third-hand testimony was admitted,* […] *Lt Perl of the Prosecution pleaded that it was difficult to obtain competent evidence. Perl told the court, 'We had a tough case to crack and we had to use persuasive methods.' He admitted to the court that the persuasive methods included various 'expedients, including some violence and mock trials.' He further told the court that the cases rested on statements obtained by such methods.* […] *The statements which were admitted*

as evidence were obtained from men who had first been kept in solitary confinement for three, four, and, five months. They were confined between four walls, with no windows, and no opportunity of exercise. Two meals a day were shoved in to them through a slot in the door. They were not allowed to talk to anyone. They had no communication with their families or any minister or priest during that time. […] *Our investigators would put a black hood over the accused's head and then punch him in the face with brass knuckles, kick him, and beat him with rubber hose. Many of the German defendants had teeth knocked out. Some had their jaws broken. All but two of the Germans, in the 139 cases we investigated, had been kicked in the testicles beyond repair. This was Standard Operating Procedure with American investigators. Perl admitted use of mock trials and persuasive methods including violence and said the court was free to decide the weight to be attached to evidence thus received. But it all went in.*

One 18 year old defendant, after a series of beatings, was writing a statement being dictated to him. When they reached the 16th page, the boy was locked up for the night. In the early morning, Germans in nearby cells heard him muttering. 'I will not utter another lie.' When the jailer came in later to get him to finish his false statement, he found the German hanging from a cell bar, dead. However the statement that the German had hanged himself to escape signing was offered and received in evidence in the trial of the others.

Sometimes a prisoner who refused to sign was led into a dimly lit room, where a group of civilian investigators, wearing U. S. Army uniforms, were seated around a black table with a crucifix in the center and two candles burning, one on each aide. 'You will now have your American trial,' the defendant was told.

The sham court passed a sham sentence of death. Then the accused was told, 'You will hang in a few days, as soon as the general approves this sentence: but in the meantime sign this confession and we can get you acquitted.' Some still wouldn't sign. […]

In another case, a bogus Catholic priest (actually an investigator) entered the cell of one of the defendants, heard his confession, gave him absolution, and then gave him a little friendly tip: 'Sign whatever the investigators ask you to sign. It will get you your freedom. Even though it's false, I can give you absolution now in advance for the lie you'd tell.'"

Or take, for a change, the methods used in communist countries to obtain testimonies in war crime trials:[8]

"One of the witnesses involved in the 1962 case stated that he was threatened by an investigator 'with a pistol.' A second witness testified that he had incriminated Niznansky 'under psychological and physical duress.'

[8] German monthly magazine *Focus*, Feb. 9, 2004.

Jan Holbus, another witness for the prosecution back in 1962, declared during his interrogation in 2001 that he was threatened that he 'will leave the room with his feet first,' if he does not testify as the prosecution expects him to."

Torture "a lie"? Who is lying here? And how can testimonies obtained that way be anything else but "ludicrously unreliable?"

Haters cannot be recognized by the content of their message, but by their style, by the choice of words. The foremost indicator of hate are hateful, unfounded expressions, like "vile, straight-faced fabrications," "group of haters," "a lie," "insidious," "false dispassionate," "pseudo-academic," "pseudo-scholarly," "small band of poisonous thinkers" "creeping insinuation." There you have a hater – writing in the *Washington Post*.

Next on my list is an article published in *The New York Times*:[9]

"Bradley Smith is a Californian who acknowledges that the Nazis were cruel to Jews but who denies that the Holocaust ever happened. He has tried to expound his views in a 4,000-word essay submitted as an advertisement to several college newspapers – giving headaches and heartaches to student editors. In the process he gives the public some valuable, if unintended, lessons in the workings of a free press.

Many readers would blanch if they came upon Mr. Smith's pseudo-scholarly tract. Yes, he concedes, Jews were mistreated by the Nazis, and 'many tragically perished in the maelstrom.' But the idea that Nazi Germany exterminated six million Jews, Mr. Smith contends, is an irresponsible exaggeration. Gas chambers? A myth. Those actually were 'life-saving' fumigation shelters to delouse clothing and prevent disease.

Should college editors risk appearing mercenary by taking money for publishing such trash? Should they risk playing censors to protect other young minds by refusing the ad? Is there some middle course, like printing the ad but with appraisals of its bizarre musings?

The dilemma is acute, just as it can be for commercial newspapers when confronted with ads that offend decency, patriotism or commonly accepted history. But the first lesson here is that it is their dilemma and not a First Amendment question. That great ordinance directs that Congress make no law abridging free expression. Government may not censor Mr. Smith and his fellow 'Holocaust revisionists,' no matter how intellectually barren their claims. Whether to publish their ads is something for the newspapers to decide.

The second lesson is that there's probably no right answer to the question of how they should decide. College editors have come out in different ways. Newspapers at Harvard, Yale, Brown and the University of Califor-

[9] "Ugly Ideas, and Democracy," *New York Times*, January 15, 1992.

nia turned the ad down. Those at Cornell, Duke, Northwestern and Michigan printed it, sometimes citing free speech.

Perhaps the most creative response was that of the student editors at Rutgers University. The Daily Targum newspaper rejected the Holocaust tract as advertising but ran the text in its news columns, along with an editorial denunciation and comment by invited authors. The editors thus transformed revulsion into education.

The public does not usually require protection from bad ideas. Even so, initial instincts in favor of publication may sometimes yield to exceptions, against quackery, for instance, or on behalf of taste or fairness. The Times, for instance, has from time to time refused advertisements – like one insisting that a politician killed in a plane crash had himself sabotaged the flight; that claim seemed unjustly unanswerable.

Denying the Holocaust may be monumentally more unjust. Yet to require that it be discussed only within approved limits may do an even greater injustice to the memory of its victims. To print or not to print? The diversity of responses from diverse editors demonstrates something more important than the answer. When there is free expression, even the ugliest ideas enrich democracy."

There is much less hate in these lines than in those printed by the *Washington Post*. The usual misplaced accusation of being "pseudo-scholarly," denigrating dissenting opinions as "trash" or mere "bizarre musings" is as bad as it gets. Much finer are the psychological slip-ups of this author. For example, why is there even a need to consider whether or not to "protect other young minds" from dissenting historical views? And why exactly is it a "creative response" to address revisionist writings with "editorial denunciation and comment"? Denunciations and comments are not exactly a scholarly refutation.

Such tolerance by the *New York Times*, however, did not last very long. After Bradley Smith had made various advertisement campaigns with alternating success for more than ten years, the leading editors of the *New York Times* finally decided that they had enough of it. They came to the conclusion that the First Amendment is not a good thing after all. They decided to teach all student editors a lesson that they had a moral obligation to suppress revisionist dissent. Arthur Sulzberger, publisher of the *New York Times*, as well as Abraham Foxman, President of the Jewish Anti-Defamation League, two of the most influential men in American culture and politics, joined together in 2003 to personally put an end to Smith's work at the universities. The Anti-Defamation League pronounced:[10]

[10] *ADL on the Frontline*, Anti-Defamation League, special summer edition 2003; cf. Bradley Smith, "Revisionist Notes," *The Revisionist* 1(4) (2003), pp. 364-366.

"When a campus newspaper editor is asked to print an ad denying that the Holocaust took place – or calling for 'open debate' on the subject – can he or she say 'no' without compromising freedom of the press?

In the view of the ADL and The New York Times, the answer is yes. Both organizations have been disturbed by the continuing – and often successful – attempts by Holocaust deniers […] *to place advertisements and other materials in campus newspapers. Out of their common concern came an annual colloquium, 'Extremism Targets the Campus Press: Balancing Freedom and Responsibility.'*

'We seek to educate campus journalists,' said ADL Campus Affairs/Higher Education Director Jeffrey Ross, 'to balance freedom of the press with responsibility of the press when responding to hate submissions.'"

So now we know it for sure: Revisionism is hate. Period. Even if presented dispassionately and without invectives. It is hate because it is hated. And it is hated because after more then ten years of trying it finally must have dawned on these haters from the *New York Times* and the ADL that revisionist arguments cannot be refuted. *The Washington Post*'s claim about "roomfuls of grisly evidence" at Auschwitz, they must have come to see, is nothing but a collection of trivial wartime memorabilia, and the "hundreds of volumes of documents" referred to in the same article in the meantime turned out to support revisionist claims.

Truth is hate for those who hate the truth. And those who call for censorship against peaceful, well-behaved dissenters are without any doubt haters – and intentional obfuscators, which is just another word for liars. Because those who tell only one side of a story and deliberately hide the other know that they are not telling the entire truth or no truth at all. Such people are called liars.

* * *

The term "Auschwitz Lie" was coined by a German war veteran named Thies Christophersen who had been stationed at an experimental farm at the village of Harmense near Auschwitz during the war. In 1973 Christophersen published a brochure, in which he described his experiences. He claimed that during his time at Auschwitz he never heard or saw anything about mass murder against Jews. The title of his anecdotal brochure made history:

The Auschwitz Lie[11]

Of course, with this term Christophersen meant the exact opposite of what is generally meant by it today. Whereas Christophersen maintained that the

[11] *Die Auschwitz-Lüge*, Series *Kritik*, issue no. 23, Kritik Verlag, Mohrkirch 1973.

claim of mass extermination at Auschwitz is a lie, today claims like that spread by Christophersen are decried as "the Auschwitz lie."[12]

Fact is that the term "Auschwitz Lie" has become a part of the German as well as the English language. And it is also a fact that lies are continuously being spread about Auschwitz to an extreme degree.

The term lie itself requires an explanation. In the more narrow sense, this is the intentional expression or dissemination of something that is knowingly untrue. In order to be a liar, it does not suffice to distribute something that is not true, because most untruths are spread without malice, because it is assumed to be the truth.

But then there is something that I want to call "intentional lack of knowledge." All those who spread a false claim, even though it would be their obligation to have the knowledge that it is untrue, are guilty of this offense against truthfulness. These individuals are not intentional liars, but liars due to crass carelessness. For instance, I call an expert a careless liar, who spreads untrue claims about an important topic of his field of expertise, even though he should have the expert knowledge to know that it is not true – or at least he could easily find out – and has the professional duty to find out – that it is untrue.

The present book is a compilation of various papers written over the past eleven years either by Italian revisionist scholar Carlo Mattogno or by me, a German revisionist scholar currently residing in the United States. They all deal with articles or books written by authors, which are opposed to the revisionist interpretation of what is generally referred to as "the Holocaust" in general and with what did or did not happen at Auschwitz in particular. Some of our papers have been published before, either in printed form or only online, some of them in English, others only in German or Italian. Since one of the most important aspects of an academic dispute is the discussion of opposing views, we decided to update the most important of our papers and publish them in printed form. This gives the reader an opportunity to find in one volume a whole range of topics and disputes covered from a revisionist point of view. It may serve as a hallmark of the depth and quality of revisionist arguments and also of the superiority of our interpretation over that of the "orthodox" historians.

Quite a few of the papers and books criticized in this volume have been announced as "definite refutation" of revisionist arguments by the media or by their authors themselves. It is the goal of this book to emphasize that nothing could be farther from the truth. In fact, after perusing this book, the reader will understand that the attempts in refuting revisionist arguments dealt with in this book were utter failures without a single exception.

---

[12] See for example Thomas Wandres, *Die Strafbarkeit des Auschwitz-Leugnens*, Duncker & Humblot, Berlin 2000.

A similar edition of this book appeared a few weeks ago in the German language, consisting exclusively of contributions authored by me.[13] Some of the papers included in the German edition have not been included in this volume, because they address works that appeared only in the German language and are thus not available to the reader unfamiliar with that language. Those who can read German are highly recommended to read those papers as well. For those who cannot read German, I may briefly summarize them here.

The political importance of some of the German papers I scrutinized in the German edition of this book results from the fact that the German government has quoted them as proof for their (false) claim that my own research results on Auschwitz (or those by Fred Leuchter,[14] whose work preceded mine) are incorrect, so for instance in 2002 the yearly report of the German "Office for the Protection of the Constitution."[15]

One of the first papers to critically address revisionist arguments about forensic aspects of Auschwitz was authored by Hellmuth Auerbach, a historian from Germany's official Institute for Contemporary History in Munich.[16] In this brief paper, which claims to refute the technical and chemical arguments of the revisionist *Leuchter Report* regarding Auschwitz, Auerbach makes several claims, none of which he backs up with any evidence. Since most of the issues he addresses are of technical nature, for which he cannot claim to have any expert knowledge, it cannot surprise that his unfounded claims are untenable.[17]

Two years after H. Auerbach, Werner Wegner authored a paper[18] also trying to refute the *Leuchter Report*.[14] The only expert knowledge this 90 year old geriatric had, however, was as a social worker. Hence, it is not surprising that his article was not just devoid of any evidence supporting his historical as well as his technical claims, but also so much off the mark with many of its ludicrous claims that merely reading his paper made my hair stand up

straight.[19] That such a dilettantish work is quoted by government officials[15] and by mainstream historians[20] in the first place is an indication how desperate they really are to quote just about anything which claims to refute revisionist arguments.

At the end of 1991, Austrian chemist Dr. Josef Bailer critiqued the *Leuchter Report* in a little booklet published in Austria.[21] In it, Bailer assumes that the claimed homicidal gassings at Auschwitz were performed with extremely low amounts of poison, resulting in long execution times. Fact is, however, that all witnesses confirming such gassings reported about very short execution times, requiring high poison amounts. Dr. Bailer also exhibited an astounding lack of understanding of the chemical process involved when hydrogen cyanide (the poisonous compound of Zyklon B) reacts with masonry. As the lack of references clearly shows, he did not even bother to consult any expert literature on the topic. Despite criticism directed at his study,[22] Bailer repeated his unsustainable objections in later publications, without responding to his critics and again without any effort to consult the most basic chemical standard literature.[23] Dr. Bailer's argument ran something like that: He could not see a way, how hydrogen cyanide could react with masonry to form long-term stable compounds (Iron Blue). Therefore, any such compound found today in masonry, which was once exposed to Zyklon B gas, cannot originate from this gas. It must have another origin, like for example wall paint. The problem with this approach is that Dr. Bailer did not even try to look into the various ways hydrogen cyanide does react with masonry. He also studiously ignored all of the evidence presented to him clearly showing that a) there are possible reactions leading to such long-term stable compounds, and b) that the compounds found in masonry in Auschwitz cannot possible stem from wall paint. This is so because a) this type of wall paint did not exist, b) these compounds can be found also within the wall, c) there is no paint layer on the

Bailer-Galanda, W. Benz, W. Neugebauer (ed.), *Die Auschwitzleugner. 'Revisionistische' Geschichtslüge und historische Wahrheit*, Berlin 1996, pp. 130-152.

walls, to name only a few facts refuting Dr. Bailer's claim.[24] Dr. Bailer's nonsense about the wall paint was subsequently not only quoted as "proof" that I am wrong by German authorities,[15] but was also a justification for a team of Polish scientists to exclude from their analysis the long-term stable compounds at issue. I deal with those Polish scientists in the chapter "Polish Pseudo-Scientists" in the present book. As such, Dr. Bailer's impact was considerable.

Even more bold were the lies spread by the German Press Agency (*Deutsche Presseagentur*, dpa) in a press release on March 29, 1994. Contrary to all well-establish scientific facts about the extreme long-term stability of the compounds under investigation here, this press release claimed:[25]

> *"Cyanide compounds decompose very quickly. In the ground, this occurs even after six to eight weeks; in masonry, these compounds could only be preserved under 'absolute conditions of conservation including complete exclusion of air and bacteria.'"*

Inquiries with the dpa press office in Stuttgart which published the report revealed that the writer responsible for the report, Albert Meinecke, had simply invented this alleged "expert opinion."[26] This obvious lie continues to be disseminated by German and foreign media[27] as well as by German government agencies such as, for example, the Bavarian Ministry of the Interior.[28]

In summer of 1991, German physician and writer Till Bastian addressed revisionist arguments on a more general level with two major articles pub-

[27] So for instance by the South African newspaper *The Citizen*, June 24, 1995, p. 8.

[28] See the Bavarian State Ministry for the Interior, *Verfassungsschutzbericht 1997*, Munich 1998, p. 64. A corresponding reference to the factual incorrectness of the remarks made in this regard by the *Arbeitskreis Zeitgeschichte und Politik* (in a letter by president Hans-Jürgen Witzsch, dated Oct. 8, 1998, Fürth) was countered by the Ministry as follows: "Your efforts to deny and/or relativize the crimes of the National Socialists have been known to the security authorities for years. […] We see no occasion for a discussion of gas chambers." The letter, from Dr. Weber of the Bavarian State Ministry of the Interior dated Oct. 13, 1998, ref. IF1-1335.31-1, probably established a new world record for stupidity.

lished in the German weekly newspaper *Die Zeit*.[29] It was triggered by the growing prominence of the *Leuchter Report*, the reputation of which Bastian intended to destroy. Whereas the first article mainly consists of innuendoes and political name-calling against revisionists, the second article focuses on some technical and historical arguments. However, Bastian's arguments are rather superficial,[30] for he followed the arguments outlined by the equally superficial Hellmuth Auerbach.[16] Even though Bastian later augmented his argument with an extended edition published as a small booklet, it added little to the depth of his argument.[31] Despite its poor historical quality, this booklet was quite a success due to its small size and probably also because of its cheap, politically correct polemics.

In 1996, Markus Tiedemann, a German student of philosophy, published a book intended as a guideline for history teachers to refute revisionist arguments.[32] Tiedemann's book is full of polemics, innuendoes, unfounded and untrue statements about revisionism, and unsupported and false historical claims.[33] Should any teacher ever try to use this book to refute revisionist arguments, he would quickly suffer total shipwreck if facing a real revisionist. Despite the fact that this book is totally worthless from a historical point of view, it won the German prize "*Das politische Buch*" (the political book) in 1998. Hence, it was praised because of its political usefulness to denigrate and defame revisionism. Due to its success, it was republished by several other publishers under license in 2000[34] and with support of the German Social-Democratic Party,[35] which at that time dominated the German federal government.

Another much more serious and competent opponent of revisionism is retired German professor for the history of ideologies Dr. Ernst Nolte. In 1993 he wrote a book on current and upcoming controversies about National Social-

[35] Rather: the SPD's fund raising organization and think tank Friedrich-Ebert-Stiftung.

ism.[36] A major part of this book addresses revisionist arguments on the Holocaust in an attempt to refute them. In contrast to all other works that appeared so far and which claimed to refute Holocaust revisionist arguments, this is the only one that abstains from political name-calling and innuendoes. Nolte is also the only mainstream scholar who publicly admits that revisionists have a right to doubt and to critically challenge the orthodox view. He even goes so far as to maintain that revisionist works on the Holocaust are superior to those of mainstream historiography.[37] In a later publication he indicated that he has even moved a little closer to revisionism in that he accepts certain revisionist arguments and conclusions as inescapable in the light of the existing evidence.[38] This lack of hostility toward revisionism and the revisionists has caused Prof. Nolte much distress. After all, lack of contempt for revisionism is punished with massive contempt by media and politics in return. The level and quality of Nolte's argument is to some degree comparable to that of M. Shermer and A. Grobman as discussed by Carlo Mattogno in this volume – minus the polemics of the latter. Including an English translation of my response to Dr. Nolte[39] would therefore have been a duplication of arguments. We therefore decided not to reproduce it here.

Also omitted was my response to German mainstream journalist Fritjof Meyer, who in 2002 triggered a controversy about the claimed mass murder at Auschwitz by decommissioning the Birkenau crematoria as sites of mass murder and by drastically reducing the Auschwitz death toll to roughly half a million. However, as a probably even more valuable replacement, an article of mine was included, which widened the scope and range of the topic by focusing on the currently latest outcrop of this controversy after it had spilled into the English speaking world with a paper published in the journal *Holocaust and Genocide Studies* in 2004. This article of mine in the present book under the title "The International Auschwitz Controversy" also includes references to all scholarly papers know to me about this controversies, most of which are available in English as well.

Not included in this volume either was Dutch-Jewish professor for cultural history Robert Jan van Pelt. Several responses of Carlo Mattogno and of mine to van Pelt's work were published before, to which I may direct the reader's attention.[40] Since van Pelt's most recent work on Auschwitz[41] is also the most

comprehensive, it deserves more than a mere response in a simple article. We therefore decided to dedicate an entire book to refuting van Pelt, a project which is still in progress as I write these lines.[42]

* * *

The pen is mightier than the sword, and for this reason propaganda lies are the most powerful weapons in the hands of governments. When it comes to refuting or merely attacking revisionism, political zeal and fanaticism go rampant. Propaganda lies against revisionism and revisionists are therefore widespread. As an example of an especially vicious lie I would like to present a statement about me spread by the German federal government:[43]

> *"The actual degree of Rudolf's 'seriousness' and 'respectability' is revealed by an article published by him in the right-wing extremist 'Quarterly for Free Historical Research' under the title 'About Fear and How to Overcome it.' In it he indirectly calls for violence against a public prosecutor highly committed to prosecuting revisionism."*

Of course, this highly respectable German government publication does not give any source for this claim, which could, after all, enable the reader to verify if this statement is true or not, and that is not what Germany's Big Brother wants his underlings to do. I therefore may quote from my article referred to by this Orwellian German authority:[44]

> *"Mark Weber correctly stated that revisionist hunters like* [public prosecutors] *Hans-Heiko Klein would no longer be alive if the often described 'danger from the right-wing' in Germany would indeed be so huge, as media and politicians claim.* […] *Indeed, that Heiko Klein is still alive borders on a miracle and proves how harmless the entire German 'scene' really is. One certainly could not win a war of liberation with such freedom fighters.* [This is sarcasm. Anyone having some humor here?]
>
> *I have been repeatedly asked to publish the full names of all persons involved in the persecution of dissidents by the authorities. After all, one never knows what good this kind of information could do in the future. That is exactly the reason why I hesitate to do this. After all the political*

Judge Gray" (vho.org/GB/c/GR/CritiqueGray.html); Ernest Sommers, "Holocaust Orthodoxy: The Road Paved with Moral Certainty," *The Revisionist*, Codoh series, No. 3, 2000.

44 Germar Rudolf, "Von der Angst und wie man sie überwindet," *Vierteljahreshefte für freie Geschichtsforschung*, 4(2) (2000), pp. 122-124.

trials and persecution, Germany really needs only one thing in the future: A large-scale amnesty, a reconciliation with itself, an end to self-flagellation and self-destruction. I am therefore strictly opposed to any kind of threat, should the table be turned one day, and then the other side will be the target. What would then be the difference between them and us? Don't count on me!"

In other words: I said the exact opposite of what the German government claimed I said: I urgently advised not to use violence against the lackeys of the German authorities, who persecute peaceful dissidents and destroy their social existence.

Hence, we have firmly established the first liar: the federal government of Germany. The exposure of the other liars follows in the upcoming chapters.

Germar Rudolf, Chicago, July 7, 2005

P.S.: Since each contribution to this book is independent, it was not always possible to avoid some repetitions. I have tried to reduce them to a minimum, though, and to point the reader to other contributions in this book instead.

In order to enable the reader to easily find the sources quoted in the footnotes, I have included Internet addresses of the source where known to me. The vivid fluctuations of addresses on the Internet will render several of those Internet references invalid with time. The use of search engines will help to remedy the situation in most cases.

Since some countries censor the Internet, some readers may not be able to reach some of the Internet addresses given here. In such cases I recommend to use anonymizing websites like www.anonymizer.com. With their service you can safely surf the net without having to fear Orwellian interferences.

For reasons of restricted space, no internet addresses were given for articles from the revisionist periodicals *Vierteljahreshefte für freie Geschichtsforschung* (*VffG*, = Quarterly for Free Historical Research) and *The Revisionist* (*TR*), although they are all available online. The individual papers can be reached from the respective home pages at www.vho.org/VffG and www.vho.org/tr. Most revisionist books can be downloaded for free at www.vho.org/download.

Pressac: From Paul to Pseudo-Saul

By Germar Rudolf

During the 1993 and 1994, French pharmacist Jean-Claude Pressac was heralded by European media like a heroic knight who had killed the evil revisionist dragon with its own – technical – methods.[1]

Serge Klarsfeld, president of the Association of Sons and Daughters of Jewish Deportees of France, characterized Jean-Claude Pressac in a preface of a rebuttal of the *Leuchter-Report* by Pressac's as a meritorious scholar considered to be one of the few specialists for the National Socialist extermination techniques in the Auschwitz camp. And this, although he almost had become a revisionist himself. But thanks to his sharp and rational intellect, he could resist the temptation of the revisionists around Prof. Robert Faurisson and managed to obey only to the demands of the truth.[2] That sounds quit interesting and raises the question: who exactly is this J.-C. Pressac that he managed to go the way from a scientific proximity to revisionism to the flagship of their opponents so effortlessly? Had he changed his mind because he was convinced he had been wrong?

When I visited Prof. Robert Faurisson in late 1991 in Vichy, he told me his side of the story – I paraphrase from the notes I made shortly thereafter:

> *"I had been in touch with Jean-Claude for some time, but I must tell you that it was no fun. I had to realize quickly that Jean-Claude is hardly capable of consequent, analytically thought-through and systematic scholarly work. This is already obvious with his so-called standard work. It is characterized by a complete organizational chaos. He repeats himself numerous times, mixes facts with interpretations and imputations, and even with wishful thinking. Moreover, it is intellectually dishonest not even to mention the one scholar – me – who has discovered most of the sources he relies upon and made them accessible for researchers.*
>
> *Jean-Claude is mentally very unstable. This became particularly obvious when he realized more and more that my thesis about the fraudulent nature of Holocaust claims is correct. Because the result of this insight was that the confrontation with representatives of the established version become extremely tough. And even more than that: it became outright dan-*

---

[1] For the reaction of European media to Pressac see, e.g., for Germany Germar Rudolf, "Pressac and the German Public," in: Germar Rudolf (ed.), *Auschwitz: Plain Facts*, Theses & Dissertations Press, Chicago, IL, 2005, pp. 21-35 (www.vho.org/GB/Books/apf); for France: Serge Thion, "History by Night or in Fog?," ibid., pp. 37-58.

[2] J.-C. Pressac, *Jour J*, December 12, 1988, pp. I-X.

gerous, because I started being prosecuted and physically attacked. Jean-Claude became frightened and begged me not to exaggerate it, but instead to bring the truth to the surface only step by step.

But if I have recognized something as true, I will not tell half-truths or outright lies. We therefore parted at that point in disagreement."

So much from the other side. Professor Faurisson did of course publish his own rebuttals to Pressac's works, to which I point the reader's attention.[3]

One may agree or disagree with Prof. Faurisson's views. The fact is that his views do not have to contradict Serge Klarsfeld's statement that Jean-Claude Pressac had become the foremost expert among exterminationist historians regarding the knowledge of source material on the alleged extermination techniques of Auschwitz as well as regarding his devotion and skill to address technical questions. Because if Faurisson is right that this progress still does not suffice scientific expectations, this would only shed a bad light on the quality of all the rest of exterminationist publications.

In order to support Faurisson's judgment, I will subsequently demonstrate that Pressac failed miserably particularly with his attempt to address technical and scientific questions. As an example I will analyze the statement of the witness of the alleged mass extermination in Auschwitz, which Jean-Claude Pressac considers to be the most important and at once the most credible witness:[4] Henryk Tauber, who according to his own statement was a member of the stoker commando in crematorium II in Birkenau. With Tauber, Pressac makes the same mistake as with all the other witnesses he quotes: he does not subject their testimony to a technical critique. Already mere sound reasoning of an alert, but technically uneducated mind reading Tauber's absurd lore should lead to the awareness that some skepticism is appropriate. But that does apparently not apply to Pressac.[5]

Tauber's absurd testimony contains the following allegations:[6]

"Generally speaking, we burned 4 or 5 corpses at a time in one muffle, but sometimes we charged a greater number of corpses. It was possible to charge up to 8 'musulmans.' Such big charges were incinerated without the knowledge of the head of the crematorium during air-raid warnings in order to attract the attention of airmen by having a <u>bigger</u> fire emerging from the chimney." (emphasis added)

---

[3] R. Faurisson, *Journal of Historical Review*, 11(1) (1991), pp. 25-66; ibid., 11(2) (1991), pp. 133-175; Faurisson, in Germar Rudolf (ed.), op. cit. (note 1), pp. 59-116.

[4] Interrogation of Henryk Tauber on May 25, 1945, appendix 18, vol. 11 of the Höss trial, quoted acc. to J.-C. Pressac, *Auschwitz: Technique and Operation of the Gas Chambers*, Beate Klarsfeld Foundation, New York 1989, pp. 481-502 (http://holocaust-history.org/auschwitz/pressac/technique-and-operation/pressac0011.shtml).

[5] For more detailed arguments about the following see G. Rudolf, *Lectures on the Holocaust*, Theses & Dissertations Press, Chicago 2005, Chapter 4.5.6. (www.vho.org/GB/Books/loth).

[6] J.-C. Pressac, op. cit. (note 4), p. 489.

The term "bigger fire" suggests that according to Tauber flames always came out of the chimney. The problem with this statement is that crematory chimneys cannot spit out any flames.[7]

It was also impossible to put as many corpses into one muffle at a time as claimed by Tauber. Tauber claims that just one person could balance the stretcher filled with two corpses while it was pushed into the muffle, sliding over two rollers installed at the muffle door.[8] Ill. 1 shows a typical stretcher, indicating that the side rails were roughly twice as long as the area where the corpse was placed. Because the corpses spread out roughly from the middle of the stretcher to its other end, half of the weight of the corpses needed to be balanced at the end of the side rails according to the lever laws, when the stretcher was pushed deep into the muffle, that is to say, when it came to rest in its middle on the two rollers. In order to balance the weight of two corpses in a controlled manner in that situation, the person holding the stretcher at the other end needed to be heavier than both corpses together. However, the corpses on the stretcher would have been lighter than the person pushing them into the muffle with considerable certainty only, if most corpses had been victims of the typhus epidemic raging in Auschwitz at that time, because typhus victims are extreme emaciated. If, however, the corpses had been the victims of gassings, as Tauber claims, which are said to have been murdered right after their arrival in the camp, the sum of two randomly chosen corpses would quite often have exceeded the weight of the person pushing them into the muffle. Hence, Tauber's testimony about inserting two corpses by just one person indicates that those corpses were victims of the epidemic, not of murder.

Ill. 1: *Typical corpse stretcher, here from a cremation oven of the Mauthausen camp.*[9]

Even though it would have been possible to place several corpses into a muffle by inserting them one after the other, this would have resulted in several severe thermo-technical problems:

8 J.-C. Pressac, op. cit. (note 4), p. 495.

9 Ibid., p. 114.

1. The muffles of the Birkenau triple- and eight-muffle ovens were interconnected with openings in the muffle walls, through which the hot combustion air flowed (see Ill. 2). If too many corpses were piled up in the muffle, these holes would have been partly or completely blocked, slowing down or completely stopping the cremation process in all muffles.
2. The introduction of numerous cold corpses would reduce the temperature at the beginning of the cremation so strongly that the cremation would have slowed down tremendously. The fire places of the ovens were not designed to supply that much heat.
3. Once the corpses' water had evaporated, the burning tissue of multiple corpses would have produced too much heat, severely damaging muffle, flue, and chimney.

Ill. 2: *Openings in walls of center muffle of Buchenwald triple-muffle oven (=Birkenau ovens, highlighted with white ellipses).*[10]

Kurt Prüfer, an engineer of the Topf firm that constructed the Birkenau cremation ovens, testified after the war that it was indeed attempted to incinerate two corpses in a muffle at once,[11] probably because of the large amount of victims of the raging typhus epidemic awaiting their cremation. But the subsequent heat stress was obviously too much for the ovens. They got so severely damaged that flue and chimney had to be repaired for four months![12]

Tauber made another claim that is just as outrageous. He went so far as to claim that ordinary corpses were cremated without fuel, since they contained enough fat to burn by themselves:[13]

> *"During the incineration of such* [not emaciated] *corpses, we used the coke only to light the fire of the furnace initially, for fatty corpses burned of their own accord thanks to the combustion of the body fat. On occasion, when coke was in short supply, we would put some straw and wool in the ash bins under the muffles, and once the fat of the corpse began to burn the other corpses would catch light themselves.* […] *Later on, as cremations succeeded one another, the furnaces burned thanks to the embers produced*

[13] J.-C. Pressac, op. cit. (note 4), pp. 489, 495.

by the combustion of the corpses. So, during the incineration of fat bodies, the fires were generally extinguished."

Of course, this is nonsense. Thousands of crematories all over the world consuming large amounts of energy are the best proof of that. The situation gets totally absurd when Tauber alleges that cremation trenches are more efficient than crematories, and that is why they shut them down in 1944.[14] The loss of energy through radiation and convection is so gigantic in open pits, if compared to proper crematory ovens, that further commentary is really not needed. Apart from the fact that cremations in open pits are never complete.

Tauber's lies become even bolder when he turns to boiling human fat:[15]

"Another time, the SS chased a prisoner who was not working fast enough into a pit near the crematorium [V] *that was full of boiling human fat. At that time* [summer 1944]*, the corpses were incinerated in open air pits, from which the fat flowed into a separate reservoir, dug in the ground. This fat was poured over the corpses to accelerate their combustion."*

First of all, the Birkenau camp was located in the midst of a swamp, where the ground water level was not lower than 1 m beneath the surface, despite a sophisticated drainage system. Thus, the deep pits claimed by Tauber and other witnesses would have quickly filled with water, which would have prevented any attempt of a large-scale corpse incineration in them.[16]

But let us assume for a moment that Tauber is correct with the claim that such incinerations were possible. However that might have worked, one thing is for sure: it would have required a hot fire, because lukewarm small fires are unsuitable to cremate corpses. The human body consists mainly of water, so a fast and complete incineration requires high temperatures. If such fires burned indeed, then the first thing that would have caught fire would have been fat pouring out of the corpses. Corpses lying within such hot open fires cannot give off fat without it immediately going up in flames. Tauber knows that very well, because he states at the same time that the fat was reused to kindle the fire and to accelerate the cremation. But if fat accelerates the cremation, it does that already at the very moment when it leaves the body. It can therefore not be lead along channels at the bottom of the pit and collected in reservoirs. Fat collects only at places where it is kept away from flames and embers and where the temperature is lower than the flash point of fat (roughly 184°C[17]), for example when putting meat in a pan. But I assume that nobody would se-

[17] J.H. Perry, *Chemical Engineer's Handbook*, Wilmington Delaware 1949, p. 1584.

riously claim that the corpses in Auschwitz were put into pans. After all, that would have turned them into lunchmeat, but not into ashes.

I may also indicate that open fires in pits, in which hundreds of corpses would be cremated within a few hours, as claimed by Tauber and his ilk, would generate such high temperatures in the immediate vicinity that it would have been necessary to wear suits made of asbestos to allow working close to these fires.

In other words, these passages of Tauber's testimony are nothing but invented atrocity stories with no base in truth. One does not have to be an expert to recognize this. If a scholar like Pressac still believes such a witness, after he had lied so boldly, then there is no help anymore for him.

To criticize Pressac's works thoroughly would require an entire book, and that is exactly what we revisionists have done already as early as 1995.[18] I therefore will restrict myself here to formal aspects of Pressac's work in order to expose Pressac's methodic weakness, if not to say his outright failure. I will do this by systematically exposing Pressac's total lack of scholarly methods based on an evaluation of his two books. The original version of this assessment was prepared in January 1994 on request of Düsseldorf defense lawyer Hajo Herrmann. It was introduced during various court proceedings in Germany as evidence (although German courts always reject any kind of evidence introduced by the defense in these matters, as they are required by law):

Expert Report on the Question of Scientific Validity of the Books *Auschwitz: Technique and Operation of the Gas Chambers*[4] and *Les Crématoires d'Auschwitz, la Machinerie du meurtre de masse*[19] by Jean-Claude Pressac

1. Criteria for Scientific Validity

The theses which are the subject of a scientific work must be supported by critical argumentation based on evidence in the work or by reference to sources and they must be subjected to criticism of works with opposing theses. Whether the books by Pressac given in the title meet these requirements is discussed in what follows. When giving examples of Pressac's work, I will restrict myself to his second book, which can be seen as a systematized and up-

[18] See the German version of op. cit. (note 1): Herbert Verbeke (ed.), *Auschwitz: Nackte Fakten*, VHO, Berchem 1996 (www.vho.org/D/anf/); see also the critique of the work by R. van Pelt, most of which applies to Pressac as well: Germar Rudolf, Carlo Mattogno, *Auschwitz: The Case against Insanity*, Theses & Dissertations Press, Chicago, in preparation (www.vho.org/GB/Books/atcai).

[19] CNRS Éditions, Paris 1993.

dated summary of the first books. The ways Pressac argues and supports his claims is basically the same in both books.

2. Method of Proof and References to Sources

With respect to the issues of technical nature and of the exacts sciences, which Pressac addresses in his work (for example, cremation, gassing with hydrogen cyanide, ventilation techniques, formation of chemical residues), he does not give any reference to sources in technical literature and also does not make his own calculations or experiments.[20] He merely cites some common historical works.

Examples from *Les Crématoires...*:

- On page 6 he has the SS deduce that one needs to burn 5 kg of coke for the cremation of one corpse without a coffin, based on the amount of coke required to cremate a corpse in a coffin (35 kg of wood plus a few kg of coke). This deduction is based on Pressac's estimate only, he gives no source reference.
- With respect to the amount of time it takes to cremate a corpse, Pressac quotes various contradicting figures from witness statements and documents (1 h., p. 7; 30-40 min., p. 13; 1 h. 12 min., p. 15; 15 min., p. 28; 1 h. 36 min., p. 34; 34-43 min., p. 49; 13 min., p. 72; 29 min., p. 74; 22 min., p. 80). There is no technical examination of these figures.
- On page 41f. Pressac interprets the acknowledgment by the Auschwitz camp administration of an article by G. Peters on a circulation delousing device to mean that the SS intended to equip the supposed homicidal gas chambers in Bunker 2 with a similar device. He gives no supporting evidence.
- For Pressac, the use of the German prefix "*Sonder-*" (special) is evidence of the mass-murder. He gives no evidence for this (pp. 46f.; 52; 60f.). On the contrary: on page 82 he cites the term "*Sondermaßnahme*" (special measure) used in connection with delousing operations.
- On page 70f. he interprets the fact that a wooden fan was built into a morgue as proof of the use of hydrogen cyanide in it, without giving any reason. The claim that this happened because hydrogen cyanide is corrosive is wrong, because hydrogen cyanide is less corrosive than the normal humidity in the air. He does not notice that he himself mentions in several places

[20] There are two exceptions to this, but their context actually underlines my accusation: In *Les Crématoires…* he gives the boiling point of hydrogen cyanide (p. 16), but confuses it with an "evaporation point," which does not exist. With this statement he merely proves his physico-chemical incompetence. He mentions another source about the circulation delousing devices, but only because he found it in a Moscow archive. He does not discuss the content of this document (p. 41).

that iron was rationed during the war and was replaced by other materials where possible (pp. 23; 38; 51; 53; 70).
– The data given by Pressac about the capacity of the ventilation system (pp. 30, 38, 74, 90) are not only dependent on motor performance, but also on the blower type and the layout of air ducts (pressure difference). Pressac does not provide a calculation adjusted to each of the various types of systems.

3. Criticism of Sources

Auschwitz: Technique... contains frequent and extensive criticism of witness statements, but this criticism is made without substantiation. Pressac "corrects" the statement to his own liking without giving any comprehensible reasons. In *Les Crématoires...* he once more silently corrects (again unsubstantiated) witness statements, without subjecting them to criticism. Neither work contains any critical analysis of documents. Since most of the documentation comes from formerly Soviet archives (those of the KGB, and others), criticism is surely necessary here.[21] Furthermore, Pressac neglects to put the documents he refers to in their broader documentary context, and many of the claims made by Pressac are not even supported by the documents he quotes as his source. He mixes his unfounded opinion with provable facts in a way that the reader without access to the source material cannot notice it.[22] Nor is there any technical criticism of the locations and structures under investigation (crematories or their remains).

Examples from *Les Crématoires...*:
– He restricts the gassings in crematoria I (main camp) to a few occurrences in a three month period — contrary to witness testimony (p. 34f.).
– After the gassings in Bunkers 1 and 2, he states that several hours elapsed before the corpses could be removed (p. 39f.). However, the witnesses report only a few minutes' delay, something Pressac does not mention. He makes the same statement about Crematories IV and V, in which conveyor belt style gassings would have been impossible without a ventilation system. He is silent about witness statements to the contrary (p. 89).
– He describes the crematory capacity given in a supposedly original document as lie-propaganda and corrects it – without giving any reason (p. 80f.).

---

[21] Since it was revealed that the alleged WWII service ID card of John Demjanjuk had been forged by the KGB, it should be self-evident that it is pivotal to subject documents coming from these archives to criticism. See Dieter Lehner, *Du sollst nicht falsch Zeugnis geben*, Vowinckel, Berg, undated.

[22] Cf. the many examples quoted by R. Faurisson, op. cit. (note 3), and Carlo Mattogno, in G. Rudolf (ed.), op. cit. (note 1), pp. 117-170.

– He presents a document on the order of "indicators of hydrogen cyanide residues" for crematories as the ultimate proof of the gas chambers. However, this document exhibits so many factual impossibilities and formal errors that a documentary criticism would be mandatory. Here again Pressac omits this. On the other hand, this document does not at all mention gas chambers or a homicidal context, so that Pressac's interpretation is premature.
– He made no study of the ruins of the site or of Allied air-reconnaissance photography.

4. Treatment of Counter Arguments

In *Auschwitz: Technique...* Pressac briefly discusses the *Leuchter Report* (without reference) and a work by P. Rassinier. He does not mention more recent and more substantial works by other authors with opposing arguments (Faurisson, Butz, Mattogno, and others). The second book contains only a suggestion that there are those who dispute his theses (p. 2), but no names, works, or arguments are given. He also omits to mention documents that might conflict with his theses (for example, air-reconnaissance photos and documents in context downright forcing a different interpretation).

Examples from *Les Crématoires...*:

– In his new book he ignores the criticisms of his first book *Auschwitz: Technique...*[23] On the contrary, he repeats the errors that had been pointed out to him.
– In both books he ignores the fact that there are no traces of the claimed Zyklon B insertion holes in the roof of what was supposedly the main gas chamber (morgue cellar 1, crematory II), and the fact that without them this main gas chamber disappears as a murder weapon and as the main instrument of the industrial mass-murder in Auschwitz.[24]

– He does not spend a single word on the chemical-physical arguments or discussions of technical issues in the *Rudolf Report*.[25]

5. Conclusions

Because of absence of criticism of documents, falsely claiming that documents have a certain content which they actually do not have, failure to put documents in their proper historical and documentary context, as well as deliberate alterations of witness statements, Pressac's books have only limited scholarly value for historiography. However, they have some informative value.

Because of lack of calculations, experiments, and other substantiation of issues of technical nature or of the exact sciences, like references to expert literature, Pressac's books do not conform to the standards that apply to scientific works in these areas. When trying to prove mass extermination in Auschwitz, Pressac always falls back on witness statements, which he fails to analyze critically and expertly.[26]

Finally, Pressac does not expose his conclusions to the criticism of others, especially in *Les Crématoires...* He does not even mention them.

6. Summary

The books *Auschwitz: Technique and Operation of the Gas Chambers* and *Les Crématoires d'Auschwitz, la Machinerie du meurtre de masse* by Jean-Claude Pressac demonstrate that the author has worked in an unscientific way. Nevertheless, because of his industrious documentary research these books contain many useful insights.

Germar Rudolf, Jettingen, January 18, 1994
revised in Chicago, December 1, 2004

Nota Bene

In May of 1993 great doings were afoot at the Max-Planck-Institute for Solid State Research in Stuttgart. One of the young PhD candidates there had become involved in a scandal, which was making news throughout Germany.

[25] Ibid.; Engl.: Germar Rudolf, *The Rudolf Report*, Theses & Dissertations Press, Chicago 2003 (www.vho.org/GB/Books/trr).

[26] For instance, in *Les Crématoires* Pressac quotes the statement by Pery S. Broad (p. 22), Rudolf Höss (pp. 51, 61, 73, 74, 98, 103), Henryk Tauber (pp. 85, 93), and frequently quotes witness statements from Danuta Czech's book *Kalendarium der Ereignisse von Auschwitz-Birkenau 1939-1945*, Rowohlt, Reinbek 1989 (pp. 41f., 49, 54, 95, 98, 121, 192-202), as well as Hermann Langbein's book *Der Auschwitz-Prozeß*, Europa Verlag, Vienna 1965 (p. 117), which is riddled with witness statements.

The name of the PhD candidate was Germar Rudolf, the author of these lines. My scandalous activity consisted of having prepared, at the request of the legal defense of Major General Otto Ernst Remer, an expert report on the so-called "gas chambers" of Auschwitz, in which I arrived at the conclusion that it was physically impossible for mass gassings to have taken place as reported by eyewitnesses. Shortly after Easter of 1993, Gen. Remer had sent thousands of copies of this report to prominent politicians, jurists, historians, chemists, and various media in Germany. As a result of this, every lobbyist and pressure group imaginable demanded that my activities as expert witness be suppressed by every means available. In that memorable springtime I received a number of telephone calls from various news media at my worksite, which displeased the business office of the Institute. The identities of the various callers and contents of conversations are of no interest here, with one exception: when the gentleman on the other end identified himself as Jean-Claude Pressac. He asked for my private telephone number, which I politely declined to give him. I suggest that he communicate with me in writing. To this he replied that, for reasons of security, he preferred to not communicate with me in writing, because it would be dangerous for him to do so. Then he warned me that I too should be on guard. Concerning the "Holocaust" in particular, he advised me to avoid challenging every aspect of it at one time. He said that in dealing with "Holocaust" the only hope for success without risking personal danger was to attack it piecemeal, one aspect at a time.

Since that telephone conversation, I have been convinced that Jean-Claude Pressac believed that we revisionists are correct in principle. In view of the overwhelming might of the exterminationists, however, he arrived early at the conclusion that the "system" had to be fought from within. His apparent defection to the ranks of "the enemy" and service to the cause of extermination-ism was his version of salami tactics. His plan was to use the "system" in order to extract one concession after another.

If we consider his publications in chronological order, it is obvious that with each publication, Pressac came closer to one or another aspect of revisionism. His first step was simply to make public discussion of the subject possible; his second, to make the "system" acknowledge the priority of scientific evidence over eyewitness testimony; his third, to force it to acknowledge the contradictions inherent in such testimony. With every new publication he also reduced the number of victims, while his evaluation of eyewitness testimony grew more critical. Finally, after attacking the very foundations of the "Auschwitz myth," he turned upon the other so-called "extermination camps."[27]

[27] Cf. Jürgen Graf, "In Memoriam Jean-Claude Pressac," *The Revisionist* 7(4) (2003), pp. 426-432.

After the publication of his second book in 1993, he must have gradually grown frightened, since this book and any subsequent statements by him made in public him many enemies. His telephone conversation with me was not the only place where he revealed his fears. Carlo Mattogno reports that he broke off all contacts with him at that time.[28] Prof. Faurisson reports that he suffered a near collapse while he was interrogated as a witness during Faurisson's trial in 1995, begging the judge to excuse him from answering Faurisson's questions:[29]

> *"You must understand that I have only one life. You must understand that I am alone in my battle."*

He refused to testify because he clearly saw that he was completely isolated and his life was in danger. The only explanation for this is the fact that a candid statement before the French court would have had severe consequences since it would have been revisionist in nature.

On July 23, 2003, Jean-Claude Pressac died at the young age of merely 59 years. With his publications he made a vast documentation, which museums and archives had been hiding until then, accessible to independent Holocaust researchers. He also pointed out where to find an even richer documentary treasure. His works also led to the establishment's acknowledgment that the revisionist method of technical and scientific documentary criticism is the only proper historiographic method. By so doing, Pressac catalyzed the progress of revisionist research to a degree as is only met by Fred Leuchter's work.

And so, even though his writings are scientifically questionable, Pressac was without doubt the most politically successful revisionist to date. He was in fact our double agent.

We should be grateful for this.

Fantasies of a Biochemist

By Germar Rudolf

George Wellers has been both Professor for Physiology and Biochemistry at France's National Center for Scientific Research (Centre National de la Recherche Scientifique, CNRS) and president of the historical commission of the Center for Contemporary Jewish Documentation (Centre de Documentation Juive Contemporaine, CDJC) in Paris. Wellers authored several contributions on the Holocaust,[1] which is why he was considered one of the most prominent French representatives of the official Holocaust thesis.

When Holocaust revisionism caused international attention for the first time at the end of the 1970s and at the early 1980s, those sitting in the offices of officially ordained Holocausters saw themselves compelled "to once and for all irrefutably write down in stone the entire historical truth." The *crème de la crème* of the exterminationists – including Georges Wellers[2] – therefore published a book in 1983, in which they laid down their best arguments meant to silence the revisionists for all eternity.[3]

I wonder, though, if these noble ladies and gentlemen have noticed that their absolutistic claim of irrefutably knowing the truth and wanting to write it in stone for all eternity, which I quoted above and which was taken from the prologue of this very book (p. 2), is nothing but a declaration of scientific bankruptcy *par excellence*?

George Wellers' contributions to this book consist of chapter VII on Auschwitz as well as a brief discussion of both poison gases, which were alle-

3 E. Kogon, H. Langbein, A. Rückerl et al. (ed.), *Nationalsozialistische Massentötungen durch Giftgas*, S. Fischer Verlag, Frankfurt 1983, from which I quoted a phrase from the introduction. The introduction to the English edition is less dogmatic: "our intention to set down, in a precise and indisputable manner, the historical truth about the massacres perpetrated by means of poison gas during this period," *Nazi Mass Murder*, Yale University Press, New Haven 1993, p. 2. I quote from the original German edition in the following.

gedly used to commit the claimed mass gassings in Nation Socialist camps.[4] His brief contribution on the poison gases is the only one that comes at least somewhat close to a forensic approach of investigating the crimes that the book claims to have happened. But Wellers disappoints us in two ways. First he does not quote any toxicological or chemical literature, which would enable the reader to verify his claims,[5] and next he – as all the other contributors as well – does not address with even a single word the revisionist theses, which the book allegedly intends to refute. Two main criteria to identify unscientific works, however, are a) not to back up factual claims with references to appropriate evidence, and b) not to even mention the thesis and its supporting evidence which the work claims to refute.

If one could at least rely on the accuracy of Wellers' statements, I would be inclined to overlook these flaws. A verification of his claims shows, however, that Wellers has failed in this regard as well.

About the first poison gas, carbon monoxide, he states (pp. 281f.):

> *"In the 'S-wagons' and in the first gas chambers of the extermination camps, exhaust gasses rich in carbon* [mon]*oxide of badly adjusted engines were used."*

True to the deceptive style of the entire book, Wellers withholds the fact that – according to witness testimonies accepted today[6] – *diesel* engines were used in the Treblinka and Belzec camps, where no less than 1,500,000 Jews are claimed to have been killed. But the exhaust gas of diesel engines can under no circumstance, not even if badly adjusted, be "rich in carbon [mon]oxide."[7] It is therefore absurd to claim that anyone would have seriously tried to use diesel engines for mass murder. Because Wellers knew that, he simply hid the diesel engine from his readers. He also did not mention that the "S" in the German term "S-wagon" (*S-Wagen*) did not stand for "special," as he suggests to his readers, but that it was an abbreviation for a truck with

"standard drive" (*Standardantrieb*, here rear wheel drive), which was in contrast to "all-wheel drive"(*Allradantrieb*, *A-Wagen*).[8]

No less misleading is Wellers on p. 283, where he suggests that the product Zyklon B released its poisonous gas very quickly, because the boiling point of liquid hydrogen cyanide is as low as 25.7°C (78.3°F):

> *"This temperature* [of human skin=34°C; 93°F] *means for hydrogen cyanide the same as 132°C* [270°F] *for water. In other words: the surface of human skin is for hydrogen cyanide similarly warm as a surface heated to 132°C for water!"*

The problem is, however, that during the alleged gassing hydrogen cyanide was not poured in liquid form onto the skin of the victims, but that it was absorbed in porous granules of gypsum.[9] The evaporation from this carrier material lasts more than an hour even at room temperature.[10]

It gets really embarrassing when Wellers makes biochemical statements. He claims, for instance, that the attachment of hydrogen cyanide to the breathing enzyme cytochrom oxydase is irreversible (p. 285). "It suffices to take a chemical handbook in the hand," writes Wellers on p. 286. If only he had done it for his own area of expertise, then he might have remembered that cyanide poisonings are reversible.[11]

Moreover, his advice to look into a chemical handbook had not the desired effect on Wellers, because he tries to explain, how to understand the confession of Josef Kramer. Kramer, former commander of the Natzweiler camp in Alscace and at war's end of the Bergen-Belsen camp, had been captured and interrogated by the British. Kramer confessed under torture[12] – which Wellers does not mention either – that inmates were gassed in the Natzweiler camp with hydrogen cyanide gas generated from a cyanide salt by pouring water over it. Chemically seen this is utter nonsense, because water is not capable of releasing large amounts of gaseous hydrogen cyanide from cyanide salts. Hy-

[11] The cyanid is bound to body-own sulfur and converted to, and excreted as, non-toxic thiocyanide. W. Wirth, C. Gloxhuber, *Toxikologie*, Georg Thieme Verlag, Stuttgart 1985, pp. 159f.; W. Forth, D. Henschler, W. Rummel, *Allgemeine und spezielle Pharmakologie und Toxikologie*, Wissenschaftsverlag, Mannheim 1987, pp. 751f.; S. Moeschlin, *Klinik und Therapie der Vergiftung*, Georg Thieme Verlag, Stuttgart 1986, p. 300; H.-H. Wellhöner, *Allgemeine und systematische Pharmakologie und Toxikologie*, Springer Verlag, Berlin 1988, p. 445f. Although the equilibrium of the reaction of cyanide with the breathing enzyme is far on the side of the cyanide-cytochrom oxidase complex, it is not irreversible.

[12] Cf. Montgomery Belgion, *Victor's Justice*, Regnery, Hinsdale, IL, 1949, pp. 80f., 90.

drogen cyanide is extremely soluble in water, so that it is hard to release it as a gas once dissolved in water.

In an attempt to salvage the credibility of this witness' confession, which is worthless already because of the torture, Wellers opened a chemical handbook and claims that he discovered in it the possibility to generate hydrogen cyanide **gas** by pouring water over a mixture of a cyanide salt (like potassium cyanide, KCN, or calcium cyanide, $Ca(CN)_2$) with a crystalline acid (like citric acid) (pp. 286f.). What Wellers did not read in his chemical handbook, however, is the fact mentioned above that hydrogen cyanide developed in this way is not gaseous but remains almost completely dissolved in the water.[13] To gas someone within a few minutes with such a mixture, as Kramer claimed, gigantic amounts of that mixture would have had to be used, more likely resulting in the victims drowning in, and being poisoned by, this water/salt mixture rather than dying of gas poisoning.

On thesis appearing already in this 1983 text of Wellers became one of the main pillars, upon which he rested his critique[14] of the *Leuchter Report*,[15] which is why I quote this passage in more detail. Considering the fact that hydrogen cyanide poisonings occur rather quickly (at least faster than carbon monoxide poisonings also discussed by Wellers), he states (pp. 285f.):

> *"Finally it is clear that in both cases* [hydrogen cyanide & carbon monoxide] *humans keep the poison inside of their body with each breath, so that the concentration of the poison in the surrounding air decreases. This reduction seems unimportant, particularly in case of Zyklon B, because in average a mere 70 mg of hydrogen cyanide suffice to kill a grown up man, a little less to kill a woman, and even less to kill a child. If assuming that in average 50 mg of pure hydrogen cyanide per person is required, that is 50,000 mg or 50 g of pure hydrogen cyanide for 1,000 people, which disappear out of the surrounding air, then this explains that the possibility of a quick ventilation* [of the gas chamber] *evolves."*

I will now investigate if that is really as clear as Wellers claims.

In 1988, the already mentioned *Leuchter Report* of American expert for execution technologies Fred Leuchter was published. For this report, Leuchter had taken wall samples from rooms in Auschwitz, which are claimed to have been used as homicidal gas chambers. An analysis of these samples indicated

---

[13] Even in half-concentrated sulfuric acid as used during U.S. executions, which is 10,000 times stronger than citric acid, some 50% of the hydrogen cyanide remain dissolved in the aqueous acid solution, as my own experiments have shown.

[14] G. Wellers, "A propos du 'rapport Leuchter' les chambres à gaz d'Auschwitz," *Le Monde Juif*, No. 134, April-Juni 1989, pp. 45-53; I have quoted from the German verison: "Der Leuchter-Bericht über die Gaskammern von Auschwitz," *Dachauer Hefte*, 7(7) (November 1991), pp. 230-241.

[15] Fred A. Leuchter, *An Engineering Report on the alleged Execution Gas Chambers at Auschwitz, Birkenau and Majdanek, Poland*, Samisdat Publishers, Toronto 1988 (www.zundelsite.org/english/leuchter/report1/leuchter.toc.html).

that no significant amounts of cyanide residues can be found in them. Hence, Wellers wrote in his 1989 critique of the Leuchter Report:[16]

> *"It is thus true what I 'predicted' since 1981,*[17] *namely that after the death of the victims no hydrogen cyanide vapors could have been left behind in the atmosphere of the gas chambers as they had been used in Auschwitz, or at most 'infinitesimal traces.'"*
>
> *"It is obvious that any poison that is administered in lethal doses in which way ever, remains in the corpse of the victims; after all, it would not be lethal if it were not present. With poison gases, which spread in lethal doses together with the circulating air inhaled inside of a hermetically sealed room, it is as follows: they penetrate into the human body with each breath and get chemically fixed in a way that the exhaled air contains nothing of those gases. Result: With each – unavoidable – inhalation the body of the victim gets enriched with poison, whereas its concentration gets reduced accordingly in the circulating air."* (pp. 232f.)
>
> *"Be that as it may, Leuchter has shown that the evacuation of corpses right after the gassing is not impossible at all and that Faurisson's speculations are nothing but delusions of a mythomaniac."* (p. 234)

Before discussing Wellers' thesis, I have to make a logical objection to the way he argues. Wellers argues that the lack of chemical residues of the poisonous gas in the claimed homicidal gas chambers does not prove that no poison gas was used there, but only that the gassings did not result in the formation of any residues. If, on the other hand, one could find large amounts of cyanide residues in the alleged homicidal gas chambers, then Wellers' thesis of the human lung as a perfect air filter would be refuted, yet the existence of homicidal gas chambers would be established anyway. In other words: For Wellers' underlying theory – the existence of homicidal gas chambers – it does not mater at all what the facts are, because his theory will be confirm under any circumstances. Theories, however, which cannot be affected by any facts, are by definition unscientific. The only proper statement would be, if Wellers would have concluded regarding Leuchter's analytical results that they can serve neither to prove nor to disprove the existence of gas chambers – provided, of course, that his thesis about lungs as perfect air filters is correct.

Let me now turn to factual matters. Wellers' thesis claims that victims of poisonings with gases (gassing) unavoidably reduce the poison content of the room they are locked into until finally all the poison is within the victims' bodies. This is why, according to Wellers, we could not possibly expect to find any residues of the poison in the walls of the homicidal gas chambers. There is, of course, no reason to restrict Wellers' thesis to human victims, because

---

[16] Op. cit. (note 14), p. 231.

[17] With reference to his first book *Les chambres à gaz ont existé*, Gallimard, Paris 1981, pp. 137ff., as well as the above mentioned passages from E. Kogon et al., op. cit. (note 3) pp. 285f.

lice, for instance, also incorporate the poison into their bodies by breathing without releasing the poison as such back into the environment. Hence, we also should not expect to find any cyanide residues in the walls of the delousing chambers. The fact is, however, that both Leuchter and I have found gigantic amounts of such residues in samples taken from the walls of these delousing chambers.[18] This shows that Wellers' thesis cannot be correct already for logical reasons.

Now to the reasons why Wellers is on the wrong track with his argument. His thesis has two prerequisites:

a. Only exactly as much poison was released into the air as was needed to kill the victims locked into the chamber.
b. The poison released only affected the victims, but did not react at all with the walls.

Point b. is not without humor, because it requires that each hydrogen cyanide molecule must have a conscience and a free will in order to intentionally stay away from the walls and fly exclusively to the victims in order to be inhaled by them.

Point a. is at least theoretically possible, but not practically. No potential murderer merely uses exactly the minimum amount of poison to kill his victim, because that would render the "success" of such a murder uncertain and would also drag it out for quite a long time. Most poison murders are therefore committed with a large overdose to ensure a fast and reliable "success."

Wellers' thesis has therefore little to do with reality and even less with the historical "evidence," which he and his colleagues are so fond of quoting, that is, the events during the supposed gassings in the alleged gas chambers as claimed by self-declared witnesses. In my own expert report I have thoroughly addressed that issue and backed it up with plenty of evidence.[19] I will now summarize the results.

First of all, Wellers' thesis contradicts claims by witnesses about the amount of poison used. According to that, amounts exceeding the minimally necessary by the factor of 35 to 170 were used.[20]

Furthermore, Wellers' thesis of a minimal amount of poison used also contradicts the execution times claimed by witnesses, which range between instantaneously to a few minutes.[21] What Wellers did not take into consideration is that, although hydrogen cyanide kills quickly, it does not kill instantaneously as for example nerve gases. The only proven data for execution times with hydrogen cyanide derive from gas chamber executions in the U.S., where dos-

[19] Ibid., pp. 208-216.
[20] Ibid., note 469, p. 211: 5-12 kg per gassing of 1,000-2,000 victims, with a lethal concentration of 70 mg per person.
[21] Ibid., note 465, pp. 208f.

es ten times higher than the lethal concentration are used. And although the victim is exposed to this concentration almost immediately, his agony still lasts between ten to fifteen minutes or more.[22]

As Italian revisionist historian Carlo Mattogno pointed out,[23] German Chemist Prof. Dr. Fritz Haber even determined an approximate relationship between the time until death occurs from poisoning and the overdose required for this. According to this "Haber equation," one has to tenfold the dose if one wants to kill within a tenth of the time. So if we wanted to kill ten times faster than the execution times in U.S. gas chambers, thus reducing 10-15 minutes to one and a half minute, this then would require ten times more poison.

It thus turns out that the successful murder of thousands of people in a few moments or minutes would require an even higher overdose than what was applied in U.S. gas chambers (at least twice as much, therefore at least an overdose of 20 to 30 times and more). The estimated breathing volume of the victims also lets us assess the approximate concentration of the poison in the air required to let the victims inhale sufficient poison within a moment, so that they die within a few minutes. This concentration also is approximately ten times as high as would be needed to kill slowly in the long run.

Because Zyklon B releases only some 5 to 10% of its poison within the first 5 to 10 minutes of its exposure to air,[10] this means that ten times as much Zyklon B had to be applied than otherwise necessary in order to obtain such a high overdose within 5 to 10 minutes. It would also have been necessary to dissipate this poison quickly throughout the entire chamber in order to swiftly reach and poison even those victims standing farthest away from the source. But since there was no such dissipating device in the alleged gas chambers of Auschwitz, this deficiency would have to have been compensated by adding even considerably more Zyklon B. One therefore had to introduce Zyklon B amounts into the alleged gas chambers, which would have exceeded the amount Wellers assumes by the factor 200, if not 400. This shows that the quantities of Zyklon B allegedly used according to witness testimony is really only the lower level of what would have been required.

Now to the last question: Could the victims' lungs have cleaned the air almost completely from the poison gas? That can be refuted as well, because the prerequisite for the scenarios claimed by witnesses is that such high overdoses were contained in the air that the victims died quickly. If the victims could have cleaned the air from the poison, those standing close to the source would have acted as filters and would have shielded those standing far away. The fact is, however, that the claimed fast murder could succeed only if high concentrations of the poison gas were present everywhere in the gas chamber at

---

[22] Ibid., pp. 11f.

[23] C. Mattogno, *Olocausto: dilettanti allo sbaraglio*, Edizioni di Ar, Padua 1996, pp. 181-189, based on: Michele Giua, Clara Giua-Lollini, *Dizionario di chimica generale e industriale*, Unione Tipografico Editrice Torinese, Torino 1948, vol. I, pp. 312f.

every time. Losses of poison by inhalation would have to be compensated by additional poison, because the high overdoses in the air had to be maintained. This apart from the fact that the initially rapidly increasing concentration of the poison gas does not come to a standstill once the last victim has succumbed to it. After all, by then the Zyklon B has released only some 5-10% of its poison. It will continue to release its poison after that, so that the poison concentration will keep rising, and even fast so, once the breathing of the victims slowed down or came to a standstill.

An almost complete incorporation of all hydrogen cyanide by the victims requires that at least some of the victims stay alive throughout the entire period during which Zyklon B releases its poison (2 hours). This would mean that only such a tiny amount of poison was to be administered that there is just enough to kill those standing for some two hours at the walls, which were farthest away from the poison source. But those victims would have suffocated much earlier due to lack of oxygen, because after all, the gas chambers are claimed to have been sealed hermetically and packed full with people. Under such conditions, death through suffocation would have occurred within some 45 to 60 minutes even without any poison gas.[24] Wellers' scenario does therefore not only contradict all witness testimonies, it does also not make any sense. Why should the SS have wasted its precious Zyklon B, if the people would have suffocated in those chambers anyway?

Back to what the witnesses claim, namely swift gassings with large overdoses of poison. If that was the case, I need to ask Dr. George Wellers, how he wants to immediately open and evacuate a room after an immediate and successful gassing of all victims, if such a gassing required a poison gas concentration many hundred times higher than the minimal lethal concentration?

It would also be nice to find out, with what kind of apparatus Dr. Wellers wants to prevent the myriads of hydrogen cyanide molecules to accumulate in the cool and wet walls of the morgues. After all, hydrogen cyanide loves cool and moist walls much more than the warm human skin.

The few chemical questions Dr. Wellers addressed in his article once more raise the question of his competence. He states, for instance, that Leuchter is right when claiming that it was necessary to heat a room beyond the boiling temperature of hydrogen cyanide in order to transform it into its gaseous aggregate state (p. 234). This is of course nonsense. After all, water does not wait to evaporate until temperatures have exceeded 100°C either.

The article discussed here is characterized by a total lack of calculations or references to technical or scientific literature, just like Wellers' initially mentioned contribution in the collective work by E. Kogon et al. The only exception is a reference to a pamphlet of the Merck Company on the toxicity of hy-

[24] Ibid., pp. 211-216.

drogen cyanide. Other than that he merely quotes his own works, where one cannot find any references to non-anecdotal, scientific literature either.

It thus turns out: what Wellers claimed to be clear back in 1983, is nothing but the wishful thinking of a professor for biochemistry who does not exactly distinguish himself with competence.

Polish Pseudo-Scientists

By Germar Rudolf

1. Prelude

Excitement filled the rooms of the Polish State Museum of Auschwitz in spring 1988, when news came to Poland that the U.S. American expert for execution technologies Fred Leuchter believed to have demonstrated, among other things with the help of chemical analyses, that the alleged gas chambers in Auschwitz could not have been used, and demonstrably had not been used, for mass murder.[1] Because things they did not want to accept could not possibly be true – after all, this would be the end of the profitable museum business – the museum's directorate ventured out to refute this American expert report. They ordered Prof. Jan Markiewicz, an expert for technical testing from the Jan Sehn Institute in Krakow, to take wall samples from various buildings or building ruins in the Auschwitz und Birkenau camps and to test them for chemical residues (cyanide compounds). These cyanide compounds are remnants of hydrogen cyanide, the active ingredient in the delousing product Zyklon B, with which lice had been killed in delousing chambers at Auschwitz, and supposedly humans in the alleged homicidal gas chambers. The results of these analyses by Prof. Markiewicz and his colleagues are given in Table 1 (next page).

Samples no. 1, 2, and 7-11 were taken from a delousing chamber, in which the clothes of inmates were deloused with hydrogen cyanide during the war. It is not claimed by anyone that humans were killed in this room. The only "positive" result of a sample taken from a room that according to the Museum had been a homicidal gas chamber is no. 15. All other samples did not contain any detectable residues.

These results seem to suggest that samples from the alleged homicidal gas chambers contain considerable less cyanide residue than samples from delousing chambers or even none at all. There are two things with the values given by Markiewicz, however, that struck me as odd:

---

[1] Fred A. Leuchter, *An Engineering Report on the alleged Execution Gas Chambers at Auschwitz, Birkenau and Majdanek, Poland*, Samisdat Publishers, Toronto 1988 (www.zundelsite.org/english/leuchter/report1/leuchter.toc.html).

Table 1: Cyanide concentrations in wall samples of homicidal gas chambers / delousing chambers

According to Institute for Forensic Reserach, department for toxicology, Krakow, Poland; data given in mg per kg

No.	Building	Sample taking location and -depth	Material	CN^-
1	Disinfestation Block 3	Room 4, around the ventilator opening, 2 mm	Plaster	0.068
2	Disinfestation Block 3	Room 4, next to doors to Room 3, 2 mm	Plaster	0.036
7	Disinfestation Block 3	Room 3, below window, opposite, 2 mm	Plaster	0.076
8	Disinfestation Block 3	Door opening between Room 2 and 1, 2 mm upper left	Plaster	0.140
9	Disinfestation Block 3	Like Nr. 8, lower left	Plaster	0.404
10	Disinfestation Block 3	Room 1, Ventilator opening, 2 mm	Plaster	0.528
11	Disinfestation Block 3	Like 10, light blue	Plaster	0.588
15	Crematorium II, morgue 1	Concrete support columns	Plaster (?)	0.024

4 additional samples from crematorium II, 1 from crematorium I, 1 from crematorium V, in each case an alleged gas chamber, and 2 control samples contained demonstrable traces of CN^-.

1. The Polish original of this table gives cyanide as mg of potassium cyanide per 100 g of sample material instead of the internationally standard of mg of cyanide per kg sample material.
2. The Krakow analytic results of samples taken from the delousing chamber are a factor 10,000(!) lower than results of samples taken from there by Fred Leuchter and by me. Apart from this, all values are below the detection level of the method of analysis used by all professional analytic laboratories in the world (app. 1 mg/kg). I therefore assumed already in 1993 that the Poles committed a methodical error.[2]

Despite their questionable background, these analytic results seemed to support the revisionists. It was therefore apparently decided by the Auschwitz Museum not to publish them. However, someone sympathetic to revisionism within the Auschwitz museum sent photocopies of these analytic results to some known revisionist in spring of 1991, who saw to it that this study was published immediately.[3] Already the comments added to these results by Prof. Markiewicz indicate that he is utterly incompetent to address the chemical issues involved:[4]

> *"Hydrogen cyanide is a weak acid, which has the result that its salts decompose slightly in the presence of stronger acids. One of these stronger acids is carbonic acid, which arises from the reaction between carbon dioxide and water.* [Even] *stronger acids, such as, for example, sulfuric acid, decompose cyanide even more easily. Complex compounds of cyanide ions*

[2] R. Kammerer, A. Solms, *Das Rudolf Gutachten*, Cromwell, London 1993 (vho.org/D/rga1/rga.html), p. 82.

[3] J. Markiewicz, W. Gubala, J. Łabędź, B. Trzcinska, *Expert Report*, Prof. Dr. Jan Sehn Institute for Forensic Reserach, department for toxicology, Krakow, Sept. 24, 1990; partially published, *e.g.* in: "An official Polish report on the Auschwitz 'gas chambers'," *Journal of Historical Review*, 11(2) (1991), pp. 207-216 (online: www.vho.org/GB/Journals/JHR/11/2/IHR207-216.html).

[4] Ibid.; I use my own translation here.

with heavy metals are more durable. Among such compounds is the already mentioned 'Prussian Blue' [=Iron Blue]*, but even this decomposes slowly in an acid environment.*

One could hardly expect, therefore, that building materials (plaster, brick) exposed to environmental influences (precipitation, acid oxides, especially sulfuric and nitric monoxide) would contain derivative compounds of cyanides after a period of 45 years."

This contradicts the facts as established in my expert report with the help of a vast amount of expert literature:[5]

a) Carbon dioxide is only slightly soluble in water and hardly forms carbonic acid in water at all. It therefore can hardly "decompose" the cyanide salts.[6]
b) Iron Blue (Prussian Blue) is extraordinarily stable in acids and is not destroyed by the influences of weathering, even over decades.[7]

In September 1991 I met a certain Werner Wegner at a seminar on revisionism held by a liberal party in Nuremberg, Germany. Wegner had decided to refute the revisionists.[8] After this meeting, a brief correspondence developed between Mr. Wegner and me, during which he also sent me photocopies of letters he had received from Prof. Markiewicz. Apparently, Mr. Wegner had brought the chemical statements I had made in a letter to him to the attention of Prof. Markiewicz with the request to address them, which he must have done promptly. In this private correspondence with Werner Wegner, Prof. Markiewicz once again revealed his ignorance on the issues involved:[9]

"VIII. Water activates many chemical processes. The chambers were certainly moist. What kind of influence this exerts upon the binding of HCN by cement (wall plaster) – is unknown to us. […]

IX. The blue stains on the exterior walls of Building 5a are not easily explained. Above all, we must examine whether or not it actual is Berlin Blue [=Iron Blue…]*"*

I had started only in spring of 1991 to investigate the conditions beneficial to the formation of Iron Blue. It was not before summer of 1991 that I came to understand that moist walls, coupled with a minimum of alkalinity, were the main factors in the formation of Iron Blue in walls exposed to hydrogen cyanide (HCN) gas. I came to that insight only because an engineer assisted me by lending me several books on the chemistry of cement and concrete. It is

9 Letter by Jan Sehn Institute for Forensic Reserach, department for toxicology, Krakow, to W. Wegner, undated (Winter 1991/92), illegible signature (probably Markiewicz), unpublished.

therefore no disgrace if one does not know certain things. But as a scientist one should strife to remedy this lack of knowledge, because that is the essence of science.

In a letter to the *Institute for Historical Review*, Markiewicz explained that his Institute considered the research results listed above not to be an end result, but that further investigations would follow.[10] It had thus to be expected that this preliminary study would be followed by a more comprehensive one, which would address the questions that Markiewicz himself had admitted to require an answer.

But what actually followed was the exact opposite.

2. Critique

2.1. Summary

The announced, more comprehensive study about the question of detectability of cyanide compounds in delousing chambers and alleged homicidal gas chambers of the Auschwitz camp was finally published in 1994.[11]

As a reminder: The analytical results of wall samples taken by Fred Leuchter[1] and by me[2,5] from the alleged homicidal gas chambers indicated no significant residues of the active ingredient of Zyklon B (cyanides), whereas samples taken from delousing chambers had gigantic amounts of such residues. Leuchter concluded from this that there could not have been any gassing at all in these rooms, whereas I concluded that gassing could at least not have taken place to the extent and in the manner reported by witnesses.[12]

The Polish authors discussed here, on the other hand, found that the supposed homicidal gas chambers contain quantities of cyanide comparable to the delousing chambers, from which they conclude that the mass gassings at Auschwitz took place.

The three Polish authors used an analytical method that is unable to detect the most important long-term stable cyanide compounds of the type of Iron Blue. They did this to prevent the detection of residues, which got into the walls by other means, for instance by a blue wall paint.

The three Polish authors also admitted not to have understood the chemical process involved when hydrogen cyanide is absorbed in building material. They ignored facts established by me, which explain these chemical processes,

[10] Letter to Mark Weber, June 7, 1991, *The Journal of Historical Review*, 11(2) (1991), pp. 207-216 (www.vho.org/GB/Journals/JHR/11/2/IHR207-216.html).

[11] J. Markiewicz, W. Gubala, J. Łabędź, *Z Zagadnien Nauk Sadowych*, vol. XXX (1994) pp. 17-27 (www2.ca.nizkor.org/ftp.cgi/orgs/polish/institute-for-forensic-research/post-leuchter.report).

[12] The analytical results of sample taken in Auschwitz by Leuchter and Rudolf were once again confirmed by John C. Ball, *The Ball Report*, Samisdat Publishers, Toronto 1993.

even though they knew about these facts, because they quoted my respective work.[13] Apart from this, a case of construction damage caused by hydrogen cyanide proves that blue discolorations of walls by Iron Blue can indeed be the result of exposing a wall to hydrogen cyanide.[14] Hence, the analytical results of the three Polish authors have to be rejected as misleading due to their intentional use of a wrong analytical method. The suspicion arises that their contribution was motivated by deceptive intentions.

2.2. Method of Analysis

Markiewicz and his colleagues exposed finely pulverized samples to 10% sulfuric acid in a microdiffusion chamber for 24 hours. Hydrogen cyanide diffusing out of the sample was captured in a lye solution. The analysis of cyanide was done by converting it to a dye that could be detected spectrometrically. For this purpose they resorted to a highly sensitive method published in 1947.[15]

The analysis institutes[16] hired by F. Leuchter and me to investigate our samples used a method that was based on the standard method for the analysis of total cyanide in liquid samples as developed by the Society of German Chemists (DIN 38 405, Part D 13). In this method finely pulverized samples are heated for 1 to 2 hours in a slightly reductive, hydrochloric acid solution. The gaseous HCN produced is fed through an alkaline solution by a stream of air. For small quantities the analysis was done by the above-mentioned spectrometric method, for larger quantities a titration method was used.

Markiewicz and his colleagues confirm that iron cyanide compounds cannot be detected with their procedure. This statement is in agreement with the technical literature cited in my expert report on the almost complete indestructibility of this very stable family of compounds even with the use of cold, concentrated acid. The Polish authors state that the reason for their choice of method was that they could not imagine how blue iron cyanide compounds could form in masonry and that they agree with Josef Bailer[17] that the blue

discoloration of the delousing chamber walls could be a coat of paint. In order to exclude such paint from the analysis they decided to employ a method that was not sensitive to iron cyanide.

In the case of the bluely stained delousing chambers, such a procedure would be correct only when one could exclude with reasonable certainty that the effect of hydrogen cyanide on masonry can lead to the formation of iron cyanide and if there is indeed any evidence of the use of a blue wall paint containing cyanide compounds. However, the Polish authors have failed completely to clarify these questions. Not only that, but they ignored altogether the arguments given in my expert report[2,5] and in a book of mine,[13] supported by a long list of relevant technical literature, for the fact that the formation of stable iron cyanide is quite likely under certain circumstances. They likewise ignored the arguments that refute the hypothesis of blue paint in the Auschwitz delousing chambers.

I have dealt with this absurd hypothesis of Bailer in detail both in my expert as well as in my above-mentioned book. I have asked Dr. Bailer how it is that this supposed "coat of paint" only appears as random, irregular patches and can also be found deep within the wall, but I have not received an answer so far. In addition, one can find high levels of cyanide in plaster and in inner layers of mortar even in places that appear completely white. Herr Bailer has never explained to me whether he knows about some "white cyanide" color with which walls, plaster, and mortar can be dyed white before they are applied. He also has to this day refused to name a blue wall color that contains the pigment Iron Blue, because such paint does not and did never exist.[18]

The Polish authors could have checked their unfounded hypothesis of the impossibility of formation of stable iron cyanide compounds against their own gassing experiments. If they had examined only one of these samples for total cyanide content with the internationally recognized DIN method, then they probably would have seen their error. It is especially strange that the samples from locations that show no blue discoloration (supposed gas chambers, prisoners' barracks, and test gassings) were analyzed with the method insensitive to iron cyanide as well. In these cases one would expect no interference from blue paint and one could have easily determined whether iron cyanide forms in masonry or not and whether the analytic results of the two different methods are comparable.

That the development of bluish patches on the surfaces of walls similar in appearance to those on the walls of the Auschwitz delousing chambers is the consequence of HCN gassing can be shown dramatically by one reference in the technical literature. In 1981, the periodically published journal *Bauschäden Sammlung* (Collection of Construction Damages) reported about the ef-

[18] Iron Blue is unstable in alkaline environments like on cement plaster and concrete, which is why it is never used in wall paint. Its use on such walls would result in patchy blue discolorations.

Tab. 2: Comparison of Orders of Magnitude of Analytical Results of Various Samples in mg CN^-/kg

AUTHOR	MARKIEWICZ ET AL.	LEUCHTER	RUDOLF
Analysis of:	Cyanide without Iron Cyanides	Total Cyanide	Total Cyanide
Delousing Chambers	0 – 0.8	1,025	1,000 – 13,000
Alleged Gas Chambers	0 – 0.6	0 – 8	0 – 7 *
Inmate Huts	0	–	0 – 3 *
Experimental Gassings	0 – 12	–	50 – 100

* not reproducible, therefore not interpretable, i.e.: insignificant, considered to be zero.

fects of a hydrogen cyanide gassing on a church that had been freshly plastered a few weeks before.[14] In that case deep blue patches appeared all over after several months. The reaction did not stop for over a year. The new plaster had to be completely knocked down, since the iron cyanide complex could not be removed any other way.

Therefore it is established with certainty that the analytic method chosen by the Polish authors excluded from the analysis exactly those compounds, which this dispute is all about.

2.3. Limits of Detectability and Results of Analysis

The Polish authors state that the limit of detectability for their analytic method is 3-4 µg cyanide per kg of sample material. In the DIN method this limit is near 2.5 µg, and in 1947 J. Epstein stated that the limit should be less than 1 µg.[15] It should be noted, however, that the last two limits only apply to solutions of cyanide compounds in water. Experience with the analysis of chemical compounds in highly heterogeneous, not completely soluble solids, such as masonry, shows that such analyses are an order of magnitude more difficult. Accordingly, professional analytical institutes give as limits of detectibility for solid samples not 2.5 µg/kg, but at least 100 µg/kg and sometimes even 1,000 µg/kg (1,000 µg = 1 mg). Sometimes even these values can be troublesome, because masonry samples usually contain large quantities of carbonate, which can disturb the detection of cyanide (cf. the DIN method).

It is doubtful that the experiences of Markiewicz and his colleagues to determine their limit of detectibility is based on use of solid materials, because in this case it would be necessary to fill these solid samples with a defined amount of cyanide, and then to try to find them again with an analysis. And if their limit of detectibility is based on experiments with liquid solutions, all analytic results with values lower than 1 mg/kg should be looked at skeptically.

Table 2 gives the orders of magnitude of analytic results of the three works discussed here in mg/kg (ppm). The conditions of my test gassings were similar to those of Markiewicz and party. However, the analyses of my samples

were made only after a relatively long period after the gassing (about 2 months) whereas the maximum values of Markiewicz and party come from analyses made 48 hours after the samples' exposure to the gas. (For more details on the test gassings see below.)

Under the assumption that these results are accurate at least in their order of magnitude, several interesting conclusions can be made from a comparison of the results of the different analytic methods:

1. 99.9% of the cyanide presently detectible in the walls of the delousing chambers of Auschwitz is bound in a way that is not detectible by the method of Markiewicz and party. Therefore these are probably complex iron cyanides such as Iron Blue. More precisely, the ratio of stable iron cyanide compounds to less stable cyanide compounds is 1,000 to 10,000 and more to 1.
2. The corresponding ratio in the samples from the supposed homicidal gas chambers is at most 10 to 1.
3. While Markiewicz and party found that the level of unstable cyanide compounds in the alleged homicidal gas chambers and in the delousing chambers are nearly equal, the analytic results of Leuchter and me show that the total cyanide level – and thus probably also the iron cyanide level – in the delousing chambers is a factor of 1,000 or more higher than that in the supposed gas chambers.
   First, one can exclude that this effect can be caused by the dissolution of stable iron cyanide compounds in the alleged homicidal gas chambers, because it flies in the face of logic that the stable compounds dissolve while the unstable ones can be detected still today at unreduced levels. If one does not want to attribute this phenomenon to a false analytical method or to an incorrect interpretation of the extremely low analytic results of the Polish authors, one cannot avoid the conclusion that iron cyanide compounds were unable to form only in the supposed homicidal gas chambers. Looking at the formation conditions of Iron Blue in the above-quoted case of construction damage to a gassed church, one is reminded of the environmental conditions that were present in the alleged homicidal gas chambers of crematoria II and III in Auschwitz-Birkenau. In both cases the walls were cool and moist, and their alkaline cement-plaster had been applied just a few weeks before the – in the case of the gas chambers: presumed – gassing. I can think of no reason why the absorbed HCN should turn into Iron Blue only in the case of the church.
4. Markiewicz and party found nearly a 50% reduction of cyanide levels in their test-gassed samples after a month's storage. Their analytic results are approximately 100 times less than in my tests, which were stored for over two months in a warm, dry room. Here also the Polish authors seem to have found merely 1% of the total cyanide, which indicates that even in such a short time the vast majority of cyanides is bound as stable iron cya-

nides. In the report on the construction damage case cited above it was mentioned that the reaction of the absorbed cyanide producing Iron Blue was complete only after 1½ years. The preliminary phase of this reaction, the formation of much paler iron cyanides (prussiates of sodium, calcium, potassium), could therefore have taken place much earlier.

2.4. Analytic Results from Test Samples

Apart from these problematic analytic results the test gassings performed by the three Polish authors reveal more interesting details that call for more questions. Table 3 lists the results of analysis of HCN test gassings that were carried out by the Polish authors under different conditions. The first row shows the data for the absorption of HCN alone, while the second row shows the data with the influence of high concentrations of carbon dioxide (CO_2) in the air on the absorption of HCN.

The results of the HCN gassing support my finding that moist walls absorb considerably more HCN than dry walls (ten times as much and more). Because the delousing chambers were heated rooms with dry walls while the alleged homicidal gas chambers of crematoria II and III were unheated cellars (morgues) with moist walls, I concluded that the reactivity of the supposed gas chambers with respect to the formation of stable iron cyanide compounds must have been much greater than that of the dry delousing chambers.

The second row is more interesting. Here air containing 2 vol.-% HCN was enriched with 10 vol.-% CO_2. The Polish authors argue that the breathing of the victims in the alleged homicidal gas chamber would have raised the CO_2-content in the air. This needed to be considered. Since according to witness statements the victims died within approximately 5 minutes, they could have raised the CO_2-content in this time up to 1 vol.-%. This was ten times greater than the concentration of HCN allegedly used, so the Poles claim. In their test, however, the Poles only applied a factor of 5.

These data of the three Polish authors need some critical remarks. First, it is not likely that it would be possible to kill quickly in a large room stuffed with people and with a relatively low concentration of HCN. I have made detailed studies of this in my expert report. It is also questionable to raise the concentration of CO_2 in a room, which supposedly had a CO_2-content of 1 vol.-%, to a concentration of 10 vol.-% for the experiments. The behavior of moist, fresh, plaster and mortar that had not yet set can be strongly influenced by this 10-fold difference, and the absorption of HCN can be greatly affected.

Table 3: Analytic results of HCN-gassed Samples from Markiewicz and others
data in mg CN^-/kg

Material:	Fresh Plaster		Old Mortar		Fresh Mortar		New Brick		Old Brick	
Exposed to:	dry	moist	dry	moist	dry	moist	dry	moist	dry	moist
2 % HCN	0.024	0.48	–	–	0.176	2.7	0.004	0.052	0.02	0
+ 10 % CO_2	5.92	12.8	1	0.244	0.492	0.388	0.052	0.036	0.024	0.060

Looking at the influence of CO_2 on the HCN absorption of various building materials, we see: With fresh, dry plaster the absorption is massively increased (247 times), with fresh, moist plaster the increase is less intense (27 times), with fresh, dry mortar the absorption is hardly increased (barely 3 times), whereas with fresh, moist mortar it is decreased (down to a seventh). Dry brick absorbs somewhat more HCN in the presence of CO_2, whereas moist brick absorbs now more, now less. From these results Markiewicz and party conclude that the cool, moist underground morgues of crematoria II and III that are claimed to have been used as homicidal gas chambers had a reactivity to form Iron Blue not higher than that of the dry delousing chambers.

The results of the combined HCN- and CO_2-gassings are anything but uniform, but in most cases HCN absorption is *increased* with increased CO_2-content. Unfortunately the Polish authors fail to attempt an explanation of their results, and thus they do not answer the question why increased CO_2 has the respective effect in any particular case.

For example, the effect of CO_2 could be due to the fact that it lowers the pH-value of the masonry (that is, increases the acidity) and makes the material less porous by enhancing the setting process (carbonatization) of the material. Both effects would be favored by a moist material and would lead to a decrease in absorption of HCN. This does, however, not explain why in most cases the HCN absorption was increased by adding CO_2.

As a matter of fact, it cannot be determined from the article by the three Polish authors what exact material their samples were composed of or what condition they were in when they were gassed. For reactivity with respect to the absorption of HCN, however, the relative proportions of water, sand, cement, and lime used to prepare the individual samples of building material is decisive, as is the amount of time and the conditions they were exposed to (temperature, humidity) before they were gassed. For example, there could be a good factor ten difference in the absorption of HCN depending on whether one gasses a sample of lime plaster on the same day it was mixed or if one waits a week until the plaster is almost completely set. The terms “fresh” and “old” used by the Polish authors are completely insufficient in this respect.

2.5. On the Interpretation of the Results

Let us first assume that the analytic results of Markiewicz and party are correct and that they can be compared with analyses of total cyanide (which is basically impossible, as indicated), and second that by samples of plaster and mortar the Polish authors meant lime mortar and cement mortar, respectively. The former material was used to build the delousing chambers while the latter was used in the walls of the underground morgues (the alleged homicidal gas chambers) of crematoria II and III. Then the warm, dry, mostly CO_2-free delousing chambers newly put in operation would show a level of 0.024 mg

cyanide per kg sample material, whereas the moist, cold, CO_2-loaded alleged gas chambers of crematoria II and III, also newly put into operation, would show a level of 0.388 mg/kg, a figure greater than that of the delousing chambers by a factor of 16. With all other combinations of materials the factor is always greater than 1 as well (cement/cement: 2.2; cement/lime: 72; lime/lime: 533). If the Polish authors claim nevertheless that the alleged homicidal gas chambers did not have a higher reactivity to bind hydrogen cyanide than the delousing chambers, then they turn their own research results upside down!

Facing the fact that the Poles' maximum analytical values of their samples from delousing chambers are comparable to those from the underground morgue no. 1 of crematorium II – the alleged homicidal gas chamber – they force themselves to conclude that this is hardly surprising since large areas of this underground morgue are protected from environmental influence. Therefore the cyanide, once bound, would have as little reason to disappear from the morgue as from the delousing chambers. That we can agree upon. We can also agree on the implicit conclusion that the traces of cyanide remaining in the delousing chambers *would* be present in the *same* order of magnitude as in the alleged homicidal killing gas chambers, *if* the latter were used to kill hundreds of thousands of inmates with HCN. However, considering the amount of total cyanide, this is absolutely not the case. Rather there is a world of difference between the analytic values – a factor of 1,000 or more – and this in spite of the higher reactivity of the alleged homicidal gas chambers.

Another point reflects even worse on the chemical competence of the three Polish authors: They say once more that they cannot explain how the brick on the outside of the delousing chambers in Birkenau came to have patchy blue discolorations. The Polish authors have confirmed the relative inertness of bricks to the formation of detectable cyanides in their own gassing experiments, which I had determined as well. But they do not seem to have read attentively my expert report or my book, which they cite. It should be clear that the high concentrations of soluble cyanide compounds on the inner side of the walls of the delousing chambers would slowly diffuse to the outer side of the wall, driven by moisture rising from the soil through the walls and evaporating preferably at the outside. Once deposited at the outside of the walls, soluble iron cyanide compounds would be quickly converted into long-term stable Iron Blue under environmental influences. Whoever inspects the surface of the bricks of this building would realize that they have been eroded on their surface, probably mostly because of acid rain, which occurs frequently in Upper Silesia, one of the dirtiest industrial regions of the world until the late 1980s/early 1990s. In chemical terms, iron oxides in the brick, which had been physically fixed by the sintering process during production, were physico-chemically activated by an acid medium and thus could more easily react with cyanide compounds migrating to the surface to form Iron Blue.

2.6. Conclusions

Whether or not the influence of CO_2 on the accumulation of cyanides in masonry as determined by the Polish authors in several experiments proves true or not may be important for the interpretation of the analytical results of samples taken in Auschwitz – in either direction – but with respect to the question how to assess the scientific value of the article by the three Polish authors, this is not important at all. For purely formal criteria their paper must be judged as insufficient to meet scientific standards:

1. With respect to decisive questions they do not even attempt to get involved into a factual discussion. They do mention that there have been other works on the same subject, but they ignore the arguments that were made in those works. As to the background of their work, namely the chemistry of building materials and of iron cyanide in general, they stay completely mute. On the questions raised they apparently never attempted to investigate if there have been pertinent results in expert literature. Instead they decided without any basis, other then their own authority, what is true and what is not. An example for this is the authors' declaration out of the good that they cannot explain how Iron Blue can form in building material. They therefore decide to exclude iron cyanide completely from the analysis.
2. The documentation of the experiments undertaken makes it almost impossible to reproduce the procedures. Neither the composition of the samples nor their history can be determined.
3. The conclusions of the Polish authors from their experimental data are diametrically opposed to the data themselves. As a matter of fact, even the research results of the Polish authors show that the alleged homicidal gas chambers had a higher reactivity to form stable cyanide compounds than the delousing chambers of Auschwitz. Yet the authors claim the opposite.

While missing information about the exact experimental conditions used by Markiewicz and party can perhaps be obtained, the application of a totally incorrect analytical methods runs into insurmountable difficulties. It must therefore be demanded that the same samples should be analyzed once more with the correct method.

3. Correspondence[19]

The three Polish authors from the Krakow Institute for Forensic Research received this article by fax at the beginning of November 1994 with the request that they comment on the questions raised here. The answer by Prof. Markiewicz and the subsequent exchange are given in the following.

[19] First published in the small Berlin periodical *Sleipnir*, issue 3, 1995, pp. 29-33.

3.1. Instytut Ekspertyz Sadowych im. Prof. dra Jana Sehna

Fax to G. Rudolf on Jan. 24, 1995, 8:51 hours

To Herr Germar Rudolf

With reference to your telefaxes of 10.XI.1994 and 9.XII.1994 and the accompanying paper, "Some questions for J. Markiewicz, W. Gubala, and J. Łabędź" we would like to kindly reply as follows:

1. In our researches [we] were interested most of all in structures or ruins of structures – mostly located within the crematoria – that are said to have functioned as gas chambers. Approximately $^2/_3$ of all samples collected come from such structures. Our interest in the rooms in which the disinfections – particularly of clothing – took place by means of Zyklon B had a lesser priority, as no one doubts that this product was used there. We chose the former prisoners' barracks as the control for this research, where – as is known – no documented use of HCN took place except for occasional general disinfection during the typhus epidemic in the camp in 1942. No cyanide compounds were found in the material from these barracks.
2. The method we used to separate HCN from its compounds excludes the possibility of decomposing of the relatively permanent "Prussian Blue" [=Iron Blue], whose origin had been claimed to be unclear in many parts of the structures under investigation. Under the experimental conditions we used for our method, the ion $[Fe^{II}(CN)_6]^{4-}$ in compounds such as $K[Fe^{II}(CN)_6]$ decomposed with the release of HCN. Even though we do not exclude other possibilities for the formation of Prussian Blue in the walls of the structures investigated, using our method we found cyanide compounds other than the above-mentioned pigment. The real level of total cyanide compounds could therefore be higher than shown by our analysis. We therefore established that as a result of the reaction of HCN with the compounds of the walls of the structures investigated not only Prussian Blue develops, but also other compounds, which in many cases can persist for periods of almost 50 years. If only such conditions were present as allowed Prussian Blue alone to develop,[20] the walls of the delousing facilities, for example, should be completely blue.
   It should be noted here that the management of the Museum in Auschwitz made available to us a small sample of diatomaceous earth from an old Zyklon B can (a museum artifact). Using our method we found 1,360 µg CN^-/kg, but there was no blue discoloration.

[20] Deceptive dialectics: No one ever disputed that all kinds of cyanides develop in addition to Iron Blue, but fact is that after 50 years of exposure to the environment Iron Blue as the most long-term stable compound must be expected to be the majority cyanide compound.

3. The materials that we – and Herr Rudolf – investigated are not homogeneous and thereby their chemical properties – particularly binding capacity and/or reaction capacity with respect to HCN – will be different from one fragment to the next. The variation of readings was, for example, in crematorium III 0-640 µg CN^-/kg, and in crematorium IV 0-500 µg CN^-/kg. The same phenomenon occurs in the disinfection facilities. For example, in block no. 30 in Auschwitz the figures were 0-900 µg CN^-/kg. For the bathhouse in Birkenau [BW5a] the figures were 0-840 µg CN^-/kg. In the latter structure there were places in addition to those, which have dark blue discolorations, where the plaster is white and has low levels of cyanide compounds. It is purely coincidental as to whether or not one takes a sample with higher or lower levels of cyanide compounds, or even a sample free of them (cf. the research results of F. A. Leuchter's samples).
4. The limit of detectibility of CN^- in the method we used, given as 3-4 µg/kg, was verified by our experiments and is close to that determined by J. Epstein, the developer of the method. It is at once a very sensitive and a very specific method, which not even Herr Rudolf disputes.
5. In connection with and on the basis of the investigations carried out on walls of structures in the former concentration camp Auschwitz-Birkenau, we carried out several pilot experiments. They do not pretend to be full-fledged studies. The material that was available to us was definitely different from the material authentically from the camp. The individual samples also differed among themselves, even macroscopically. Unfortunately it was not possible to use the same sample repeatedly under different analytical environments, since they were destroyed in the course of the analysis. Plaster and other "fresh" materials were a few weeks old, and the "old" materials were approximately ten years old. Disregarding the substantial simplifications of the analyses, certain behaviors were noticeable that we shall investigate later in more extensive research. These behaviors are as follows:
   a) Increased binding of HCN in moist material, which is easily understood;
   b) CO_2, which must have been present in the chambers in considerable concentrations, can impede the solution or binding of HCN by compounds of the material under analysis. At least one needs to be aware of this. After all, carbonic acid is a much stronger acid than hydrogen cyanide. Carbon dioxide in the air can slowly dissolve alkali cyanides. Therefore it will not favor the formation of cyanide. The samples gassed with HCN with added CO_2 apparently lose HCN more easily under stronger ventilation.
   c) Water flushes significant quantities of the adsorbed or bound HCN, at least in the first stage after the fumigation.
6. The example given by Herr Rudolf of a church whose walls suffered extensive blue discoloration due to Prussian Blue during nearly a year after fumigation with HCN proves that the chemical composition of the plaster

of this church and other factors not described favored the formation of this compound. Fumigation of buildings by use of HCN is done frequently even today and it is certainly not always the case that such spotting occurs after fumigation with Prussian Blue.

7. Certain considerations of Herr Rudolf such as those on the origin of the dark-blue stains on the outer (brick) walls of the delousing facility in the Birkenau camp have the character of scientific speculation that may or may not be correct. One cannot assume them as axioms without an empirical basis. This applies also to assertions that with our method we detect only 0.01%, 0.1% or 10% of the cyanide compounds in the subject material.
8. We welcome with pleasure the renewal of an expert discussion of the problems involved by competent chemists, but we cannot avoid expressing our displeasure about several expressions by Herr Rudolf that were address to us and which were certainly not necessary.
9. Since we are in frequent contact with the area of the Auschwitz-camp near Krakow, we do not intend to be satisfied with the investigations done so far, the major part of which we could recently publish.

P.S.: Thank you very much for the interesting book!

3.2. Comment on the Krakow Institute's Response

G. Rudolf, Jan. 25, 1995

On point 2: Detectibility and Visibility of complex iron cyanides:

In Iron Blue (Prussian Blue, $Fe^{III}_4\,[Fe^{II}(CN)_6]_3$) it is exactly the compound $[Fe^{II}(CN)_6]^{4-}$, which is so extraordinarily stable. Also, Iron Blue never consists of pure $Fe^{III}_4\,[Fe^{II}(CN)_6]_3$, but rather, depending upon the conditions of formation, of different proportions of Fe^{3+}- and alkali or earth-alkali ions (M) ($Fe^{III}_x\,M_y[Fe^{II}(CN)_6]_z$). The resistance of Iron Blue to the analytical method of the Polish scientists is therefore probably due to nothing other than the stability of $[Fe^{II}(CN)_6]^{4-}$ ion. If CN^- in Iron Blue cannot be detected by the method used by the three Polish scientists, their method will also not detect it in all other compounds of the type $M_x[Fe^{II}(CN)_6]_y$, such as $K_4[Fe^{II}(CN)_6]$. If this is correct, then it cannot be surprising when the three Polish scientists cannot detect the biggest part of cyanides with their method, since over time cyanide compounds in masonry change into more stable components of the type $Fe^{III}_x\,M_y[Fe(CN)_6]_z$.

---

[21] E. Gauss, *Grundlagen zur Zeitgeschichte*, Grabert, Tübingen 1994; Engl: G. Rudolf (ed.), *Dissecting the Holocaust*, 2nd ed., Theses & Dissertations Press, Chicago, IL, 2003.

The assertion is incorrect that the entire surface of the walls of the Birkenau delousing chambers should be blue, if 0.1% to 1% of the walls consisted of the pigment Iron Blue. A proportion of 0.1% to 1% blue material in white plaster (mix ratio 1:100 to 1:1000) will only cause a slight, hardly noticeable bluish hue. In view of this small proportion of blue material the question rather arises: Why are there deep blue patches at all? This can be explained as result of an accumulation process of cyanide compounds on the surface of the wall because of the migration of moisture in the walls, which brings soluble cyanide compounds along with it.

The fact that samples of diatomaceous earth do not show blue discoloration despite high levels of cyanide can be explained as a result of the lack of iron oxides as well as a result of the fact that the accumulation process cannot take place in granules of diatomaceous earth [or gypsum] stored in cans, because there is no migration of moisture similar to that found in masonry.

On point 3: Lack of cyanide compounds in white plaster samples:

My test samples # 19a and 19b show that samples showing no blue discoloration can very well have high levels of cyanide. They came from the Birkenau delousing chamber BW 5b. Both samples were gray to brown-gray but had cyanide levels of 1,860 mg CN^-/kg in the outer layer of plaster and 3,880 mg CN^-/kg in a deeper layer.[22]

Fact is that the analytic results of the Krakow scientists are in no way reconcilable with the data from the American Alpha Analytical Laboratories, from the German Institut Fresenius, and from the German Institut für Umwelt- und Schadstoffanalysen (IUS). Since it is highly unlikely that these three renowned institutes would all use a nonsensical method to measure the same nonsense for decades, the error must lie with the analytical method of the Polish scientists, which is utterly unusual in the realm of professional analytic chemistry and which is incapable of detecting the major part of cyanide content. This can be verified by the Poles themselves taking samples from delousing chambers and having them tested by an independent institute using the DIN procedure. It would also be best, if they would not mention the source of the material in order to guarantee the independence of the analysis.

On point 5: Sample description and effect of CO_2:

There is still no description of the composition of the samples. What do they mean by "plaster," by "mortar"?

The question, why in six to eight cases of HCN gassing in the presence of CO_2 the HCN absorption by the samples was sometimes distinctly greater than without CO_2, needs yet to be answered. The blank assertion of the Polish

[22] Considering the general lack of competence, maybe the samples without any traces of cyanide taken by the Poles from a delousing chamber were actually taken from walls that were added after the chamber was no longer used for Zyklon B disinfestation, as was the case for some internal walls in building BW5a. Samples from these walls do not have any significant cyanide residue, see my samples #10, 21, op. cit. (note 5), pp. 254-257.

scientists that CO_2 can not favor the accumulation of HCN is directly contradicted by their own data.

On point 6: Blue discoloration in the plaster of a gassed church:

The practice of gassings with HCN since its inception was usually confined to the treatment of older buildings that had been in use a long time – and thus required disinfestations – and whose plaster was thus old and well-set. The difference to the case documented by G. Zimmermann, where a church developed dark blue discolorations after just one gassing, was certainly due to the fact that in this case a fresh layer of cement plaster was added just a month before, which had therefore not completely set and was thus moist and alkaline.[23]

Repeated gassings with HCN over an extended period of time, such as those that occurred in the delousing chambers at Birkenau and allegedly also in the alleged homicidal gas chambers there, did not occur either before or after World War II. During the war, however, there are at least also the cases of the delousing chambers (allegedly used as homicidal gas chambers according to the official view) of Majdanek [and Stutthof], in which, under the same conditions as the Birkenau delousing chambers (and as claimed for the homicidal gas chambers) a similarly massive blue discoloration can be seen.

Other delousing facilities, especially those of the Dachau type (DEGESCH circulation device), do not show this blue staining, since in wise foresight the unnecessary loss of HCN through absorption in the walls had been prevented by coating them with an impermeable paint.

This fact remains: Cyanide compounds of the type of Iron Blue can form as a result of HCN gassings, which then stain the walls with blue patches. It is also a fact that an irregular patchy discoloration can neither be explained as a result of a coat of blue paint nor can the high level of cyanide found deep in the wall and also in places where the wall appears not to be unstained be explained with such a wall paint.

It remains furthermore a fact that in view of these considerations the use of an analytic method that cannot detect these blue compounds reeks like (self-)deception.

On point 7: Patchy blue discoloration of the delousing facility's outer walls:

The three Polish authors have contributed nothing that would either support or contradict my well-founded thesis on the way, in which blue stains formed on the outer walls of the Birkenau delousing facility BW5a and 5b. They label it without reason as "scientific speculation." It would be much better to discuss my reasoning critically and to knock at the weak points. I have never spoken of "axioms" that one must accept with respect to my interpreta-

[23] G. Zimmermann (ed.), op. cit. (note 14), as well as personal communications of Konrad Fischer, Hochstadt upon Main.

tion. Also it should not be very difficult for the Polish scientists living in Krakow, almost around the corner from Auschwitz, to take samples from the outer walls of the delousing areas and to analyze them with respect to their total cyanide content (analyzed with the DIN standard!), which would answer many questions all at once.

On point 8: Joy over beginning of discussion and disagreeable expressions:

The three Polish scientists write in a way as if it has been revisionists that for the last 45 years have been silent about the arguments of the other side and have reviled them and ruined them by judicial and social harassment. The shoe is on the other foot. Yes, I am very glad that finally there is a discussion on the scientific level, although it requires a learning process on dealing with our mutual sensitivities.

Unfortunately the three Polish authors do not mention, which expressions in my article displeased them. This probably relates to the suspicion of scientific deception. If the three Polish authors are prepared to subject their old samples or newly taken samples to an analysis for *total* cyanide content following the DIN procedure and to present these results, I will gladly retract this suspicion. The explanations they have offered so far for the analytic method they chose are not satisfactory.

If we are to discuss disagreeable expressions I would like to raise a point that I was ready to let pass, but due to the reproaches of the Polish researchers should now be addressed:

In their article the three Polish authors impute to the revisionists the desire to white-wash the Hitler system. I have the following comments:

– Scientists should interest themselves for the scientific arguments of other scientists and not for their possible intentions. That applies even for the relationship between established science and revisionism.
– Regardless of whatever intentions whatever revisionist may have: The suggestion of presumed intentions does not weaken one single scientific argument of revisionists and therefore has no place in a scientific publication.
– Whatever the outcome of the controversy over revisionism may be, a scientist should interest himself only for the truth and not for the effect it may have on the political or moral assessment of Adolf Hitler or anybody else.
– Whoever imputes a political intention in the research of his scientific counterpart, which he then does not even bother to prove, suggests to the reader that this scientific counterpart wants merely to produce wished-for, predetermined results and should therefore not be taken seriously as a scientist. In this way we leave the area of scientific argumentation and enter the area of political agitation.
– The assertion that all revisionists want to white-wash the Hitler regime is wrong. Neither the founder of revisionism, Paul Rassinier, a former member of the French resistance who was imprisoned by the National Socialists in several concentration camps, nor Dr. Robert Faurisson, who was once in-

volved in the political left, nor Serge Thion, nor the American Jew David Cole, to mention only a few, want to white-wash the Hitler regime. The same applies to me.

– He who stays in a glass house should not throw stones.

3.3. Instytut Ekspertyz Sadowych im. Prof. dra Jana Sehna,

Fax to G. Rudolf, March 28, 1995, 12:45 hours

Honored Sir!

In summarizing the foregoing correspondence, we would like to state that we have been and are completely aware that in our researches on the structures of the former concentration camp Auschwitz-Birkenau the cyanide content was not completely determined. We especially excluded the disputed Prussian Blue (the chemical formulas of which are more complicated). However, the presence of cyanide compounds other than Prussian Blue, which we have found in structures where the use of Zyklon B has been claimed, shows clearly that these structures had been in contact with these compounds. That is the point of our work.

The work we have begun will be continued.

We found the expressions on the revisionists in publications that we cited (*Amoklauf*[24] J.C. Pressac[25]). They were necessary for the Polish reader because this topic is completely unknown among us. Without this information the purpose of our research would not be understood.

With friendly greetings

3.4. To Messrs. Markiewicz, Gubala and Łabędź

G. Rudolf, April 7, 1995

First, thank you very much for your brief answer of March 28 to my last letter. Let me comment on the points discussed:

You write that the expressions that you have taken from exterminationist publications on the revisionists were necessary to enable the Polish reader to understand the purpose of your work. According to this, the purpose of your

---

[25] J.-C. Pressac, *Auschwitz: Technique and Operation of the Gas Chambers*, Beate Klarsfeld Foundation, New York 1989 (http://holocaust-history.org/auschwitz/pressac/technique-and-operation/pressac0011.shtml); Pressac, *Les crématoires d'Auschwitz. La machinerie du meurtre de masse*, CNRS Editions, Paris 1993.

research is to combat the presumed tendency of revisionists to white-wash the Hitlerite system. You also want to prevent that the onus on the Hitler system might be mitigated by certain research results. This is, however, not a scientific intention, but solely a political one. I would like to remind you that you as a researcher should have an interest in finding the best-possible approximation to the truth and not in incriminating or exoneration some system which has disappeared long time ago. Although it has become a ritual in our time to proclaim the nastiness and evil of the Hitler regime over and over again and to damn up one side and down the other anything that would make it less so, that does not alter the fact that this is a seriously unscientific mode of operation. If science determines that the Hitler regime is not culpable in a particular point, one has to accept this even though one might not like it on political grounds.

I am particularly amazed that you would claim that the blanket political suspicions and vilifications to which the exterminationists expose revisionists are "information" necessary for the Polish reader. When you write a scientific article on any certain theme you should be capable of distinguishing between scientific arguments and political demagogy. The latter does not belong in a scientific piece.

If you really wish to enlighten the uninformed Polish reader on this topic, then it would have been better, for example, to discuss the following points for him, so that he could understand the background of the detection of cyanide in masonry:

1. Since the 1920's until the end of the World War II, Zyklon B has been the most often used insecticide against all kinds of pests (lice, bedbugs, corn beetles, wood worms etc.).
2. During World War II, Germany and her allies consumed many thousands of tons of Zyklon B in order to combat these pests in military as well as civilian facilities (pest control in barracks, food storage areas, ships, trains, prisoner-of-war camps, work camps, and concentration camps).
3. In the Auschwitz camp, devastating typhus epidemics occurred repeatedly. This disease is carried by the louse. To combat the louse, inmate barracks and all other habitable places in Auschwitz as well as all prisoner's belongings including their clothing were repeatedly deloused with Zyklon B.
4. Relative to its camp population, the Auschwitz camp, the only one in which it is claimed that there were mass killings with Zyklon B, did not receive noticeably more Zyklon B than other camps. The established research assumes therefore that even at Auschwitz 95% to 98% of all Zyklon B deliveries were used for harmless delousing purposes.
5. In Auschwitz the SS spent many million Reichsmarks (many [tens of] millions of DM/Euro by today's values) to erect up-to-date facilities for pest-control and prevention of epidemics – unfortunately not before 1943, so that the earlier devastating typhus epidemics claimed tens of thousands of victims.

This basic knowledge is absolutely necessary for the reader in order to understand the significance of Zyklon B. Today all we hear about this agent is that it was exclusively or principally used in Auschwitz to killing people. Naturally, viewed from this distorted angle the detection of small traces of cyanide in underground morgue 1 of crematorium II in Auschwitz-Birkenau, the alleged homicidal gas chamber – which I have found not to be reproducible –, is taken as evidence that people were killed there.

It is furthermore a fact that even the exterminationist premise of a 98% use of Zyklon B for pest control suggests a probability of exactly these 98% that the traces of cyanide we find today come from simple pest control operations – apart from any quantitative considerations that I will not repeat here. The use of Zyklon B in Auschwitz does not in itself signify killing of people, although you have portrayed it that way in your article.

If you would like to enlighten the Polish reader, I would like to ask you to explain this one thing: How could the Zyklon B have gotten into the underground morgue 1 of crematorium III in Auschwitz-Birkenau, the alleged homicidal gas chamber? The witnesses describe three or four insertion holes in the roof of that cellar. It should have been obvious to you from your researches in the ruins of this cellar that those holes are simply not there. This cellar was allegedly the most intensively operated homicidal gas chamber of the Third Reich, and it is basically still intact. On this point one must concede to Prof. Faurisson when he says, "No holes, no 'Holocaust!'"

4. Final Remarks

Many people, both experts and laymen, rely naively upon the findings of the Jan Sehn Institute for Forensic Research in Krakow, *i.e.*, the study published in 1994 by Prof. Markiewicz and colleagues. These Polish scientists, however, tested their samples with analytical methods that were unable to detect long-term stable iron cyanide compounds. They did this because they could not imagine how such stable iron cyanide compounds could form. It is, of course, no shame to fail to understand something initially. Anyone, however, who makes a claim of working scientifically must, before making statements upon the subject, at least attempt to investigate and understand. But not so the Polish scientists. They assert their lack of understanding as a justification for their failure to act. Has anyone ever heard that failure to understand a phenomenon was any reason for scientists *not* to study it? To the Polish scientists, this was obviously the case. It would only be permissible to exclude Iron Blue from the study if it were possible to *exclude,* with practical certainty, that the effects of hydrogen cyanide on masonry could result in the formation of iron cyanide, and, consequently, Iron Blue, and if there were at least some indication that these rooms had been painted with Iron Blue. The Polish scien-

tists completely neglected to do this. And even worse: they did not even attempt to refute my arguments on the formation of stable iron cyanide compounds which I published in early 1993.[26] They were familiar with this publication, because they quoted it, but not in order to discuss my arguments, but simply to condemn it flatly as an example of the allegedly diabolical deeds of the "deniers" and the "whitewashers" of Hitler, who Prof. Markiewicz and his colleagues intended to refute – so their own words. This should suffice to show that the actions of these Poles were ideologically motivated to a high degree. If they had been neutral scientists, they would have applied the correct and interpretable method of analysis and would have discussed my publications in a scholarly manner instead of worrying about Hitler's dirty laundry.

Prof. Markiewicz and his colleagues did not even attempt to find any explanation for the high iron cyanide concentration in the walls of the disinfestation chambers and their blotchy-blue surfaces.

Although they had sought out an analytical method able to produce the results desired by them, the results of their first series of tests were obviously so disturbing that they decided to suppress them and never published them. These data only became public knowledge through an act of indiscretion in 1991.

The Polish scientists therefore rejected the undesired results of their first series of tests and took more samples, until they finally produced the results that fitted in with their preconception: this time, both the samples from the disinfestation chamber and the alleged gas chambers showed cyanide residues on the same order of magnitude.

Let me quote Prof. A.R. Butz, who made an appropriate metaphor to emphasize the degree of intellectual dishonesty revealed by Markiewicz and his colleagues:[27]

> *"The argument* [of Markiewicz *et al.* for excluding Iron Blue from their analyses]*, to the extent that it was intelligible enough to be summarized at all, was that they did not understand how the iron-cyanide compounds got to be there, so they decided to ignore them in reaching their conclusions. I don't understand how the moon got there, so I will ignore all effects associated with it, such as tides. I hope I don't drown."*

But even Prof. Markiewicz and his colleagues, during the test fumigations performed by them, at least confirmed that moist cement mortar (as was used in the morgues of crematoria II and III) absorbs at least ten times more hydrogen cyanide than dry lime mortar (as used in the disinfestation chambers), as I had assumed for my calculations in my own expert report.

Not even a direct confrontation with my arguments and the open expression of suspected fraud could move Prof. Markiewicz and his colleagues to

[26] E. Gauss, op. cit. (note 13), pp. 163-170; 290-294.

[27] Arthur R. Butz, "Historical Past vs. Political Present," *Journal of Historical Review* , 19(6) (2000), pp. 12ff. (online: www.ihr.org/jhr/v19/v19n6p12_Butz.html).

justify or correct their unscientific behavior. The director of this group, Dr. Jan Markiewicz, who was not a chemist, but rather, a "Technical Testing Specialist," died in 1997. Both the other authors have remained silent.

One can after all understand that these Polish authors, who made their careers in Communist Poland and, as Polish patriots, can under no circumstances permit the undermining of "Auschwitz" as a moral justification for the Polish ethnic cleansing of East Prussia, East Pomerania, and Silesia after the end of World War II and the greatest land robbery of modern history, as a result of which some three million Germans lost their lives. Many Poles might fear in their hearts that the post-war state of Poland stands and falls with Auschwitz. This may explain Prof. Markiewicz's and his colleagues' scientific contortions, but it fails to be a justification. Even the possible circumstance that the responsible scientist assigned to the topic was not a chemists and that his laboratory was perhaps not equipped up to Western standards, cannot explain this, since an analysis of the total cyanide content is not expensive in terms of laboratory equipment and the chemistry involved is anything but complicated.

The manner with which the Polish scientists approached the problem, however, gives rise to serious suspicion that this was an attempt at scientific fraud, a suspicion which is also supported by the fact that they were unable to justify their incorrect methods of analysis except through their incompetence and intentional ignorance.

The conclusion to be drawn from the above is clear: the only "scientific" attempt to refute Fred A. Leuchter's sensational argument proves, upon closer examination, to be one of the greatest scientific falsifications of the 20th century.

How desperate must one really be, if it is believed necessary to stoop to such methods in an attempt to defend the established version of the Holocaust, *i.e.*, the alleged systematic extermination of Jews in homicidal gas chambers?

Green sees Red

By Germar Rudolf

Another strange story is that of Richard Green, a PhD Chemist with a similar educational background as I have. The layman would expect two experts with similar educational background to come to similar conclusions in questions relating to their expert knowledge. But this is only partly the case. The reason for this may be Green's political prejudices, which I will highlight in the following.

1. Political Polemics

In spring of 1998 American Chemist Dr. Richard J. Green published papers on the Internet,[1] which criticized the *Leuchter Report*[2] and my own expert report on the gas chambers of Auschwitz.[3] These articles are characterized as follows:

1. Green repeats arguments of Deborah Lipstadt,[4] for example the stupid, unscientific claim that there should be no debate with "Holocaust deniers."
2. He argues that Leuchter didn't have the formal qualifications he claimed to have, which is not true[5] and is also irrelevant for the matters at issue.

---

1 Richard J. Green, "The Chemistry of Auschwitz," May 10, 1998, online: holocaust-history.org/auschwitz/chemistry/, and "Leuchter, Rudolf and the Iron Blues," Feb. 25, 1998, online: holocaust-history.org/auschwitz/chemistry/blue/. Because the second article is rather superficial, I focus my attention on the first.

2 Fred A. Leuchter, *An Engineering Report on the alleged Execution Gas Chambers at Auschwitz, Birkenau and Majdanek, Poland*, Samisdat Publishers, Toronto 1988 (www.zundelsite.org/english/leuchter/report1/leuchter.toc.html).

3 Rüdiger Kammerer, Armin Solms (eds.), *Das Rudolf Gutachten*, Comwell Press, London 1993 (www.vho.org/D/rga1); revised: Germar Rudolf, *Das Rudolf Gutachten*, 2nd ed., Castle Hill Publishers, Hastings 2001 (www.vho.org/D/rga2); Engl.: Germar Rudolf, *The Rudolf Report*, Theses & Dissertations Press, Chicago 2003 (www.vho.org/GB/Books/trr).

4 Deborah E. Lipstadt, *Denying the Holocaust: The Growing Assault on Truth and Memory*, Free Press, New York 1993.

5 Engineering Board of Massachusetts had accused Leuchter to have used the title "engineer" unjustly. The court dealing with the case refused to admit the case and forced the two parties to come to a settlement, in which Leuchter agreed "to do none of the things that he never did in the first place and not to recant or change anything he ever did or said, in return for the board's dropping of the complaint," cf. Leuchter's letter dated April 5, 1999 (www.vho.org/GB/c/DI/Shallit.html); see also Fred A. Leuchter, "Witch Hunt in Boston," *Journal of Historical Review* 10(4) (1990), pp. 453-460 (www.vho.org/GB/Journals/JHR/10/4/Leuchter453-460.html); Mark Weber, "Probing Look

3. He cannot understand why I have been using several pen names, even though he admits that I am unacceptably persecuted because of my views.
4. Green imputes that the freedom of expression as granted by the First Amendment of the United States would be lost if "people like Rudolf and his hero Remer ever to come to power here." I cannot speak for General Remer, who died in October 1997, but regarding my person this is not only wrong, it is a libel. And furthermore: General Remer is not my hero. He was a defendant who had a right for unrestricted defense as every defendant. I was merely called to testify in his court case as an expert witness. By describing Remer as my hero, Green obviously intends to link me to Remer's political convictions.
5. Finally, Green labels my arguments "deceptions:"

   "Owing to the fact that he [Rudolf] *actually has some understanding of chemistry many of his deceptions are more sophisticated than other Holocaust deniers. Nonchemists should be somewhat careful in addressing his arguments. Ultimately, he engages in the same deceptions and specious arguments as Leuchter and Lüftl, but the case he makes for those deceptions and arguments involves more difficult chemistry."*

   But even if I made mistakes – nobody is perfect – that does not mean that I intended to deceive anybody. This insinuation of bad intentions, unfortunately to be found on either sides of this debate, has as a prerequisite the strong believe of the insinuator that he holds the one and absolute truth, and on the other side has as a consequence that the opposite side is being restricted in their rights, namely by not being granted of having scientific valid arguments, by denying them to participate in discussions and debates. As a final step their human rights of freedom of expression and freedom of science are restricted, as we can see in many European countries already today. And indeed, Green strongly insists that his views of historical events are "historical fact," that what the Revisionists are doing is "pseudoscience" or "pseudoscientific," spreading "distasteful and false propaganda." Even if it "ought to be permitted to spread untruth, [this] does not make untruth into truth." He imputes that we are happy to "spread a bit of confusion to obfuscate the truth"; that we are telling a "lie" which he intends to "expose" as such.

At the end of his polemic attacks, Green himself summarizes the point I just made, thus giving us a perfect example for a logic that ostracizes dissenters:

"I am not embarrassed to call Holocaust-denial hate speech. That is what it is. People who are smart enough to obfuscate using pseudoscientific arguments are also smart enough to know what they are doing: propa-

at 'Capital Punishment Industry' Affirms Expertise of Auschwitz Investigator Leuchter," *Journal of Historical Review* 17(2) (1998), pp. 34ff.; cf. also Stephen Trombley, *The Execution Protocol*, Crown Publishers, New York 1992.

gating a lie. Although some people may be attracted to Holocaust denial because of gullibility and/or mental illness, these people are not the same people who write these clever but mendacious pseudoscientific reports. The people who write these reports are motivated by a desire to rehabilitate Nazism, an ideology of hate. Hate-speech is what it is, and in calling it that I am merely exercising my right of free speech."

Here we have it: Hate speech. Imputing that I want to rehabilitate the incarnation of evil on earth – and that is what National Socialism is in the eyes of the vast majority of all people – and that I am using evil techniques for this purpose, and that all those who believe I am right must be either mentally ill or feeble-minded. In the long run, that sort of arguing drives us directly into mental asylums, prisons, or onto pyres, a situation which unfortunately is no longer unlikely in Germany today.[6] Green's statements are real hate speech, and unfortunately it is politically correct and thus supported by nearly everybody. And by the way: Even if it were true that some of us would like to rehabilitate National Socialism – I trust that this is only a minority –, this is not an argument against the validity of our arguments.

Reacting to this, Green stated with malicious dialectics:[7]

"And what exactly is 'real hate speech?' It seems it is hate speech to label someone's speech 'hate speech.' If that is the case, he [Rudolf] *engages in hate speech by his own definition. If labeling speech 'hate speech' is the equivalent of censorship, then Rudolf is a censor."*

This is pure nonsense, because first of all I have never supported and would never support any kind of censorship, even if it is "hate speech." Second, I did not call Dr. Green's speech "hate speech" because he was labeling my speech "hate speech," but because he is claiming that we revisionists are morally inferior, because we are allegedly using all sorts of evil techniques in order to rehabilitate what he in his first article called the ideology of hate. Green did not prove that I or other revisionists intend to rehabilitate the reign of hate, and he could not succeed in proving it. He is just claiming it, and by doing so, he exposes us to the utmost hate of the world. Hence he is inciting the hatred of the world against us. That is what I call a hate speech: A speech with unfounded and wrong claims that results in the world hating something or somebody. If somebody would say something like the following without presenting supportive evidence:

"All Jews are lying and obfuscating the truth in order to establish the worldwide reign of hatred."

---

6 Cf. in this regard G. Rudolf, "Discovering Absurdistan," *The Revisionist* 1(2) (2003), p. 203-219.

7 www.holocaust-history.org/auschwitz/chemistry/not-the-science/. This article was co-authored by Jamie McCarthy. Because it cannot be recognized, which statement was made by which author, I subsequently only address Dr. Green.

I assume that Dr. Green would agree with me that this is hate speech. But if one writes without prove:

> *"All revisionists are lying and obfuscating the truth in order to establish the worldwide reign of hatred."*

– then this is supposed to be appropriate?

On the other hand, Richard Green's ways of arguing are evidence that he has a strong political motivation himself, which may twist the way he perceives reality: apparently he is an extreme opponent of *any* historical rehabilitation of National Socialism. But that sort of motivation must not influence our scientific arguing, since it is purely political in nature. The results of our scientific research must not depend on the effects they might have on the cleanliness of the moral or criminal record of any historical person or political ideology. It is highly unscientific to let one's research results be guided by the potential political impact it can have.

A follow-up paper by Green indicates that he has not understood the fundamental prerequisites of the scientific method and a civilized dispute. He states that there "cannot be a real debate between those who seek to understand history and those who seek to obfuscate it" and "that accurate information must be presented so that the gullible will not be taken in by those who wish to whitewash the Nazi regime."

Large parts of Green's second paper consist of personal attacks against me, to which I responded appropriately.[8] Because I do not want to waste paper for this Greenish mud slinging, the interested reader shall be referred to my paper as it is posted on the Internet. I merely want to stress two points:

Green considers it to be honorable and politically necessary to remember the victims of the Jewish Holocaust. Similarly, I consider it just as honorable and politically necessary to remember the victims of the Holocaust committed against Germans during the ethnic cleansing of eastern Germany after World War II. As a son of a father who had been expelled from his home in Silesia after the war, I was temporarily involved in associations and political parties close to the interests of German expellees. For Green this is proof that I am a political right-winger. He therefore concludes:

> *"Rudolf's credentials as a non-dogmatic and objective seeker of truth must be called into question."*

Green's view seems to be that commemorating massacres against Jews is good, commemorating massacres against Germans, however, is bad. This proves that Green is nothing but an ordinary anti-German racist.

Everyone has his own political views. But the reputation of a scientist does not depend on his political views, but on the formal and scientific quality of his work. Part of this quality is that he does *not* suspect his scientific opponents politically. After all, I do not write that Green is a Jew and associates

[8] www.vho.org/GB/c/GR/CharacterAssassins.html.

with left-wing extremists,[9] which is why he should be rejected as biased and his arguments should be ignored.

How characterless Green is indeed, is demonstrated by his attacks against me for associating with individuals, who are – in most cases unjustly – labeled with all sorts of political swear words in the media. Most of these individuals attacked by Green have assisted me with my works or offered help, protection, and shelter at times, when I had to flee my home country because of the ever growing tide of persecution against me. Whatever the views of these individuals may be, I would be a scoundrel if I would turn away from them or even against them just because they are reviled by media and politicians. After all, it is not political views that determine the quality of humans, but virtues like: wisdom, justice, courage, modesty, altruism, loyalty, and honesty. My refusal to distance myself from acquaintances and friends I gained in times of despair provoked the following response by Greens:[10]

"Rudolf is not willing to call Nazis evil."

This was the bottom of the pit of malice. But no matter how many of the persons, with which I associate, are actually National Socialists, Green has apparently not understood the western system of justice: A person is evil in a legal sense only if found guilty for a crime, and then only in the context of this crime. Not all National Socialists and those supporting them – the vast majority of all Germans between 1933 and 1945 – have committed crimes nor were they in average any more evil than other humans anywhere else. Not even Green can claim that, or does he? Thus, a sweeping argument of "Nazis are evil" exposes his tendency to jump to prejudiced conclusions and to call for collective responsibility and punishment. I do indeed refuse to make any such sweeping statements, be it "Nazis are evil," "Communists are evil," "Jews are evil," "Witches are evil," or what have you. It is Green's problem when he thinks I have to make such a statement in order to protect my integrity. But if he insists on it, he then cannot argue morally against people saying "Jews are evil," because those people, too, can come up with arguments to support such a thesis. While certain aspects of Nation Socialism – ideologically and historically – might justly be described as evil – as is the fact for Communism, Christianity, Islam, Judaism, and many other ideologies – this does not justify any sweeping statement.

---

[9] In the first edition of this book I wrote in this footnote: "This is an unproven hypothesis, which I use as an example only in order to illustrate the way Green behaves toward me. Although both are possible, it does not contribute anything to the factual controversy, so that I will not waste my time to do research on this." Well, it turns out that Green is actually a Jew; see his polemic exchange with A.S. Marques, www.codoh.com/newrevoices/nrmarques/nrmgreen.html, where he stated in the mid 1990s: "Liar, I am a Jew and I receive no reparations."

[10] www.holocaust-history.org/auschwitz/chemistry/not-the-science/postscript.shtml

Nota bene: In a response to my self-defence against his vicious *ad hominem* attacks, Green lambastes me for that as well.[11] So, whereas he has a right to attack me personally, I don't have a right to defend myself?

2. "No Holes, no 'Holocaust'"

In his first article, Green spends a few paragraphs on discussing Faurisson's famous quip "No Holes, no 'Holocaust.'" Faurisson's thesis is that there are no holes in the roof of the underground morgue 1 of crematorium II in Birkenau, through which Zyklon B could have been thrown into this basement as claimed by various witnesses. But if these holes do not exist, there was no way to commit the claimed gassings, so that the entire basis collapses on which the Holocaust story rests: witness testimonies.[12]

Green's evidence for the existence of holes in that roof are based on arguments in an article by Michael Shermer Artikel printed in his magazine *Skeptic*, which was reprinted in his book in a slightly revised versions in 1997.[13] I have refuted each and every single one of these alleged evidence in my expert report as early as 1993.[14] Green does not mention this with a single word.[15]

3. Between Chemistry and Alchemy

Although Dr. Green's elaborations are more competent when he turns to chemistry, they are still not characterized by the kind of careful considerations the topic deserves. This topic is about the question of the formation and detectability of Iron Blue, the famous iron cyanide compound of blue color, which *can* develop in masonry upon exposure to hydrogen cyanide, the active ingredient of "Zyklon B." When discussing this topic, I initially wish to correct a few wrong concepts, which stubbornly persist not only, but especially among revisionists.

There are three conceivable explanations for the difference in cyanide content of samples taken, on the one hand, from walls of Zyklon B delousing chambers, that is to say, hydrogen cyanide delousing chambers, which have

---

[15] See C. Mattogno's contribution "The Elusive Holes of Death" to the present book, starting at p. 279.

been preserved to this very day in Auschwitz, Birkenau, Stutthof, and Majdanek (very high content of cyanide), and those taken from walls of the alleged homicidal gas chambers in Auschwitz and Birkenau on the other hand (insignificant cyanide content or none at all). Green lists all three possible explanations:

1. "*The presence of Prussian-Blue* [= Iron Blue] *staining is a necessary consequence of exposure to HCN and the fact that it is not present in the homicidal chambers proves they were not used for homicidal gassing.*" (emphasis added)

   This is the way Leuchter argued,[2] and I agree with Green that this is an unfounded assumption.

2. "*The Prussian-Blue staining is present for reasons having nothing to do with the exposure to HCN. For example the Austrian chemist Dr. Josef Bailer has suggested it may be a pigment from paint.*"

   Even in this point I agree with Green who more or less dismisses Bailer's unfounded theory.[16]

3. "*The Prussian-Blue staining indeed owes its presence to exposure to HCN, but the conditions under which it formed were not universally present in all facilities exposed to HCN. The rate of Prussian-Blue formation may be very different under the conditions used in homicidal chamber versus the conditions in delousing chambers.*"

   And again, I agree with Green that this is the correct approach to this problem. But I strongly disagree when Green continues:

   "Answer number one is, of course, untenable. We know that homicidal gassings occurred from historical evidence independently of the chemistry involved."

First of all, you cannot refute chemical or other findings of the exact sciences with eyewitness accounts, and there is no other evidence apart from eyewitness accounts, the only other existing "evidence," as far as I know. Green does not even try to give us a clue what "other historical evidence" he is referring to.

Secondly, and most interestingly, this sentence clearly shows that Green will never accept any proof of the exact sciences, which refutes what he believes to be true. It shows that it is impossible to change Green's opinion about this matter, i.e. his opinion is not a scientific one, but a dogmatic one.

Green is the first exterminationist author who accepts my suggestions of how Iron Blue can be formed from hydrogen cyanide and iron oxides, the latter being a common component of all sorts of mortar, plaster, and concrete.[17]

---

[16] First time: Josef Bailer, "Der Leuchter-Bericht aus der Sicht eines Chemikers," in: *Amoklauf gegen die Wirklichkeit*, Dokumentationszentrum des österreichischen Widerstandes, Bundesministerium für Unterricht und Kultur (eds.), Vienna 1991, pp. 47-52; see my remarks in the introduction to the present book, pp. 16f.

[17] Regarding the mechanism cf. *The Rudolf Report*, op. cit. (note 1), pp. 159-170, 180-189.

Green even adds some more explanations, which are, however, not worth a discussion in this context. Green criticized my thesis about the chemical mechanism involved, but finally, after some forth and back, forces himself to admit,

> *"that Rudolf is correct or nearly correct regarding the formation of blue staining in the delousing chambers."*

Of course he has restrict this concession to the delousing chambers, because if he would admit that I am correct all the way, his dogma about the homicidal gas chambers would collapse, and that is something he can impossibly permit to happen. In the following I want to discuss Green's objections.

Green's biggest disadvantage is that he cannot read German. Thus, he has no knowledge of the findings made during the last years. However, since the second half of 2003, this can no longer be an excuse, because by that time the most important of these publications had appeared in English as well.[18]

3.1. Chemical Conditions

In his first article, Green starts a discussion of the factors influencing the formation process of Iron Blue, like:

1. Water content of the wall (the wetter, the better)
2. reactivity of the iron oxides in the wall (mortar is good, brick bad)
3. temperature of the wall (cool better than warm)
4. pH value (acidity) of the wall (basic better than neutral)
5. HCN concentration the walls were exposed to (the higher the better)
6. time of exposure (the longer the better)
7. other influences, e.g. were the walls rinsed, cleaned, chemically treated, covered by paint, tiles…

Green quits the discussion, however, before getting into details, because he assumes:

> *"that the kinetics are too difficult to model without resort to experiment."*

Again I do agree with him to a certain degree: An exact answer to the question: "Could long term stable Iron Blue compounds be formed by human gassings, and if so: which amount would be formed?" would indeed require large-scale experiments, for which I do not have the necessary means. At any rate, the widespread assumption that one or several gassings with Zyklon B *automatically* and under *any* circumstances lead to traceable cyanide residues is incorrect.

---

[18] Cf. *The Rudolf Report*, op. cit. (note 3); G. Rudolf (ed.), *Dissecting the Holocaust*, 2nd ed., Theses & Dissertations Press, Chicago 2003 (www.vho.org/GB/Books/dth); C. Mattogno, J. Graf, *Concentration Camp Majdanek*, Theses & Dissertations Press, Chicago 2003 (www.vho.org/GB/Books/ccm); C. Mattogno, J. Graf, *Concentration Camp Stutthof*, Theses & Dissertations Press, Chicago 2003 (www.vho.org/GB/Books/ccs).

However, regarding the points 5 and 6 listed above, well-founded assumptions can be made, as I will show further down below. For factors 1 to 4 and 7 listed above one can come to very reliable conclusions both for the delousing chambers as well as for the underground morgues in Auschwitz allegedly misused as homicidal gas chambers by using the know consistency of the building material used and data given in expert literature, which, after all, was one of the main topics of my expert report. Interestingly enough, Green never even attempted to answer the questions he raises by using expert literature, as I had done, although I asked him to do this several times.

As an example for Green's arrogant ignorance I want to address the question of the pH value of masonry. I agree with him that an alkaline environment is a basic requirement, so that hydrogen cyanide dissolved in water, which is always present in the micropores of the masonry, is converted into soluble cyanide salts. This is the first step toward the later conversion into the long-term stable Iron Blue pigment. In this regard, Green has drawn graphs similar to mine.[19] He then hypothesizes that masonry is actually pH-neutral or even slightly acidic, so that no accumulation of cyanides can be expected. One does not find any references to literature in his paper, which backs up his hypothesis. I then pointed out to him, with reference to expert literature on construction material, that his hypothesis is wrong. The fact is that newly erected masonry based on mortar, cement, or concrete is always alkaline. This is particularly true for the material used to build the morgues under discussion, which remained alkaline for months, if not years. To this, Green simply stated:

> *"The IFRC* [Institute for Forensic Research, Cracow = Jan Sehn Institute]*, on the other hand measured* [in 1993] *the pH* [of mortar samples from the alleged homicidal gas chambers] *to be between 6 and 7* [that is neutral or slightly acid]*."*

Instead of consulting expert literature, Dr. Green asked for advice from the researchers of the Jan Sehn Institute. The problem with the value determined by the Jan Sehn Institute is, however, that it was measured 50 years after said walls were built. If Dr. Green had only the slightest idea about the chemistry of masonry material, he would know that mortars and concrete do of course not stay alkaline eternally. If he would have read or understood my expert report thoroughly, he would have noticed that I even quoted a PhD thesis to this effect. This thesis determined in the 1960s the speed, with which the front of carbonatization (= front of neutralization) progresses into samples of mortar and concrete.[20]

---

[19] Cf. my expert report, Engl. edition, op. cit. (note 3), pp. 165, 168f., which were already included in the first German edition, op. cit. (note 3), pp. 42, 44.

[20] N.V. Waubke, *Transportphänomene in Betonporen*, Dissertation, Braunschweig 1966; cf. 1st German ed., R. Kammerer, A. Solms (ed.), op. cit. (note 3), chapter 2.5.2., pp. 50f.; Engl. ed., op. cit. (note 3), pp. 181f.

Not even a PhD chemist has to know all of this, because the chemistry of masonry material is a special area, which is not usually part of the curriculum of a chemistry department at any university. I had to teach myself about that topic with the help of expert literature before I could understand it. It therefore does not come as a surprise that Dr. Green has no knowledge about these issues. But it indicates a great deal of intellectual dishonesty that he simply ignores my repeated references to his mistakes and to the appropriate expert literature[21] and instead refers to analytical results, which are utterly irrelevant already because they were gained from samples taken 50 years after the walls under discussion were built.

In order to make the reader see how flawed Dr. Green's way of arguing is, let me say it in a parable:

By referring to a couple of Italian expert pizza baking instructions, I showed that a pizza, when taken out of the oven, is hot or warm for quite a while (one hour). Now, Dr. Green comes along claiming that I am wrong because a science friend of his has just now measured the temperature of a pizza which was baked a week ago, and which has been lying around somewhere since. And this scientist found out that this pizza is indeed cold right now. Surprise, surprise!

That I have to deal with that kind of alleged "refutation" of my arguments clearly shows, onto which level Dr. Green must have declined to keep the illusion that his claims are somehow cogent.

3.2. Concentrations of Poison Gas

Initially Dr. Green assumed a wrong evaporation speed of the hydrogen cyanide from the carrier material of Zyklon B. After I made him aware of the evidence proving him wrong,[22] he corrected this and even conceded that the execution times claimed by basically all witnesses are said to have been very short. Yet Green refused to admit the unavoidable consequence of this: that very short execution times require high concentrations of poison gas. He simply assumes that amounts of Zyklon B were used as testified to by a few witnesses, which is comparable to the amount used in delousing chambers. Due to the slow evaporation of hydrogen cyanide, however, the actual concentration obtained during the first decisive minutes of the alleged homicidal gassing would have been only a few percent of what eventually developed in

delousing chambers after several hours. Green ignored that this would not have led to the fast execution as testified to by the witnesses. Green also ignores the only reliable data available in this regard: executions in U.S. gas chambers for capital punishment.[23]

3.3. Ventilation

In order to minimize the time, during which hydrogen cyanide would have been in contact with the basement walls of the alleged homicidal gas chambers, Green claims contrary to the facts that the ventilation systems installed in these morgues of crematoria II & III were capable of cleaning these rooms from poison gas within 20 to 30 minutes to such a degree that this would have allowed heavy labor in the morgues without wearing gas masks and protective suits.[24] He obtains his unrealistic short ventilation times by:

a) Assuming a low amount of poison gas applied, contrary to witness statements about very short execution times.

b) Exaggerating the capacity of the ventilation system.

c) Not taking into consideration several toxicological facts, like for example that the incorporation of lethal amounts of a poison is not identical with the occurence of death. In most cases, death actually occurs much later. In the case under discussion, a swift death can be obtained only with large overdoses of the poison. Green also neglects the fact that the successful murder of all victims (lethal dose 100%, LD_{100}) requires much more poison than the threshold value given in toxicological literature, which is meant to be a lower risk level in order to safe lives (lethal dose 1%, LD_1).

d) Ignoring that there were no holes in the roof of these underground morgues, into which some obscure "Zyklon B introduction devices" could have been installed as claimed by witness Michał Kula.[25] These devices are claimed to have allowed the removal of the Zyklon B from the alleged gas chamber after the execution was over. After all, if the Zyklon B would not have been removed, it would have kept releasing its poison gas into the chamber, thus preventing a speedy, successful ventilation of the chamber.

After I had pointed out to Dr. Green with the help of documents that his data given for the capacity of the ventilation system is wrong,[26] he merely replied:

---

[24] Cf. in this regard my expert report, Engl. ed., op. cit. (note 3), pp. 223-227.

[25] Cf. about this C. Mattogno's article "The Elusive Holes of Death" in this volume.

[26] The wrong capacity given by Green falsch is based on a false and unfounded by J.-C. Pressac, together with Robert van Pelt, in: Israel Gutman, Michael Berenbaum (eds.), *Anatomy of the Auschwitz Death Camp*, Indiana University Press, Bloomington 1994, pp. 210, 232; cf. the Moscow documents RGVA 502-1-312, p. 69 and 502-1-312, pp. 65-68. The real ca-

"Regarding the performance of the ventilation system, it simply does not matter."

It is that easy: If I successfully proved him wrong, he simply ignores it and continues as if nothing has happened.

3.4. Rigoros Ignorance

Equipped with such a lack of knowledge and an ignorance that can hardly be surpassed, Dr. Green meant that three conditions must be met before he could accept my thesis:

"Until Rudolf and Leuchter can demonstrate rigorously [a] *that the pigments found on the delousing chamber are indeed the result of exposure to HCN, and* [b] *that the kinetics involved with the formation of such pigments dictate that significant quantities should be formed in all of the homicidal gas chambers, and* [c] *that these pigments could not possibly have degraded over time, their 'forensic reports' remain unsupported speculation."*

In the subsequent discussion, Green acknowledged that I succeeded to rigorously prove the conditions here marked with a) and c), so that he gave in this regard.[27]

Green's condition here marked with b) is nonsense, because what does "all of the homicidal gas chambers" mean, if the properties of "all of the homicidal gas chambers" cannot be determined due to a lack of definition? And what exactly does "dictate" mean, if we cannot possibly know the exact conditions of the claimed homicidal gassings, because the witnesses contradict each other and also contradict both material facts and technical possibilities? Nothing rigorous can be built upon such a flimsy base.

My approach was therefore different, namely a comparison of the presumed conditions during the alleged homicidal gassings with those that prevailed in the delousing chambers, where the formation of Iron Blue was indubitably the result of gassings with Zyklon B. The differences between both cases were then assessed using known factors that influence the formation of Iron Blue.

The fact of the matter is that the conditions for the formation of Iron Blue were much more favorable in case of the alleged homicidal gas chambers of

pacity is given in invoices by the firm that delivered and installed the ventilation systems: Invoice no. 729, May 27, 1943. Archive of the State Museum of Auschwitz, D-Z/Bau, Nr. inw. 1967, pp. 246f.; ibid., pp. 231f.: Invoice no. 171, Feb. 22, 1943 for crematory II. RGVA 502-1-327, pp. 25 + 25R; 502-1-327, pp. 16 +16R. Reproduced and discussed in Carlo Mattogno, "Auschwitz: The End of a Legend," in: G. Rudolf (de.), *Auschwitz: Plain Facts*, Theses & Dissertations Press, Chicago, IL, 2005, pp. 153-155. (www.vho.org/GB/Books/apf).

[27] With reference to the arguments listed in my expert report, Engl. ed., op. cit. (note 3), pp. 20-22, 151-155, 170-180.

the crematoria II and III in Birkenau than in the case of the delousing chambers located in the buildings BW5a and BW5b in the same camp:

– the alleged homicidal gas chambers were located underground;
– they were unheated and thus cool and moist;
– they possessed a cement plaster, which has an extremely high inner surface liable to intensely absorb any kind of substances
– their cement plaster also remained alkaline for an extended period of time;
– their walls were not coated with any kind of paint or coating;
– and they are said to have been put into operation right after it was finished.

In August 1976, the Protestant church at D-96484 Meeder-Wiesenfeld was fumigated with Zyklon B. Subsequently, blue-colored stains appeared all over the plaster.

In contrast to that are the delousing chambers:

– located above ground;
– heated, which means that their walls were relatively dry (in particular the internal wall separating the delousing chamber from the rest of the building);
– mortar and plaster consisted of lime mortar with a relatively low inner surface (=low tendency to absorb substances);
– their plaster and mortar also set rather quickly, that is, it quickly lost its alkalinity.

I therefore cannot see any reason why the formation of iron cyanides should be less likely to occur in the morgues under consideration than in the delousing chambers. But that is, of course, not automatically so for any room exposed to hydrogen cyanide, or for "all of the homicidal gas chambers," to use Green's words.

Already in 1994 I reported about a case where the newly applied plaster of the protestant church of Meeder-Wiesenfeld in Bavaria, Germany, developed massive blue staining several months after it had been gassed with Zyklon B.[28] A short while later I managed to gain access to the files of the construction company responsible for this case. From this it can be concluded that the conditions of this church were very similar to those that would have prevailed in

[28] In Ernst Gauss (ed.), *Grundlagen zur Zeitgeschichte*, Grabert, Tübingen 1994, pp. 401-404, based on an article discovered by Walter Lüftl: Günter Zimmermann (ed.), *Bauschäden Sammlung*, vol. 4, Forum-Verlag, Stuttgart 1981, pp. 120f.; Engl.: in G. Rudolf (ed.), op. cit. (note 18), pp. 557-561.

the alleged homicidal underground gas chambers in Auschwitz: cool, unheated, and moist walls freshly plastered with an alkaline cement plaster.

To this add the fact that without a single exception *all* Zyklon B delousing chambers of the Third Reich era still in existence today, whose walls were not covered with a gastight coating – two in the Majdanek and one in the Stutthof camp[29] – exhibit the very same patchy blue discolorations and the very same analytical results as the delousing chambers in Auschwitz and Birkenau as well as those of the church in Bavaria mentioned above. How then could Dr. Green initially claim that it is not certain that the massive Iron Blue residues in these delousing chambers are the result of exposure to hydrogen cyanide, that is, gassings with Zyklon B? And who could not be impressed by the similarity of the conditions of the Bavarian church and the alleged homicidal underground morgues in Birkenau? This striking similarity almost forces the conclusion that we ought to expect similar chemical reactions, too.

After I pointed out this case of a Bavarian church to Dr. Green, he simply played the infamous three monkeys, claiming that he would return to it later, but he never did that as far as I know. All he tried was an evasive maneuver by claiming that this one case of a Bavarian church was an exception, therefore it proves that blue discolorations do normally *not* occur. What Dr. Green misses, though, is the fact that the conditions of mass gassings in delousing chambers and alleged homicidal gas chambers during the Third Reich era were not "normal" in terms of being comparable to the usual application of Zyklon B. Zyklon B was and is usually used only in single occasions in buildings that have been severely infested with vermin. Such an infestation does not usually occur in newly erected – or renovated – buildings. After all, a severe infestation usually occurs only after a building has been in use for years or decades. The mortar and plaster of such buildings, however, would have been much less inclined to react with hydrogen cyanide than buildings especially – or allegedly – built for no other purpose than to be repeatedly or even continuously exposed to this gas right after they had been erected: the delousing chambers and alleged homicidal gas chambers of the Third Reich. As indicated above, all of these delousing chambers developed such blue staining.

As also indicated above, my reasoning does of course not offer absolute certainty, because too many factors are uncertain due to unreliable and untrustworthy witness statements. But considering the known factors in connection with what would have been technically possible, I think it is reasonable to conclude that the claimed homicidal gassings are incongruent with the material evidence. This conclusion is not only based on chemical arguments, but in particular also on technical and architectural facts. I therefore also conclude that chemistry is not the science, which can prove or refute any allegations

[29] See the illustrations in C. Mattogno, J. Graf, *Concentration Camp Majdanek*, op. cit. (note 18); C. Mattogno, J. Graf, *Concentration Camp Stutthof*, op. cit. (note 18).

about the Holocaust "rigorously," as for example the genetic fingerprint is capable of rigorously proving or refuting the fatherhood of a man. The data we have is simply not reliable enough for that.

In his epistemological ignorance, Green repeated my above statement triumphantly by claiming, I had distanced myself from my own expert report and would now claim that chemistry is an "inexact science." He made fun of me, because he stated that chemistry is, after all, an "exact science," so that one could expect exact results from it.

This episode proves the infantile state of mind of Dr. Green. After all, the term "exact science" does not mean that all the results of such a science are exact (or rigorous) in a mathematical sense, that is, with no margin of error. The term "exact science" is used as a generic term summarizing all natural sciences as well as technical sciences, in opposition to the social sciences like historiography, sociology, etc. The term is derived from the methods used by these sciences, which are exact in nature, in contrast to those of the social sciences, which are often speculative. It has nothing to do with the actual research results of these sciences. The lack of rigorosity or exactitude of the chemical conclusions of my research are caused exactly by the fact that during my research I had to operate with results obtained with the speculative methods of social sciences, namely uncritically recorded witness testimonies.

4. Moral Capitulation

After assessing all factors, Dr. Green finally had to admit that the formation of Iron Blue in the walls of rooms exposed to hydrogen cyanide is indeed possible. He also conceded that the high content of cyanide residues in the walls of the delousing chambers in the Auschwitz, Birkenau, Majdanek, and Stutthof camps is exactly the result of such gassings.

By so doing, Dr. Green also admitted indirectly that the analytic method used by the Jan Sehn Institute in Krakow was wrong. As a brief reminder: the Krakow scientists had intentionally chosen an analytic method incapable of detecting long-term stable cyanides of the Iron Blue type in order to prevent that they detect blue wall paint. They ignored all arguments known to them, which refute their thesis of a blue wall paint, and did nothing to verify their wall paint thesis. But by excluding Iron Blue from their analyses, they excluded exactly the one cyanide compound, which is the only one that can be expected to be found 50 years later.[30]

Because Dr. Green agrees with me that the thesis of the Krakow scientists about the blue wall paint is profoundly wrong, it should be expected that he also agrees with my conclusion that the Krakow scientists chose the wrong analytic method and that they should repeat their analyses with the proper me-

[30] Cf. my article "Polish Pseudo-Scientists" in this volume.

thod. But that is not the case. Instead, Green created an auxiliary hypothesis bordering at the insane: He invented a scenario during which items "soaked with aqueous solutions of HCN" were allegedly leaned against such walls, hence causing blue stains.[31] The problem with that claim is that "aqueous solutions of HCN" didn't exist. Infact, treating garments with such self-made solutions would have been extremely dangerous.

In other words: Green makes up wild stories so he can continue his support for the Krakow pseudo-scientists' exclusion of Iron Blue from their analyses. But since Green does not claim that any blue paint or "HCN-soaked items" was used in the homicidal gas chambers, what exactly is it that justified the exclusion of the one chemical compound that is most likely to be found after 50 years? This makes no sense at all, except perhaps that he does not want to expose his exterminationist friends from the Jan Sehn Institute as what they really are: imposters.

Additionally and more generally, Dr. Green should also say that the Krakow scientists neither tried to understand what they claimed not to have understood, nor discussed the attempts to understand as made by others, which were known to them. No matter which results the Krakow scientists produced and what their scientific opinion might have been: their behavior is extremely unscientific, as **the most important task of a scientist is to try to understand what has not been understood so far, and to discuss the attempts of others to make understandable**. The Krakow scientists did just the opposite: they decided to ignore and exclude what they did not understand. Finally, in their article as well as in a letter to me, the Polish scientists themselves stated that the purpose of their paper was to refute the "Holocaust Deniers" and to prevent Hitler and National Socialism from being whitewashed, that is to say, their purpose was *not* to find out the truth! Thus, by their own confession, they used unscientific methods in order to produce desired results for the purpose of achieving certain political goals.

And the amazing thing about Dr. Green is that he – and with him all those who relies on him[32] – does not only defend Prof. Markiewicz's behavior in every regard, but he attacks me for my critique against the Polish scientists, while omitting *all the reasons* I gave for doing so. To crown this, Dr. Green even defends the fact that Prof. Markiewicz never even bothered to address any of my critique, even though addressing critiques is paramount for scientists. Dr. Green argues:

---

[31] Richard J. Green, "Report of Richard J. Green," introduced in evidence during the libel case before the Queen's Bench Division, Royal Courts of Justice, Strand, London, David John Cawdell Irving vs. (1) Penguin Books Limited, (2) Deborah E. Lipstadt, ref. 1996 I. No. 1113, 2001, p. 18; www.holocaust-history.org/irving-david/rudolf/affweb.pdf.

[32] Robert Jan van Pelt, *The Case for Auschwitz. Evidence from the Irving Trial*, Indiana University Press, Bloomington/Indianapolis 2002, pp. 391-398 (reference to Markiewicz et al.), 498 (reference to R. Green).

> *"Rudolf complains that Markiewicz et al. have not responded to his queries. Why should they do so? What credibility does Rudolf have, that demands they answer his every objection no matter how ill-founded?"*

However, since Dr. Green agrees that the Iron Blue detectable in the walls of delousing chambers *is* the result of gassings with Zyklon B, he himself has indirectly admitted that all my objections against Markiewicz's method of analysis are well-founded, that is, just the opposite of "ill-founded."

And why does Dr. Green think I bear no credibility demanding a discussion of any of my arguments? Not because I lack scientific qualifications. No, he thinks I am an abomination because of my (merely alleged) views, and because I have been subject to social persecution and political prosecution, leading to the total destruction of my social existence, my reputation, and finally my freedom. Dr. Green even resorts to calling me a "liar," "obfuscator," and "hater" because of my different well-founded opinions.

The scheme is as follows: first, people like Dr. Green attempt to do everything to destroy my reputation by name-calling, persecution, and prosecution, and when they succeed, they claim that there is no need to discuss anything with me anymore, since I do not have any reputation and credibility anyway. This way they can nicely ignore any argument refuting their flawed thesis. And they have the chutzpah to call themselves righteous scientists and to call me a pseudo-scientific liar and obfuscator of the truth.

Dr. Green unconditionally defends the scientific frauds from the Krakow institute, and both get away with it, because in the eyes of the public, both have the "politically correct" "scientific" opinion about Auschwitz. Birds of the same feather flock together.

An Accountant Poses as Cremation Expert

By Carlo Mattogno

I. Preliminary Observation

In October 1999 John C. Zimmerman published a tendentious article with the title "Body Disposal at Auschwitz: The End of the Holocaust Denial"[1] directed against my study of cremations at Auschwitz. I responded to his unfounded accusation with my article "John C. Zimmerman and 'Body Disposal at Auschwitz': Preliminary Observations,"[2] in which I documented Zimmerman's historical, technical, and documentary incompetence as well as his obvious bad faith. He immediately reacted to my response by attacking me with another arrogant article, "My Response to Carlo Mattogno,"[3] in which his imposture was raised to a systematic level.

In return I swiftly wrote a long and detailed rebuttal "Supplementary Response to John C. Zimmerman on his 'Body disposal at Auschwitz,'"[4] in which I unmasked all of Zimmerman's lies one by one. This reply dating from August 2000 was published on the Website of Russell Granata, who unfortunately deceased on August 14, 2004.[5] At the end of October 2000, Zimmerman promised by e-mail that he would respond to my rebuttal within six months. Almost five years have past by now, but John C. Zimmerman remained silent.

In 2000 he published a book[6] that contains various critiques against me, but they are a mere repetition of the lies contained in his articles mentioned above. He had nothing to say about my final rebuttal. His silence equals an unconditional surrender. It is his admission that his arguments were and remain unfounded and untenable.

5 See C. Mattogno, "Memories about Russell Granata," *The Revisionist* 2(4) (2004), pp. 442f.
6 J.C. Zimmerman, *Holocaust Denial. Demographics, Testimonies and Ideologies*, University Press of America, Lanham/New York/Oxford 2000.

Zimmerman claimed to have written a refutation of my arguments concerning corpse cremations at Auschwitz; or better still, even a *definitive* refutation, as he makes clear from the subtitle of his article: "The End of Holocaust-Denial." Zimmerman disputes my study "The Crematoria Ovens of Auschwitz and Birkenau,"[7] regarding which he writes:

> *"It appears that this was intended to be the definitive denier argument on the issue."*

This is merely *one* of the grand illusions of our professor. The work he cites is a translation of my article "Die Krematoriumsöfen von Auschwitz," which was published in the German anthology edited by Ernst Gauss (=Germar Rudolf), *Grundlagen zur Zeitgeschichte*.[8]

That work is a summary (carried out by the editor) of a text of approximately 80 pages, which was a synthesis summary of a larger work that I had compiled by 1993 with the cooperation of Engineer Dr. Franco Deana.[9] "Omissions," of which Zimmerman accuses me, are the result of the drastic reduction of my original text for that anthology.

Whereas that work arose from a period of limited availability of sources, since 1995 I have had access to a vastly larger amount of material, therefore the article "The Crematoria Ovens of Auschwitz and Birkenau" is not a definite work, as Zimmerman believes, but merely a drastically abridged point of departure.

My "definitive" study concerning cremations at Auschwitz – assuming that I would speak of a "definitive study" – would be the two-volume work currently being prepared for publication: *I forni crematori di Auschwitz. Studio storico-tecnico, con la collaborazione del dott.ing. Franco Deana* (The Cremation Ovens of Auschwitz. A Historical and Technical Study, with the assistance of Dr. Ing. Franco Deana).[10]

The major parts of the objections raised by Zimmerman have already been refuted with ample documentation in that work.[11] But already the last updating of my above-mentioned article, which appeared in 2003,[8] is sufficient to upset Zimmerman's historical and technical fantasies.

Actually, our professor has drawn a blank and therefore must start all over again with his "refutation," but this time his task will be much more difficult.

---

7 www.vho.org/GB/Books/dth/fndcrema.html

8 Grabert Verlag, Tübingen 1994, pp. 281-320; an updated English version was published as C. Mattogno, "The Crematoria Ovens of Auschwitz and Birkenau," in: Germar Rudolf (ed.), *Dissecting the Holocaust*, 2nd ed., Theses and Dissertations Press, Chicago, 2003, pp. 373-412 (www.vho.org/GB/Books/dth).

9 For this reason he is cited as co-author, although I alone wrote that article.

10 The planned year of release for that publication is 2005.

11 Documents cited here, except were indicated otherwise, are published and discussed in this book.

In this overview, I shall limit myself to raising some preliminary observations.

1. Zimmerman's Competence

First of all, let us assess the competence of this critic who presents himself as "Associate Professor, University of Nevada, Las Vegas" (p. 1).

The first qualification required of one who wants to seriously occupy himself with the alleged Holocaust is knowledge of the German language, but our professor does not know German, and for interpretations of texts written in that language he has to trust translations by others. He in fact declares:

> *"The author wishes to thank Judith Jenner and Karola Raab, both of the University of Nevada, Las Vegas, for their translations of the German language material used in this study."*

It is as though a professor wanted to explain obscure passages of the Bible without knowing Hebrew and Aramaic! This already qualifies Professor Zimmerman as a dilettante.

From the historiographical point of view, Zimmerman relies for the most part on second-hand information filtered through various authors such as Pressac, Piper, van Pelt, Czech, etc. The original documents known to our professor are few and irrelevant. We shall subsequently show what blunders result from such documentary ignorance.

From the technical point of view, Zimmerman walks in the dark. He has not the faintest idea of the structure and function of crematory ovens in general and those of Auschwitz in particular, going off into absolutely unfounded conjectures as if they were sacred truths. This fact shall be illustrated with appropriate examples.

As to methods and professional honesty, Zimmerman demonstrates a truly worrisome deficiency, and while he charges that Mattogno "basically reverts to the common denier tactics of omission and misrepresentation" – an accusation of specious methods against me – we are about to see just how honest Zimmerman's "refutations" are.

2. Zimmerman's Fabrications and Deceptions.

We begin with the case of air photos. First of all, Zimmerman claims that I changed my mind about certain photographs of Auschwitz, which had been published in books. This is absolutely ridiculous. Being a dilettante, he evidently believes that I act like he does by looking for the documents in books and not in the archives.

I possess all the Auschwitz air photos he mentioned (and many others he does not even know or is unaware of), and already since 1989 I also own copies of the surface photos he mentioned.

If I change my opinion concerning interpretation of specific points, then this resulted only from the progression of my studies, and was not due to the fact that later books have published documents, which I had already in my possession.

I will now examine in more detail Zimmerman's "definitive refutation":

1. Zimmerman writes that Mattogno

> *"claimed in 1995, the year following the publication of the May 31 photo, that the smoke was not from burning bodies but most probably from trash."*

Zimmerman cites as a source my booklet *Auschwitz Holocaust revisionist Jean-Claude Pressac: The "Gassed" People of Auschwitz: Pressac's New revisions*.[12]

Zimmerman's claim is false. I never wrote such a thing; not in that booklet nor elsewhere.[13]

2. Our professor claims that "Mattogno simply had no explanation for the presence of this smoke (p. 41)." This is also false; anyone may read my "explanation" on page 43 of my book *My Banned Holocaust Interview*.[14]

3. Regarding the photographic note, which Zimmerman reproduces in his article, he declares that "it is possible to see 14 Sonderkommandos in uniform." This too is false. The photograph in question shows only 8 persons (almost certainly prisoners) standing, and a 9th [person] on the left, who is probably a guard. As I have explained in *My Banned Holocaust Interview* (pp. 41-44), this photograph does not only *fail to* demonstrate, but also *refutes* the story of mass cremation of "gassed." This lie serves to advance the number of prisoners in that photograph of "25 Sonderkommandos" declared by Filip Müller.

4. Still, Zimmerman writes that "Mattogno never addressed this photo" (p. 46), to which I respond once again: See *My Banned Holocaust Interview* (pp. 41- 44).

5. He furthermore declares that

---

[12] Granata Publishing, Palos Verdes 1995.

[13] An online Internet version (www.vho.org/GB/c/CM/gcnewrev.html) includes these words, which had been added without the author's consent: "The small column of smoke rising from the courtyard near Crematory V which appears in the aerial photographs of May 31, 1944 is consistent with outside trash incineration in an open-air container where lower level combustion air is able to enter; we know of no aerial photographic evidence of pit incineration where burning would have been very slow because of poor air circulation." Editor's remark.

[14] Granata Publishing, Palos Verdes 1995.

> *"Mattogno had also assured his readers that Red and White Bunkers were not found in any German documents and that they had 'been created by postwar witness.'"*

Here our very virtuous professor falsifies my affirmation. I have in fact written:[15]

> *"Before examining Jean-Claud Pressac's statements on Bunkers 1 and 2, it is well to specify that this designation (like those of 'red house' and 'white house') is not found either in the German documents or in the reports of the clandestine resistance movement of the period at Auschwitz; it has been created by postwar eyewitnesses."*

I referred to *terms*, while Zimmerman declares that I referred to *things*.

6. Our professor of integrity again falsifies my assertions shortly thereafter by claiming that:

> *"He* [Mark van Alstine] *has identified three burning pits in the area of the White Bunker (Mattogno states that there were four)."*

In reality I referred to traces of four mass graves filled with soil located approximately 200 meters west of area BIII of Birkenau. I did not speak of "burning pits," of open graves, or of graves "in the area of the White Bunker"; these are simply Zimmerman deceptions.

7. Referring to one of my citations concerning an article by H. Fröhlich entitled "Zur Gesundheitspflege auf den Schlachtfeldern," Zimmerman wrote that Mattogno

> *"cited a study by H. Frohlich* [sic] *in an 1872 German military journal that the attempt to dispose of the bodies of soldiers by opening mass graves and filling them with tar 'resulted in charring of the uppermost layer of the corpses, the baking of the intermediate layer and no effect on the bottom layer.' He ignored the fact that the author of the study gave guidelines for the effective disposal of bodies in pits by using gasoline. Frolich wrote that the grave had to be drenched with gasoline in a tar pit. After three hours, 250 to 300 bodies were disposed of."*

Yet in the pages cited, the military medic Fröhlich expounds a criticism of a disinfestation procedure after the Battle of Sedan, which was carried out by the chemist Créteur, and above all, of the results which he pretended to have obtained. Créteur opened mass graves, poured in liquid tar, which was then ignited. Fröhlich objected that with such a procedure corpses at the bottom of the grave remained practically intact.

One of two passages mentioned by Zimmerman (in reference to his note 278) references a citation by Fröhlich concerning a writing by Créteur, but the "guidelines," of which he expounds, are those typically critical of the military

[15] *Auschwitz: The End of a Legend*. Institute for Historical Review, Newport Beach, CA, 1994, p. 72; more recent: C. Mattogno, "Auschwitz: The End of a Legend," in: G. Rudolf (de.), *Auschwitz: Plain Facts*, Theses & Dissertations Press, Chicago, IL, 2005, p. 161 (www.vho.org/GB/Books/apf).

medics. Moreover this passage does not contain any mention of "gasoline." The only combustible liquid of which Créteur writes (other than tar) is mineral oil (*Steinöl*), which however served only to ignite the tar:[16]

> *"Thereupon I ignited the tar with the help of straw soaked in mineral oil."*

The other passage is the citation of a letter appearing in Belgian script, which states that the corpses were soaked with tar and mineral oil which were then ignited.[17] Hence, in the Fröhlich article "gasoline" is never mentioned.

8. To this falsehood, Zimmerman then also adds another deception, writing:

> *"In 1887 Dr Hugo Erichsen, one of the world's leading experts in 'Body Disposal' in the late 19th and early 20th centuries, wrote of the Belgian government's efforts along these lines in a battle in 1814. The individual charged with 'Body Disposal' was named Creteur."*

In reality, Zimmerman presents the same source – the affirmations of Créteur – as if they were two different sources! This also shows our poor professor making a rather stupid historical chronological blunder: the fact is, of course, that Créteur's activities occurred at the time of the Franco-Prussian War: 1871, not in 1814! And if that is not enough, reporting on the activity of Créteur, Dr. Erichsen – this alleged world expert of cremation – was declaring according to Zimmerman that the corpses of the soldiers were "saturated with kerosene" (p. 44), which is false, because Créteur speaks only of "mineral oil." So here is our Professor Zimmerman, relying upon a world "expert," but he is incapable of distinguishing mineral oil from kerosene!

9. Conclusions Zimmerman draws from things such as the above are only initial examples of his crass ignorance of the subject-matter while assailing me:

> *"Deniers like Mattogno would have people believe that the Germans of World War II were incapable of replicating the achievements of an early 19th century European country."*

If Professor Zimmerman had made a serious research in this regard, then he would have known that the scope of the disinfestation in the battlegrounds never had been the *cremation* of the corpses, but only the more or less complete carbonization of their soft tissue in an attempt to ward off the onset of epidemics. Therefore this concerns completely different problems.

10. Zimmerman affirms that

> *"Mattogno claimed the maximum cremation capacity of the six original ovens* [of Auschwitz Krema I] *was 120 per day, even though he was familiar with evidence from another concentration camp that showed a Topf double muffle oven could burn 52 per day or 26 per muffle."*

---

[16] H. Fröhlich, "Zur Gesundheitspflege auf den Schlachtfeldern," in: *Deutsche Militärärtzliche Zeitschrift*, I, 1-4, Januar - April 1872, p. 101.

[17] Ibid., p. 100.

In this case, the Zimmerman falsification consists in the omission of factors which permitted such a higher cremation capacity.[18] I wrote:[19]

> *"The average cremation time of a continuously operating oven was about forty minutes of principal combustion (in the muffle), obtainable with the aid of the installation of an intake draft system (data relative to the Gusen oven).*
>
> *The average time of a cremation without an intake draft system (taking into account the combustion capacity of the furnace grill) was sixty minutes, as is evident from the statement by Engineer Prüfer (in the 1 November 1940 letter), as well as from the diagrams published by Engineer R. Kessler concerning the principal combustion in the muffle (considering the structural differences of the Gebrüder Beck oven compared to those at Auschwitz-Birkenau)."*

Naturally Zimmerman does not mention the documents I quoted in this passage because they refute categorically his thermotechnical fantasies.

11. To "demonstrate" that Bunker 2 continued to function even after Crematory II at Birkenau started functioning, Zimmerman presents an argument which is truly a masterpiece of deception as well as bad faith. He affirms:

> *"Another useful piece of information is a report from the Bauleitung on June 13, 1943. It states that doors for Krema II are 'urgently needed for the execution of the special measures... Likewise, the completion of windows for the reception building and the doors for 5* [barracks] *for the accommodation of prisoners* [Häftlingsunterkünfte] *is urgently required for the same reasons.' There is no further information about the five barracks in the memo. Recall, however, that Höss mentioned five barracks in his memoirs for the two bunkers in the area where prisoners were gassed, and this is the same number referred to for 'special treatment' in the Bauleitung memo of July 15, 1942. It would appear that the five barracks in the June 1943 memo are the same ones used for undressing in the areas where the two bunkers were located. Thus, their continued usage after the crematoria were built and before the Hungarian operation was undertaken is strongly suggested.'"*

Well, first of all Zimmerman falsifies the date of that document, which is a letter from the head of the Central Construction Office, Bischoff, to the *Deutsche Ausrüstungswerke* Auschwitz (DAW, German equipment works) dated January 13, 1943.[20] To this falsification Zimmerman then adds an interpretation, which is not only absolutely unfounded, but decidedly ridiculous: the "5

---

[18] Another factor no less important was the special structure of the Gusen oven muffle grill.

[19] C. Mattogno, *Auschwitz: The End of a Legend*, op. cit. (note 15), p. 23; in G. Rudolf (ed.), ibid., p. 132.

[20] Auschwitz Museum Archive, BW 30/34, pp. 78f.

accommodations for prisoners"[21] mentioned in this letter were supposed to have been the alleged "undressing barracks" of the alleged homicidal bunkers. The foundation for this interpretation is the simple presence of the number "5" in the two cited documents and the affirmation of Höss!

Moreover, Zimmerman here furnishes another proof of his ignorance of documents, because "in the Bauleitung memo of July 15, 1942" it is clearly specified that one of the "5 barracks for special treatment and accommodation of inmates" was meant for the village of Bor**,** a little settlement located about four km south of Birkenau:[22]

> *"4 pieces barracks of inmates in Birkenau 1 pc. barracks for accommodation of inm. in Bor."*

So maybe in Bor there was a branch office of the alleged gassing Bunker of Birkenau? The four huts planned for Birkenau were already mentioned as BW 58 in a list of constructions of the camp dated from March 31, 1942. A letter of the head of the Central Construction Office from June 9, 1942, explains that it served "for the accommodation of personal effects [inmate property]."[23]

12. Zimmerman wrote "the total number of prisoners registered in Auschwitz in 1941 is not known," but the *Kalendarium* of Danuta Czech, which he keeps citing, states explicitly that in 1941 there were 17,270 "registered" (*eingeliefert*) prisoners and 9,997 Soviet captives.[24]

13. Zimmerman declares:

> *"Mattogno and other deniers often argue that a planned expansion of the camp to 200,000 was the catalyst for the new crematoria. However, the Bauleitung began negotiating with firms for construction of the four crematoria in July 1942, while the first evidence of the planned expansion to 200,000 is on August 15."*

This involves another Zimmerman deception. In the file memo of August 21, 1942, which Zimmerman cites on page 9, one reads (cited from the translation of the Pressac book to which our professor refers):[25]

> *"Regarding the construction of a 2nd crematorium with 5 3-muffle furnaces, together with the ventilation and air extraction systems, it will be*

---

[21] Evidently for Zimmerman "*Häftlingsunterkünfte*" (inmate accommodation) is a code-word for "*Auskleidebaracken*" (undressing hut). The imagination of these people is limitless!

[22] "*Kostenanschlag für Bauvorhaben Konzentrationslager Auschwitz O/S*" dated July 15, 1942. RGVA, 502-1-220, p. 36.

[24] Danuta Czech, *Kalendarium der Ereignisse im Konzentrationslager Auschwitz-Birkenau* 1939-1945, Rowohlt Verlag, Reinbek bei Hamburg 1989, p. 160.

[25] J.-C. Pressac, *Auschwitz: Technique and Operation of the Gas Chambers*, New York 1989, p. 204 (http://holocaust-history.org/auschwitz/pressac/technique-and-operation/pressac0204.shtml).

necessary to await the result of negotiations already under way with the Reich Security Main Office [RSHA] *on the subject of rationed materials."*

Therefore no decision to construct Crematory II had yet been made.

On this same document there is evidence that the Prüfer proposal to transfer two 8-muffle ovens from Mogilew to Auschwitz was made on August 18. The proposal (proved by a handwritten note in the margin) was accepted by the WVHA on August 24.

So this signifies that the number of oven muffles for Crematory IV and V had not yet been decided upon at that time. Therefore Zimmerman knows he lies.

Regarding augmenting the camp population, the Zimmerman affirmations are refuted by Pressac, his main source, who writes:[26]

"Himmler had ordered that the camp should accommodate 200,000 inmates, and the Central Construction Office had completed a design for the enlarged camp at the end of July."

In the original edition of his second book, Pressac declares again more explicitly:[27]

"According to the orders of Himmler and of Kammler, the effective capacity of the POW camp Birkenau was determined to be 200,000 prisoners, which induced a new expansion of the camp and an increase of its cremation capacity. End of July, a fourth sector of 60,000 prisoners was added, located to the south of the first sector, thus increasing the capacity of the camp to 200,000."

So according to Professor Zimmerman, Pressac is also a "denier"!

3. Zimmerman's Historical-Documentary Ignorance

14. Zimmerman writes "the Auschwitz Construction Agency, known as the Bauleitung." In his entire article he always writes "Bauleitung" of Auschwitz. The poor professor has no idea of the fact that the *Bauleitung* (Construction Office) was promoted to *Zentralbauleitung* (Central Construction Office) on

---

[26] J.-C. Pressac, "The Machinery of Mass Murder at Auschwitz," in: I. Gutman, M. Berenbaum (eds.), *Anatomy of the Auschwitz Death Camp,* Indiana University Press, Bloomington/Indianapolis 1994, p. 210.

[27] J.-C. Pressac, *Les crématories d'Auschwitz. La machinerie du meurtre de masse*, CNSR Editions, Paris 1993, p. 48 :

"Fixer, selon les ordres de Himmler et de Kammler, l'effectif du KGL de Birkenau à 200000 détenus entraînait un nouvel agrandissement du camp et un renforcement de sa capacité d'incinération [...]. *Fin juillet, une quatrième section de 600000 prisonniers fut ajoutée, placée au sud de la première, portant ainsi la capacité du camp à 200000."*

November 14, 1941,[28] and remained *Central Construction Office* until the end of the war in 1945.

15. Zimmerman presents another classic example of his historical-documentary ignorance after citing a Topf letter from the Mauthausen *SS-Neubauleitung* (New Construction Office) of July 14, 1941. He knows this document only from a reference to it in *Kalendarium* by Danuta Czech and its false reproduction in the book by R. Schnabel, *Macht ohne Moral*.[29] Then Zimmerman continues:

> *"On the same day that the Gusen instructions were issued, two Topf engineers stated that the double muffle furnace could incinerate 60 to 72 bodies* [30 to 36 per muffle] *in a 20 hour period with three hours of maintenance required."*

This time his source is Pressac's article "The Machinery of Mass Murder at Auschwitz."[30] But our poor professor didn't know that Pressac's document is exactly the same document mistranslated by R. Schnabel, so Zimmerman thought they were two different documents!

16. Citing Henryk Tauber through Pressac, Zimmerman repeats without any comment Pressac's foolish claim that in the triple-muffle oven "the flames went first round the two side muffles." This mistake was initiated, as I have explained elsewhere,[31] by a translation error[32] and is technically false.[33] From this one may surmise Professor Zimmerman's comprehension of cremation technology and sources!

17. Zimmerman writes that "Miecyslaw Morawa, a worker in the crematoria, testified that..." But there is no existing testimony from Morawa. Our poor professor, being incapable of correctly interpreting the sources indicated by Danuta Czech in her *Kalendarium of Auschwitz*, had picked up a stupid blunder and confused Morawa with Tauber!

18. Zimmerman writes "the two structures in the wooded area [the alleged Bunkers of Birkenau] were completely destroyed by the Germans and no trace remains." But our professor ignores the fact that there still exist solid traces of what is said to have been Bunker 2 – ruins of the foundation and walls, as seen by visitors to Birkenau.

---

[28] See in this regard, my study *The Central Construction Office of the Waffen-SS and Police Auschwitz. Organization, Responsibilities, Activities*, Theses & Dissertations Press, Chicago 2005 (www.vho.org/GB/Books/cco).

[29] Incredibly, Schnabel wrote "10-35 corpses" whereas the original text states "30-36." Danuta Czech, who relied on this source, reproduced the same error and the same goes for Zimmerman.

[30] J.-C. Pressac, op. cit. (note 26), p. 189.

[31] *Auschwitz: The End of a Legend*, op. cit. (note 15), p. 91; in G. Rudolf (ed.), ibid., note 7, p. 118.

[32] The Polish preposition "przez" (through) with "around."

[33] The Auschwitz crematory ovens cremated by direct process, to be precise, the gas generator combustion products entered directly into the muffle.

19. To the question of "Sonderbehandlung," "Sonderaktion," etc., I refer Zimmerman, who only refers to second hand documents, to my study *Special Treatment in Auschwitz. Genesis and Meaning of a Term*.[23] Here is already the first book that awaits its "definitive refutation" by Zimmerman. Our poor professor can not even imagine how many difficulties he would yet have to face in order to be able to "refute" the revisionist writings.

Here I limit myself to a few glaring errors which Zimmerman presents:

In reference to a file memo of August 21, 1942, he declares:

> *"The letter is saying that these special actions are taking place in the 'bathing installation.' Just so there is no misunderstanding as what these words mean, they are the only ones in this lengthy two page memo which are underlined."*

In the document which Zimmerman knows (through Pressac), the expression "*Badeanstalten für Sonderaktionen"* is underlined effectively in pen or pencil. But – even supposing that this has a sinister significance – how does Zimmerman know that this word had been underlined by the Germans and not by the Poles who had this in their hands for a whole decade? Our naive professor ignores that in the Moscow archives there exists another version of this document (signed regularly and with the same handwritten annotation in the left margin), in which, however, the term in question is *not* underlined.[34] Another example of Zimmerman dilettantism!

20. While commenting on the "*Fernschreiben*" (telex) by Bischoff of December 18, 1942, in which a "special action" by the Gestapo in regard to civilian workers is mentioned, Zimmerman considers Pressac's[35] interpretation possible, but adds:

> *"It is quite possible that the camp administration sought to make an example of some of the civilian workers by executing them. This could explain why the memo is marked 'secret'"*

The original text states there was a "special action by the Gestapo of all civilian workers," that is *all*, not some. If the Zimmerman interpretation is correct, the Gestapo executed *all* civilian workers. In December 1942 the civil workers that worked to Auschwitz were more of 900.[36] But what does one expect from an alleged Holocaust expert who doesn't know German? The fact that the document bears the term "secret" doesn't matter. For example, that term does not appear at all on the letter by Bischoff of January 29, 1943, which would have been much more compromising in that it displays the term "gassing cellar."

21. Zimmerman offers another example of his technical as well as his historical-documentary ignorance when he writes:

---

[34] RGVA, 502-1-313, pp. 159f.

[35] Pressac justifiably thinks that the term signified interrogation by the Gestapo.

[36] C. Mattogno, op. cit. (note 28), p. 54.

"The estimated capacity of cremation ovens for Mogilew was 3000 per day."

Our naive professor ignores that of the 4 Topf 8-muffled ovens originally ordered by the SS Main Office Budget and Construction, Mogilew was restricted to only half of one 8-muffled oven, which therefore amounted to 4 muffles.

And assuming the absurd cremation capacity shown in a letter by the Central Construction Office of June 28, 1943, to be correct, those 4 muffles would have been able to cremate 384 corpses in 24 hours! And also if the 3,000 cremated mentioned above were not one of the many Zimmerman falsifications but rather a blunder by his source, then Zimmerman would still be guilty of a total lack of critical sense, because he reports this foolish lie as if it were the truth.

4. Zimmerman's Technical Incompetence

22. To "refute" my arguments regarding duration of the cremation processes in the coke-fueled ovens at Auschwitz, Zimmerman shares a document note relating to cremations carried out in the crematory at Gusen from September 26 to November 12, 1941, however, due to his utter ignorance of thermotechnology, it is not surprising that he has not understood anything. First of all, the first column of the document bears the inscription "Uhr" "hour," but nowhere is it specified to what this "Uhr" corresponds. However Professor Zimmerman authoritatively decides that the data contained in this column is to refer to the time of cremation. This is not merely an unauthorized interpretation, it is also technically absurd, because if that were the case, the oven would have been able to cremate one corpse in 8 (eight) minutes with a grill speed[37] of 343 kg/hr, while the maximum speed (with an artificial maximum draft of 30 mm water column) was 90 kg/hr. Eight minutes would by absurdly short even for our professor.

With this artifice, founded on one day of cremations (that of November 7, 1941),[38] Zimmerman declares that "each oven could incinerate a body in 25.2 minutes," which is both unfounded by documents and technically absurd.

23. Zimmerman writes moreover:

"Kurt Prüfer, the Topf engineer who built the 46 Birkenau ovens,[39] *stated in a letter on November 15, 1942 that the ovens be installed in the Buchenwald concentration camp had a one-third greater output than had previously been thought."*

---

37 The quantity of coke burned in one hour on the furnace grate.

38 On the other days – if the Zimmerman interpretation were correct - the resulting duration fluctuates between 8 and 30 minutes.

39 There were 12 cremation ovens in the Birkenau camp. The number 46 refers to the number of cremation chambers or muffles.

The source of this is the Pressac book, *Auschwitz: Technique and Operation of the Gas Chambers*. Professor Zimmerman continues:

> *"Unfortunately, he does not say what number the one third is greater than. However, on the same day he informed the Bauleitung that five triple-muffle furnaces, 15 ovens, could incinerate 800 corpses in 24 hours."*

The source is another writing by Pressac, *The Machinery of Mass Murder at Auschwitz*, in which that French historian wrote:[40]

> *"Extrapolating the Buchenwald data for Auschwitz, Prüfer concluded that the five furnaces of the new crematorium in Birkenau could incinerate 800 corpses in 24 hours."*

Pressac's archival reference is identical to that of the letter of November 15, 1941, mentioned above: "[*Staatsarchiv*] Weimar, 2/555a, letter Prüfer November 15, 1942."[41]

So Zimmerman once again has cited the same document twice as though there were two different documents! Considering his crass documentary ignorance, I do not believe that this is attributable to bad faith. Zimmerman is limited to only inventing the letter's addressee (Prüfer "informed the Bauleitung"). The alleged Prüfer "conclusion" ("Prüfer concluded...") is a simple invention by Pressac, because the letter in question, in which he himself has published the original text and the transcription,[42] does not mention any numerical figure.

24. In that letter, the phrase, which stirred up the imagination of both Pressac and Zimmerman, is: "The furnaces perform 1/3 better than I had foreseen." Now, both Pressac and Zimmerman arbitrarily interpret this in the sense of production/yield/capacity – that is, the number of cremated corpses per time, but it can also be interpreted in the sense of "efficiency," which is the coke consumption per corpse. The way I understand it, I interpret the German term "leisten" precisely in the sense of efficiency. Zimmerman pretends to refute the thermotechnical reasoning for this reduction of the coke consumption originally expected by Prüfer,[43] but instead neither Pressac nor Zimmerman have explained why this term in question should refer to the capacity of the ovens. The Pressac fabrication indicated above has an essential importance to the Zimmerman pseudo-demonstrative display to which he also returns later.

25. Zimmerman affirms:

> *"Contrary to Legacé and Leuchter, it is known that the Topf ovens could work on a continuous daily basis."*

---

40 J.-C. Pressac, op. cit. (note 26), p. 212.

41 Ibid., note 74 on page 243.

42 J.-C. Pressac, op. cit. (note 25), pp. 98f.

43 C. Mattogno, F. Deana, "The Crematoria Ovens of Auschwitz and Birkenau," in: E. Gauss (=G. Rudolf, ed.), *Dissecting the Holocaust. The Growing Critique of "Truth" and "Memory*," Theses and Dissertations Press, Capshaw, Alabama, 2000, pp. 390f.

This is supposed to have been demonstrated by the Topf letter of July 14, 1941, mentioned above. However this actually refers to a forced functioning of an oven, which certainly could have functioned continuously for even more than 24 hours, but which, in this manner, would have progressively lost its efficiency until finally it would have stopped functioning altogether if slag had not been removed from the oven grills, which restricts the flow of required combustion air. Even the expert Pole Roman Dawidowski, in his calculation of a technically absurd cremation capacity, admitted during the Höss trial:[44]

> *"A continuous functioning in two shifts of 12 hours per day, considering 3 hours pause per day for the extraction of slag from the gas generators and for various minor work, with the inevitable interruptions of continuous activity."*

Pressac also admits a 3 hour pause in continuous activity. This affirmation also appears in the article *The Machinery of Mass Murder at Auschwitz*,[45] but Zimmerman prefers to ignore this. Therefore Lagacé and Leuchter are in excellent company!

26. Zimmerman works himself up, attempting to demonstrate with a series of illogical arguments that the cremation capacity of the crematories of Auschwitz were excessive for only the natural mortality of the prisoners, and that this demonstrates that they were planned and built for a criminal purpose; for mass extermination.

I shall spare the reader of this article the refutation of Zimmerman's technical foolishness, and shall limit this to mentioning one single document. This concerns a letter of the head of the Cental Construction Office dated July 10, 1942, from which results that a crematorium of type II/III with 15 muffles was projected for 30,000 prisoners, whereby the muffle-prisoner ratio was 1:2,000. Thus the 46 muffles of Birkenau were projected for 92,000 prisoners, but according to the final plans of the SS, the Birkenau camp was supposed to contain 140,000 prisoners, and 70 muffles were supposed to have been requested. In practice, the number of muffles at Birkenau was really inadequate in regards to the projected expansion of the camp![46]

27. Zimmerman wrote one entire paragraph to the problem of "Durability of the Ovens." He, among others, pretends to demonstrate that the Auschwitz ovens could have carried out without any damage an enormously greater number of cremations than those I have put forward based upon the article by Engineer R. Jakobskötter, which I cite below, that is, 3,000 cremations per muffle. Zimmerman writes:

> *"In the late 1880s, two ovens were installed in a crematory in Southern Paris. These ovens were designed to cremate 5000 bodies per year or 2500 per furnace."*

---

[44] *The Höss Trial*, volume II, p. 47.
[45] J.-C. Pressac, op. cit. (note 26), p. 189f.
[46] See below, chapter II.12, p. 161.

This is confirmation of the validity of my argument. Zimmerman refers to the Toisul and Fradet oven installed in the Paris cemetery by Père Lachaise in 1889. It consisted of a gigantic three-floor structure: on the ground floor was the provision for the recuperator; on the first floor the cremation chamber; and in the basement the gas generator. It was a single oven with a single cremation chamber.[47]

28. Zimmerman continuous:

> *"Augustus Cobb, a leading cremation expert of the period, learned from the engineer who worked in the crematory that '(a)lthough nearly four hundred bodies are burned in these furnaces every month, a close inspection of their walls showed no traces of fissures, and the same remark applies to the walls of the furnaces in the crematory in Milan (in Italy)."*

The figure put forward by Zimmerman (400 corpses per month) is false. In the first five years of activity, in the Toisul and Fradet oven mentioned above, there were cremated: 49 corpses in 1889; 121 in 1890; 134 in 1891; 159 in 1892; and 189 in 1893. This is a total of 652 in five years[48] and an average of 10 to 11 per month!

At the end of the 1920s, when the number of crematories in France increased and the practice of cremation was more widespread throughout the country, there were 877 cremations during 1926; 861 in 1927; 945 in 1928; and 1,118 in 1929.[49] In Germany, where cremation was more widespread, there were a total of 881 corpses cremated from 1889 to 1893,[50] averaging approximately 15 per month!

As for the crematory of Milan (Italy), 304 cremations occurred from 1874 to June 30, 1884, averaging approximately 3 per month![51]

I don't know if the deception is from Zimmerman or from his sources; but that's of little importance: the topic is absolutely bogus.

29. Professor Zimmerman continues like this:

> *"Additional information on these ovens published in 1893 shows that from 1889 to 1892, 11,852 were cremated in these facilities."*

This is yet another deception. As I related above, during the period indicated by Zimmerman, there were a total of 652 corpses cremated in the Père Lachaise oven. Therefore the bogus figure put forward by Zimmerman is 18 times more than the real one.

In all of Germany, which was the European country where the practice of cremation was most widespread, there were a total of 881 corpses cremated

51 G. Pini, *La crémation en Italie et à l'etranger de 1774 jusqu'à nos jours*, Hoepli, Milano 1885, p. 30.

from 1889 to 1893. The figure of 11,000 in one year was exceeded only in the year 1916 with 49 crematories![50]

30. Zimmerman triumphantly concludes:

> *"As will be seen, Germany led Europe in cremation technology in the 1930s. It would appear logical to conclude that Germany of the 1940s had more durable ovens than France of 50 years earlier."*

The bad faith of Zimmerman is quite evident because the article I quoted is from 1941! Rudolf Jakobskötter, by profession *"Stadtoberingenieur*" (chief engineer of the city), was a cremation professional and an authoritative and reliable source (different from the popularized citations spread by Zimmerman). In that article, Jakobskötter relates:[52]

> *"Since more than 3000 cremations were performed in the second electrical oven at Erfurt, while so far muffles withstood only 2000 cremations, depending on their design, one can claim that the design regarding the durability has been affirmed. The construction firm is counting on a life span of 4000 cremations per muffle in future."*

Therefore in October of 1941, German technology, which was in the leading position throughout the world in the field of cremation, had not yet developed fire-resistant muffle walls that could withstand 4,000 cremations.

Zimmerman claims to refute this factual data from 1941 with false data from 1893! Another shining example of his utter bad faith.

From 1941 until today progress has not been exceptional in this area. Here is what the American firm "Industrial Equipment & Engineering Co." writes in their description of its electrically heated "Ener-Tek II" crematory oven:[53]

> *"The refractory and insulating materials used in the construction of the Ener-Tek II are of a very high quality, which will ensure many thousands of cremations before repair of the brick work is required."*

Here it still refers to "many thousand," not to "tens of thousands," as would have been necessary at Auschwitz if the ovens had also cremated the corpses of the "gassed." Documentation concerning the "Ener-Tek II" oven comprising various technical designs was published by Fred Leuchter in his report, which Zimmerman well knows, but he prefers to ignore this data which contradicts his baseless conjectures.

31. To "refute" my argument concerning the durability of the refractory walls in the Topf 2-muffled oven at Gusen after scarcely 3,200 cremations (1,600 per muffle), Zimmerman claims that "it is possible that the Gusen ovens may not have originally been built correctly." An unfounded hypothesis which is based upon a simple analogy:

---

[52] Rudolf Jakobskötter, "Die Entwicklung der elektrischen Einäscherung bis zu dem neuen elektrisch beheizten Heisslufteinäscherungsofen in Erfurt," in: *Gesundheits Ingenieur*, October 25, 1941, issue no. 43, p. 583.

[53] Fred A. Leuchter, *An Engineering Report on the alleged Execution Gas Chambers at Auschwitz, Birkenau and Majdanek, Poland*, Samisdat Publishers, Toronto 1988, p. 188.

"Topf admitted that Krema IV ovens were made defectively."

But that is false. "Topf" did never make an "admission" of this sort. Zimmerman furnishes in this regard the erroneous reference to a "Topf letter of April 4, 1943 to the Bauleitung in APMO, BW 30/34 p. 43" (note 88), while in reality this deals with a letter of April 10, in which "Topf" does not even believe that the 8-muffle oven of Crematory IV had actually been damaged ("the cracks to have allegedly occurred recently.")[54]

32. To my affirmations that the Central Construction Office documents do not in the least attest to four complete replacements of the refractory walls of all the muffles of all the Auschwitz ovens, which would have been necessary if there was also corpse cremation of alleged "gassed," Zimmerman objects:

> *"In fact, no information has surfaced from these archives, or any other archives, that even one cremation took place in Auschwitz. In other words, not one contemporaneous document has surfaced from any source showing that even one cremation took place in Auschwitz."*

And he concludes:

> *"According to Mattogno's logic, this must mean that no cremation took place at Auschwitz!"*

To begin with, the Zimmerman affirmation is false. Those who have such documentary ignorance should refrain from affirming things categorically. There in fact exists a "*Kontrollzettel für die Firma J.A. Topf & Söhne, Erfurt*" concerning the first crematory oven at Auschwitz in which one reads:[55]

> *"The test incineration of the first corpses was performed the same day."*

As to the rest, Zimmerman evidently ignores that the Moscow archival documents enable the reconstruction of the complete picture of the Topf Company commissions and invoice controls, among others. This picture categorically excludes that Topf had ever replaced the refractory walls of the Birkenau ovens. For the ovens of the Auschwitz main camp, one single replacement was probably carried out.

The fact that in this documentation only one reference to a cremation can be found (in order to verify the efficiency of a cremation oven) is simply due to the fact that the Central Construction Office was only responsible for the construction and maintenance of the crematories, whereas their operation was the responsibility of the Political Department.

33. Nevertheless, when he takes it easy, Zimmerman insolently and opportunistically resumes my arguments against me, by adapting to the Gusen case:

> *"If these overhauls had taken place, they would have certainly been detailed in this file because the information on the 1941 overhaul includes all*

---

[54] Auschwitz Museum Archive, BW 30/34, p. 42.

[55] August 15, 1940, RGVA, 502-1-327, p. 215.

correspondence with Topf on materials used, billing information and time sheets for the days and hours worked, including overtime."

Thus Zimmerman knows very well, but feigns not to understand, that the same thing is valid for Auschwitz as well! It is true that for 1941 the correspondence between the Topf company and the SS New Construction Office (later Construction Office) of Mauthausen is nearly complete, but one can not say the same thing for sure for the following years. As to 1941, after the replacement of the refactory walls of the Gusen oven, it cremated at the maximum approximately 1,900 corpses,[56] therefore the oven could cremate another 4,100, that is to say 6,000 in all or 3,000 in each muffle. Because the documentation is fragmentary, one cannot affirm nor exclude anything for the subsequent years.

34. Still, Zimmerman objects that

"from 1940 through April 1945 there were 27,556 cremations in Mauthausen. Yet, Mattogno was arguing that all 52 Auschwitz ovens could not have disposed of more than 162,000 bodies."

Let us assume that this figure is exact (it is said to result from a list of cremations conserved at Arolsen, which no one has ever seen), then the comparison just does not make any sense. The first crematory oven at Mauthausen was installed by the Kori Company, about which no correspondence exist. Therefore, for all we know, the Kori Company could have replaced the oven refractory walls ten times.

The Topf two-muffled oven was not installed "in July 1944," as Zimmerman pretends, but during January-February of 1945. The Topf-Mauthausen correspondence, which Zimmerman knows well, contains a letter from Topf to the Mauthausen Construction Office dated December 20, 1944, in which Topf advises to quickly begin the work for the oven foundation and for the smoke conduit, and a letter dated January 3, 1945, in which Topf gives advance notice of dispatching head engineer Schultze for January 9,[57] therefore the oven was constructed then. But we must understand: our "Holocaust expert" doesn't know German!

35. And to "demonstrate" the reality of multiple crematories at Auschwitz, our Professor Zimmerman can't find anything better to cite than a deposition concerning Dachau (!) according to which[58]

"an oven could burn 7 to 9 bodies in two hours when they were all introduced simultaneously."

---

[56] In the Gusen camp, 887 prisoners died in November 1941 and 986 in December. Hans Maršálek, *Die Geschichte des Konzentrationslagers Mauthausen*, 2nd ed., Österr. Lagergemeinschaft Mauthausen, Vienna 1980, p. 156.

[57] BKA, NS4 Ma/54.

[58] This comes from a deposition of Eugen Seibold dated November 10, 1945. Dachau Museum Archives, 767, p. 84.

This claim is simply too foolish to merit a response. For a scientific discussion of multiple cremations at Auschwitz, I return for now to the last updated version of my article on cremations at Auschwitz.[59]

36. Now we come to Zimmerman's awkward attempt to "refute" my thermal balance calculations of the Birkenau ovens. The point of departure for the calculation of coke consumption is the effective consumption of the Gusen oven for 677 cremations (October 31 to November 12), that is, an approximate average of 30.6 kg of coke per corpse.

Zimmerman states that from September 26 to October 15, 203 corpses were cremated in the same oven (in reality there were 193) with a consumption of 153 wheelbarrows of coke, which amounts to 9,180 kg of coke, or in average 45 kg per corpse (in reality 47.5). In the column "Karren Koks" of the cremation lists at Gusen, it clearly states: "1 K.= 60 kg," which allows the transformation of wheelbarrows into kg.

The difference in consumption results from the fact that during the period of September 26 to October 15 cremations were less frequent. On September 27, 28, and 30, and October 2, 4, 5, 7, 9, 11, and 12 there were *no* cremations at all, so the oven cooled-down. During the remaining days the average daily number of cremations was very low – hardly 19 – amounting to approximately 9 to 10 per muffle. However, from October 31 to November 12 cremations occurred every day for a daily average of 52, which averaged 26 per muffle.

A cold oven consumes considerable calories in its refractory walls in order to reach operational temperature. Therefore, when the frequency of cremations is low, the consumption of fuel per corpse is higher. For example, the 8 consecutive cremations carried out by Engineer R. Kessler on January 5, 1927, in the Dessau crematory (regarding which he published very detailed diagrams of the cremation process and of coke consumption) required on the average 54.5 kg of coke per cremation, of which, however, a good 25 were debited to heating up the oven. (The consumption of coke was 200 kg of coke for pre-heating of the oven, and 236 kg for the 8 cremations). If the oven had already been hot, the coke consumption would have been 29.5 kg for each corpse.

Professor Zimmerman, who does not even possess this elementary knowledge, draws an arbitrary and unfounded conclusion from that fact:

> *"There is some reason, however, to suspect that each wheelbarrow did not contain 60 kilograms of coke but that this was a generic number based on the theoretical maximum that each delivery could hold."*

There is, however, no reason to assume that this "generic" quantity had to be "the theoretical maximum" instead of an average. And even if this were true, the wheelbarrows during that period of October 31 to November 12 would have contained only the (30.5 ÷ 47.5 × 100 =) 64% of the coke con-

[59] Op. cit. (note 8, 2003 edition), pp. 400f.

tained in the wheelbarrows of the period from September 26 to October 15, but this is definitely a senseless supposition.

On the other hand, the head of the Gusen crematory was drafting the reports concerning "*Brennstoffverbrauch"* (fuel consumption) in kilograms, and in one of these documents, the coke consumption from September 26 to October 15 is indicated as being exactly 9,180 kg,[60] which signifies that one wheelbarrow of coke corresponded to an average of 60 kg. And with this, all of Zimmerman's suppositions collapse.

37. Zimmerman objects that

> *"the practice of multiple cremation was known outside of Germany well before World War II. In Osaka, Japan in the 1880s there were 20 cremation ovens, each of which could incinerate three bodies simultaneously in a period of four hours."*

I point out first of all that the average duration for the cremation of one corpse here is 80 minutes per corpse, and *not* 25 minutes or less. Here Zimmerman offers another sample of his incompetence. By completely ignoring cremation history and crematory installations, our professor cannot know that there existed collective ovens, which could cremate several corpses simultaneously indeed, but which had a completely different design than those at Auschwitz. Any comparison in this regard is therefore meaningless.

5. Zimmerman's Methodical Errors

38. Zimmerman dedicates a sprawling two-page paragraph to the question of the "Necessity of the Crematoria." He claims:

> *"The only way to test the necessity is to compare it to deaths in other concentration camps and the cremation capacity of those camps"*

Zimmerman thereupon makes a comparison between the ovens of Mauthausen-Gusen and those of Auschwitz and concludes that the crematories of Auschwitz had an excessive cremation capacity for prisoners deceased from natural causes.

However, if he had made his comparison with the crematory of Buchenwald, he would have arrived at the opposite conclusion. The two Topf triple-muffle ovens of that crematory went into operation during the second half of August and the beginning of December 1942. From May 3 to November 29, 1942, 1,691 prisoners died at Buchenwald, averaging approximately 241 per month, with a maximum point of 335 (August 3 to 30). The average population of the camp was approximately 8,660 prisoners, with a maximum of 9,777 (November 2 to 29).[61] Making the same calculations as Zimmerman did (based upon data of 26 cremations per muffle and day), the ovens would have

[60] Mauthausen Museum Archives, 3 12/31, 350.

[61] *Konzentrationslager Buchenwald*, Thüringer Volksverlag GmbH, Weimar, no date, p. 85.

been able to cremate (26×6×30=) 4,680 corpses per month, which is almost 14 times more than the maximum mortality actually registered!

Yet in the case of Auschwitz – still following Zimmerman's reasoning – the cremation capacity would have been (30,000÷9,000=) approximately three times greater than the maximum mortality.

So for a camp, which was *not* for extermination, the German authorities "anticipated" a mortality rate 14 times higher than the actual maximum, but for a camp which alleged *was* for extermination, the German authorities "anticipated" a mortality rate merely three times higher than the actual maximum!

39. Contesting the alleged "Typhus Myth," Zimmerman objects that "only 2,060 of the 68,864 deaths were from typhus," claiming that the cause of death appearing on the "death certificates" was very often falsified by the SS, and Professor Zimmerman concludes:

> *"How then can they be explained if the stated causes do not conform to physical reality? The only explanation is that camp authorities were engaged in a massive killing campaign of registered prisoners."*

Well, two facts are incontestable: that at the beginning of July 1942 a typhus epidemic broke out in Auschwitz, and during that month the mortality of the prisoners increased enormously. Now if Professor Zimmerman doesn't want to see a cause and effect connection between these two facts, that's his business. Of course it's true that some survived the typhus epidemics, such as Lucie Adelsberger and Ella Lingens Reiner, but it's equally true that the poor inmates who were not "prominent" – even if they survived *that* sickness – because of the general prostration of their physical condition, the weakening of their immune system, and because of the scarcity of medicine, they could easily incur other ailments and die from other causes. In my opinion this explains the relatively small number of deaths from typhus in the *Sterbebücher* (death books) of Auschwitz.[62]

Regarding babies that "were said to have died from 'decrepitude'," it is difficult to believe that doctors were falsifying in this idiotic way. Grotum and Parcer, Zimmerman's sources, indicated one single case of this kind,[63] even by making a computerized analysis of the data contained in the *Sterbebücher*. It is reasonable to assume that this one is the only one.[64] This is therefore most likely an ordinary error.

---

[62] In many cases, death of typhus victims occurred due to various organ failures caused by what is called typhus. If merely such organ failure was reported in the death records, then this does not mean that typhus did not exist. Similar today, if someone dies of AIDS, medical records might hardly ever say "Aids" or "HIV" but name the actual medical reasons, which can be rather complex. That does not mean the victim did not die of what we popularly refer to as "Aids." Editor's remark.

[63] Staatliches Museum Auschwitz (ed.), *Sterbebücher von Auschwitz*, Saur, Munich 1995, p. 242.

[64] It should have been very easy for these two analysts to indicate the exact number of these cases, just as they had indicated the exact numbers concerning a great deal of other data.

40. One last observation concerning the connection between the deceased and the coke supplies to the crematories. Zimmerman writes in conclusion of his analysis of the problem:

> *"Therefore, the month of the second-highest recorded coke delivery also corresponds with the month of either the lowest or one of the lowest monthly death totals of registered prisoners."*

This fact, which Zimmerman considers to be an implacable contradiction, is nevertheless perfectly normal, as I explained in point 36. Few cremations signify major cooling of the oven and major consumption of fuel for maintaining operating temperature. Many cremations signify instead minor cooling down of the oven.

II. The End of John C. Zimmerman

1. Introduction

Zimmerman's article "Body Disposal at Auschwitz: The End of the Holocaust Denial" was all too clearly an ideological attack against revisionism without any historical or technical foundation, which is why I limited my initial refutation to the essential points reproduced above. But Prof. Zimmerman, who is clearly out to prove a predefined image, probably in league with the so-called "Holocaust History Project," immediately responded with another even more arrogant and senseless article: "My Answers to Carlo Mattogno." This required a radical refutation of Zimmerman's lies, which is accomplished by the following article. Not knowing how to counter my arguments, Prof. Zimmerman disappeared entirely from the stage after this rebuttal as I indicated above. My refutation did not only upset Zimmerman, but also the ranks of his fans, who, after several years of pondering, established a kind of "Aid Committee" with the purpose to rehabilitate Zimmerman by discrediting me with further lies. I have addressed their assault in another study, which complements the observations made here.[65]

2. Zimmerman's "Errors"

In my response, I immediately exposed the absurdity of the claim of this professor who poses as a specialist in the correct interpretation of German

[65] C. Mattogno, "The Zimmerman Aid Committee and their Bag of Tricks," *The Revisionist* 3(1&2) (2005), in preparation.

documents but doesn't even understand the German language. In addition I have revealed his ignorance of historical and technical matters as well as his bad faith which I have documented with many examples. Our professor has received the blow and has been exposed as a blatant liar and has been constrained to admit his "errors" in his "My Response":

1. His "error" regarding the date of Bischoff's letter of January 13, 1943, to which he ascribed the date June 13 (point 11 of my "Observations"). Zimmerman's excuse is that he had at his disposal "a copy of the original German document," he reported the date appearing in the English translation published by the NMT, so that he "never cross checked the date from the translation. A careless error, to be sure, but an honest one." That is how he provides another proof of his superficiality and dilettantism.
2. His "error" regarding the furnace at Mauthausen, which was constructed in January 1945 (point 45): "Relying on a *secondary source*, I gave the date of July 1944." And this is just what I reproached him for: using secondary sources.
3. His "error" regarding the letter of Topf dated July 14, 1941 (point15):

   "In citing a report by Topf engineers dated July 14, 1941 describing the efficiency of an oven as being able to burn 10 to 35 bodies in ten hours, I believed that it was a different report than the one Pressac cited from the same day which talks about burning 30 to 36 bodies in 10 hours."

   One more proof of the superficiality and dilettantism of our professor, as well as proof of his rash tendency to refer to secondary sources.
4. His "error" regarding the "testimony" of M. Morawa. To tell the truth, Zimmerman is reluctant to admit this "error," and the reason is easy to understand: his inability to interpret even the sources reported by D. Czech in her *Kalendarium*[24] is truly the peak of his dilettantism! Zimmerman justifies himself as follows:

   "I have not been able to ascertain whether this was Morawa based on information I received from Auschwitz State Museum."

   So Zimmerman would want us to believe that not even the Auschwitz Museum succeeded in resolving this tremendous "enigma"! Now, according to the Auschwitz Museum, Morawa was shot dead at Mauthausen on April 3, 1945.[66] When and to whom did he give this phantom "testimony"?

   Danuta Czech, in her *Kalendarium*, reports the reference: "APMO, D-Mau-3a/16408, Häftlings-Personal-Karte von Mieczyslaw Morawa."[67]

   Therefore our professor takes a "Häftlings-Personal-Karte" (inmate personnel card) for a "testimony"! Another brilliant example of his crass ignorance and dilettantism.

---

[66] *Inmitten des grauenvollen Verbrechens. Handschriften von Mitgliedern des Sonderkommandos*, Verlag des staatlichen Auschwitz-Birkenau Museums, 1996, p. 37, note 28.

[67] D. Czech, op. cit. (note 24), p. 432.

5. His "error" regarding the mix-up of the year 1814 with 1871.
6. His "error" regarding the 4 barracks of Birkenau.
7. His "error" regarding the complete destruction of so-called *Bunker 2*, without leaving any trace, from which it emerges that our "expert" on Auschwitz has never visited the camp!
8. His "error" regarding Zimmerman's attribution of Pressac's simple *calculation* to Kurt Prüfer! This shows once more that Zimmerman does not even comprehend his own sources!
9. His "error" regarding the *Aktenvermerk* of June 16, 1944:
   "I thought that the reference to BA I and II was to Birkenau Kremas I and II, known in most literature as Krema II and III."
   Therefore, our "expert" on Auschwitz has confused *Bauabschnitte*, construction sectors in the Birkenau camp, with the crematoria! Yet another example of his astonishing ignorance!
10. Besides, Zimmerman has made another "error" in asserting that "Mattogno never addressed the issue of open air burnings."
11. Another "error" admitted by Zimmerman relates to his travesty of what I wrote on the so-called *Bunker* of Birkenau:
    "Mattogno correctly states in this regard that in the full quotation he specifically uses the word 'designation' when referring to these structures."

This list is far from complete. He is prudently silent on other obvious "errors." For example, he is silent on the translation regarding the flames of the triple-muffle oven which went "round the two side muffles." He reported this absurdity without the least comment, showing that he does not have the faintest idea of how these triple-muffle ovens worked – and not only these.

He says nothing of the "errors" concerning the "gasoline" of Frölich (point 7 of my "Observations"), or the "kerosene" of Erichsen (point 8), nor of the interpretative error concerning an emphasis in the only version of the file memo of August 21, 1942, which he knows (point 19). Zimmerman nevertheless admits:

"in the "Body Disposal" *study I made some errors to be discussed later on, on several occasions relied on inaccurate sources – in one case very badly (in one case resulting in a significant error)."*

Perhaps with these admissions Zimmerman wants to give the impression that he is an unbiased researcher who can recognize his own mistakes, but the fact remains that he has been compelled to this by the force of my arguments. How true this is can be seen from the fact that he has not admitted his most serious "error," which I did not point out in my "Observations" because at the time I did not yet have access to the source he cited.

Zimmerman writes in "Body Disposal":

"Kurt Prüfer, builder of the ovens, was asked why the brick linings of the ovens were damaged so quickly. He replied that the damage resulting

after six months was 'because the strain on the furnaces was enormous.' He recounted how he had told Topf's chief engineer in charge of crematoria, Fritz Sanders [sic]*, about the strain on the furnaces of so many corpses waiting to be incinerated as a result of the gassing. Sanders stated that he had been told by Prüfer and another Topf engineer that the 'capacity of the furnaces was so great because three (gassed) corpses were incinerated (in one oven) simultaneously.'"*

He adds in a footnote:

"Prufer said that two bodies were simultaneously incinerated in his presence."

The reference is to the interrogations of the Topf engineers on the part of a Soviet inquiry of SMERSH between 1946 and 1948. An excerpt was published by Gerald Fleming,[68] from which Zimmerman takes his citations (notes 121f.).

In reality Kurt Prüfer – according to Fleming – had stated the very *opposite* of what Zimmerman attributed to him by means of a despicable manipulation. On page 200 of the cited work, this is how Fleming summarizes part of the interrogation which K. Prüfer underwent on March 5, 1946[69]:

"Normal crematoria[70] *work with prewarmed air*[71] *so that the corpse burns quickly and without smoke. As the crematoria in the concentration camps were constructed differently, this procedure could not be used.*[72] *The corpses burned more slowly and created more smoke, necessitating ventilation.*[73]

Question: How many corpses were incinerated in Auschwitz per hour?

Answer: In a crematorium with five furnaces and fifteen muffles, fifteen corpses were burned." (my emphasis)

During the interrogation of March 19, K. Prüfer declared:[74]

"I spoke about the enormous strain on the overused furnaces. I told Chief Engineer Sander: I am worried whether the furnaces can stand the excessive usage. In my presence two corpses were pushed into one muffle instead of one corpse. The furnaces could not stand the strain." (my emphasis)

Recapitulating, Kurt Prüfer stated that:

70 The ovens of civilian crematoria.

71 The pre-heating of the air for combustion took place in the recuperator.

72 Because these ovens were without recuperators.

73 Error by the Russian translator. The ovens of crematories II & III were equipped with blowers.

74 G. Fleming, op. cit. (nope 68), pp. 206f.

1. The cremations in the concentration camp ovens took place "more slowly" than in civilian ovens.
2. In Krema II and Krema III of Birkenau (5 three-muffle ovens) it was possible to cremate 15 corpses in one hour, that is, the duration of a single cremation was one hour.
3. The attempt to simultaneously cremate two corpses failed because "the furnaces could not stand the strain."

These three statements alone constitute a radical refutation of Zimmerman's thermotechnical fantasies. I summarize and conclude that:

1. in order to prove the thesis of "multiple" cremations, Zimmerman quotes a second-hand declaration of Prüfer and omits the primary declaration of Prüfer himself.
2. For the same motive, Zimmerman quotes Prüfer's statement in which he "said that two bodies were simultaneously incinerated in his presence," but omits the statement which follows: "The furnaces could not stand the strain."

These surgical omissions are unequivocal proof of Zimmerman's complete and deliberate deceptiveness.

I later found out that Fleming's translation ("enormous strain," "the furnaces could not stand the strain") is wrong, too. Particularly the sentence "pječi nje spravljalis' s toi nagruzkoi" does not mean "the furnaces could not stand the strain" but "did not cope with that load," that is to say, to the load of two to three corpses inserted into one muffle; "nagruzka" designates in fact the "load" of the oven. Prüfer therefore meant that the ovens did not succeed to cremate such a load in an economically advantageous manner if compared to a load of merely a single body per muffle.[75] This does, of course, not alter the fact of Zimmerman's own manipulations.

3. "Terminologies"

Pointing out in my "Observations" that in "Body Disposal" Zimmerman always talks of the *Bauleitung* of Auschwitz, I wrote that he:

> *"has no idea of the fact that the* Bauleitung *(Construction Office) was promoted to* Zentralbauleitung *(Central Construction Office) on November 14, 1941"*

Zimmerman objects that I myself used the term "Bauleitung" in 1996 concluding:

> *"Apparently, Mattogno believes that he is exempt from having to use correct terminology."*

[75] For more details see my article already quoted, op. cit. (note 65).

In 1998 I published the book *La "Zentralbauleitung der Waffen-SS und Polizei Auschwitz,"*[76] which is the most profound study that exists on this most important Auschwitz office. Since 1998 I obviously no longer make the blunder of using the terms *Bauleitung* and *Zentralbauleitung*, which Zimmerman by contrast continues to use. Surprising, is it not, that he persists in his pathetic attempt to refute my writings on Auschwitz but ignores one of my important studies on the subject! And it is precisely this ignorance that I wanted to emphasize in the above way.

Not only this, but – as we will see below – Zimmerman cites a passage from a work published in 1996 by the Auschwitz Museum, in which it is clearly stated that already in July 1942 the Construction Office of Auschwitz had been promoted to the rank of Central Construction Office, and he is still ignorant of the difference between the two terms, paying not the slightest attention to them and continuing his blunder to speak of the Construction Office, evidently because he feels himself "exempt from having to use correct terminology."

4. "Lack of Documentation"

The documentation of the Central Construction Office kept in Moscow no doubt has some gaps. The problem is, to whom are these gaps due? Zimmerman maintains that:

> *"the lack to date of any such information is more incriminating than all of the evidence that does exist on Auschwitz."*

This presupposes that the gaps are due to the SS of Auschwitz, which is precisely what needs to be proved. Zimmerman claims that:

> *"all documents relating to crematoria construction were under a blanket order of secrecy going back to June 1942."*

He repeats that again when writing:

> *"there was a blanket order of secrecy on building projects dating from at least June 1942."*

Therefore, all the documentation relating to the crematoria were "*geheime Sache*" (secret matters) or "*geheime Reichssache*" (state secrets) as the SS put it. But why then did the SS not destroy the entire archive of the Central Construction Office, which contains thousands of "secret" documents on the crematoria?

Jean-Claude Pressac was the first to look into this question. He formulated the following hypothesis:[77]

> *"The reason for leaving behind* [the archives] *as they were can perhaps be found in the personality of the SS lieutenant Werner Jothann, who was*

[76] Edizioni di Ar; Engl. see note 28.
[77] J.-C. Pressac, op. cit. (note 27), p. 1.

the second – and last – director of the Auschwitz [Zentral]*bauleitung. This architectural engineer had not personally been involved in the homicidal revamping of the crematoria at the end of 1942 and in early 1943 under the first director, SS captain Karl Bischoff. Unaware of the 'explosive' character of the files concerning those changes, Jothann left without worrying about them and did not order them to be destroyed."*

Later, Robert Jan van Pelt returned to this topic with an argument of a disconcerting banality:[78]

"When the Germans burned the archives of the camp Kommandantur prior to their evacuation from Auschwitz in January 1945, they overlooked [!] *the archive of the building office that had been closed some months earlier, and as a result the material in this archive was found more or less intact."*

SS-Obersturmführer Jothann succeeded *SS-Obersturmbannführer* Karl Bischoff as head of the Central Construction Office on October 1, 1943, when the crematoria of Birkenau were supposedly carrying out exterminations at full throttle. Therefore, even if he had not come to know the allegedly "explosive character of the files," he could not have ignored the alleged reality of the mass exterminations that went on in buildings, for which he was now directly responsible. He actually knew the contents of those files perfectly well, because in the transfer document signed by him together with Bischoff on January 5, 1944, there is a list of all buildings, for which he was now responsible, including crematoria II and III with their respective documentation.[79]

As for Bischoff, he had become head of the Construction Inspection of the Waffen-SS and Police Silesia, which was in direct control of the Auschwitz Central Construction Office. He therefore remained Jothann's immediate superior in the hierarchy of the SS-WVHA. Bischoff himself could not possibly ignore the "explosive character of the files," and one telephone call from him would have been enough to get Jothann to destroy them. But things are quite different.

The files of an SS office were not the personal property of its director. They belonged to the State, and therefore only the SS-WVHA could decide on the fate of the various archives. As results from numerous files kept in the Archives of Military History in Prague, documents classified as "geheime Sache" (secret) and "geheime Reichssache" (top secret), belonging to *Einsatzgruppe VII* of *Organisation Todt* were destroyed at the end of January

---

[78] R.J. van Pelt, *The Case for Auschwitz. Evidence from the Irving Trial*, Indiana University Press, Bloomington/Indianapolis 2002, p. 207. When working on this book, van Pelt also had the support of John Zimmerman (p. XIV) and that is plain to see!

[79] "*Übergabe der Zentralbauleitung durch SS-Sturmbannführer (S) Bischoff an SS-Obersturmführer (F) Jothann* and *Verzeichnis der Akten*." January 5, 1944. RGVA, 502-1-48, pp. 42-49.

1945 by order from above, and a "*Vernichtungsprotokoll*" (record of destruction) listing all the documents destroyed was drawn up.[80]

At Auschwitz, the destruction order for the archive of Central Construction Office had to come from the head of Office Group C of SS-WVHA, who had approved all camp projects, including the one on the alleged "homicidal revamping of the crematoria."

But in that case, as Zimmerman asserts, the files would have been classified "top secret" and the head of Office Group C of SS-WVHA would have ordered their destruction. Instead, they were neither destroyed by ignorance nor by carelessness, and the obvious conclusion is that the SS authorities considered the archive of the Central Construction Office to be totally innocuous.

What is Zimmerman's explanation?

As I demonstrated in the above-mentioned book on the Central Construction Office, the organization of this office was most complex and also decentralized. Already by the beginning of 1943 it was subdivided into 5 Construction Offices, and the Central Construction Office itself comprised 14 section (*Sachgebiete*).[81] Each Construction Office and each section had its own archive. What we now call "the archive of the Central Construction Office" originally constituted some tens of archives. Like all documents, those on the crematoria were drawn up in several copies (the addressees were listed under the item "*Verteiler*" = distributor). Each copy was sent to the respective office, where it was archived. For example, Bischoff's letter of February 28, 1943, on *"KGL* [=POW camp]= *Krem. II und III BW 30 (elektr. Aufzüge)"* was drawn up in 6 copies and sent to *"Bauwirtschaft," "Rechnungslegung," "Baultg. KL," "Baultg. KGL," "Sachbearb."* and *"Registr. BW 30."*[82] Copies of the letter of March 29 on *"Krematorium II und III KGL, BW 30 u. 30a,"* were sent to *"Baultg. KL," "Baultg. KGL," "Bauwirtsch.," "Rohstoffstelle," "Handakte"* and *"Registr. BW 30 KGL."*[83]

So these two letters alone gave rise to 14 documents, which were archived in various offices. Several thousands of pages from the Central Construction Office kept at Moscow are in the form of carbon copies of this type.

The original archive comprised many folders (*"Ordner"*), each of which held the documents relating to one or more *Bauwerke* (construction sites). For example, the *"Ordner"* no. 15 contained *"7 Zeichnungen Krema II u. III,"* apart from *"Schriftswechsel"* and *"Tagelohnzettel."*[84]

Now it is certain that "secret" documentation on the crematoria exists. It contains all the designs for the crematoria and also a very rich correspon-

---

[84] RGVA, 502-1-48, p. 45.

dence. It is just as certain that there are evident gaps, for example all the technical designs for the ovens, the reports on the cremation tests, and the reports on the consumption of coke for 1944.

According to Zimmerman's thesis, the SS, instead of destroying in bulk all this "secret" documentation, had spare time and patience to leaf through every *"Ordner"* relating to the crematoria – which were found in all camp archives – and pick out and destroy individual documents regarded by them as compromising while leaving the rest intact, beginning with the plans for the crematoria themselves! Finally, they would have had the crematoria blown up in order to obliterate traces of their "crimes" but at the same time they would have left alive for the Soviets about 7,000 eyewitnesses of these "crimes"! Truly watertight logic!

On the other hand, the Soviets, who had to propagate the thesis of monstrous Hitlerian exterminators of millions of people, had all the interest, time, and resources to leaf through every *"Ordner"* on the crematoria, which were found in all camp archives, and pick out individual documents useful (or detrimental) for their propaganda while leaving the rest intact, beginning with the plans of the crematoria themselves. Which of these two hypotheses is more rational?

Zimmerman continues:

> *"Mattogno has begun to hint that the Soviets have suppressed the records."*

The usual falsification: I simply said that the Soviets had *selected* the documents. Perhaps for Zimmerman, by a kind of conditioned reflex, *selection* is equivalent to *suppression*: If "selected" detainees are eliminated, so are selected documents!

Playing on this falsification, Zimmerman then raises objections as follows:

> *"The interrogation occurred in March 1946. Engineer Kurt Prufer, who built the Auschwitz ovens, stated that the Birkenau ovens could incinerate one corpse per hour and that brick lining on the ovens was damaged after six months because the enormous strain being placed on the ovens. Prufer's statement directly contradicted a Soviet report on this issue."*

What is more, Zimmerman confronts me with the case of the Auschwitz *Sterbebücher* (death books):

> *"Moreover, if the Soviets were really anxious to <u>suppress</u> unfavorable information, then the more likely candidate would have been the Auschwitz Death Books,* [because the Books document] *approximately 69,000 registered prisoners."*

– while the Soviets claimed that the total number of camp deaths was 4 million. In this way he only validates my thesis, because the interrogations of the Topf engineers, the *Sterbebücher*, and the entire documentation of the Central Construction Office remained *secret* (!) until the collapse of the Soviet regime, and they would still have remained so had this not happened. Why?

Until the collapse of the Soviet regime nobody knew of the existence of such documentation. So is it just as absurd to think that the missing documents were – certainly not "suppressed" – but, on account of their importance, transferred to a place more secure than an archive, and for this reason no one knew of their existence, as was earlier the case for all the other documents?

However that may be, the fact remains that my hypothesis is at least reasonable while one can certainly not say the same thing for his.

5. Prüfer and the "Enormous Strain" on the Crematoria

Above I cited the passage of Zimmerman regarding the Soviet interrogation of Kurt Prüfer. Here I wish to look at it from another point of view. Let us read it once more:

> *"The interrogation occurred in March 1946. Engineer Kurt Prufer, who built the Auschwitz ovens, stated that the Birkenau ovens could incinerate one corpse per hour and that brick lining on the ovens was damaged after six months because the enormous strain being placed on the ovens."*

Zimmerman summarizes the following passage from K. Prüfer's interrogation of March 6, 1946:[85]

> *"Q.: Why was the brick lining of the muffles so quickly damaged?*
>
> *A.: The bricks were already damaged after six months because the strain on the furnaces was enormous."*

We have here another error in translation. The Russian text of the interrogation[86] does not, in fact, speak of "the brick lining *of the muffles*," but of "*vnutri shamotnaja otdjelka tryb krjematorjev*," i.e. the "internal refractory lining of the *tubes* of the crematoria." The term "tryba" (tube) refers to the flue that went from the muffle to the chimney (in German *Rauchkanal* or *Fuchs*) and to the smoke ducts within the chimney (in German *Zug*).

In fact, the damages in question became apparent at crematorium II very early in its operation (and not after six months). On March 25, 1943, *SS-Untersturmführer* Kirschneck wrote a file memo about a meeting at Auschwitz on March 24 and 25 of the Topf representatives Prüfer and Schultze and representatives of Central Construction Office – Kirschneck himself and probably the civilian employee Lehmann. At that time, only the damage to the three forced draft units was on the agenda:[87]

> *"Because the three forced draft units have not, in any way, turned out to be useful and even suffered damage on account of excessive temperatures when they were first put into full operation, they will be removed at the expense of Topf & Söhne and taken back by this company."*

---

[85] G. Fleming, op. cit. (note 68), p. 202.
[86] Interrogation of K. Prüfer on March 5, 1946. FSBRS, N-19262, p. 37.
[87] APMO, BW 30/25, p. 8.

Later on it was discovered, however, that the refractory lining of the chimney had cracked or was damaged, and that even whole sections ("*ganze Gewölbeteile*") of the flues had collapsed.[88] Around the same time the refractory lining of the chimney of crematorium IV was also damaged, and Prüfer had to work out a new project for both chimneys, as results from a telegram sent by Bischoff to Topf on May 14, 1943:[89]

> *"Bring along calculations on heat technology and structurals of chimneys for crem*[atoria] *II and IV. Immediate presence of chief engineer Prüfer indispensable."*

As far as the cause of the damage is concerned, Prüfer's explanation was not only wrong, it was the exact opposite of the truth:[88]

> *"On the basis of the new drawings you have provided, we can see that the first project concerning the chimney did not take into account the different thermal expansion and the high temperatures that were foreseeable; this was done only now in the second project."*

On the other hand, this mistake was admitted by Prüfer himself:[90]

> *"On his last visit, he declared in the presence of the commander that the cause had been the stress caused by the firing of only some of the ovens, which had not been taken into account in the original project."*

The Central Construction Office agreed with this explanation and accepted that for the new chimney

> *"the possible stresses arising from the heating of individual ovens have been accounted for by the elasticity of the brick structure."*

The damage was therefore not due to an "enormous strain," but was caused on the contrary by the fact that only some of the ovens had been operated.

Crematorium II (and III) had six flue ducts, five for the five crematorium ovens and one for the garbage incineration oven. The flues fed in pairs into the three ducts that made up the chimney: flues of ovens 1 and 2 fed into the duct on the left, flues of ovens 3 and 4 into the central duct, and the flues of oven 5 and of the garbage incineration oven fed into the duct on the right. Each of the three chimney ducts was linked to a forced-draft blower by means of a short vertical by-pass. At the outlet of the three vertical ducts, below the corresponding blower, a movable plate allowed to operate the chimney under natural draft by closing the vertical duct.

The direct cause of the damage to the flues was the excessive temperature of the combustion gases, whereas the "heating of individual ovens" contributed to the damage to the refractory lining of the chimney by causing high thermal stresses due to the fact that the walls of the ducts were overheated on one side but stayed cool on the other. We should underline here that this

---

88 Letter from *Zentralbauleitung* to Topf dated July 17, 1943. APMO, BW 30/34, p. 17.

89 "*Dringendes Telegramm*" (urgent telegram) from Bischoff dated May 14, 1943. APMO, BW 30/34, p. 41.

90 *Aktenvermerk* by Jährling dated September 14, 1943. RGVA, 502-1-26, pp. 144-146.

"heating of individual ovens" is decidedly at variance with the testimony of H. Tauber and Danuta Czech's *Kalendarium*, which states that the ovens of crematorium II were not only running 24 hours a day but operated even *after* the damage mentioned had occurred! Henryk Tauber has in fact declared in this connection:[91]

> *"During the cremation of this first transport in mid-March 1943, we worked without interruption for 48 hours, but did not succeed in burning all the bodies, because in the meantime a Greek convoy that had just arrived was also gassed.* [...] *On average, we incinerated 2,500 corpses a day."*

I will end this item with one more observation: according to K. Prüfer and as quoted by Zimmerman, "the Birkenau ovens could incinerate one corpse per hour." How does Zimmerman reconcile this statement with his own claim of a duration of 25.2 minutes for a cremation at Gusen and with "15 minutes per body" at Birkenau?

6. "Falsifications" and "Suppressions"

In order not to waste too much time with this dilettante, I ignored in my "Observations" several of Zimmerman's impostures. In his reply he returns to the same deceptions. The impudence of this individual is intolerable and deserves an adequate response.

6.1. The *Gasprüfer*

In "Body Disposal" Zimmerman wrote:

> *"Mattogno argued that this document*[92] *was a forgery because the type of gas detector mentioned in the memo was not the one which would have been used to detect prussic acid. Auschwitz: The End of a Legend, p. 66.*[93] *However, Pressac also realized that this was not the same type of gas detector which would have been used to detect prussic acid."*
>
> *"The letter only shows that Topf was ignorant as to the type of gas detector which would be needed. The real problem for Mattogno was to explain why the oven builders would know it to be necessary to have such a device for a crematorium which several weeks earlier was stated to have a 'gassing cellar.' Since he could not find any such explanation, he reverted to the familiar denier tactic of labeling anything which cannot be explained as a forgery"* (Zimmerman's note 76)

In "My Response" he returns to the argument affirming:

---

91 Deposition by H. Tauber dated May 24, 1945, in: J.-C. Pressac, op. cit. (note 25), p. 494.
92 The letter of Topf of March 2, 1943.
93 C. Mattogno, in G. Rudolf (ed.), op. cit. (note 15), p. 160f.

"Elsewhere he has argued – without any proof – that the Soviets had altered a document from the captured Bauleitung archives to attempt to link Zyklon B to Krema II."

Considering Zimmerman's crass ignorance regarding historical and technical matters, he perhaps truly believes in the existence of a *Gasprüfer* (gas testers) for hydrogen cyanide! In *Auschwitz: The End of a Legend* (pp. 119-122)[94] I reproduced each page from the most important German engineering manual of the 1930's, from which it emerges that the *Gasprüfer* were simple analyzers of combustion gas and so could have been used only for the crematory ovens. On p. 123,[95] I reproduced a letter of Tesch & Stabenow, in which the "gas detector" for hydrogen cyanide was called by its true name: *Gasrestnachweisgerät.* On p. 124,[96] I published a photograph showing that a *Gasrestnachweisgerät* was found at Auschwitz by the Soviets; on pages 105 and 106,[97] I provided the precise description of its constituent elements and of the usage of a *Gasrestnachweisgerät.* Instead of accepting the strictly *documented* conclusions that the *Gasprüfer* had nothing to do with hydrogen cyanide, Zimmerman claims to prove the opposite by appealing to Pressac ("However, Pressac also realized […]") Here our professor gives another brilliant sample of his bad faith. In fact, Pressac wrote:[98]

"The detection of residual hydrocyanic gas would have been performed with a chemical method and not with the ten gas testers requested too late to be delivered on time."

But the French historian not only did not explain what this "chemical method" was (and how the Central Construction Office came into its possession), he also did not produce any archival reference or any other evidence for it.

Hence, when it does not suit Zimmerman, he rejects the affirmations of Pressac, because they are not documented, as in the case of the Birkenau camp's expansion to hold 200,000 detainees ("however, Pressac did not cite a source"), but when it suits him, he accepts Pressac's assertions without any source, even when they are patently false!

Zimmerman next falsifies the significance of the letter under consideration. It is untrue when Zimmerman claims that it "shows that Topf was ignorant as to the type of gas detector which would be needed." It only shows that Topf did not manufacture the *Gasprüfer*, and for that reason had requested them already two weeks earlier "from 5 different companies."[99] This falsification tries to confirm the false thesis of the existence of *Gasprüfer* for hydrogen cyanide. If Topf, which produced combustion systems, "was ignorant as to the type of

94 Ibid., p. 184
95 Ibid., p. 185.
96 Ibid., p. 186.
97 Ibid., p. 171.
98 J.-C. Pressac, op. cit. (note 27), p. 73.
99 RGVA, 502-1-313, p. 44.

gas detector which would be needed," it follows that there existed different types of *Gasprüfer*! This is what may be called coherence within the lie.

Once he thinks he had established with this deceit that *Gasprüfer* referred to hydrogen cyanide, Zimmerman wonders why some simple constructors of crematory ovens had to be enlightened about "gas detectors," which were used for hydrogen cyanide, and since I was in no position to provide an answer, he claimed that I simply declared the document "a forgery." Here Zimmerman gives another demonstration of his bad faith, deliberately misrepresenting what I wrote in the article "The 'Gasprüfer' of Auschwitz," which was published on the web on February 18, 1998.[100] Having placed the document in its context, I concluded with the words:[101]

> *"The historical context would therefore strengthen Robert Faurisson's interpretation, wherein these – presumed, I might add – display devices were used for normal disinfestations of the crematorium. In support of this interpretation, it could be added that according to the general provisions of the SS camp physician, 200 detainees who were working in late February 1943 in Crematory II would have been able to resume their activity only after a disinfestation of their bodies and of their work-place,* i.e*., Crematory II."*

Zimmerman cites this article, but limits himself to the following sentence:

> *"As usual, he presented no evidence for his latest peregrination"*

("Body Disposal," note 76)

Therefore our professor lies knowing that he lies. If I concluded that the Topf letter "has been produced by an amateurish forger, who concocted a new term 'display devices for hydrocyanic acid residues,'"[102] it was certainly not because the letter created some problem. On the contrary, following the interpretation of Pressac-Zimmerman, it would have been a further confirmation of my thesis that "the term Vergasungskeller designates a disinfestation basement."[103] So, if I arrived at this conclusion it was only because the relevant documents provoked historical problems so serious and so numerous that the only reasonable solution seemed to me to be this one. I explained these problems in more than one page under the paragraph heading "Problems Pressac left unresolved" (pp. 145f). Zimmerman, being incapable of resolving them, cunningly tries to make them disappear with his squalid lies. On the basis of

[100] Now at www.vho.org/GB/c/CM/gasprufer.html (version of Nov. 28, 2000); an expanded and updated version was published as "The 'Gas Testers' of Auschwitz" in *The Revisionist*, 2(2) (2004), pp. 140-154.

[101] Ibid., version in *The Revisionist*, p. 144. The last phrase "and of their work-place, i.e. Crematorium II" is my own comment.

[102] Ibid., p. 148.

[103] *Auschwitz: The End of a Legend*, op. cit. (note 15), p. 64; in G. Rudolf (ed.), ibid., p. 156. Here I recalled that the gas chamber operated with hydrogen cyanide of BW 5a and 5b was named "*Vergasungsraum*" in a document of October 1941.

new documents, I have gone more deeply into the question of the "*Gasprüfer*" (gas testers) and the "*Vergasunskeller*" (gassing cellar) in later articles.[104]

6.2. The Central Construction Office Letter of June 28, 1943

Regarding this letter Zimmerman writes:

> *"He also argued – again without any proof – that the Soviet suppressed the 'correct' version of the Bauleitung report of June 28, 1943, which states that 4,756 bodies could be incinerated in a 24 hour period. Mattogno theorizes that this report was corrected in a subsequent report."*

In this case, too, our professor refrains from quoting my thesis correctly. In the article "The Auschwitz Central Construction Headquarters letter dated 28 June 1942: An alternative Interpretation,"[105] I was interested in the origin of the letter as well as its bureaucratic significance. Pursuing this, I demonstrated by means of the documents that the letter in question is "bureaucratically senseless," since from one point of view it lacked the one date, which constituted the reason for its existence (as appears under its "subject matter"[106]), that is, the communication of the *Übergabeverhandlung* (transfer negotiation) of Krema III. To contrast this, I may point out that on January 30, 1943, R. Höss asked the head of Central Construction Office for a "report on the capacity of all crematoria," and Bischoff's reply obviously concerned the "capacity of all crematoria" and not "completion of crematorium III."[107] From another point of view, the letter of June 28, 1943, contains a date that, bureaucratically speaking, has nothing to do with the reason for the letter's existence, that is, an indication of the cremation capacity. I repeat, the problem is purely bureaucratic and has nothing to do with the figures mentioned in the document. The problem would be there even if the numbers were ten times fewer, because it is the communication in itself of the cremation capacity, which is a bureaucratically inexplicable anomaly.

This drew me to the conclusion that the letter, which we know is an erroneous version that was subsequently substituted by a correct version, in which the *Übergabeverhandlung* (transfer negotiation) of Krema III was reported and in which the cremation capacity was *not* mentioned, as the arrangements of Kammler of April 6, 1943, prescribed.[108] As to the cremation capacity, I

wrote that the numbers indicated in the letter are authentic, but that does mean that they are correct, and I explained the reason for this distinction. Below I will demonstrate that the numbers are technically absurd.

Instead of discussing my analysis of the document, and instead of explaining the serious bureaucratic anomalies which it presents, Zimmerman limits himself to quoting my conclusions out of context in order to make his readers believe that the correction, of which I spoke, referred to the cremation capacity.

Zimmerman's "real problem" is that he, like all dilettantes, is incapable of critically analyzing a document. He accepts everything blindly and opportunistically and pretends that the problems, which the document creates, do not exist. Not only that, he also has the impudence to reprove the person who discovers them, who understands their importance, and who searches to resolve them.

7. The Gusen Oven

7.1. Coke Consumption

In "Body Disposal," Zimmerman wrote:

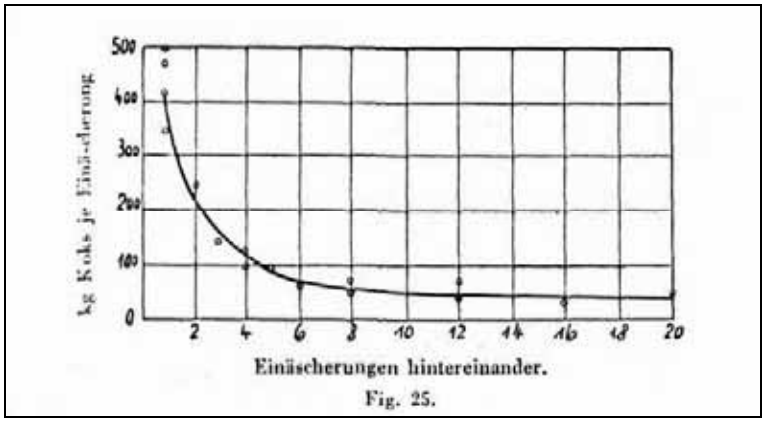
"The Gusen file that Mattogno relied on shows the amount of coke in the form of wheelbarrows used to transport it to the ovens. At the top of the page it states 'Karren Koks,' or wheelbarrows of coke. Below this heading it states that one wheelbarrow equals 60 kilograms. However, this weight is only stated for the period from September 26 to October 15, 1941. During this period, 203 bodies were cremated using 153 wheelbarrows. This means that 9,180 kilograms (60 kilograms times 153 barrows) incinerated 204 bodies at 45 kilograms per body. The 9,180 number appears on a backup page of this file where the 153 wheelbarrows are multiplied by 60 kilograms.

There is some reason, however, to suspect that each wheelbarrow did not contain 60 kilograms of coke but that this was a generic number based on the theoretical maximum that each delivery could hold. In other words, 60 kilograms was attached to each wheelbarrow regardless of actual weight.

For example, on October 3 eleven bodies were incinerated using 13 wheelbarrows. At 60 kilograms per wheelbarrow it would have taken 71 kilograms per body. However, on October 15, 33 bodies were incinerated using 16 wheelbarrows, or 29 kilograms per body."

---

crematoria Leistung," which has been corrected in the current version (note 105): "with indication of the Übergabeverhandlung and without crematoria Leistung."



In my "Observations" I mentioned a report on the consumption of coke used by the Gusen oven, according to which "from Sept. 26, 1941 to Oct. 15, 1941, 9,180 kg of coke were used."[109] Here "kg" are explicitly mentioned so that it is clear that the 153 "wheelbarrows of coke" consumed during this period correspond to exactly 9,180 kg, whence each "wheelbarrow" was exactly equivalent to (9,180 ÷ 153 =) 60 kg. Therefore this demolishes Zimmerman's hypothesis solely on *documentary* grounds.

The claim that one wheelbarrow of coke was equivalent to 60 kg only during the period September 26 to October 15 is another of Zimmerman's lies. The list of cremations for this period is a sheet of paper divided into two parts: The registrations for the period September 26 to November 3 are on the left, those for November 4 to 12 on the right. Each part is in turn subdivided into 4 columns carrying the designations "Uhr," "Datum," "Leichen," "Karren Koks 1 K. = 60 kg." The fourth column in the left-hand part of the document (like the first three) extends to November 3 and continues in the right-hand part until November 12.

Now as to the part on the left, it is clear that the designation "Karren Koks 1 K. = 60 kg" refers to the *entire* column, until November 3. By breaking up the logical sequence of the table, Zimmerman, on the other hand, claims abusively that it holds only up to October 15. And it is just as clear that these designations are valid for the right-hand part, which is a continuation of the part on the left. It is true that the fourth column of the right-hand part only has the wording "Karren Koks," but what need was there to repeat that one wheelbarrow of coke was equivalent to 60 kg? Granted for the sake of the argument that the wheelbarrows in the column on the right would be equivalent to less than 60 kg, they must nevertheless have always contained a *uniform* quantity, since the head of the crematorium had to draw up the report on coke consumption in kilograms (or in *Zentner* = 50 kg; see below). Had the 249 wheelbarrows used for the registered cremations in the right-hand part been continued, showing for example 20 kg, 35, 55, 40, 60, 25 kg of coke and so on, how would the head of the crematorium have calculated the total consumption? For the same administrative reason, had the wheelbarrows mentioned in the right-hand part of the report contained a uniform quantity less than 60 kg, there would have been an indication of the relative weight in the fourth column; for example: "Karren Koks 1 k. = 40 kg."

The hypotheses of Zimmerman are therefore unsustainable. As a confirmation of this, I offer another argument. As I demonstrated above, documentation alone assures us that for the period form September 26 to October 15 the wheelbarrows each contained exactly 60 kg of coke. During this period, 193

[109] Point 36 of my response to Zimmerman. The source of the document is: AMM, 3 12/31, 350.

III. 1: *Chart by Prof. Dr. P. Schläpfer on coke consumption for subsequent cremations.*

corpses were cremated with a consumption of 9,180 kg of coke, which corresponds to 47.5 (=9,180 ÷ 193) kg per corpse.

677 corpses were cremated in the period from October 31 to November 12 with 345 "Karren" of coke. Since Zimmerman asserts that the weight of 60 kg of coke for each wheelbarrow was "the theoretical maximum that each delivery could hold," it follows that each wheelbarrow of coke had to weigh less than 60 kg. Nevertheless, assuming the weight of 60 kg, the coke consumption for the cremation of 677 corpses during the above-mentioned period comes to about 30.6 (=60×345÷677) kg. According to Zimmerman, the consumption was still less. But then why was the average consumption of coke 47.5 kg?

In his profound ignorance of thermotechnical questions on crematory ovens heated with coke, Zimmerman is shockingly ironic about the experimental *fact* established in all the crematoria fitted with coke ovens that the coke consumption per corpse varied with the number of cremations.

For example, the chart *"Einäscherungen hintereinander,"* published by professor P. Schläpfer in 1936[110] and compiled on the basis of practical experiments, shows a coke consumption of over 400 kg of coke for the first cremation in a cold oven, of around 200 for the second, and a little more than 100 kg for the fourth. Starting from the eighth cremation, the curve indicating the coke consumption tends to level out and at the twentieth and final cremation studied, the consumption of coke resulted in about 37.5 kg.[111] This signifies that 20 discontinuous cremations carried out on various days separated from one another would have needed over 8,000 (=400×20) kg of coke, while 20 consecutive cremations would have required only 740 (=37.5×20) kg.

[110] Prof. Dr. P. Schläpfer, "Ueber [sic] den Bau und den Betrieb von Krematorien," separate reprint from *Jahresbericht des Verbandes Schweizer. Feuerbestattungsvereine*, Zürich 1936, p. 36, see illustration.

[111] Naturally it is always necessary to add the heat produced by the coffin.

From the tenth cremation onward the coke consumption tended to be uniform, so that by then the refractory masonry was absorbing very little heat. It was for this reason that, in my calculation of the thermal equilibrium for the Auschwitz crematory ovens, I took into consideration the condition of the oven at the eighteenth cremation, that is, when its refractory masonry absorbed practically no more heat and the oven functioned with a minimum of fuel.

It is evident that the Gusen oven had an accumulation of heat notably lower to that in the above-mentioned chart. Nevertheless the principle still remains valid for this installation.

The difference in coke consumption for the two periods considered above – 47.5 and 30.6 kg – and also for the intermediate period[112] – 37.2 kg – depends *essentially* on the periodicity and number of the cremations, as I explained in point 36 of my reply to Zimmerman.

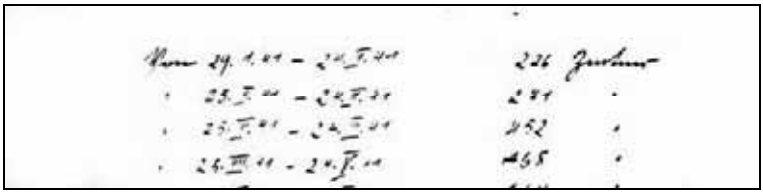
Zimmerman, in his crass thermotechnical ignorance, rejects these elementary facts, but since the documents confirm that the coke consumption for the period from September 26 to October 15, 1941, was 47.5 kg per corpse, it follows that the consumption of coke for the period form October 31 to November 12 must have been 32,157.5 (=47.5×677) kg of coke, so that each of the 345 wheelbarrows of coke used to cremate the 677 corpses during this period would have had to contain on average 93.2 (=32,157.5 ÷ 345) kg of coke! Exactly the opposite of what this dilettante wished to prove!

The soundness of my conclusions is also confirmed by two other documents. The first is the report on the coke consumption of the Gusen oven from January 21 to August 24, 1941, drawn up by the head of the crematorium, Wassner.[113] The other is a reference note, which reported the coke consumption for the period form August 25 to September 24, 1941.[114] In both the documents the amount of coke is expressed in *"Zentner,"* an old German measure of weight equivalent to 50 kg. In the following table I summarize the dates contained in the document and add the number of cremated corpses taken from the list of deaths in the Gusen Camp, which comes from the published official history of the Mauthausen camp.[56] The number of deaths refers to the entire month, while the supply of coke is offset daily. However, the difference in the outcome is very slight and actually irrelevant regarding the order of magnitude of the results. In any case, for the overall calculation I will try to be as precise as possible.

[112] The period October 26-30, during which 129 corpses were cremated with 80 wheelbarrows of coke = 4,800 kg, that is (4,800÷129=) 37.2 kg per corpse.
[113] AMM, 3 12/31, 353.
[114] AMM, 3 12/31, 351.

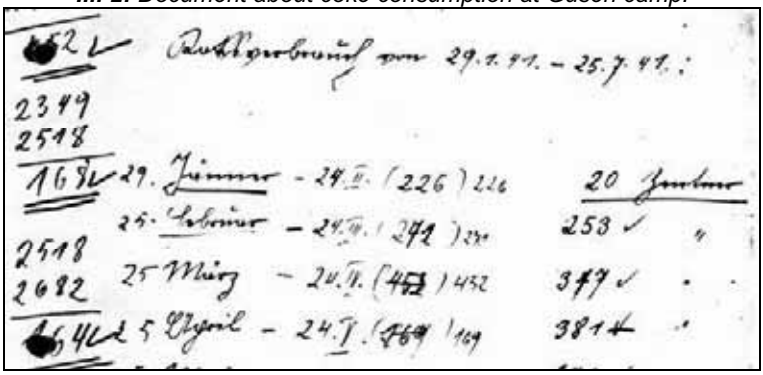
Period	coke ["Zentner"]	coke [kg]	corpses cremated	average per day	average coke per corpse
Jan. 29-Feb. 24	226	11,300	250	9	45.2
Feb. 25-Mar. 24	271	13,550	375	12	36.1
Mar. 25-Apr. 24	452	22,600	380	13	59.4
Apr. 25-May 24	68	3,400	239	8	14.2
May 25-Jun. 24	164	8,200	199	7	41.2
Jun. 25-Jul. 24	298	14,900	369	12	40.3
Jul. 25-Aug. 24	527	26,350	479	15	55
Aug. 25-Sep. 24	479	23,950	426	14	56.2
Total	2,485	124,250	2,717	11.25	45.7

Two lists exist on the subject of coke consumption at Gusen. The first, for the period of April 25 through May 24, has a consumption of 68 "*Zentner*" (1 Zentner = 50 kg ≈ 110 lbs), but in front of the figure 6 there is a 1, which seems to be struck out (see Ill. 2, p. 128).[115] Initially, I thought that for the period in question the coke consumption had in fact been 68 and not 168 Zentner, because by adding up all individual entries for coke consumption one obtains a total of 2,006 Zentner, which agrees with the figure in the document. In the first version of the current article I had therefore taken that figure to be abnormal and tried to explain it. However, the second document (see Ill. 3, p. 128)[116] for the period in question has a consumption of 169 Zentner, which means that the sum of the individual entries in the first document is in error. In the left margin of document 2 there is a column with the consumptions after the 24th of each month and from the consumption of the following month that of the preceding months is subtracted to obtain the actual consumption for the month in question.



The consumption from January 29 through February 24, 1941, is therefore (1,626-1,400=) 226 Zentner; the consumption from February 25 through March 24 is (1,897-1,626=) 271 Zentner; that from March 25 through April 24 is (2,349-1,897=) 452 Zentner and that – which interests us here – from April 25 through May 24 is (2,518-2,349=) 169 Zentner. These figures are identical to those of document 1, except for the consumption from April 25 through May 24, which is 168 Zentner instead of 169.

This consumption corresponds to a total (169×50=) 8,450 kg of coke and to an average consumption of (8,450÷239=) 35.35 kg per corpse, which is almost equal to that of March. Hence there is no anomaly in the monthly coke consumptions of the oven.



Let us now try to complete the data of the table.

During the month of January, 220 detainees died, on average 7 per day, so that for the days January 29-31 it may be presumed that roughly 21 detainees

[115] ÖDMM, B 12/31, p. 353.
[116] Ibid., B 12/31, p. 352.

III. 2: *Document about coke consumption at Gusen camp.*

III. 3: *Another document on coke consumption at Gusen camp.*

died. For the cremation of these corpses one may assume the average resultant quantity of coke for the period form January 29 to February 24, was, to be precise, 45.2×21=949 kg. From September 26 to 29[117] – according to the list of cremations discussed above – 34 corpses were cremated with a consumption of 28 wheelbarrows of coke, that is 1,400 kg. For September 25, in the absence of data, we may assume the data of the 26th, that is, 20 cremations[118] with a coke consumption of 960 kg.

Recapitulating, between January 29 and September 30, 1941, 2,792 people died at Gusen and were cremated with a consumption of 127,559 kg of coke. Since the number of non-documented days is 4 in 244, the eventual margin of error in the calculation is totally negligible.

The average consumption of coke per corpse therefore comes out at 45.6 kg (=127,559÷2,792). The soundness of this calculation is assured by the fact that, as I said above, during the period from September 26 to October 15 the average consumption of coke was of the same order of magnitude, that is, 47.5 kg per corpse. The average number[119] of daily cremations during this period was also of the same order of magnitude: 9 -10 as against 10 -11 per day.

To the data displayed above we may add that which comes from the list of Gusen cremations under discussion, from which we may conclude that 2,985

[117] No cremations were carried out on September 30.

[118] The average mortality in the month of September was 14 deaths per day.

[119] It obviously concerns an arithmetic mean in which the days on which no cremations took place are also included; the average number of cremated in the above table is calculated on the same basis.

(=2,792+193) corpses were cremated in the crematorium of Gusen between January 29 and October 15, 1941, with a coke consumption of 136,739 (=127,559 + 9180) kg, on average 45.8 kg per corpse.

Thus, why should the consumption of coke have been so drastically reduced during the period from October 26 to November 12 so as to be actually less than that obtained here, assuming that the wheelbarrows always contained 60 kg of coke? The Zimmerman hypothesis is therefore senseless.

7.2. Duration of the Cremation Process

In "Body Disposal" Zimmerman writes:

> *"On November 7, 1941 these two muffles incinerated 94 bodies in a period of 19 hours and 45 minutes, or 47 per muffle. This means that each oven could incinerate a body in 25.2 minutes. This was probably achieved by adding a new body to the oven before the prior body had been totally incinerated, a method which appears to have been envisaged by the Topf instructions discussed earlier.* […] *This method should not be confused with multiple body burnings to be discussed in the next part of this study. This 25 minute figure is not far from the Prüfer estimate cited in the prior paragraph. Mattogno totally ignored this information. Rather, he focused on the November 8 information which shows 72 bodies burned. He erroneously claimed that it took 24½ hours to burn these bodies. He has misread the time sheets. The actual burning time for these bodies was between 16 and 17 hours."*

In his response Zimmerman returns obsessively to these presumed "25.2 minutes," and he hurls various accusations at me: "Mattogno's knowingly false statement"; Mattogno "misread" the document. Finally, I am supposed to be "unable to read a simple time sheet that deals with these issues." Worse yet, he attacks the competence of those who *are* able to read this sheet.

Well then, I state and confirm that Zimmerman is not only "unable to read" this document, but also that he has understood nothing of this document due to his total incompetence. And here is the proof of my claim:

In his response our professor explains how he calculated the presumed duration of 25.2 minutes:

> *"We know the time because the operation started at 11:15 A.M. The last load of coke was added at 5 A.M. on November 8. We know that this last burning only lasted two hours because the time sheet for November 8 starts at 7 A.M."*

And between 11:15 AM of day 7 to 7 AM of day 8 there are 19 hours and 45 minutes. Therefore, the hypothesis of Zimmerman is based on two assumptions:

1. that the first entry in the column labeled "Uhr" refers to the beginning of the cremation;

2. that the number of wheelbarrows of coke appearing next to the times, refers to the coke "added" or "introduced" (p. 24), that is, to the coke put into the gas generators of the furnace.

Both assumptions are erroneous. Let us examine the first.

1. In the registrations for October 6, the first hourly registration appears in the document as 9:15. The second and last is 10:50. At 10:50,[120] according to Zimmerman's hypothesis, five wheelbarrows of coke (=300 kg) were "added." Since he claims that the 7 (= 420 kg) wheelbarrows "added" to the five of November 8 were burnt in two hours (between 5:00 and 7:00), giving an hourly consumption of 210 kg, the five wheelbarrows of coke mentioned above must have been consumed in around 100 minutes. So, on October 6 the cremations began at 9:15 and ended at 12:30. It follows that in 195 minutes the furnace cremated 25 corpses, so that each cremation lasted 15.6 minutes!
2. In the registration of October 1 the first hourly indication appearing in the document is 9:15, the last 11:00. According to Zimmerman's hypothesis, four wheelbarrows of coke (=240 kg) were "added" at 11:00, which would have to have been burnt in around 70 minutes. So, on October 1 the cremations began at 9:15 and were terminated at 12:10. Therefore, 20 corpses were cremated in 175 minutes, which corresponds to a time of 17.5 minutes for each corpse!

But the essential reason why Zimmerman's hypothesis is false is to be found in the combustion capacity of the furnace grills, or gas generators. This is the only scientific point of departure for an understanding of the Gusen document. The combustion capacity of a grill is the quantity of coke burnt in an hour on one grill of the furnace. The grill capacity is increased – within certain limits – by the chimney's draft, which draws air through the gaps of the grill and carries the necessary oxygen to the fuel. For a coke-heated crematory, the maximum admissible draft operating with a forced draft installation (*Saugzug-Anlage*) is a pressure difference corresponding to the pressure of a 30 mm column of water. The fuel consumption corresponding to this draft is about 180 kg of coke per square meter of grill. As each grill of a Gusen furnace had a surface area of (0.5×0.5=) 0.25 m^2, the maximum capacity of a grill with a draft of 30 mm of water was (180×0.25=) 45 kg of coke per hour, 90 kg for a grill with two gas generators. Thus, if it is assumed that Zimmerman's hypothesis is correct, on October 1 the furnace would have worked with a grill capacity of about (1,200 kg[121] ÷ 130 min.[122]) 554 kg/hour, on October 15 with

[120] I grant the benefit of the doubt. The first digit of minutes is difficult to read and could be a zero, so the time could be 10:00.

[121] I convert "wheelbarrows" (*Karren*) to kg directly since the document specifies that "1 K. = 60 kg"

[122] 105 minutes from 9.15 to 11.00, plus about another 35 minutes to the time of 11.00 in order to burn the 120 kg of coke "added."

a capacity of around (960 kg ÷ 190 min.[123]=) 303 kg/hour! From September 26 to October 15 the capacity of the oven grill would have been around (=9,180÷2,300[124]) 240 kg per hour, that is, 2.6 times faster than the theoretical maximum!

It is therefore clear that the column "Uhr" appearing in the document in question cannot refer to the beginning of a cremation. But then, to what does it refer? Perhaps it refers to the coke unloaded into the gas generators at the times indicated by the document? This is not possible either, because the useful volume of a gas generator in a Gusen oven was around 0.2 m^3. 1 m^3 of metallurgical coke weighs between 380 and 530 kg, which means that each gas generator could accommodate a maximum of about (530×0.2=) 110 kg of coke. In any case, in the document in question the number of wheelbarrows corresponding to times – that is, the respective quantity of coke – is often much greater than the capacity of the gas generators. For example, on November 8 at 16:00 hours 16 wheelbarrows of coke[125] were registered, that is, (16×60=) 960 kg, over four times the capacity of two gas generators.

Does the column "Uhr" refer to the coke burnt in the gas generators? This hypothesis is incorrect as well. Let us return to the previous case. Another wheelbarrow of coke was registered at 18:15 on the eighth day (the relative enumeration changes from 24 to 25), so that the 960 kg of coke relative to the time of 16:00 would have to have been burnt in two hours and 15 minutes, which corresponds to a grill capacity of about 427 kg per hour!

Well then, to what does the column "Uhr" refer? The answer is simple: to the coke withdrawn from time to time from the depot and *unloaded* near the oven. Let me explain this in more detail. Following a rational organization of the work – and nobody will deny that the Germans were most efficient at this – the coke had to be unloaded from time to time near the two gas generators of the oven in such a way that the stokers could carry by shovel a sufficient supply of fuel. As in any unloading of goods, the delegate who undertook the fuel's delivery and who took responsibility for its use gave bureaucratic account of its receipt, indicating the number of the wheelbarrow as well as the time *when the unloading was completed,* not the time when it began. But the oven was already put into operation with the first wheelbarrow. That is why the column "Uhr" in the document under discussion refers not to the begin-

[123] 120 minutes from 11.00 to 13.00, plus 70 minutes to the time 13.00 in order to burn the 240 kg of coke "added."

[124] Comprehensive time calculated on the basis of the column "Uhr" and the 1,685 minutes, to which I add the necessary time to burn the coke "added" at the end of each day (that is 180 kg to 12 noon 26/9, 120 kg to 11:30 of 29/9 and so on), in total 36 wheelbarrows = 2,160 kg, the combustion of which, according to Zimmerman, would have required 2,160 ÷ 210 = about 615 minutes.

[125] The enumeration passes from eight wheelbarrows concerning 11:00 hours to 24 wheelbarrows concerning 16:00 hours.

ning of a cremation but to *the end of the unloading* of a series of wheelbarrows of coke.

I can explain myself better with an example. A large supermarket orders 100 cases of mineral water. The truck transporting the cases arrives at 8:00 in the morning and immediately begins unloading them. The work takes four hours, and the warehouseman of the supermarket, having counted the unloaded cases, signs for the receipt of 100 cases at 12 noon. In the meantime the cases have already been placed in the sales circuit and the first cases are sold at 8:15. In the documents the unloading will be recorded as having taken place at 12 noon but the sales as beginning at 8:15.

Now let us return to the Gusen document. In the registrations of November 7, the first datum refers to 11 wheelbarrows of coke (= 660 kg) at 11:15. This signifies that the unloading of these 11 wheelbarrows was recorded as ending at 11:15. The second datum concerns the unloading of two wheelbarrows between 11:15 and 11:30. For this reason the coke which the personnel had finished unloading at 11:15 was already almost totally burnt up.

Therefore the first wheelbarrow was unloaded *before* 11:15, but how long before? If we assume a maximum grill capacity of 90 kg/hour, it can be reckoned that during the preceding seven hours, (7×90=) 630 kg of coke were unloaded and burnt, so that the cremations were initiated at 4:15 while at 11:15 there still remained 30 kg of coke near the gas generators. Consequently, between 11:15 and 11:30 a further two wheelbarrows of coke were emptied. That is how the average duration of each cremation would have gone up to 34 minutes; and this would be the *minimum theoretical* time. The *real* duration would have been undoubtedly greater.

In fact, we know that the oven was out of service between October 16 and 25. During the whole month of October there were 462 deaths at Gusen,[126] but the number of corpses cremated were only 351 (159 from day 1 to day 15 and 192 from day 26 to day 31), so that on November 1 there remained (462–351=) 111 corpses in the morgue to be cremated. To these it is necessary to add the corpses of those detainees who died in the first week of November. In a situation so critical, only Zimmerman could seriously believe that on November 7 the head of the crematorium had waited at least 11 hours (the last registration recording unloading of coke for day 6 was at 22:10) before putting the oven back into service to cremate 94 corpses. On the other hand, the more rational explanation is that, because he had to dispose of some further tens of corpses behind schedule, he ordered a minimum pause in order to hurriedly clean the grills of the gas generators and immediately thereafter put the oven back into operation. In this context, the more probable hypothesis is that the oven was reactivated shortly after midnight.

[126] Hans Maršálek, op. cit. (note 56), p. 156.

If, for example, the cremation was started at 0:45, by 11:15 the oven will have burnt 630 kg of coke in ten and a half hours leaving a remnant of 30 kg of coke. This corresponds to a *normal* grill capacity[127] of 60 kg/hour. In this case the average time for one cremation would be around 39 minutes. This is my interpretation.

In this way I dispose of all our "expert's" thermotechnical fantasies. Therefore I confirm and reconfirm that his unfounded conjecture of 25.2 minutes for the duration of a cremation is "technically absurd."

As to the efficiency of the oven, Zimmerman finds the following:

> *"One of the factors I noted in the study is that the ovens* [sic!] *were still undergoing repairs at the time these efficiencies were being achieved (Body, note 118). Thus on November 6, 7 and 8 there were four hours of repairs on the oven each day. Yet the ovens were able to incinerate 57, 94 and 72 bodies on these days. These numbers suggest very high efficiencies even when undergoing repairs."*

This is yet another of Zimmerman's impostures. The document to which he refers – the "certification of day labor on special account"[128] of Willing for the period November 6-10, 1941[129] simply mentions *"Ofen Arbeiten"* for days November 6-8. In German, "repairs" means "Reparaturen," *"Ausbesserungen"* or *"Instandsetzungen,"* certainly not *"Arbeiten,"* which is a generic term for work, for example a job of surveillance of the cremation activity, or a job to regulate the roller shutters and the oven blowers. Such an expression does not minimally imply that the ovens "were still undergoing repairs."

Not having any awareness of the history and technology of cremation, Zimmerman is necessarily incapable of an organic view of the argument. It is such an organic view that in the end can only weaken his thermotechnical fantasies and validate my own scientific conclusions. For example, I refer to the cremation experiments of the engineer Richard Kessler with an oven heated with coke,[130] from which the conclusion is drawn that the *principal combustion* lasts for about 55 minutes. I also refer to the list of cremations in the crematorium of Westerbork (a Kori oven heated with coke) showing an average cremation time of around 50 minutes,[131] as well as to furnaces for the combustion of animal carcasses functioning with charcoal, to which I will return below.

Not even the Soviet experts, second to none with all their hyperbolic exaggerations, dared to attribute the exceptionally short times of the cremation process to the real temperatures found in practice in their "Guideline diagram

---

[127] With a draft of a 10 mm column of water.

[128] *"Bescheinigung über gegen besondere Berechnung geleistete Tagelohn-Arbeiten"*

[129] BAK, NS 4 Ma/54.

[130] An oven of Gebrüder Beck, Offenbach, with an optimally constructed system which engineer Kessler preliminarily made even more efficient thanks to various improved techniques.

[131] "The Crematoria Ovens…," op. cit., (note 8, 2003), pp. 395f.

for the determination of the time of combustion of corpses in various crematorium ovens as a function of the temperature," which can be found in their expert reports on the crematoria of Majdanek and Sachsenhausen. On the contrary. For example, they attributed a duration of 120 minutes to the normal temperature of 800°C and a duration of 75 minutes to the temperature of 1,100°C. The scale ends with a duration of 15 minutes at a temperature of 1,500°C. However, this situation can hold only in the gas generator at best, certainly not in the muffle.[132]

7.3. My Alleged "Omissions"

In the article "Die Krematoriumsöfen von Auschwitz-Birkenau"[133] I mentioned in passing the case of the cremations of November 8-9 at Gusen, writing:

> *"For example, on 8 and 9 November 72 corpses were cremated in around 1,470 minutes with a total consumption of 2,100 kg of coke, that is, on average 29.1 kg per corpse. This means that in each muffle (72÷2=) 36 loads of corpses were introduced with a cremation time of about 41 minutes per load."*

As can be seen from the heading of the paragraph in which this passage appears, I exhibited this case not as a determination of the *duration* of the process of cremation but in order to refute the story of multiple cremations, a topic I return to below. In setting out this case I explained provisionally that "the *analysis* of the list of cremations and coke consumption shows that [...]." Therefore, being a simple example, my above assertion does not have any particular significance, since my conclusions regarding the Gusen document derive precisely from an *analysis* of the *whole* document – not just from the individual registrations contained in it – and are based essentially on the capacity of the furnace grill. It is therefore clear that Zimmerman's accusation, according to which I "misread" the document regarding the case of November 8-9 is without foundation, so that his suppositions are false.

The duration of around 1,470 minutes is based on a calculation of the grill capacity closest to the maximum, that is, 86 kg/hour, which is still extremely high for a continuous operation of 24 hours.

In conclusion, based on *documentary evidence,* Zimmerman's hypothesis of an average cremation time of 25.2 minutes is unfounded.

And *technically?* Technically such an hypothesis is senseless according to engineer Kessler's experiments on cremation. Even the phase, during which

---

[132] The maximum cremation temperature which emerges from many diagrams – which I publish in my work – is 1,120°C, maintained for a few minutes during the combustion of the coffin.

[133] In Ernst Gauss (ed.), op. cit. (note 8), p. 304. This passage is not part of the more recent English edition of 2003, op. cit. (note 8), since this article has been considerably superseded by my book, op. cit. (note 10).

water evaporated from the corpse, required on average 28 minutes in an optimum coke-operated oven![134]

7.4. The Documentation on Mauthausen

In my reply to Zimmerman (point 33) I wrote that

"It is true that the correspondence between the Topf firm and the SS-Neubauleitung (finally Bauleitung) of Mauthausen for 1941 is almost certainly complete, but the same thing can definitely not be said for the following years."

Zimmerman maintains that "this is blatantly and knowingly false:"

"There is not as much correspondence after October 1941 because there was no further oven installation until January 1945 in Mauthausen. Prior to November 1941 there had been two installations in Gusen – the original one in February 1941 and the overhaul in October 1941. This is what accounts for so much correspondence. However, there is enough paper trail in the file to show that no overhaul could have occurred from November 1941 to August 1943, and probably none occurred after August 1943."

Let us now see who tells falsehoods. The documentation on Mauthausen contains about 120 documents with dates between February[135] and December 1941. However, it is not "complete" (at best, it is *nearly* complete), because already one of the two most important documents is missing from this documentation, even though it was received and registered by the *"S.S. Neubauleitung Mauthausen."* This is the letter of Topf dated July 14, 1941, stating that in the two-muffle Topf oven heated with coke it was possible to cremate 30 – 36 corpses in about 10 hours. The documentation contains the request of the *SS-Neubauleitung* of Mauthausen (letter of July 9, 1941), but not Topf's reply, which is at Weimar, where it was accidentally discovered by J.C. Pressac. In addition, the construction drawing D58479 of Topf (mentioned in the letter of April 21) is missing from the documentation as well as all invoices. For example, the invoice for 118 RM, that for 80 RM, and the one for 108 RM dated May 2 (mentioned in the letter of June 12); the invoice for 303 RM of August 25 (mentioned in the letter of September 23); that of September 4 for 1,594 RM (mentioned in the letter of October 11); the invoice for 165 RM of November 3, 1941, and respectively those for 622.30 RM and 361.90 RM of November 21 (mentioned in the letter of December 14). Also missing from the documentation are the financial documents regarding payments made by the SS, in particular the down payments (*Abschlagszahlungen*), the final invoices (*Schlussrechnungen*), the final account statements (*Schlussabrechnung*). By

[134] "The Crematoria Ovens…," op. cit., (note 8, 2003), pp. 394f.
[135] The Gusen oven went into operation on January 29, 1941.

contrast, such documents are preserved for the crematory ovens of Auschwitz.[136]

How many other important documents have been removed from correspondence between the Topf firm and the *SS-Neubauleitung?* I do not know, but the examples mentioned should be cause for thought. Let us now consider the subsequent years. In the following tables I summarize data relevant to the consistency of the documentation:

1942	DAYS	DOCS	1943	DAYS	DOCS
January	From day 5 to day 28	12	January	From 8 to 23	9
February	Days 3 and 6	2	February	13, 24 (3 documents)	4
March	13	1	March	-	-
April	-	-	April	22 (2 documents)	2
May	-	-	May	5	1
June	-	-	June	-	-
July	-	-	July	-	-
August	From 17 to 28	4	August	11, 28	2
September	16, 26 and 30	3	September	-	-
October	From 19 to 24	4	October	-	-
November	3,13, 17, 20,30	5	November	-	-
December	21 (2 documents)	2	December	-	-
1944	DAYS	DOCS	1945	DAYS	DOCS
January	-	-	January	3, 21 (2 documents)	3
February	-	-	February	-	-
March	-	-	March	-	-
April	-	-	April	-	-
May	-	-			
July	-	-			
July	-	-			
August	-	-			
September	-	-			
October	-	-			
November	-	-			
December	20	1			

Let us recapitulate. There is a blank of 190 days in the documentation for the year 1942, from February 7 to August 16 (with only one document, that for March 13). For 1943, from February 25 to December 31 the documentary gap is 310 days (with just two documents for April, one for May, and two for August). For 7 months (March, June, July, September, October, November and December) there is not a single document. For 1944 (366 days) there is a documentary gap of 365 days! Just one document, dated December 20, features for the whole year. For 1945 there are only three documents (for January). For 22 months out of 37, from January 1942 to January 1945, there is not even one document!

[136] Regarding this, see my study, the *"Zentralbauleitung der Waffen-SS und Polizei Auschwitz."* Edizioni di Ar, 1998.

In spite of this, Zimmerman quite incredibly has the impudence to say that my assertions on the incompleteness of the documentation "is blatantly and knowingly false!"

His explanation for the enormous documentary gaps is radically challenged by the fact that he presupposes *a priori* the very thing, which he wants to prove: Starting with the presupposition that the documentation concerns only "oven installation," he concludes that the documentation is complete since there was no other "oven installation" until January 1945. But how can it be excluded that further replacements of the refractory masonry of the Gusen oven were not made during the long periods of the documentary gaps? Only by an *a priori* and opportunistic negation that this could have taken place. And this is precisely what Zimmerman does.

Here our professor gives yet another demonstration of his deceptiveness, since the "correspondence" on the second "oven installation" (the one installed at Mauthausen in January 1945) contains just two documents! And how can Zimmerman seriously claim that this "correspondence" is *complete?* Hence, also in this case it is evident that the documentation is extremely full of gaps and that our professor lies, knowing that he lies.

Thus the argument of the exceptional long life of the refractory masonry in the Gusen oven (around 30,000 according to the estimate of the International Red Cross)[137] also collapses, since it is not known how many times the refractory material was replaced, which is true for the Kori ovens of Mauthausen as well.

7.5. The Gusen Oven Planned "with a Defect"?

Zimmerman maintains that the Gusen oven was badly constructed by the Topf firm and this – and not the wear following the number of cremations carried out – was responsible for the necessity of replacing the refractory masonry in October of 1941. In "Body Disposal" Zimmerman wrote:

> *"It is possible that the Gusen ovens may not have originally been built correctly."*

In his response he returns to this question stating:

> *"I speculated that perhaps the overhaul had to do with a defect in the Gusen ovens."*

On both occasions, our professor relies on the Topf letter of April 10, 1943, which is supposed to testify that "Topf admitted that the Krema IV ovens at Auschwitz were made defectively." He quotes the following translation of the first part of the document in question:[138]

---

[137] "Gusener Krematorium verbrannte *schätzungsweise* Leichen...." AMM, 7/7, Nr.4, ISD Arolsen.

[138] APMO, BW 30/34, p. 42.

"In response to your written communication referred to above, we inform you that we have instructed our foreman, Mr. Koch, to take care of the cracks that apparently have recently occurred in the eight muffle oven of Krema IV. At the same time, we also took note of the agreement between your construction leader, SS-Major Bischoff and our senior engineer Mr. Prufer according to which we will take care, at no cost to you, of the defects that have appeared, within two months of their start-up, in the cremation ovens built by us (innerhalb zwei Monaten nach Inbetriebnahme der Ofen auftreten.) Understandably we take it as a given that the defects have appeared because of defective operation, and not because of overheating the ovens or by scraping away the interior masonry with the stoking devices, etc.

(Hierbei ist selbstverständlich[139] *Voraussetzung, dass die evtl.*[140] *aufgetretenen Mängel infolge fehlerhafter Ausführung entstanden sind und nicht etwa durch Überhitzung der Öfen bezw. durch Abstoßen der inneren Ausmauerung durch die Schürgeräte usw.)"*[141]

Zimmerman comments:

"Therefore, Topf clearly accepted responsibility for defects under the warranty – though reluctantly."

With this comment Zimmerman completely distorts the significance of the text, which is as follows: According to the existing agreement between Bischoff and Prüfer, Topf were held to repair *gratis* all breakdowns which were verified within the two months of the guarantee, beginning with installation entering into operation, but *only on the condition* that such breakdowns were due to construction errors of the oven *and not* due to its improper usage. Topf had given the installer Koch the job of repairing *"die jetzt eingetretenen Schäden,"* but this does not mean that the Topf firm had "clearly accepted responsibility for defects." It had only accepted the work of repairing the damages ("*Schäden zu beseitigen*"), but without in any way admitting that such repairs went back to the above-mentioned guarantee. If Topf had admitted that the damages were due to a construction error of the oven, why did the letter insist on the fact the guarantee did not cover damages caused by an error in usage? It is clear that the question of responsibility was still open.

In a word, the sense of the letter is *not* what Zimmerman claims it to be (the damages were caused by faulty construction, so we carry out the repairs

[139] The text says erroneously "selbstverstundlich."

[140] In the text appears erroneously "dieevtl."

[141] I have corrected (and underlined) the eleven (!) transcription errors of Zimmerman in this one sentence, who has clearly never heard of "Umlaute." Moreover, he transcribed the letter "ß" in "Abstoßen" with a single "s" and has managed to make three errors in the transcription of "Schürgeräte," which he writes as "Schugerate"! As we see, we are faced with a real specialist in the German language who is in a position to carry out the deepest philological analysis of the documents!

free of charge according to the terms of the contract). What it really says is: If the damages are due to faulty construction of the oven (and not due to an error in usage), then we carry out the repairs free of charge according to the terms of the contract.

Having misrepresented the sense of the above document regarding these Auschwitz ovens, Zimmerman produces another "proof" of the bad construction of the Gusen oven:

> *"However, on March 13, 1941, six weeks after the ovens had been installed, the camp authorities complained that they had found 'several defects' ('verschiedene Mangel'*[142]*) in the ovens and requested material to fix them. More repair materials were ordered in June. Therefore, there is strong evidence that the first double muffle oven installed in Gusen was not made correctly."*

Well, let's look at the facts the way they really are. On March 13, 1941, the *SS-Neubauleitung K.L. Mauthausen* wrote the following letter to Topf:[143]

> *"Our construction site in Gusen informed us that various defects have been detected at the incineration oven. The sheating shows that it is peeling off in several areas. We ask you therefore to send us immediately*
>
> *10 sacks Monolit and*
>
> *6 pieces Monolit crosses*
>
> *so that the necessary material for repairs is available in case of larger damages. We ask you for a delivery without any delay. Order sheet and bill of lading with restriction sheet I are enclosed."*

Here the term "sheating" (*Ummantelung*) refers to the refractory dressing of the muffles – as can be seen from the request for 6 "Monolit crosses," which were the refractory bars of the muffle grills. They were therefore "peeling" at various points.

As Zimmerman indicated, the snag arises "six weeks after the ovens had been installed," so that the oven was still under guarantee by Topf. In fact, according to an arrangement of March 1938, the guarantee "for those parts of the incineration installation in contact with fire"[144] held for one year (6 months for the refractory overlay of the gas generators).[145]

Therefore, if – as Zimmerman claims – the above snag was due to the fact that "the first double muffle oven installed in Gusen was not made correctly,"

---

[142] Read: "Mängel."

[143] BAK, NS 4 Ma/54: "*Von unserer Baustelle in Gusen wird uns mitgeteilt, dass beim Verbrennungsofen verschiedene Mängel festgestellt wurden. Die Ummantelung zeigt, dass sie an verschiedenen Stellen abblättert. Wir ersuchen Sie daher, uns umgehend¶10 Sack Monolit u. ¶6 Stck Monolit-Kreuze¶zuzusenden, damit im Falle grösserer Schäden das erforderliche Material zur Ausbesserung vorhanden ist. Die Auslieferung erbitten wir ohne jede Verzögerung. Bestellschein und Frachtbrief mit Speerzettel I liegen bei.*"

[144] "*für die vom Feuer berührten Teile von Feuerungsanlagen*"

[145] Letter from Topf to the *Bauleitung* of Mauthausen of January 24, 1942. BAK, NS 4 Ma/54.

Topf, by accepting "though reluctantly" its responsibility, would have sent the material for the repairs free of charge. Instead, as is shown by the letter of March 18, 1941, Topf debited the *"SS-Neubauleitung KL Mauthausen"* with 80 RM for "10 sacks = 500 kg Monolit" and with 118 RM for "6 pieces cross grills." In this letter Topf specifies:[146]

> *"We accept the order based on the general terms of delivery no. B known to you."*

This means that the terms of delivery, which also defines the conditions of a guarantee similar to the "general terms of delivery no. A," completely excluded the responsibility of Topf.

At this point, the document turns against Zimmerman's interpretation nullifying his hypothesis. After hardly 6 weeks, the refractory masonry of the muffles was already "peeling" at various points on account of the cremation of fewer than 500 corpses, 250 per muffle!

Let us turn to the "more repair materials" which "were ordered in June." The only materials supplied to Gusen in June 1941 were 50 sacks of "Monolit"[147] forwarded by the firm Alphons Custodis of Düsseldorf on behalf of the Topf firm and dated June 25.[148] Nevertheless, this material was not used for repairs, but was part of the supply of materials, which Topf sent to Gusen for the second crematory double-muffle oven. This comes out clearly from the letter of Topf dated June 12 cited above in which it says:[149]

> *"The 50 sacks of Monolit mentioned by you here are part of the construction material that we delivered for the construction of a new incineration oven; we will not send you a special invoice for this material."*

This "new crematory oven" was actually the result of a misunderstanding. Topf believed that the *SS-Neubauleitung* of Mauthausen had ordered it on December 6, 1940, with "order no. 41 D 80,"[150] while it concerned an error due to a change in the heating system of the already installed oven (from heating with naphtha to heating with coke).[151]

This is what Zimmerman's "strong evidence" has been reduced to! So our professor has either understood nothing at all or resorts to deception.

---

[146] BAK, NS 4 Ma/54: "*Wir nehmen den Auftrag an aufgrund unserer Ihnen bekannten Allgemeinen Lieferungs-Bedingungen B.*"

[147] This concerns granular isolating material which served to fill in the cracks in the oven.

[148] *Versandanzeige* of the firm Custodis of 25 June 1941. BAK, NS 4 Ma/54.

[149] *"Die von Ihnen weiterhin erwähnten 50 Sack Monolit gehören zu den Baustoffen, die wir zur Errichtung eines neuen Einäscherungsofen anlieferten; eine Sonderrechnung über dieses Material lassen wir Ihnen nicht zugehen."*

[150] Letter from Topf to the *SS-Neubauleitung* of Mauthausen of 25 August 1941. BAK, NS 4 Ma/54.

[151] Letter of 28 August 1941 from the Mauthausen *SS-Neubauleitung* to Topf. BAK, NS 4 Ma/54.

Following the above misunderstanding, Topf had already conveyed the following refractory and insulating material for the oven, as emerges from Topf's letter of September 4, 1941:

- 2,100 fire-bricks of various sizes
- 1,200 kg of refractory mortar
- 1,000 insulating bricks
- 400 kg of insulating mortar
- 3,000 kg of solid monolith

Moreover, this letter also indicates that the *SS-Neubauleitung* of Mauthausen, although it had cancelled the order for the second Gusen oven, nevertheless wished to purchase (*ankaufen*)[152] this material "for later repair works."[153]

Note the date: September 4, 1941. The official request for the "immediate commissioning of one of your oven experts for the repair of the crematory oven in the labor camp Gusen" was moreover forwarded twenty days later by the construction office of Mauthausen on September 24.[154] Probably the first signs of damage to the oven's refractory masonry were already showing, damage which eventually became irreparable.

Whatever the case, it remains a fact that twenty days earlier, at a time when fewer than 2,700 cremations had been carried out in the Gusen oven (1,350 per muffle), the construction office of Mauthausen was already planning to have at its disposal refractory material "for later repair works."

Already from this, one infers that the construction office did not trust the marvelous longevity of the refractors in the Gusen oven that Zimmerman wishes to attribute to them.

The high fragility of the Topf ovens is reflected in many documents of the Auschwitz Central Construction Office. I will limit myself here to one of the first documents concerning the double-muffle oven, which was the most solid of the Topf series of ovens. The first double-muffle oven of crematorium I at Auschwitz went into operation on August 15, 1940. Five months later, on January 8, 1941, the head of construction *SS-Untersturmführer* Schlachter sent Topf a letter in which he stated:[155]

> *"SS New Construction Office has already informed you by cable that the first oven unit has already been damaged on account of high usage and can therefore not be fully operated any more. It is therefore indispensable that the extension of the plant is begun."*

Up to January 8, 1941, 8,496 detainees had been registered at Auschwitz.[156] If we follow the "Polish War Crimes Office," some 1,600 detainees

[152] The material had not yet been paid for.
[153] Letter of 4 September 1941 from Topf to *SS-Neubauleitung* of Mauthausen.
[154] Letter of September 24, 1941, from *Bauleiter* Naumann to Topf. BAK, NS 4 Ma/54.
[155] RGVA, 502-1-327, p. 180.
[156] NTN 95, pp. 20-24 (copy of the list of transports to Auschwitz).

died between June 1940 and January 1941.[157] Hence, the oven had "already been damaged" after *less than* 800 cremations per muffle!

8. The Durability of the Oven's Refractory Masonry

8.1. The Electric Oven of Erfurt: 1939 or 1941?

In describing the third electric oven of Erfurt in an article published on October 25, 1941, engineer Rudolf Jakobskötter emphasized that the durability of refractory material may exceed 2,000 cremations achieved so far and may actually reach 4,000 cremations in future due to a new oven design.[52] I commented that German technology had not yet developed fire-resistant muffle capable of withstanding 4000 cremations in 1941. I also criticized Zimmerman for falsely claiming that the information cited above referred to "cremation technology in the 1930's" ("Observations," point 30, see p. 102).

In "My Response" Zimmerman rejected my accusation of "bad faith" since "the article was *published* in 1941 while Jakobskotter's [*sic*] figures go to 1939." By so writing, Zimmerman completely confirms his obvious deceit. It is true that the third Erfurt oven "was finished on December 1, 1939" and was "slowly dried " until January 31, 1940,[158] but it is false that "Jakobskotter's figures go to 1939." On page 586 of Jakobskötter's article there is a table headed "Incinerations and electricity consumption in the electr. incineration ovens at Erfurt." The table summarizes the practical results of three ovens at Erfurt. Those of the third oven stem from February 1940 to April 1941, so that Jakobskötter did not write his article before *May* 1941. Naturally, Zimmerman takes good care not to mention these dates. As we see, the impudence of this imposter is simply unbelievable.

Zimmerman again objects:

> *"The electric ovens had started to be manufactured in 1933. However, problems arose after the development of the first electric oven in 1933. Jakobskotter* [sic] *writes: 'Nachdem in dem elektrischen Ofen uber*[sic] *1300 Leichen eingeaschert*[sic] *worden waren, machte sich eine Erneuerung notig'*[sic]. *(After over 1,300 bodies had been cremated in the electric oven, a renovation was required). Therefore, we know that there were problems which had arisen with this type of oven."*

To be precise, according to the cited table on p. 568 of the article, the number of cremations was 1,294. Zimmerman in "Body Disposal" comments thus:

> *"The first generation could burn 2,000 bodies. The second generation, beginning in 1935, had a life of 3,000 bodies which was expected to increase to 4,000 bodies. A third generation would go into effect in 1939. No*

[157] NTN, MSW London, 113, p. 518.
[158] Rudolf Jakobskötter, op. cit. (note 52), p. 585.

durability was specified for the third generation. Jakobskotter [sic] *did state that 'they expect to have even higher numbers*[159] *for future ovens.'"*

Zimmerman distorts the succession of the ovens' "generations": The first "generation" is the first oven, which carried out 1,294 cremations, the second is the second oven, which carried out 2,910 cremations (according to the table on p. 586), the third is the third oven, for which Jakobskötter expected "an even longer durability."[160]

In this context, how should we place the phrase "while so far muffles withstood only 2,000 cremations, depending on their design"? To what does the number of 2,000 cremations refer? Certainly not to the first oven, which had carried out 1,294 cremations. It also did not refer to the second oven, which had carried out 2,910 cremations. On the other hand, the "first generation" oven, to which Zimmerman attributes 2,000 cremations, was a single oven with a single muffle. But then, why does Jakobskötter speak of "the muffles," in the plural, and why does he employ the expression "depending on their design," seeing that the muffle was of only one type?

It is clear that Jakobskötter is referring to oven types preceding the electric oven, those heated with coke and/or gas. He therefore affirms that the results of the second electric oven, as far as the number of cremations is concerned, had surpassed those of other types of ovens, and this is obvious as we will see in the next paragraph.

Granted that the Jakobskötter's article was not written before May 1941 and that it was published in October 1941, it is clear that the phrase "The construction firm is counting on a life span of 4000 cremations per muffle in future" means that by the end of October 1941 a "life span of 4000 cremations" had not yet been attained. If it were any different, Jakobskötter would have written it clearly.

On the other hand, the text says only a little more about expectations for an indeterminate future (*"künftig"*): the German verb *"rechnen"* means "to consider to be possible and probable"[161] That an expectation must necessarily be realized, is not expressed. And since the expectation of 4,000 cremations on the part of the "construction firm" (Topf) went back to at least May 1941 and looked forward to the future, the expectation could not refer to the third Erfurt oven, which, at the time Jakobskötter wrote the article, had already carried out 1,417 cremations.

And if finally Jakobskötter expected "an even longer life span" for the third oven in comparison with the second oven, this was necessarily less than 4,000 cremations. This expectation was justified by the fact that experiments done with the first two ovens made it possible to overcome the drawbacks,

[159] The German text says *"Lebensdauer."*
[160] Ibid., p. 587.
[161] *Duden. Deutsches Universal Wörterbuch*, Dudenverlag 1983, p. 1009: *"als möglich u. wahrscheinlich annehmen."* (I indicate the page for Zimmerman).

which occurred in the first oven: the formation of smoke caused by the "high" draft of up to 24 mm water column. The combustion gases passed the muffle faster than the time required for the carbon particles to burn completely, so that they formed smoke instead.

8.2. The Electric Oven of Erfurt: the Heating System

Zimmerman again objects:

> *"Moreover, Mattogno ignored my basic criticism that the Jakobskotter* [sic] *study dealt with electric ovens. The concentration camps used coke fired ovens, many of which had been converted from oil burning."*

With this "basic criticism" Zimmerman does no more than – once again – draw attention to his crass ignorance. This poor naïve person does not know that the electric oven, by uniformly distributing the heat generated, had a longer life span than coke ovens, because its refractory masonry was subjected to less stress.

The first electric crematorium went into operation at Biel in Switzerland on August 31, 1933. Its designer, engineer Hans Keller, wrote in February 1935:[162]

> *"So far 200 cremation were carried out in the electric oven. The fire-proof bricks still look like new, which cannot be said for a coke oven after this number of incinerations.* […]
>
> *The heat distribution of this oven is more even, which contributes to the increase of its life span."*

Therefore, the life of the refractory masonry in a coke-fired oven was inferior to that of an electric oven. And if the life span of an electric oven in 1941 was 3,000 cremations, then that of a coke oven was still less!

Quod erat demonstrandum! (Which had to be demonstrated!)

8.3. Factors Influencing the Longevity of the Refractory Masonry

In his crass ignorance of the technology of cremation, Zimmerman disregards essential factors which influenced the longevity of the refractory masonry:

a. the mass
b. the quality of the refractors
c. the exposure to flames of the refractory masonry

Let us examine these factors

---

[162] Hans Keller, *Der elektrifizierte Ofen im Krematorium Biel*, Biel 1935, pp. 3f: "*Bis jetzt fanden im elektrischen Ofen 200 Kremationen statt. Die feuerfesten Steine sehen noch aus wie neu, was beim Koksofen nach dieser Zahl von Einäscherungen nicht gesagt werden durfte.* […] *Der Ofen hat daher eine gleichmässigere Wärmeverteilung, was zur Erhöhung seiner Lebensdauer beiträgt."*

a. Our naïve professor does not know that the ovens of civilian crematoria had a refractory mass enormously larger than the ovens of Auschwitz-Birkenau. Normally the refractory masonry of one muffle weighed about 6,500 kg (the recuperator about 8,200 kg).[163]
The coke-heated oven tendered on June 2, 1937, by the firm W. Müller of Allach "to the Reich Leader SS of the NSdAP, Munich Karlstrasse," that is, to Dachau, had an additional 15,500 kg of refractory material.[164] Like the Topf ovens of Auschwitz-Birkenau, the oven had no recuperator.
According to the "List of materials for a Topf-double cremation oven" drawn up by Topf on January 23, 1943, this oven – the Auschwitz model – had refractory material consisting of 1,600 ordinary fire-bricks (*Schamotte-Normalsteine*) and 900 wedge-shaped bricks (*Keilsteine*).[165] In terms of weight, around 8,600 kg for two muffles, about 4,300 kg per muffle with a gas generator. Of these 4,300 kg, about 2,000 kg were for the gas generator, so that the refractory material of the muffle weighed about 2,300 kg.[166]
The refractory material of an eight-muffle oven consisted of 4,500 normal fire-bricks and 1,600 wedge-shaped bricks;[167] in terms of weight, around 24,100 kg, that is, about 3,000 kg for one muffle and ½ a gas generator,[168] or about 2,000 kg for one muffle. The refractory masonry for a three-muffle oven, to judge from a comparison in price, must have had an intermediate weight of refractory masonry, certainly less than 2,300 kg.
The "cremation installation for the SS in Belgrade" tendered by the firm Didier-Werk on August 26, 1943, made provision for 6,600 kg of refractory material, 1,100 kg of wedge-shaped fire-bricks and 5,500 kg of ordinary fire-bricks.[169]
Also, the Kori oven with one muffle was notably more massive than ½ oven from Topf with two muffles. If the SS chose the Topf ovens for Auschwitz-Birkenau, then this selection was certainly not due to the fact the Topf ovens were better than those from other firms – on the contrary! It depended on the fact that they cost much less. A one-muffle Kori oven cost 4,500 RM without accessories, while a two-muffle Topf oven (the third Auschwitz oven) cost 6,378 RM. Such a competitive cost (6,378 RM as against 9,000 RM, the crematory rooms costing the same) depended *also*

[168] There were four gas generators in the eight-muffle oven, each of which served two muffles.
[169] URSS-64.

on saving refractory material, which was achieved by assembling 2, 3, and 4 muffles together in one oven.[170]

b. Let us now consider the quality of the refractors. Already from the fact that Germany was in a state of war, it is easy to see intuitively that the refractory material used for the crematory ovens could not be of the same quality as that used for civilian crematoria in peacetime.
It was not by chance that Topf, already by the end of 1940, issued no guarantee for the refractory material, not even if it wore out with correct usage of the facility:[171]
"The guarantee does not include the regular wear of the fire-proof masonry, namely of the grills, and other parts exposed to the fire."
The Topf operating instructions for a two-muffle oven recommends that the temperature not exceed 1,100°C, and for a three-muffle oven 1,000°C. This means that the refractory masonry of a three-muffle oven could sustain a smaller thermal load and so had a weight-quality ratio less than that of a two-muffle oven, which was already notably inferior to that of the civilian ovens.

c. The wear on the refractory masonry was essentially caused by the open flames which assailed it. While in a coke oven the heat necessary for the cremation was provided by open flames, which continuously attacked the refractory masonry, in an electric oven this heat was provided by electrical incandescent resistances. Here the refractory masonry endured much less strain, as resulted from the experiment with the Biel crematorium, referred to by Jakobskötter on p. 580 of his article:
   – The electric oven required 388,000 Kcal (thousands of calories) for its heating, the coke oven 2,100,000 Kcal.
   – For a six-day week of work with seven cremations, an electric oven required 880,000 Kcal, a coke oven 7,700.000 Kcal, so that the electric oven used around 11,5% of the heat used by a coke oven. By contrast, the thermal wear suffered by a coke oven was over eight times higher.

Therefore my assumption of 3,000 cremations for the life of the refractory masonry is really optimistic!

8.4. The Crematoria of Paris and Milan

In "Body Disposal" Zimmerman wrote about the huge number of cremations in crematoria in southern Paris and Milan without any noticeable damage. The Paris crematorium mentioned by Zimmerman is that of Père La-

[170] The eight-muffle oven constituted two blocks of four-muffle ovens.

[171] *Allgemeine Lieferungsbedingungen A*, already enclosed in the *Kosten-Anschlag* from Topf of November 1, 1940, regarding a two-muffle oven heated with coke. BAK, NS 4 Ma/54: *"Auf die regelrechte Abnutzung, namentlich der Roste, des Schamottemauerwerkes und anderer, dem Feuer ausgesetzter Teile bezieht sich die Gewähr nicht."*

chaise, but was situated in the eastern, not southern sector. A provisional oven with the Gorini system was initially installed in this crematorium which came into operation on October 22, 1887.[172] The definitive oven with a system of Toisul and Fradet began operating on August 5, 1889.[173] In my "Observations" I maintained that the numbers of *corpses* cremated were the opposite of huge (point 28, see p. 100). In "My Response" Zimmerman objects that the numbers reported by me referred only to the cremations arranged by families. Apart from these, there were two other categories of cremation, those "for paupers and dissecting tables." He does not know into which category were included the "3,743 stillborn children" mentioned in his article.

It is true that there were other cremations in the Père Lachaise crematorium beyond those which I listed, but cremations *of what*? In statistics going back to 1904 the same number of *corpses* quoted above by me for the years 1889-1892 is indicated, to which two categories are effectively added, one of the *"Anatomienleichen"* (dissected corpses, 7,429 from 1889 to 1892), the other of *"Embryos"* (3,960 from 1889 to 1892).[174] I know well what the "embryos" are.[175] But what were the *"Anatomienleichen?"* Corpses and body parts dissected in the anatomy theaters. I most certainly cannot believe that the heart of one corpse, the liver of another, leg of yet another, a brain of a fourth corpse, a body organ of a fifth were cremated individually, so that here one should not speak of 7,429 corpses, but of 7,429 parts of corpses. It is precisely for this reason that the cremations of *corpses* were charged under separate cover in the official statistics. Be that as it may, the fact is that the oven of Toisul and Fradet on one hand and the ovens of the nineteen thirties and forties on the other hand cannot be directly compared because, as I explained in my "Observations," this installation of the late 1800s was structured on three levels and its massive refractories were impressive.

As to the Milan crematorium, which was on a par with the one of Paris, Zimmerman's source makes a huge blunder. 271 cremations were carried out in this crematorium between 1876 and 1883,[51] and 486[176] cremations between 1884 and 1893,[177] so that it has been falsely cited as an example of the long life of refractory masonry in ovens, which were successively installed.

[177] This is the date of the source given by Zimmerman in "Body Disposal," note 103.

9. Multiple Cremations

Leaving aside the declarations of "eyewitnesses," which are worth as much as Zimmerman's claims, in order to prove the reality of "multiple" cremations, our professor places his trust in Bischoff's letter of June 28, 1943. He thinks – perhaps seriously – that this document presents a "dilemma" for me. In "Body Disposal" he writes:

> *"The real dilemma for Mattogno was in the Bauleitung figures given on June 28, 1943, discussed earlier, that 4,416 bodies could be burned in a 24 hour period in the four new crematoria, or 2,208 in a 12 hour period. When the 7,840 kilograms of coke usage for a 12 hour period are divided by the 2,208 bodies which could be cremated in a 12 hour period, the average comes out to about 3,5 kilograms per body."*

These data – which I will elaborate on in more detail below – are not only not a "dilemma" for me, but constitute one of the fundamental *proofs* of the technical absurdity of the cremation capacity appearing in this letter.

The true "dilemma" is Zimmerman's: If it was possible to cremate one corpse in 15 minutes with 3.5 kg of coke, how are we to explain that the Gusen oven consumed a minimum quantity of coke at least 9 times as high? If it was so simple to save 92% of the fuel at a time when Germany could not afford to waste anything, much less its coke (and if it was so simple to save 75% of the cremation time), how is it that at Gusen this miraculous "multiple" cremation could not be realized? Why is it that for each cremation about 27 kg of coke was thrown away?

Jährling's file memo of March 17, 1943, calculates the coke consumption of the Birkenau crematoria for 12 hours of operation. 2,800 kg of coke for each of crematoria II and III were foreseen, 1,120 kg for each of the crematoria IV and V.[178] The above letter of Bischoff attributes a cremation capacity of 1,440 corpses in 24 hours – so 720 corpses in 12 hours – for each of II and III a capacity of 768 corpses in 24 hours – therefore 384 in 12 hours – for each of Kremas IV and V.

If these data were realistic, the coke consumption for each corpse would have been about (2,800÷720=) 3.9 kg for Kremas II/III and about (1,120÷384=) 2.9 kg for Kremas IV/V.

Regarding the coke consumption of the Topf ovens, the only fact *certified by the documents* is that for the Gusen oven. During the period of its greatest activity, from October 31 to November 12, 1941, the Gusen oven cremated 677 corpses with a coke consumption of 345 wheelbarrows of coke, that is (20,700÷677=) 20,700 kg. The average consumption of coke per corpse was therefore about 30.6 kg. For this reason, this *experimental* result is the only point of departure for a *scientific* discussion of the subject.

---

[178] APMO, BW 30/7/34, p. 54.

The Auschwitz double-muffle oven was structurally similar to the Gusen oven, so that, without going into technical details, it can be said that the coke consumption of the two types of ovens was approximately equal.

A three-muffle oven of Krema II/III was no different from a two-muffle oven with a third muffle interposed. It is true that the central muffle enjoyed the thermotechnical advantage of gas combustion at a high temperature originating from the two lateral muffles, which reduced its specific coke consumption considerably. Nevertheless, the two lateral muffles did not technically enjoy any thermotechnical benefit, since the flow of gases originating from the gas generators traveled in the direction of the central muffle, from which it was introduced into the smoke conduit. Hence the two lateral muffles heated the central muffle, but were not themselves heated by this muffle, from which we deduce that two lateral muffles had a coke consumption approximately equal to that of a double-muffle oven.

In conclusion, the two lateral muffles behaved like a two-muffle oven: they cremated in the same time – around one hour[179] – and required the same amount of fuel – about 30 kg of coke. Even if assuming that the central muffle did not consume any heat, the cremation of three corpses would nevertheless have needed on average of around ((30+30)÷3=] 20 kg of coke.

In an eight-muffle oven, each of the four gas generators served two muffles: the combustion gas passed from the first to the second muffle and from there it was led into the flue. Even if assuming that the second muffle did not consume any heat, the cremation of two corpses would on average have needed (30÷2=) 15 kg of coke.[180]

Zimmerman imagines that the average coke consumption of "about 3.5 kilograms per body" depends on "multiple" cremations, which, according to the data in Bischoff's letter of June 28, 1943, means that the Birkenau ovens cremated four corpses in a single muffle in one hour. Let us see how founded this hypothesis is.

The only installations which carried out the equivalent of a multiple cremation were those using animal carcasses for fuel. The most important manufacturer was the Berlin firm of H. Kori. Oven model 1a could burn 250 kg of organic material in five hours with a consumption of 110 kg of fossilized carbon, that is, the equivalent of four corpses of about 62.5 kg each, so with a consumption per corpse of 27.5 kg of fossilized carbon in 75 minutes. The most prestigious model, oven 4b, burned 900 kg of organic material in 13.5 hours with a consumption of 300 kg of fossilized carbon. This is for example equivalent to the simultaneous cremation of 15 corpses of 60 kg in an average time of 54 minutes each and a coke consumption of 20 kg per corpse.[181]

[179] Duration confirmed by Kurt Prüfer, as is seen above.

[180] On the actual coke consumption for typical corpses see "The Crematoria Ovens…," op. cit., (note 8, 2003), pp. 392f.

[181] Ibid., p. 400.

These experimental results demonstrate that by increasing the load of organic burning material, one increased either the corresponding fuel consumption or the duration of the combustion process. Hence, should "multiple" cremations in the Birkenau ovens have been successful, this would not have been of any effective advantage regarding either the duration or the coke consumption of the cremations. Therefore, "multiple" cremations would only have multiplied the duration of the cremation process and the coke consumption by the number of corpses loaded into the muffles.

The cremation of many corpses in one muffle in an oven planned for the cremation of only one single corpse at a time would have caused insuperable thermotechnical problems. Here I limit myself to briefly hinting at the most important of such problems for a three-muffle oven.

A cremation without a coffin develops in two principal phases. The initial endothermic phase of evaporation of the water in the corpse, which removes a large quantity of heat and lowers the temperature in the muffle, and the final exothermic phase (up to the peak of the corpse's main combustion), in which the corpse itself burns, producing heat.

During the first phase of the cremation process, the water evaporation from four corpses in a single muffle would have led to a drastic reduction of the oven's temperature as well as of the smoke with a consequent reduction in the draft. Reducing the chimney's draft would have had the effect of reducing the draft of the furnace (which depended on it), ending up in a lowering of the capacity of the oven's grills. For this reason, the availability of heat at the time it was most needed would also have been diminished. The reduction of the muffle's temperature to below 600°C would have had further deleterious effects. For example, the heavy hydrocarbons formed by the gasification of the corpses would have remained unburned and at the lower temperature the corpses would only have been carbonized.

Besides, the introduction of four corpses into a single muffle would have brought about physical problems for the draft. The corpses would have obstructed the three inter-muffle apertures that linked the lateral muffles with the central one, blocking the passage of combustion products from the gas generators. The four corpses placed on the grill of the central muffle would have obstructed the existing spaces between the bars of the grill finally blocking the passage of the gas from the gas generator by getting into the smoke conduit. This would have ultimately diminished the chimney's draft and that of the furnace, with a further diminution in the availability of heat.

If, after hours of efforts, all these difficulties had been overcome, during the exothermic phase of the principal combustion, the four corpses together with the flow of gas from the gas generator would have greatly surpassed the terminal thermal load of the muffles. That is, they would have produced a quantity of heat above that which the refractory masonry could sustain, thus damaging it (fusion of the refractors).

Finally, the 12 corpses cremated in each oven in an hour, together with the gases made by the gas generators, would have produced a quantity of smoke too great for the crematory chimney to get rid of when reckoned for normal usage (one corpse per hour per muffle).

In conclusion: In a three-muffle oven, the cremation of four corpses per muffle, had it succeeded, would have required at least (30×8=) 240 kg of coke, and the duration of the cremation process would have been not less than four hours. The cremation capacity of Kremas II/III would then each have been 360 corpses in 24 hours, and the coke consumption 20 kg per corpse. The cremation capacity of the Kremas IV and V would have been 192 corpses in 24 hours, the coke consumption 15 kg.

Therefore, the information in Bischoff's letter of June 28, 1943, is *technically absurd*, and only naïve people like Zimmerman could take it seriously.

10. The Duration of the Cremation Process at Auschwitz

10.1. The Ovens of Ignis Hüttenbau Co.

I asserted earlier that Zimmerman's conjectures with respect to the duration of a cremation in the oven at Gusen as lasting 25.2 minutes are technically absurd, and I have already furnished various items of proof, such as Kessler's cremation experiments, the results of the operation of the Westerbork oven, the results of the operation of the ovens for the cremation of animal carcasses, or the Soviet guideline diagram. Here, I shall present an even more stringent proof: the results of the operation of the four crematorium ovens installed in the Theresienstadt crematorium by Ignis Hüttenbau Co. of Teplitz-Schönau, now Teplice in the Czech Republic. Those installations were among the most efficient of the time. They were naphtha-based, with a controllable burner that allowed the fuel consumption to be adjusted to the various phases of the cremation. They also possessed a sophisticated supply system of combustion air consisting of sixteen pipes – eight on each side – linked to a blower and set at various points in the wall of the muffle. They could be individually throttled. The enormous size of the muffle – which had a height of 100 cm, a width of 90 cm and a length of 2.60 meters – allowed the cremation to be carried out in a most economical way, which was as follows:

After the warming-up period, the first corpse was introduced into the oven on a stretcher made of raw boards. The stretcher was placed into the front portion of the muffle, where it was exposed to the combustion air coming from the nozzles installed there. It burned rapidly. At the same time the corpse began to dry out. After some 30-35 minutes, when the drying process had progressed far enough or was complete, the dry and disarticulated body was raked into the rear part of the muffle, close to the burner, by means of a four meter long rake, operated from a special opening in the back of the oven, and then

underwent the proper combustion. In this section, the corpse was in direct contact with the controllable flame of the burner and with the combustion air introduced through the nozzles installed here.

The ashes were removed through a dedicated opening in the rear portion of the oven. In continuous operation, the oven thus contained two corpses at a time, one in the drying phase, the other in the combustion phase, and the duration of the cremation process was generally equal to the time needed to dry a corpse. For this cremation plant, name lists are available that indicate also the time necessary for the cremations. From the records concerning a sample of 717 cremations carried out between October 3 and November 15, 1943, a period of 41 operating days,[182] an average incineration time of 35.5 minutes for female corpses and 36.5 minutes for male corpses can be computed.

The bottom of the Ignis-Hüttenbau ovens was a solid floor, 2.60 meters in length. It had no openings but led step by step into a shaft, which was the post-combustion chamber, and then into a final shaft, somewhat lower, the ash receptacle. The combustion of the corpses thus took place in a horizontal direction.[183]

Hence, whereas the Ignis-Hüttenbau oven could accommodate in its muffle a fresh corpse as soon as the body introduced earlier had dried out, with a Topf oven one had to wait until an advanced stage of the incineration process was reached. Already for that reason the time needed for an incineration in the Topf oven at Gusen was necessarily longer than for the Ignis-Hüttenbau oven. This difference is further accentuated by the fact that the Theresienstadt ovens had a more effective heating system and a technically more advanced design. From these considerations it becomes obvious that the minimum theoretical duration for the cremation, which I assigned to the Gusen oven – some 40 minutes – is certainly very optimistic. The actual duration may well have been around 45 minutes.

Nevertheless, the exceptional results of the Gusen oven could not be achieved by the two-muffle ovens of Krema I at Auschwitz because the Gusen oven depended on two essential factors:

a. the particular structure of its muffle grill;
b. the use of forced draft blower.

10.2. The Muffle Grills of the Gusen Oven

The muffle grills in the Gusen oven consisted of intersecting bars, which formed eight rectangular openings of about 30 × 25 cm each. Hence the *principal combustion* of the corpses began in the muffles but developed for the

[182] Of the 41 cremation lists examined, 18 lists have over 20 cremations per day, 10 lists have over 15 such entries. The maximum number of cremations for one furnace is 27. To save on fuel, cremations were generally carried out in two shifts in a single oven which always stayed hot. In this way, each of the four ovens was used periodically.

[183] "The Crematoria Ovens…," op. cit., (note 8, 2003), p. 397.

most part underneath the muffle in the ash receptacle, so that the muffle was freed relatively quickly (after about 45 minutes) and it was possible to introduce another corpse.

The Auschwitz ovens, on the other hand, had a completely different muffle grill and were much less efficient. The two ovens of Krema I reconstructed after the war by the Poles utilizing original parts dismantled by the SS show a muffle grill made of I-shaped slabs of monolith arranged in a slot of grooves. Between them were gaps about five centimeters in width. With this type of grill, not only did the principal combustion have to take place in the muffle, but so did the post-combustion of corpse residues. For this reason, the duration of the process was necessarily longer.

The efficiency of these ovens can be seen from the following fact: On June 1, 1942, Bischoff wrote a letter to Kammler to inform him of the damage caused to the chimney of Krema I and he specified:[184]

> *"The chimney has suffered damages because of overheating due to continuous usage (operating day and night)."*

Both Danuta Czech's *Kalendarium* and Pressac exclude any connection between this breakdown and the cremation of corpses of presumed victims of gassings. Therefore, during May 1942 *only* the corpses of deceased detainees of the camp were cremated in the *Stammlager* crematorium.

On March 30, 1942, Bischoff was informed of the damage done to the chimney by *SS-Oberscharführer* Josef Pollock in his capacity as the officer in charge of police affairs concerned with construction,[185] so that the snag had manifested itself before this date. During the second half of the month the greatest mortality occurred in days 19 to 29, during which about 1,450 detainees died, 132 per day on average.

Bischoff's letter of June 28, 1943, attributes a cremation capacity of 340 corpses in 24 hours to the three two-muffle ovens of Krema I. This corresponds to an average duration of 25 minutes per cremation, which is practically the same as that erroneously supposed by Zimmerman. If this were true, then the ovens could have cremated the approximately 1,450 daily corpses mentioned above for the second half of May in a little over nine hours, that is, in a simple day shift. But since day and night operation of the ovens was necessary, their cremation capacity was notably lower. If we assume the normal duration for the process of cremation, the ovens were active for about 22 hours per day – exactly a day and night operation.

The other difference between the Gusen oven and those of Krema I of Auschwitz is that the Gusen forced draft system served two muffles, while in the Auschwitz crematorium it served six, so that the latter was less efficient.

---

[184] RGVA, 502-1-272, p. 256: *"Durch die fortgesetzte Inbetriebnahme (Tag- und Nachtbetrieb) hat der Kamin durch Überhitzung Schaden erlitten."*

[185] Report of Pollock to Bischoff of 30 May 1942. RGVA, 502-1-314, p. 12.

After the reconstruction of the chimney in August of 1942, the forced draft system was eliminated completely.

In a three-muffle oven, the muffle grill was made up of bars arranged transversally at a distance of about 20 cm from each other. The principal combustion developed in the muffle, and the corpse residues fell through the grill gaps into the ash pan where post-combustion took place (lasting some 20 minutes according to the service instructions of Topf). In addition, the Birkenau ovens functioned without an forced draft system.[186]

Therefore the cremation capacity of Krema I appearing in Bischoff's letter of June 28, 1943, has no real basis, and this is also valid for the Birkenau ovens, which were *less efficient* than the Gusen oven.

10.3. The Forced Draft System of the Gusen Oven

Zimmerman writes:

> *"However, he* [Mattogno] *did not cite any evidence to this effect nor did he provide evidence that the Gusen oven had any features that differed from the Auschwitz ovens. The cost sheets for the Gusen double muffle oven installed in October 1941 list no such item."*

This assertion is false. Invoice no. D 41/107, drawn up by Topf on February 5, 1941, lists the constituent elements of the oven, among which were:[187]

> *"collapsible chimney of 4 m height, forced draft installation."*

The delivery note of December 12, 1940, mentions among the "parts for the cremation oven":[188]

"1 wagon for the blower station with three blowers."

Of these 3 blowers one served for the two burners – because the original oven was planned to operate with naphtha, another for transporting combustion air into the muffles, the third for the forced draft installation (*Saugzuganlage*).

Zimmerman declares:

> *"At the time I wrote the body disposal study I did not have access to the full Topf file on the Gusen ovens. I only had a few documents from that file. Thanks to the efforts of Ulrich Roessler of The Holocaust History Project, I now have the complete file NS 4 Ma/54."*

So if Zimmerman possesses "the *full* file on the Gusen oven," it is clear that his lie is deliberate.

And although he possessed the whole of this documentation, Zimmerman did not even manage to see that the Gusen oven was not "installed in October 1941" but in January. Its parts were shipped by Topf via rail-freight on December 12, 1940, and arrived at their destination on December 19. On the

[186] The facility of Krema II was irreparably damaged after a few days of use and was dismantled.

[187] BAK, NS 4-Ma 54: *"umlegbaren Schornstein von 4 m Höhe, Saugzuganlage."*

[188] Ibid.: *"1 Wagen für die Gebläse-Station mit 3 Gebläsen."*

same day, the SS New Construction Office of Mauthausen camp sent Topf a telegram asking for the immediate dispatch of a technician.[189] Topf decided to send their specialist August Willing for December 27.[190] Work started the same day and ended on January 22, 1941. The two gasifiers for the coke were set up during the construction of the oven,[191] which went into operation at the end of January.[192]

11. The Expansion of the Birkenau Camp and the Necessity of the Crematoria

11.1. Origin of the Birkenau Crematoria

Zimmerman writes:

"In the study (Body, 12) I cited an article by camp historian Danuta Czech that the negotiations for the four crematoria began in July 1942, before the announcement of planned expansion to 200,000 on August 15.

Elsewhere, Czech cites a Bauleitung[193] *document from July 1, 1942 as follows:*

'The Central Construction Office of the Waffen SS and Police in Auschwitz contacts the companies that have already carried out building contracts in Auschwitz Concentration Camp. It asks the Huta (Engineering Company) and Lenz Industrial Construction Company of Silesia, located in Kattowitz to submit proposals to build new crematoriums.' (emphasis added)

Mattogno's response is to cite the following Aktenvermerk of August 21, reproduced by Jean-Claude Pressac:

'Regarding the construction of a 2nd crematorium with five three-muffle furnaces, together with the ventilation and air extraction systems, it will be necessary to await the results of negotiations already under way with the Reich Main Security Office on the subject of rationed materials' (Italics added).

Mattogno then announces:

'Therefore, no decision to construct Crematory II had yet been made (by August 21)' (Reply, 7, emphasis added).

---

[189] Telegram by *SS-Neubauleitung* of Mauthausen camp to Topf dated December 19, 1940. BAK , NS 4 Ma/54.

[190] Letter by Topf to *SS-Neubauleitung* of Mauthausen camp dated December 23, 1940. BAK, NS 4 Ma/54.

[191] Topf, "*Bescheinigung über gegen besondere Berechnung geleistete Tagelohn-Arbeiten für Firma: SS-Neubauleitung d. Kz.L. Mauthausen*," BAK, NS 4 Ma/54.

[192] Letter by *SS-Neubauleitung* of Mauthausen camp to Topf dated February14, 1941. BAK, NS 4 Ma/54.

[193] In reality *Zentralbauleitung*.

Before continuing, I need to strongly stress that nowhere in the body disposal study did I ever state the contract negotiations for any of the crematoria were completed or when any final decisions were made. I only stated, on the basis of Czech, when they began, and in a footnote, when the authorization was given to begin (Body, note 80)."

Therefore, the entire argumentation is founded "on the basis of Czech." Appropriate for a dilettante, Zimmerman trusts blindly in Danuta Czech, but his trust is very badly misplaced. In fact, the document in the *Kalendarium* of Auschwitz, which he cites,[194] refers *only* to Krema II. Franciszek Piper correctly summarizes it as follows:[195]

"With the completion of the first stage of planning on July 1, 1942, the Zentralbauleitung offered two construction firms, Huta Hoch- und Tiefbau AG and Schlesische Industriehaus[196] *und CO AG in Kattowitz, which had been cooperating with the camp for some time, to undertake the construction of the crematorium building (number II)."* (my emphasis)

Zimmerman knows this article well since he cites it in note 14 of "Body Disposal." Here then is a brilliant example of opportunistic misuse of the sources. Finding himself faced with two contradictory accounts of one document, he was totally uninterested in the original document and has obviously chosen the version that is most convenient for him! If Zimmerman still has any doubts in this regard, then let him get the original document from his mentor Ulrich Rössler and publish it!

That the offer of Central Construction Office referred only to the "*Krematorium*"[197] (singular!) of the POW camp (Birkenau) is evidenced by other documents, e.g. Bischoff's letters of October 13, 1942,[198] and of May 5, 1943.[199]

The fallacious summary of this document provided by D. Czech has a clear ideological-propagandistic motivation, as can be seen from what she writes in the essay, which Zimmerman invokes in "Body Disposal" ("Origins of the Camp, Its Construction and Expansion" published in the book "Auschwitz: Nazi Death Camp," notes 80 and 52). Here in fact is what D. Czech wrote in her essay, according to the official Italian translation of this book:[200]

---

[194] Danuta Czech, op. cit. (note 24), p. 240.

[195] Franciszek Piper, "Gas Chamber and Crematoria," in: I. Gutman, M. Berenbaum (eds.), op. cit. (note 26), p. 165. The archive reference is the same as that provided by D. Czech: "D.Z.bau/6" (op. cit., note 24, p. 179) from the "collection Zentralbauleitung."

[196] *Recte*: Schlesische Industrie*bau* Lenz u. Co.-AG, Kattowitz, Grundmannstrasse 23.

[197] The future crematorium II. At the time it was the only one being planned and was therefore simply called "Krematorium" in the documents.

[198] GARF, 7021-108-32, pp. 46f.

[199] RGVA, 502-1-83, which mentions an "*Angebot der Firma Huta über die Bauarbeiten* […] *für den Ausbau des Krematoriums im KGL vom 8.7.1942*."

[200] Various authors, *Auschwitz. Il campo della morte*, Edizioni del Museo Statale di Auschwitz-Birkenau, 1997, pp. 29f. Here D. Czech does not even provide any archival references.

> *"At the end of July of the same year the Construction Office, which in the meantime had become the Central Construction Office of the Waffen SS and Police Auschwitz and which was responsible for construction work in the Auschwitz and Birkenau camps, started negotiations with various firms for the installation of not two, but of four large crematoria and their respective gas chambers."*[201] (my emphasis)

In passing I might indicate that it is stated clearly in this passage that already in July 1942 the Construction Office of Auschwitz had been promoted to *Central* Construction Office. Although I made specific reference to this passage from "Body Disposal"[202] (note 80), Zimmerman has continued to make the blunder of using the term *Bauleitung.* Another example of his superficiality and dilettantism.

The account of Danuta Czech on the "start" of negotiations for the presumed "new crematoriums" at the end of July 1942 being false, so is therefore the conclusion of Zimmerman. This conclusion is ultimately refuted by the "overview" by Bischoff of July 30, 1942, regarding ongoing and planned constructions, which were to be done in the third financial year of the war (*"die...im dritten Kriegswirtschaftsjahre zu errichten sind"*). Regarding the POW camp (Birkenau) it mentions only the item "*Krematorium*"[203] for the reason explained above. This means that even by July 30 no one planned to build the remaining three crematories. They were planned later.

11.2. The Strength of the Camp

Having determined that the decision to construct Kremas III, IV, and V was taken in August 1942, let us now see what the historical context was. I assert that this decision was taken as a consequence of two facts:

1. the expansion of the camp to a strength of 200,000 detainees;
2. the terrible typhus epidemic that raged in the camp.

The essential factor was therefore the mortality as a function of the camp's strength. As to point 1, Zimmerman writes in his response:

> *"My guess is that if Mattogno had documentation for his assertion that the 200,000 was planned in July he would have cited it by now."*

In his letter of August 3, 1942, addressed to the head of Office CV of WVHA, Bischoff writes:[204]

---

[201] After Pressac, no supporter of the reality of the Holocaust can seriously maintain that the Birkenau crematoria were *planned* as homicidal gas chambers.

[202] The English edition of the work is dated 1996.

[203] RGVA, 502-1-275, p. 35.

[204] "*Da sich inzwischen die Belegstärke vergrössert hat und verschiedene andere Gesichtpunkte berücksichtigt werden mussten, wurde der beiliegende Lageplan Nr. 1453 vom 8.7.42 aufgearbeitet, welcher zusätzlich folgende Baracken enthält.*" For references I refer to my work on cremation at Auschwitz.

"Since the occupation has increased and various other aspects had to be taken into consideration, the enclosed situation plan no. 1453 from July 8, 1942, was compiled, which includes the following additional barracks:"

These supplementary barracks were: "24 accommodation barracks, 2 sickbay barracks, 1 storage barrack" for construction sector I and "36 accommodation barracks, 4 laundry barracks, 4 sickbay barracks" for each of the construction sectors II and III. Thus it lists 96 supplementary accommodation barracks for the plan of July 8. Bischoff adds:[205]

"The expansion of the planning was shown to Head of Office Group C SS-Brigadeführer and Major Generalof the Waffen-SS Dr. Ing. Kammler on the occasion of the Reichsführer's visit on July 17 and 18, 1942."

In this letter, written – I emphasize – on August 3, 1942, Bischoff goes on to write:

"Apart from that, the location for the new crematorium close to the quarantine camp was determined."

Therefore, still on August 3, 1942, the head of the Central Construction Office of Auschwitz knew of only one crematorium, that which would finally become Krema II.

11.3. What Camp Strength Was Anticipated?

As far as I know, no plan is known of July 8, 1942, but in his letter of June 29, 1942, to "Office C V" of the WVHA (that is, to Kammler) Bischoff writes:

"according to the order of Reichsführer SS and Chief of the German Police, the camp is to be expanded from 125,000 to 150,000 prisoners of war."

Therefore the plan of July 8 must have foreseen a strength of 150,000 detainees.

After his visit to Auschwitz on July 17 and 18, 1942, Himmler decided on a new "expansion" of the camp. For what strength? Dwork and van Pelt have published the plan for a "accommodation barrack for a prisoner camp," which carries a "capacity" of "app. 550 men." This figure is cancelled by a pencil stroke and above it appears the hand-written numeral "744."[206] Therefore the supplementary 96 barracks would have housed at least about (96×550=) 52,800 detainees, which brought the camp strength to about 202,800 detainees when added to the 150,000 already projected.

But there is an even more explicit document. On August 27, 1942, Bischoff sent to head of Office CV of SS-WVHA a letter concerning "*Lageplan*

[205] "*Die Erweiterung der Planung hat anlässlich des Reichsführer-Besuches am 17. und 18. Juli 1942 dem Amtsgruppenchef C SS-Brigadeführer und Generalmajor der Waffen-SS Dr. Ing. Kammler vorgelegen.*"

[206] D. Dwork & R.J. van Pelt, *Auschwitz 1270 to the present*. W.W. Norton & Company, New York London 1996, Plate 13.

Kriegsgefangenenlager Auschwitz" (lay-out plan of POW camp Auschwitz) in which he said:[207]

> *"In the lay-out plan attached, the enlargement of the POW camp to a capacity of 200,000 men, as recently requested, has already been incorporated."*

The letter referred to a memo from Office CV dated August 10. The new "*Lageplan*" mentioned in the document is the one dated August 15, 1942, which planned precisely for a capacity of 200,000 detainees.[208]

Thus the first point of my thesis has been proved. Let us consider the second. August 1942 proved to be the month of the highest mortality in the entire history of the Auschwitz camp. During the whole month around 8,600 detainees died,[209] nearly double the mortality for July (about 4,400 deaths). The first indication of a decision to build the remaining three crematoria goes back to August 14 (the date on which plan 1678 for Kremas IV/V was worked out). By the end of August 13, another 2,500 detainees had died, giving an average mortality of over 190 deaths per day. From August 14 to 19 (the day on which the discussions summarized in the file memo of August 21 were reported) the mortality became even higher: about 2,400 deaths, on average about 400 per day. The peak occurred on August 19, when more than 500 deaths were confirmed. On August 1 the male strength of the camp was 21,421 detainees. 4,113 detainees had died by the end of August 19, on average 216 deaths per day, of which 1,675 occurred from August 14 to 19, on average 279 per day. The average strength of the camp between August 1 and 19 was about 22,900 detainees.

What would have happened if another typhus epidemic had broken out in a camp with 200,000 detainees?

The explanation for constructing more crematoria is all here.

11.4. The Typhus "Myth"

Zimmerman has the impudence to head one of the paragraphs of his ponderings "The Typhus Myth" ("Body Disposal"). This "myth" would be proved by death certificates presently available. Referring to these in "Body Disposal," Zimmerman writes:

> *"It is known on the basis of these certificates that very few prisoners died from typhus. They show that only 2,060 of the 68,864 deaths were from typhus."*

He then finds that in these certificates many of the causes of death are abnormal or false and concludes:

---

[207] GARF, 7021-108-32, p. 41.

[208] Published by J.-C. Pressac, op. cit. (note 25), p. 203.

[209] The figures are based on statistical processing of data contained in the *Sterbebücher* of Auschwitz.

"How then can the death certificates be explained if the stated causes do not conform to physical reality? The only explanation is that the camp authorities were engaged in a massive killing campaign of registered prisoners. Part of this has to do with typhus."

In "My Response" Zimmerman explains:

"that most of the sick prisoners were being murdered en masse in Auschwitz because it was easier to kill them than to hospitalize them."

So if I understand him well, "most of the sick" from typhus were killed. In how many cases of the death certificates is it that the "stated causes do not conform to physical reality?" Zimmerman mentions two of them:

"In some cases children were said have died from 'decrepitude,' an affliction of the aged."

In reality, Zimmerman's source[210] mentions *a single case* of this kind among 68,864! How can it seriously be claimed that this case is an intentional falsification and not a simple error? Were the SS doctors truly such idiots? Let us consider the second case referred to by Zimmerman:

"Kielar's description is borne out by the death certificates of 168 prisoners who were shot on May 27, 1942 but whose cause of death was listed as 'heart attack.'"

Thus, at the maximum, we have 169 documented causes of death, 169 among 68,864, that is 0.2%. And this would be the proof of the alleged *mass* falsification of causes of death in the certificates?

The falsification of these 169 causes of death is not explainable by the hypothesis that a mass extermination of sick detainees was going on at Auschwitz – according to the official historiography these detainees were "gassed" and not shot – but by the fact of the abuses committed by the head of the Political Section, Maximilian Grabner, who was accused by SS judge Konrad Morgen of having arbitrarily killed 2,000 detainees.[211] It is therefore probable that, earlier on, some complaisant camp physician had been willing to cover Grabner's crimes by falsifying the death certificates of detainees illegally shot by Grabner. These falsifications, though, demonstrate the very opposite of what Zimmerman asserts, because here we do not have a change of "gassing" to "shooting" for the cause of death, but rather of "shooting" to "heart attack." These falsifications did not cover up a mass extermination by means of gas, they covered up shootings which, being hushed up in this way, were illegal and arbitrary. Had a mass extermination been going on at that time by orders from higher up, there would not have been a need to hide these mass shootings.

Zimmerman asserts that during the typhus epidemic the sick detainees were killed *en mass.* Let us see what happened during the month when the typhus epidemic reached its peak: August 1942.

---

[210] *Sterbebücher von Auschwitz*, op. cit. (note), 1995, p. 242.
[211] *IMT*, vol. XX, p. 507.

From a "Holocaust" angle, a "selection" for "gassing" exists only if it is attested to by documents or by testimony. If both are missing, such gassings did not occur. In her *Kalendarium*, Danuta Czech diligently collected and recorded all the documentation which shows, in her opinion, individual "selections." In the *Kalendarium* three "selections" appear for August 1942:

– August 3: 193 "gassed"
– August 10: an indeterminate number of "gassed"
– August 29: 746 "gassed."

We can say that the round figure is 1,500 "gassed." All other deaths were therefore due to "natural" causes. But in August 1942 there were 8,600 deaths overall, of which 7,100 were due to "natural" causes even according to Czech. What caused this extremely high mortality if it was not typhus? As we see, this "myth" is truly fatal.

As to the reason for the small number of causes of death documented in the death books related to typhus, I fully maintain everything I wrote in point 39 of my "Observations," which is that deaths of sick persons from typhus could have been due to complications arising from a general prostration of their physique and weakening of their immune system, aggravated by the scarcity of medication. I can cite a document, the "Notes on the treatment with preparation 3582/IGF/ against typhus," to confirm this. At the beginning of February 1943, an experiment at Auschwitz with a new drug against typhus was carried out on 50 detainees affected with this disease, 15 of whom died during the treatment or immediately after it stopped. The note points out:[212]

> *"Of the 15 deceased death occurred: 6 due to weakening of the heart, 6 due to toxic cachexia, 2 due to brain complications (encephalitis), 1 due to resulting fever, the origin of which could not be determined."*

So none of these 15 detainees died from typhus, but that illness was nonetheless the indirect cause of their death.

12. Connection between Camp Strength and Number of Crematory Ovens

12.1. The Example of Dachau

Zimmerman writes:

> *"The most informative comparison of oven needs versus camp expansion comes from the Dachau concentration camp. Dachau had six ovens. A total of 22,675 prisoners arrived at Dachau in 1940; 6,255 in 1941, 12,572*

[212] "*Bemerkungen über die Behandlung mit Präprarat 3582/IGF/ bei Fleckfieber*," Auschwitz, February 8, 1943. Trial of the camp garrison, Volume 59, p. 61: *"Von den 15 Verstorbenen starben: 6 an Herzmuskelschwäche, 6 wegen toxischer Kachexie, 2 wegen Hirnkomplikationen (Encefalitis), 1 wegen eines in der Folge aufgetretenen Fiebers, dessen Ursprung nicht festgestellt werden konnte."*

in 1942, 19,358 in 1943 and over 76,000 in 1944. Therefore, the prisoner population of the camp had reached over 41,000 by the end of 1942, over 60,000 by the end of 1943 and over 137,000 by the end of 1944. By contrast, the registered Auschwitz camp population never reached more than 92,000 – 112,000, if 20,000 transit prisoners to be shipped to other camps are counted in the summer of 1944. Moreover, there were typhus epidemics in Dachau in the winters of 1942-43 and 1943-44. Therefore, Dachau should have undergone a dramatic expansion of its cremation capacity, if the 'denier' arguments about Auschwitz are correct. Thus, at a time of typhus epidemics and a doubling of Dachau's camp population, there were never more than six ovens. Why did Auschwitz need 52 ovens and Dachau only six?"

Zimmerman begins with the usual imposture in that he peddles "the prisoner population of the camp" for those who were *transported* to the camp. This can be seen from an official publication of the Dachau Museum,[213] which gives the following figures:

1940: 22,675 1943: 19,358
1941: 6,135 1944: 78,635
1942: 12,572

The camp population was much lower than what Zimmerman claims. The real numbers are as follows:[214]

Period	Real strength	Fictitious strength	Excess
December 1942	14,000	41,000	27,000
August 1943	17,000	60,000 (to December)	43,000
December 1944	47,000	137,000	90,000
		Total:	160,000

So with this imposture Zimmerman increases the strength of Dachau by 160,000 detainees, who for the most part had been transferred to other camps.

Similarly with another imposture he reduces to 92,000 – or 112,000 counting the Jewish detainees of the transit camp – the maximum strength of the Auschwitz camp, which "in the summer of 1944" reached 105,168 detainees – or 135,168 counting the 30,000 Jewish detainees of the transit camp.[215]

---

[213] Johann Neuhäusler, *Wie war das im KZ Dachau?* Kuratorium für das Sühnemal KZ Dachau, Dachau 1980, p. 22. Identical figures are in another work edited by "Comitato Internazionale di Dachau": *Il campo di Concentramento di Dachau 1933-1945,* 1978, p. 212. Here too the figures refer to "detainees arriving at Dachau."

[214] Joseph Billig, *Les camps de concentration dans l'économie du Reich hitlérien*, Presses Universitaires de France, 1973, p. 75.

[215] D. Czech, op. cit. (note 24), p. 860. The date is August 20, 1944.

Let us now see what the confirmed mortality was at Dachau as a result of the camp's expansion and the typhus epidemics of 1940 to 1944:[216]

YEAR:	1940		1941		1942	
MONTH	DEATHS	PER DAY	DEATHS	PER DAY	DEATHS	PER DAY
January	/	/	455	14.6	142	4.5
February	17	0.5	393	14	104	3.7
March	86	2.7	321	10.3	66	2.1
April	101	3.3	227	7.5	79	2.6
May	87	2.8	322	10.3	98	3.1
June	54	1.8	219	7.3	84	2.8
July	34	1.1	140	4.5	173	5.5
August	119	3.8	104	3.3	454	14.6
September	134	4.4	73	2.4	319	10.6
October	171	5.5	88	2.8	207	6.6
November	273	9.1	110	3.5	380	12.6
December	439	14.1	124	4	364	11.7
Total	1,515	4.1	2,576	7	2,470	6.7

YEAR:	1943		1944	
MONTH	DEATHS	PER DAY	DEATHS	PER DAY
January	205	6.6	53	1.7
February	221	7.8	101	3.4
March	139	4.4	362	11.6
April	112	3.7	144	4.8
May	83	2.6	84	2.7
July	55	1.8	78	2.6
July	51	1.6	107	3.4
August	40	1.2	225	7.2
September	45	1.5	325	10.8
October	57	1.8	403	13
November	43	1.4	997	33.2
December	49	1.5	1,915	61.7
Total	1,100	3	4,794	13.1

Therefore, "at a time of typhus epidemics," during the winters of 1942-1943 and 1943-1944, the detainee mortality was effectively highest: a good nine per day during the first typhus wave and 42 during the second! Excluding the last two months of 1944, when conditions in the camp started to become tragic, the highest mortality was confirmed in January 1941, with 455 deaths, on average 14.6 per day. Of course, this needed a "dramatic (!) expansion" of the crematory capacity of the Topf two-muffle coke oven in the camp's old crematorium!

Like the Gusen oven, this installation was originally a naphtha-heated oven, which was transformed into a coke oven by the addition of two lateral gas generators. Thus the cremation capacity of this oven must have been the same as that of the Gusen oven. Zimmerman's claim is therefore even more

[216] Johann Neuhäusler, op. cit. (note 213), p. 26.

ridiculous in that he attributes to this oven – and consequently to the Dachau oven – a cremation capacity of 4.7 corpses per hour (two every 25.2 minutes!), 47 in 10 hours, 94 in 20 hours.

What then would have been the use of another crematory oven?

Yet, in spite of this, a new crematorium was constructed at Dachau (the "Barrack X"), in which four Kori single-muffle coke-heated ovens were installed. The cost estimate for the installation bears the date March 17, 1942,[217] a period during which the mortality was lowest: two deaths per day. The plan of the ovens was completed by the Kori firm on May 12, 1942,[218] but it seems that the installation went into service only in the spring of 1943.[219] Nevertheless, during this period – from March 1942 to May 1943 – the camp had an average mortality of barely three deaths per day.

Thus the argument turns against Zimmerman. As another four ovens were constructed when the mortality was so low, and if the existing two-muffle oven was more than sufficient, what was the need to install more ovens?

12.2. The Example of Gusen

Zimmerman writes:

> *"In the body disposal study I cited data from Gusen. Let us now look at the Gusen data and Mattogno's response. In 1944 Gusen expanded from two to three camps, but did not add any ovens. Figures for Gusen show that 14,500 entered the camp in 1940 and 1941, 6,000 in 1942, 9,100 in 1943, 22,300 in 1944 and 15,600 in 1945. Death rates from 1940 to 1945 were very high. From 1940 to 1944 slightly less than 25,000 of the 52,000 prisoners who entered the camp died. The population of the camp exceeded 22,000 by September 1944. Yet there was never more than one double muffle oven in Gusen. As noted earlier, the Mauthausen authorities ordered another double muffle for Gusen, but never installed it."*

Therefore, why were more ovens not installed at Gusen as a result of the camp's expansion?

First of all, let us see the picture of the mortality at this camp. I give the relevant data in the tables which follow:[220]

August	479	15	562	18	164	5	242	8
September	426	14	374	12	192	6	168	6
October	462	15	655	21	154	5	429	14
November	887	30	552	18	250	8	943	31
December	986	32	1,719	55	328	11	994	32
Total	5,272	14	7,410	20	5,248	14	4,091	11

Hence the average mortality for these four years was about 15 deaths a day. The highest mortality occurs in January 1943, with an average of 46 deaths per day. With a forced draft blower the Gusen oven could cremate two corpses in around 40 minutes (one in each muffle), so that it handled the mortality peak with about 15 hours of operation. In accordance with the average mortality, it operated daily for about five hours, for six if we include one hour for heating it up.

What was the need for another oven?

12.3. The Example of Buchenwald

I showed the captious nature of Zimmerman's methods in point 38 of my "Observations." For comparison with Auschwitz, he chose two examples which he naively thought favored his thesis: Dachau and Gusen, examined above. I objected that the case of Buchenwald completely invalidated his thesis. Zimmerman claims that in this area I kept silent on "some crucial information." This is what he wrote in "My Response" on this matter:

> *"Not surprisingly, Mattogno did not reveal some crucial information about the installation of the additional six ovens in Buchenwald. Shortly after the installation of these ovens the camp began to undergo a dramatic expansion in its population. It rose from 9,500 at the end of 1942 to over 37,000 by the end of 1943. Buchenwald continued to grow until by September 1944 it held over 84,000 prisoners. Seen in light of the actual growth of the camp, the new six ovens were not unusual. The Buchenwald authorities certainly must have anticipated this growth when the oven additions were made."*

It is true that on December 31, 1943, the average strength of the camp was 37,319 detainees, but it is also true that the two ovens came into operation on

August 23 and October 3, 1942, respectively.[221] An event occurring after 14 months cannot really be said to have taken place "shortly after!" But let us overlook this. If the first of the two ovens went into operation on August 23, 1942, the decision to construct them was taken at the latest in the spring of 1942.

According to the statistics of the sick bay, the actual situation at the time was as follows:[222]

Period	Average strength	Mortality	Daily mortality
March 30 – May 2	6,653	337	9.9
May 3 – May 31	6,600	243	8.3
June 1 – June 28	7,828	231	8.2
June 29 – August 2	8,394	331	9.4
August 3 – August 30	9,461	335	11.9

The average strength of the camp was kept stable at around 9,000 detainees until January 1943, then it began to continuously rise as in the following table:[223]

Month	Strength	Month	Strength
January	9,719	July	16,500
February	11,513	August	18,500
March	12,526	September	22,736
April	13,186	October	27,736
May	14,503	November	33,379
June	14,741	December	36,103

Here, as in the examples of Dachau and Gusen, Zimmerman has slyly diverted the discussion to the camp strength, as though I had considered it the *only* factor, which led to the decision to construct another three crematoria at Birkenau. In actual fact, I consider the essential factor to be the mortality (caused mainly by the typhus epidemic) *as a function* of the camp strength.

Although the average strength of Buchenwald in 1943 was about 19,300 detainees, that is, it increased by 232% with respect to the average strength for 1942 (about 8,300 detainees), the mortality increased by hardly 43% (from 2,542 deaths in 1942 to 3,636 in 1943) and the average daily mortality was hardly 10 deaths.

Zimmerman argues retrospectively, as though the Central Construction Office of Weimar-Buchenwald was planning this expansion before August 1942, but his statement is "without any proof." With typical Pharisaic hypocrisy, our professor has the impudence to throw in my face the statement that the decision to expand the strength of Auschwitz-Birkenau to 200,000 detainees was

[221] J.-C. Pressac, op. cit. (note 27), pp. 116f. In my "Observations," I wrote through a slip "beginning of December."
[222] *Konzentrationslager Buchenwald*. Weimar, without date, pp. 84-85.
[223] Ibid., p. 85.

taken in July 1942, claiming it is "without any proof," and he hurls the same rebuke at Pressac, that he too is guilty of having made a statement "without any proof." One more example of the squalid opportunism of this individual.

Nevertheless, *let us suppose* that Zimmerman's statement was perfectly documented. In that case the Central Construction Office of Weimar-Buchenwald would have decided on the construction of two three-muffle ovens in anticipation not only of the camp's expansion but also of a mortality in proportion to its strength.

On account of transports of evacuees from other camps, the Buchenwald camp reached its maximum strength of 85,900 detainees in October 1944. It certainly cannot be seriously maintained that in 1942 the Central Construction Office of Weimar-Buchenwald had predicted this increase in the camp's strength because at the time it would have foreseen the defeat of Germany.

Nevertheless, granted for the sake of the argument that the phantom plan of spring 1942 for the camp's expansion really concerned this strength of 85,400 prisoners, on the grounds of the experience of the first six months of 1942, during which there were 1,310 deaths among an average population of 7,400 detainees (around 7 deaths a day). Then the plan could also have foreseen the average mortality of about (85,400÷7,400×7=) 81 deaths daily.

But then of what use would six muffles have been, which – according to Zimmerman – could cremate from 342 (one cremation in 25.2 minutes) to 576 (one cremation in 15 minutes) corpses in 24 hours?

Therefore, even if we assume the most absurd hypotheses favoring Zimmerman's thesis, the conclusions which follow radically contradict it.

Let us pass from hypotheses to reality. The two Buchenwald ovens were ordered and installed during a period when for months the mortality oscillated between eight and twelve deaths per day. So, using Zimmerman's argument based on real data, since the cremation capacity of the new installations was 120 corpses in 20 hours, that is, 3,600 per month, in two months they could have devoured the entire camp population! On the other hand, since this real capacity was at least ten times more than the above maximum mortality, it follows that the ovens had a criminal purpose and served to cremate the corpses of mass extermination!

The problem with that, of course, is that not even Zimmerman claims that there ever was a mass extermination in Buchenwald.

12.4. The Case of Auschwitz

In March 1942, 66 detainees died at Dachau, which had an average daily mortality of 14 deaths during the previous year. Despite this, the Munich Central Construction Office made plans for a new crematorium with four ovens.

At Buchenwald the average mortality was 8-12 deaths per day, and in spite of this the Central Construction Office of Weimar-Buchenwald planned and had installed two three-muffle ovens.

In addition to the 15 muffles planned for crematory II, how many muffles should the Central Construction Office have planned for Auschwitz, where in August 1942 the average daily mortality was 277 deaths? Let us make some quick calculations:

	Dachau	Buchenwald	Auschwitz
Mortality in month, during which the new ovens were planned	66	337	8,600
Number of planned new muffles	4	6	31[224]

Therefore, the number of new muffles at Auschwitz was 5.1 times more than that of Buchenwald and 7.7 more that that of Dachau, whereas the mortality was respectively 25.5 and 130 times more. Had the Central Construction Office of Auschwitz adopted the same criterion as that chosen by the Central Construction Office of Weimar-Buchenwald, for instance, the former would have planned an installation with (8,600÷337×6=) 153 muffles!

12.5. The "Static" Population of Auschwitz

Zimmerman finds in "Body Disposal":

> *"More importantly, I also noted that during the period of the typhus epidemic when the camp experienced its highest death rate for registered prisoners, the camp population remained static at about 30,000. I cited a Bauleitung report dated July 15, 1942 – twelve days after the typhus epidemic hit the camp – which stated that for the time being the camp population would remain at 30,000."*

Nowhere does Zimmerman mention the source of this document. Never mind! The number 30,000 of detainees appears in two reports of Bischoff of July 15, 1942:

"Explanatory Report on the temp. expansion of the concentration camp Auschwitz O/S,"[225]

and

"Explanatory Report on construction project concentration camp Auschwitz O/S."[226]

[224] 15 muffles in the future Krema III and 16 muffles in Kremas IV and V.

[225] "*Erläuterungsbericht zum prov. Ausbau des Konzentrationslager Auschwitz O/S,"* RGVA, 502-1-223, p. 1ff.

[226] "*Erläuterungsbericht zum Bauvorhaben Konzentrationslager Auschwitz O/S.*," RGVA, 502-1-220, p. 1ff.

However, in neither is it stated that "the camp population remained static at about 30,000." In the *"Dienstliche Veranlassung"* (official inducement), which appears on page two of the first document, one reads:[227]

"According to the order of Reichsführers-SS and Chief of the German Police, a concentration camp for at present 30,000 inmates is to be established on the grounds of a former Polish artillery barracks in Auschwitz O/S."

The same sentence is repeated in the official inducement on p. 2 of the second document, with the addition:

"simultaneously agricultural enterprises are to be established."

Both documents refer exclusively to the main camp (*Stammlager*). So as usual, our naïve professor has understood nothing. In the case at hand, I do not even believe that he is trying to deceive us on purpose, since he does not give the source of the document he cites. It is clear that he puts his trust in second-hand or third-hand sources. So here he only provides additional proof of his crass ignorance and dilettantism.

13. Open Air Incinerations

13.1. Air Photo of May 31, 1944

Zimmerman writes:

"In my disposal study I had supposed that Mattogno received any information he had about this topic from John Ball. In the article Mattogno wrote with Franco Deana he had twice referred his readers to an article by Ball when discussing the grave sites in the area outside of the camp that appear on the May 31 photo. He wrote: 'John Ball demonstrates in the present volume that air photos taken of Auschwitz by the Allies show no traces of incineration in pits.'

I was able to show that Ball has lied consistently about these photos. Mattogno now states (Reply, 3) that he possesses all of the aerial and surface photographs of Auschwitz from 1944. This is quite a revelation since he has given no less than three different versions of what is on this photo. Mattogno writes that 'if I change opinion concerning interpretation of specific points, that depends only upon progression of my studies, and not due to the fact that later books have published documents which I have already possessed' (Reply, 3). But since he already had these photos, one wonders what could have changed on them to give varying accounts of their contents. Did he actually examine them or did he rely on Ball? I strongly sus-

[227] "*Laut Befehl des Reichsführers-SS und Chef der Deutschen Polizei ist auf Gelände der ehemaligen polnischen Artilleriekaserne in Auschwitz O/S ein Konzentrationslager für vorerst 30000 Häftlinge zu errichten.*"

pect that Mattogno was deceived by Ball but is now too embarrassed to admit."

I respond briefly.

1. I am in possession of the air photos of Auschwitz-Birkenau since 1989-1990. If Zimmerman doesn't believe it, that's his affair. If he is curious, let him ask his compatriots near the National Archives, Washington D.C., to check the "Orders for Reproduction Services" starting from 1989.
2. I am not an expert on aerial photogrammetry, neither have I ever said I was one, nor do I have the technical instruments to attempt an analysis of this kind.
3. The photographs are in black and white and it is not easy with the naked eye to distinguish extremely small objects, especially if there is vegetation round about. However this may be, it is a fact that Zimmerman's expert, Mr. Carroll Lucas, "a photo imagery expert with 45 years experience" ("Body Disposal"), speaks of "'possible' lines of people moving between the open hand dug trenches toward Crematorium V" ("Body Disposal") in his "report." Hence, in spite of his 45 years of experience, in spite of his sophisticated technical instruments, he has not been able to establish with certainty what these "lines" are.
4. In my analysis of the document I was partially misled by "eyewitness" testimony, like that of Nyiszli, invoked by Zimmerman in "Body Disposal." Referring to the period of "extermination" of the Hungarian Jews, Nyiszli wrote:[228]

   > *"We set off in the direction of the thick twisting spiral of smoke. All those unfortunate enough to be brought here saw this column of smoke, which was visible from any point in the KZ, from the moment they first descended from the box cars and lined up for selection. It was visible at every hour of the day and night. By day it covered the sky above Birkenau with a thick cloud; by night it lighted the area with a hellish glow."* (my emphasis)

   If one considers that the Birkenau camp measured 1,657.01 m × 720 m, the photographs should have showed more than a square kilometer covered with smoke!

   In order to have an objective point of reference, I compared the photographs of May 31 with the one of September 13, in which clouds of smoke caused by bomb explosions were perfectly recognizable. Nothing like this, however, appeared in the photographs of May 31, so that I concluded that they showed no trace of smoke.
5. My reference to John Ball cited by Zimmerman appears in the German work *Grundlagen zur Zeitgeschichte* (1994), which also includes an article by John Ball on air photos. On page 247 one reads:

[228] Miklos Nyiszli, *Auschwitz. A Doctor's Eyewitness Account*, New York 1961, p. 68.

"Only on the exposure of Mai 31, 1944, one can see a small smoke plume acceding from behind crematorium V."

Therefore, John Ball contradicted my assertion. Owing to the subsequent debate and thanks to the analysis of considerable enlargements of the above photographs, I became convinced that John Ball was correct on this score.

6. In contrast to Zimmerman, who recognized his numerous "errors" only after my tight criticism, I recognized my own spontaneously and corrected it. No Zimmerman forced me to do it. And no Zimmerman forced me to make the corrections that I mentioned in the "Author's Note" appearing in the introduction to the English translation of the *Grundlagen* article.[229] This demonstrates that my revisions are a result of ongoing progress made in my studies on the question.

13.2. "Trash Incineration"?

In "Body Disposal" Zimmerman wrote:

"Mattogno claimed in 1995, the year following the publication of the May 31 photo, that the smoke was not from burning but most probably from trash."

I retorted that "I have never written anything like this, neither in this booklet nor elsewhere" ("Observations," point 1). The booklet I refer to is my article *Auschwitz Holocaust revisionist Jean-Claude Pressac. The "Gassed" People of Auschwitz: Pressac's New revisions*, published by Russ Granata in 1995 precisely as a booklet. In "My Response" Zimmerman quotes the following sentence taken from the *online* version of the above article:

"The small column of smoke rising from the courtyard near Crematory V which appears in the aerial photograph is consistent with outside trash incineration."

I confirm once more what I said: I never wrote – and can add, never thought of writing – such a thing. This sentence in question was inserted by the editor of the *online* version without my knowledge. In fact, the sentence does not appear in the original version of the article, which is in the above booklet, two editions of which were published by Russ Granata. Moreover, I was perfectly aware of the existence of the two waste incineration ovens in crematoria II and III.

13.3. Activity or Inactivity of the Crematory Ovens?

In the controversy with Prof. Cajani on the interpretation of one of the May 31, 1944, air photos I wrote in *My Banned Holocaust Interview*:[230]

[229] Op. cit. (note 8), Engl. edition.
[230] Granata, Palos Verdes 1996, p. 43.

"The fact that smoke appears only in the courtyard of Crematorium V, and not from the crematoria chimneys, supposing that the smoke comes from a cremation facility, means only that this was the only facility then in operation; it is possible that they had recourse to such a facility when there was a shortfall in coke for the crematory ovens or when the crematoria were shut down for repairs.

Danuta Czech writes in her Kalendarium that corpses of Gypsies alleged to have been homicidally gassed on 2 August 1944, were cremated out in the open because the crematory ovens at that time were not working ('Denn die Krematoriumsöfen sind zu der Zeit nicht in Betrieb')"

Zimmerman trims this passage in such a way that "it is possible," becomes a certainty. To prevent the reader from confirming this, he cites neither the page nor the title of my booklet, which he simply calls "the 1996 tract" (p. 5). On the previous page he mentions "a publication entitled *My Banned Holocaust Interview*" without supplying any information, not even the 1996 date of its publication, even though it is "very difficult to obtain."[231] So Zimmerman's reader cannot know what this "1996 tract" is!

To my hypothesis on open air burning on account of the crematoria being out of service, he counters me with two opposing objections. The first refers to the *Kalendarium* of Auschwitz. Zimmerman rebukes me for not having mentioned the *source* of Danuta Czech! This rebuke is rather hypocritical since Zimmerman, like everybody else, cites the page of the *Kalendarium* without mentioning her source, because the *Kalendarium* itself is considered to be a source!

The second objection is this:

"However, he could cite no sources which mention any oven failures during the Hungarian operation from mid May to mid July 1944."

I will satisfy him at once. Here is the list of jobs drawn up for the locksmith shop in the period under consideration:[232]

"13.4 1944. Nr. 1483. Krematorium-Verwaltung. Przedmiot [object]*: Instandsetzung von 20 Ofentüren u. 10. Kratzern in den Krematorien I und II* […]*. Ukonczono* [finishing]*: 17.10 1944."*

"1.6 1944. Nr. 1600. Krematorium-Verwaltung. Przedmiot: Instandsetzung von 30 Ofentüren der Krematorien III und IV, sowie Anfertigung von 4 Stück Feuerhaken […]*. Ukonczono: 7.6 1944."*

"7.6 1944. Nr. 1617. Krematorium-Verwaltung. Przedmiot: Lfd. anfallende Reparaturen in den Krematorien 1–4 vom 8.6 – 20.7 44. Ukonczono: 4.7 1944."[233]

---

[231] This booklet is now available from Castle Hill Publishers (online at www.vho.org). It was also for sale on the old website of Russ Granata, where Zimmerman found all of Carlo's articles.

[232] *Höss Trial*, vol. 11a, p. 96. I give the text with all its errors.

The order no. 1617 refers to the order of the *SS-Standortverwaltung* no. 337/4 of May 31, 1944, which means that the damage to be repaired occurred before this date.

In fact, at the beginning of May 1944, the masonry of the smoke flue and chimney of the crematories of Birkenau was again damaged, because on May 9, the head of the Central Construction Office of the Birkenau camp asked the camp commandant for a "permission to enter the crematoria I-IV" for the Koehler Firm,[234] because it had been "commissioned to make urgent maintenance works at the crematoria."[235]

It has therefore been *proved by the documents* that the four Birkenau crematoria were undergoing repairs on May 31, 1944.

13.4. A Final Observation

In "My Response" Zimmerman writes:

> *"Another piece of evidence that the ovens were functioning is a reference in a camp document dated June 1, 1944 – one day after the May photo was taken – to the production of four pieces of firehooks (feuerhaken)* [sic!] *for 30 ovens. Why have such devices for ovens that were not working?"*

By transforming the "repair of 30 oven doors" into "production of four pieces of firehooks for 30 ovens" our professor falsifies the document's text, which is the order no. 1600 of June 1, 1944, cited above by me. Another example of Zimmerman's deliberate deceit. Even though he has access to the documents, which prove that the crematoria were undergoing repairs, he not only fails to mention this, but falsifies the documents in order to prove the contrary!

The impudence of this imposter is truly incredible! And with self-righteous hypocrisy he accuses me of saying nothing about compromising documents!

13.5. The Absence of Smoke from the Crematory Chimneys

Since the Birkenau ovens lacked recuperators preheating the combustion air up to 600°C, the ovens inevitably produced more smoke than the civilian ovens. This is revealed in the first place by Prüfer's statement cited above and which I wish to repeat here:

> *"Normal crematoria work with pre-warmed air so that the corpse burns quickly and without smoke. As the crematoria in the concentration camps*

---

[233] This date is definitely due to an error. If repairs had to be carried out between June 3 and July 20, they could not have ended on July 4. One must therefore read July 24.

[234] The Koehler firm had constructed and repaired the smoke flues and chimney of the crematoria II & III.

[235] RGVA, 502-1-83, p. 377.

were constructed differently, this procedure could not be used. The corpses burned more slowly and created more smoke, necessitating ventilation."

In the second place, smoke was a drawback which beset even the most sophisticated civilian crematory ovens. Furthermore, in 1944 engineer Hans Keller conducted a series of experiments to find out what caused the formation of smoke.[236]

That the crematory chimneys of Birkenau smoked emerges from the photographs published by J.-C. Pressac's first work on Auschwitz[25] on pp. 340f. This is how he comments on photograph 17:

"South/north view of the greater part of the south side of Krematorium II, probably taken in summer 1943. […] *The Krematorium had already been at work, as we can see by the soot at the top of the chimney."*

In fact, the extremity of the chimney appears strongly blackened by soot, which becomes even more evident by contrast with the photograph 17a published alongside it, in which the extremity of the chimney is still clean.

From the large *external* soot deposits from the ovens' eight smoke conduits at an elevation of over 15 meters we deduce that when the ovens were in operation the chimney not only smoked, but it smoked *heavily*.

The definitive and irrefutable proof of the fact that the chimneys of the crematoria smoked when the ovens were in operation is furnished by the air photo of Birkenau taken on August 20, 1944 – one of the images in my album, which Zimmerman claims I do not possess![237]

Nevertheless, in the air photos of May 31, 1944, none of the six chimneys of the Birkenau crematoria are smoking. This confirms that the crematories of Birkenau were out of service and that for this reason the corpses of the registered detainees were cremated in the open.

13.6. Mass Cremations?

In the first version of this article I had challenged Zimmerman – who had invoked two alleged experts of aerial photogrammetry, Mark van Alstine and Carroll Lucas – to publish not only their "discoveries" but also the respective air photos with precise indications of these "discoveries." In his book *Holocaust Denial* already mentioned, Zimmerman has come back to the "discoveries" of his alleged experts, but obviously without publishing any air photos.

In a specific study[238] I have radically refuted the fanciful findings of those two experts by means of 48 documents, among which there are numerous air photos and their respective enlargements. Here, I will limit myself to some general observations.

---

[236] H. Keller, *Ursache der Rauchbildung bei der Kremation*, Biel 1945.
[237] NA, Mission USEC/R 86. Can B 10658, Exposure 5018.
[238] *Auschwitz: Open Air Incinerations*, Theses & Dissertations Press, Chicago, IL, 2005 (www.vho.org/GB/Books/aoai).

In "Body Disposal" Zimmerman reported the findings of another expert, Mark van Alstine:

> *"He has identified three burning pits in the area of the White Bunker (Mattogno states that there were four).*[239] *Van Alstine is able to confirm from the photograph the existence of three huts that were used for prisoner undressing near the White Bunker.* […] *Van Alstine also confirms the existence of three pits near Krema V each of which he estimates to be about 1,150 square feet for a total of 3,450 feet of pit space."*

This claim is completely wrong, as I documented in my study mentioned above.

It is known that the Soviets found only a basin with a surface area of 30 square meters during an on-site investigation of the region of Bunker 2 made a few months after the alleged events.[240] What kind of honesty or competence our expert has, can be deduced from this alone! As to the "three pits near Krema V," I accept for the sake of the argument that they entail three pits each of about 106 m^2. Filip Müller states:[241]

> *"On order of Moll five pits were soon started to be dug behind crematorium V, not far away from the three gas chambers."*

As it issues from what he writes on p. 198, the order was given at the beginning of March 1944. The first two pits:[242]

> *"were 40 to 50 meters long, about 8 meters wide and 2 meters deep."*

"In the middle of May 1944," F. Müller continues, the transports of Hungarian Jews began arriving; consequently:[243]

> *"Moll had three more incineration pits dug out in the courtyard behind crematorium V, so that he now had five of them there. Even the farmhouse west of crematoria IV and V, which served already in 1942 as an extermination site, had been brought back to an operational condition as so-called Bunker V. In addition to the four rooms of this house, which served as gas chambers, four incineration pits had been dug out."*

So, according to Filip Müller, on May 31, 1944, in the courtyard of Krema V there were *five* "cremation pits," two of which each had minimum dimensions of 40 m × 8 m = 320 m^2 and four "cremation pits" of unknown size in the region of so-called *Bunker* 2. Van Alstine claims to have noted *three* – and

---

[239] As I have already shown in my "Observations," this is another Zimmerman imposture. In "The Crematoria Ovens…," to which Zimmerman refers, I wrote: "Mass graves were almost certainly located to the southwest of the 'temporary earth basin'[a], about 650 ft. west of what was to become Sector BIII of Birkenau, since the air photos from 1944 – specifically those from May 31 – show traces of four huge, parallel pits in that area" (op. cit., note 8, 2003, p. 412). So I refer neither to "burning pits" nor to an area of the "White Bunker!"
a) Imprecise translation. The "*Kläranlage*" is a sewage or waste water treatment plant.

[240] See the plans of March 3, 1945, published by J.-C. Pressac, op. cit. (note 25), p. 180.

[241] F. Müller, *Sonderbehandlung*, Steinhausen, Munich 1979, p. 200.

[242] Ibid., p. 207.

[243] Ibid., pp. 211f.

not four – pits in this area, and *three* – not *five* – pits in the region of Krema V, with a *comprehensive* area equal to that of *only one* of F. Müller's five pits! As we see, Van Alstine has solidly "confirmed" the trustworthiness of this "eyewitness!"

Among other things, I trustingly expect that Zimmerman's "experts" will indicate in any air photo the exact location of the "area of some 60 meters length and 15 meters width," which Moll ordered "concreted" "next to the pits at the crematorium."[244] The thing should be extremely easy, given that we are dealing with an area *larger* than that of Krema V!

But let us proceed. By maintaining with authority that "at least 75%" of the 400,000 Hungarian Jews allegedly gassed "were burned in the open" (p. 18), Zimmerman deludes himself in challenging my conclusions on cremation at Auschwitz. In his judgment:

> *"An Auschwitz-Birkenau oven had the capacity to burn between 10,000 and 15,000 bodies. Since the Krema IV ovens went down shortly after being placed in operation, the 44 remaining ovens probably burned about half of the 1.1 million killed in the camp.*
>
> *This estimate is based on the information available on the Gusen ovens after their overhaul in 1941, the Enek-Tek II data cited by Mattogno, the multiple cremation testimony I cited by Sonderkommando Henryk Tauber – who noted that the authorities had ways to place the bodies in the ovens to maximize efficiency (Body, 28) – and the method of burning in 25 minutes, instead of the usual 50 or 60 minutes, mentioned earlier in this response."*

The ignorance of this inexperienced person is truly unbelievable. Such an "expert" on the crematory ovens of Auschwitz does not even know that Krema I, with its six muffles, ceased activity in July 1943. That is why the number of available muffles in 1944 was 38, not 44.

Finally, I note that the "estimate" of 75% of the 400,000 allegedly gassed Hungarian Jews – that is, "at least" 300,000 corpses cremated in the open – is not based on anything. It concerns the arbitrary number chosen by Zimmerman to balance his calculations. We will see shortly how reliable this number is.

For an "estimate" of the durability of the refractory masonry of "an Auschwitz-Birkenau oven" (without any distinction between ovens with 2, 3, or 8 muffles, which is totally ignored by Zimmerman), he gives 10,000 to 15,000 cremations! As demonstrated above I note that the information "available on the Gusen ovens" is false and arbitrary. The "Enek-Tek II data"[245] refers to an ultramodern gas oven of the 1980s, which can be applied to a coke oven of the forties only by a delusional standard of judgment. If a Ferrari F 2000 can attain a maximum speed of 360 km/h, then a Ferrari of the 1940s

[244] Ibid., p. 212.
[245] The oven is named "Ene*r*-Tek II."

necessarily had a lower maximum speed. But Zimmerman uses such facts in an inverted sense: If a Ferrari F 2000 can reach a maximum speed of 360 km/h, so can a Ferrari of the 1940s. This logic is simply ridiculous.

Multiple cremations "attested to" by Tauber are technically impossible and are also refuted by Kurt Prüfer. The cremation in 25.2 minutes is based on an erroneous interpretation of the list of cremations at Gusen, hence does not have the least reliability. In conclusion, the "estimate" of the durability of the ovens' refractory masonry is arbitrary and completely without foundation.

Let us now see what the basis is for Zimmerman's claim that 300,000 corpses of Hungarian Jews were cremated in the open. In the booklet *Auschwitz Holocaust Revisionist Jean-Claude Pressac. The "Gassed" People of Auschwitz: Pressac's New Revisions* (pp. 15-17), I demonstrated on the basis of documents that between May 30 and 31, 1944, about 21,950 Hungarian Jews reached Auschwitz. Zimmerman thinks the percentage of those, which were (allegedly) gassed to be 91% (=400,000÷437,400×100). It follows that 91% of these 21,950 people, around 19,800, were allegedly "gassed" during the days of May 30 and 31, 1944. Moreover, from May 16 to 31[246] at least 184,000 Hungarian Jews arrived at Auschwitz, of whom therefore 91% or about 167,400 were allegedly "gassed" and cremated in 16 days, on average about 10,500 per day. The minimum number arriving on May 30, 1944, was around 9,050, of whom about 8,200 would have been "gassed."

Let us analyze this information on the basis of Filip Müller's testimony, which describes the preparation of a "cremation pit" as follows: At the bottom of the pit a layer of wood was placed, on top of this 400 corpses were placed, then another layer of wood and another 400 corpses, followed by a further layer of wood and finally another layer of 400 corpses.[247]

He does not specify if this refers to a pit of 40-50 m × 8 m, but the number of corpses is perfectly in accord with such an area.[248]

Let us examine the *hypothesis* most favorable to Zimmerman's thesis. We assume *ad absurdum* that:

– The Birkenau crematoria could cremate 4,416 corpses in 24 hours
– From 16 to 31 May 1944 the Birkenau crematoria were in operation for 20 hours a day (= 3,680 cremations)
– In a pit of 320 m^2 1,200 corpses could be cremated per day.[249]

In this case the crematoria would have been capable of cremating about (3,680×16=) 58,900 corpses during the above 16 days, so that the remaining

[246] The day of arrival of the first transport of Hungarian Jews.
[247] F. Müller, op. cit. (note 241), p. 219.
[248] The minimum area available for each corpse was 320 ÷ 400 = 0.8 m^2.
[249] F. Müller states that the duration of combustion was 5-6 hours (p. 221). To this must be added the time needed to fill the pit with 1,200 corpses and with not less than 360 tons of wood, apart from the time needed to remove some tons of ash, so that the average combustion per day for each pit appears just too optimistic.

(167,400–58,900=) 108,500 corpses would have been cremated in the open, on average around 6,800 per day.

The cremation of these 6,800 corpses using the method described by Filip Müller would have required a burning area of about 1,800 m^2, which would therefore be visible in the air photos of May 31, 1944.

On the other hand, what have Zimmerman's "experts" found here? A *presumed* burning area of 320 m^2! I omit the "three burning pits" in the region of the so-called Bunker 2, since its existence is denied by the Soviet on-site investigation of March 1945. At most another 30 m^2 of burning area can be conceded, that is, by Zimmerman's method another 100 cremated corpses.

Therefore, even assuming the *patently absurd* premises most favorable to Zimmerman's conjecture, the cremation capacity of the "cremation pits" would have been about (1,200+100=) 1,300 corpses per day. And where would the remaining (6,800–1,300=) 5,500 corpses per day have been cremated? They could neither have been cremated in the "pits" nor in the crematory ovens.

Hence, in 15 days – from May 16 to 30 – (15×5,500=) 82,500 corpses would have accumulated for cremation!

I am sure that with a bit of good will Zimmerman's "experts" shall succeed in "locating" these corpses on the air photos. Zimmerman only needs to explain carefully to them what it is they must "locate"!

Let us pass from the absurd to the probable. The stratified system of combustion described by Filip Müller is similar to that tried by the Belgian chemist Créteur after the battle of Sedan for the disinfection of the common graves. By pouring tar into the graves themselves and igniting it, Créteur's purpose was to burn the corpses in the graves in which they lay to prevent epidemics. That was his intention. But what was the result? The following:[250]

> *"That the so-called incineration procedure (crémation) was satisfactory cannot be claimed with the certainty the chemist Créteur thinks it can. The success of the procedure was not at all an incineration in the chemical sense, but merely a carbonization; but even the latter, which in and of itself would suffice for hygienic purposes, was not reached to the degree that was necessary to render the corpses harmless. Before the corpse parts could be ignited, the hydrocarbons of the tar had to be burned. But as a result of this the O* [Oxygen] *content of the air was reduced to such a degree that only a small part was left over for the carbonization, which in addition could have a direct carbonization effect only if the corpse parts had already lost a major part of their water content. As a result of this only the corpse parts at the surface were carbonized, the content in the depth, however, to which O could not get (and that is particularly true for mass*

[250] Dr. H. Fröhlich, op. cit. (note 16), pp. 109f.

graves), was not at all or only to a minor degree involved in that process. The flesh in lower parts was at best roasted by the influence of the heat."

It is clear that the same problem of oxygen deficiency would occur in two layers less than those claimed by Filip Müller in his "cremation pits." It is not by chance that Zimmerman tried to twist this fact by turning to the squalid impostures, which I unmasked in points 5-7 of my "Observations," and it is not by chance that in his *Mea Culpa* appearing in "My Response" he took good care to avoid admitting these "errors."

What can be conceded to the burning technique described by Filip Müller? At most the burning of 400 corpses in 320 m^2.[251] The maximum capacity of the four Birkenau ovens was 920 corpses in 20 hours, so that these installations, assuming they operated every day at full speed, could have cremated a *theoretical* maximum of about (16×920=) 14,700 corpses during the above 16 days. Thus, (167,400–14,700=) 152,700 corpses would have remained to be cremated in the open, on average about (152,700÷16=) 9,500 per day.

In order to cremate these corpses, a burning area of (9.500÷400×320=) 7,600 m^2 would have been needed, that is, – to make a visual comparison – 9.5 times more than that of a crematorium of type IV/V!

Once more: what have Zimmerman's "experts" found in the photographs of May 31, 1944? A *presumed* burning area of 320 m^2! Burning the above 152,700 corpses with such "cremation pits" would have ended in August 1945!

Thus the myth of open-air cremations *en mass* is definitely disposed of.

13.7. "The White Bunker"

Let me say, first of all, that I have devoted a specific study to the so-called Birkenau "Bunkers," in which I have demonstrated that these buildings have never existed as homicidal gassing installations.[252] This is yet another book which is waiting for Zimmerman's "definitive refutation"!

In "Body Disposal" Zimmerman writes:

"Holocaust History Project member and computer programmer Mark Van Alstine has examined the May 31 photo for the author and confirms Brugioni's observation that the White Bunker is in the wooded area where the eyewitnesses say it was. He has identified three burning pits in the area of the White Bunker (Mattogno states that there were four).

---

[251] Ground photographs taken after allied bombardments of German cities show open-air pyres with metallic beams on which several layers of German victims are placed. These photographs only show the beginning of "cremation"; to my knowledge none show the end result. In my opinion, one only wanted to obtain the carbonization of the victims' soft tissue in order to avoid epidemics.

[252] *The Bunkers of Auschwitz. Black propaganda versus History*, Theses & Dissertations Press, Chicago, 2005 (www.vho.org/GB/Books/tboa).

Van Alstine is able to confirm from the photo the existence of three huts that were used for prisoners undressing near the White Bunker. Recall that Hoess wrote that there were three huts near the White Bunker."

Above I occupied myself with the first part of this "expert's" "discoveries" and showed that these are in conflict with the assessments made by the Soviets in 1945. Let us now confront the question of the "three huts." The Birkenau camp consisted of brick buildings and wooden barracks that could be dismantled (*zerlegbar*). The most common type was the "horse stable barrack type 260/9," which measured 40.76 m × 9.56 m and was used for various purposes. Moreover, these barracks made up most of the *Effektenlager* – 25 barracks among 30, were the property of inmates was stored. The remaining five, of which three were east of the *Zentralsauna,* were of type "Type 501/34" and measured 41,39 m × 12,64 m. The barracks that had a provisional use were dismantled and moved according to the needs of the day, as is attested to in the documentation of the Central Construction Office.

The "5 barracks for prisoners (special treatment)," which Zimmerman claims for the so-called Bunker 1 and 2 ("Body Disposal") were horse stable barracks. Therefore, in the area of the "White Bunker" there should appear three barracks of this type.

If we are speaking here of the place where undressing barracks were located according to "witnesses" and the Auschwitz Museum, then we can assert with certainty that van Alstine's interpretation is simply a swindle, because on the air photos of 31 May, 1944, only three rectangular shapes of deforested and cleaned-up land can be seen in that location, but no barracks. Anyone wishing to convince himself that this is so only has to compare these rectangles with the barracks of the *Effektenlager* to the east of the *Zentralsauna*, which are perfectly visible and clear. It is obvious that Zimmerman's "experts" find what Zimmerman wants them to find in the photographs!

Let us now proceed to the "Red Bunker." Let me add that the expressions "Red Bunker" and "White Bunker" are inventions by Zimmerman who fused together the holocaustic designations "Bunker 1" or "little red house" (*czerwony domek*) and "Bunker 2" or "little white house" (*bia_y domek*).

In "Body Disposal" Zimmerman falsified my statements on the *denomination* of "Bunker," "white house" and "red house." In "My Response" Zimmerman had to admit his "error," adding:

"I pointed out that this structure and the huts next to it – which were used as gas chambers and undressing huts identified by many eyewitnesses – is visible on the May 31 photo. Mattogno has yet to address the issue of the existence of these structures on the photo."

In my study *Auschwitz: Open Air Incinerations* I have demonstrated that the presence of three "huts" on the photograph of May 31, 1944, is nothing but a lie.[238]

As to the structure he calls "Bunker," there is no question that a structure is visible on the photographs of May 31, 1944. However, with his distorted sense of logic, Zimmerman uses this fact to come to a completely arbitrary conclusion. This is his reasoning: The masonry structure of the "White Bunker" appears in the photographs, therefore the "White Bunker" existed *as a homicidal gas chamber*. With the same distorted logic one can argue as follows: The crematoria structures appear in the photographs ("identified by many eyewitness" as installations equipped with homicidal gas chambers), therefore the crematoria contained homicidal gas chambers!

That in the photographs there is a structure subsequently named "Bunker 2" is a *fact*. That this building was used as a homicidal gas chamber is an arbitrary *conjecture* – unless Zimmerman claims that the decisive factor is the witnesses: the structure in question is a homicidal gas chamber because that is what the witnesses say. But then (leaving aside the all but irrelevant credibility of the testimonies), why refute my writings at the *technical and documentary* level?

Having created *from nothing* the "three huts" and the *homicidal function* of the structure under discussion, Zimmerman ventures into a comical "prediction" of half a page, in which he himself presents and refutes objections which are based on the two false conclusions mentioned above. The thing is so absurd that it is not worth dwelling upon.

13.8. Pits "Recently Bulldozed"

On examining the air photo of May 31, 1944, Zimmerman's other "expert" Lucas found, according to Zimmerman's "Body Disposal":

> *"'four, possibly five large, recently bulldozed linear excavations… The total length of these excavations is between 1,200 and 1,500 feet. All appear to have recently been covered over, since no shadows are evident. These excavations have the classic appearance of a mass grave site…'*
>
> *Mattogno claimed that these grave sites had ceased being used in 1943 with the completion of the four crematoria. However, Luca's observation about their recently being bulldozed shows that they were in current use."*

With his typical deceitfulness, Zimmerman writes that I "claimed that these grave sites had ceased being used in 1943 with the completion of the four crematoria." As he knows well, this is not *my* assertion but the official thesis of the Auschwitz Museum. In the previously cited article, *Gas Chambers and Crematoria*, an article Zimmerman is well aware of, since he cites it more than once, Franciszek Piper writes:[253]

> *"In the spring of 1943, with the launching of new gas chambers and crematoria, the two bunkers were shut down. Shortly thereafter, bunker 1 and the nearby barracks were dismantled. The incineration pits were filled*

[253] In I. Gutman, M. Berenbaum (eds.), op. cit. (note 26), p. 164.

in with earth and leveled. The same work was performed on the pits and barracks of bunker 2, but the bunker itself was left intact. It was brought into operation again in May 1944 during the extermination of Hungarian Jews. At that time several incineration pits were re-excavated and new barracks for undressing were constructed." (my emphasis)

Piper's article is based on an analysis of all the testimonies available to the Auschwitz Museum relevant to this matter. If he reaches this conclusion, then it means that no witness (or no witnesses considered to be reliable by him) states the contrary.

So it is only arbitrarily – that is, without the support of any document or any testimony – "without any proof!" – that Zimmerman can claim that the presumed "cremation pits" or "grave sites" of the so-called *Bunker* were active after the crematoria came into operation.

As to the "four, possibly five large, recently bulldozed linear excavations," Zimmerman says only that Lucas has identified them "outside of the Birkenau complex" without specifying where.

The photographs of May 31, 1944, show traces of four long trenches running north-south, outside of the Birkenau camp at about 160 meters north of crematorium V. Starting in the west, the first two trenches are about 100 meters long, the other two about 130 meters. The width of the trenches is roughly 10 meters. It is, however, wrong to state that these trenches had been "recently bulldozed," if by "recently" is meant a period of less than several months, because the trenches appear to have been covered by vegetation to a large extent.[254]

Actually, we have here the mass graves dug in 1942 for the burial of the registered detainees who died on account of the tragically deficient sanitary conditions in the camp. During 1942, some 48,500 detainees died. On the basis of the coke supplies we can say that about 12,000 of them could be incinerated in the old crematorium at the main camp, so that another 36,500 had to be buried.[238]

On the photographs mentioned above, something like five (perhaps six) "recently bulldozed linear excavations" between 30 and 40 meters long and 9 to 10 meters wide do actually appear at a distance of about 650 meters from crematorium II, but no witness has ever asserted that there were mass graves in that area.

In fact, on the official map of Birkenau appearing on p. 27 of Danuta Czech's *Kalendarium,* this region is not even mentioned. The "mass graves" are located in a region north of Krema V, beside the "pyre" (*Scheiterhaufen*) of Bunker 1. Other "pyres" are indicated in the area of Bunker 2.[255]

[254] Also, if they had been recently bulldozed, the vegetation around them would have been destroyed by the intensive earth-moving work with both men and machinery. Yet the area around those former graves looks untouched. Editor's remark.

[255] D. Czech, op. cit. (note 24), p. 27.

Therefore, whatever these possible "excavations" may be, they are not associated with the homicidal Bunkers. The distance, as the crow flies, between possible "excavations" and Bunker 2 is about 600 meters, but the distance by road is much longer. The two areas are connected by two roads. One of about 1,500 meters first goes north-east, then turns back towards the south-west, then goes south. The other of about 1,300 meters enters the camp in a south-westerly direction, makes a long curve through the waste water treatment plant area and again leaves the camp in an easterly direction as an extension of the camp road that ran alongside the railway platform.

Since there was enough space for the "cremation pits" in the region of the "White Bunker" what was the point of digging so far away?

Zimmerman himself makes a similar objection, to which I will respond below:

> *"The problem is as follows: since there already was an area available for these burnings, why was it necessary to create a second area near Krema V?"*

But Zimmerman's problem is this: "since there already was an area available" for the "mass graves" near the so-called *Bunker* 1 and one for the "pyres" next to the so-called *Bunker* 2, "why was it necessary to create a second area" so far away? Finally, what does "*recently* bulldozed" mean in terms of time?

13.9. Ground Photos[256]

Zimmerman writes:

> *"Rather than actually going to take a look at the photo to see if I had represented it correctly, he* [Mattogno] *simply made an uninformed statement. The reason was obvious: the expanded edition of the photo was published in 1993 while Mattogno's comments on the issue in* My Banned Holocaust Interview *were made in 1996. He did not want to admit that he was not familiar with the photo.*
>
> *In 1996 he cited the incomplete version of the photo* […]*"*

The impudence of our professor goes beyond all limits of decency. Since the start of 1990, three years before the publication date mentioned by Zimmerman, I have in my possession *two* photographs that show a scene of open-air burning. If he has any doubts about this, let the Auschwitz Museum send him a copy of the letter of November 21, which was enclosed with the documents sent to me on this day, among which were the negatives "277, 278 spalenie zwlok na stosach."

Moreover Zimmerman shows – once again – his bibliographical ignorance. The two photographs had already appeared in the following publications, among others: in 1978 in the book *Auschwitz (Oswiecim) Camp hitlérien*

[256] I have dealt with this topic more thoroughly in my study *Auschwitz: Open Air Incinerations*, op. cit. (note 238).

d'extermination,[257] in 1980 in the book *KL Auschwitz. Fotografie dokumentalne.*[258] They were published by Pressac in 1983 in the book *L'album d'Auschwitz*,[259] and again by Pressac in 1989 in his *Auschwitz: Technique and Operation of the Gas Chambers* (p. 422). The clearest photograph (that corresponding to negative 278) was already published by, among others, Jan Sehn in 1961[260] and also by Danuta Czech in the 1989 German edition of her *Kalendarium* (p. 791).

I do not really understand what Zimmerman means when he speaks of the "expanded" photographs. The two photographs in question were taken through an open door from the inside of Krema V. The original photographs are those published by Pressac, which show the rectangular shape of the door. In any case, the photographs are cut to correspond with the door jambs, and it is probably this type of reproduction which Zimmerman names "expanded."[261] If this is so, he is also mistaken here, since the photograph published by Jan Sehn already in 1961 is "expanded" in this way.

13.9.1. "Cremation Pits" or Pyres?

Earlier I cited the expression "na *stosach*," which appears in the November 13, 1990, letter from the Auschwitz Museum. This expression means "on pyres." The roll of film containing the photographs under discussion (which refers to August 1944) was clandestinely removed from the camp. The note accompanying the roll says that the photographs depict "jeden ze *stosów* na wolnym powietrzu" ("one of the open-air pyres").[262] Therefore, the person himself who obtained the clandestine roll of film in the first place and who must have known what he had photographed speaks of "pyres" and not of "cremation pits."

13.9.2. Analysis of the Photographs

In *My Banned Holocaust Interview* (p. 43) I wrote the following on the above photograph:

> *"The photograph does not show hundreds of men from the Sonderkommando, or thousands of bodies, but rather, eight men in the midst of about thirty corpses; that is all. Not only does this therefore fail to confirm the mass extermination thesis, it decisively refutes it."*

---

[257] Editions Interpress, Warsaw 1978, unnumbered photographic appendix between pp. 176f.
[258] Krajowa Agencja Wydawnicza, Warszawa 1980, p. 184.
[259] Editions du Seuil, Paris 1983, p. 221.
[260] *Oswiecim-Brzezinka (Auschwitz-Birkenau) Concentration camp*, Warszawa 1961, p. 142.
[261] There is a black zone in the photographs outside these limits which corresponds to the walls of the location around the door. So that if the photograph is "expanded" it gains nothing more of the field of view but is only enlarged.
[262] APMO, microfilm n. 1063/35d.

Zimmerman claims that I used "the incomplete version of the photo," which, as I showed above, is ridiculous, and then claims that I had "completely misrepresented the true context of the photo," which is false. Our professor writes:

> *"First, it is impossible to tell how many Sonderkommandos were involved in this burning operation because the total area of Krema V is not shown in the photo. For all we know, there could have been an additional hundred Sonderkommandos dragging bodies from Krema V.*
>
> *It is impossible to tell how many additional Sonderkommandos and bodies were involved because the photo simply does not cover the total relevant area from Krema V to the pits.* […]
>
> *Second, and more importantly, it is impossible to tell how many bodies are being burned because smoke is obscuring the pits. For all Mattogno knows there could have been hundreds of additional bodies being burned. The photo shows 50 corpses – not the 30 claimed by Mattogno from the incomplete photo – which have not yet been burned. The thick smoke from the photo shows that a significant burning operation is underway. This means that there were more bodies than the 30 mentioned by Mattogno."*

Once again our professor tries to elude the problem with one of his banal tricks. Instead of paying attention to what *is* in the photograph, Zimmerman attempts to draw our attention to *what is not*. The photograph in question is presented by Zimmerman and his associates as *proof* of the reality of *mass cremation*, so as proof of *mass* extermination at Birkenau. The true problem then is this: Does the photograph in effect show *mass* cremation? As I showed above, *mass* extermination and *mass* cremation means *thousands* of persons per day.

Let us therefore examine *the order of magnitude* of what *is* in the photograph. The photograph corresponding to negative No. 278 shows a field of vision of about nine meters, of which the smoke – at the level of the base of the wire fence poles – takes up a length of around seven meters. The photograph corresponding to negative No. 277 similarly shows a visual field of about nine meters, but it was taken from a different angle. For this reason it extends the field of view by about two meters. At the level of the base of the poles there is a space of about four meters without smoke. At the extreme left appears a rather blurred figure resembling a guard with a gun over his shoulder. In this area no smoke appears, so that this is the left-hand limit of the area under smoke.

In the first photograph eight standing figures in civilian clothing appear who are assigned to the burning. On the extreme left the leg of a ninth person is visible which almost certainly belongs to the guard of the second photograph. In this photograph six figures in civilian clothing appear, who are assigned to the burning, and the guard. Since the two photographs show fields of vision, which overlap laterally in about 75%, the figures in question are the

same and their numbers do not need to be added together. This is what Zimmerman has done in "Body Disposal" writing "it is possible to see 14 Sonderkommandos in uniform.[sic!]" There are two possibilities: either Zimmerman is too inept to understand that the figures in the two photographs are the same – so 8 not 14 – or he has understood this and intended to deceive the reader.

It is now clear that the detainee who took the two photographs wanted to document the "atrocities" of the SS and photographed what seemed to him or what he thought the addressees of the photographs would regard as the most hideous. So if to the right of the field of vision of the first photograph there had been a more atrocious scene than in the second photograph, the detainee photographer would not have missed taking a picture of it. From his position it would have been enough to take half a step to the left rather than to the right. If then the detainee photographer preferred to overlap the field of vision of the two photographs on the left, wasting four meters of "atrocities" (the four meters without smoke), it signifies that on the right there was nothing "atrocious" of interest. That is, it means that the area under smoke began at the right-hand edge of the first photograph. For this reason the smoking area had a length of about 7-8 meters.

As to the number of corpses, Zimmerman judges that *the* photograph "shows 50 corpses." *Incredibile dictu*, in this tangle of inextricable bodies, our professor has counted them as *exactly* 50! And he admonishes me for having estimated them by eye to be "about thirty."[263] It is also possible that the number of corpses is about 50, but that does not in the least change *the order of magnitude* of the number.[264] If, on the other hand, Zimmerman has examined them so thoroughly as to count 50 exactly, he will certainly have noticed the strangeness of certain corpses. For example, the one lying at the feet of a standing man with his right arm stretched out could easily be the body of a space alien. Another has no face. It is clear that the corpses have been badly touched up on the negative.

The air photo of August 23, 1944, which has recently been discovered, shows a single wisp of smoke in the area of crematorium V. The triangulation of the smoking site with respect to the north door of the alleged gas chamber[265] of crematory V corresponds exactly to the locations shown on photographs 277 and 278, which depict the outdoor cremation scene examined above. The air photo of August 23, 1944, thus presents from above what pho-

[263] *Intervista sull'Olocausto*, Edizioni di AR, 1995, p. 50. *My Banned Holocaust Interview*, op. cit. (note 14) is the English language edition of this booklet.

[264] It is practically impossible to precisely establish the number of corpses, because their contours are for the most part indistinguishable; nevertheless at the left side of photo 278 the layer of corpses begins with three bodies and those in the lower row are about 10, so the total number of corpses would have to be of about 30-40.

[265] The point from which photographs 277 and 278 were shot.

tographs 277 and 278 show from ground level.[266] The cremation site on the air photo measured about 7 by 7 meters, and that size confirms fully my analysis of the two ground level photographs mentioned above.[238] This destroys at the same time all of Zimmerman's dreams of what there *could be* (!) in the yard of crematorium V.

Let me recapitulate the order of magnitude appearing in the photographs under discussion:

– an area of about 7- 8 meters in length under smoke;
– eight men assigned to the burning;
– about 50 corpses waiting to be burned.

This picture is not at all reconcilable with a *mass* cremation of hundreds of corpses (1,200 according to Filip Müller's method) of those presumed gassed, but is perfectly reconcilable with a small burning of tens of corpses of those who had died in the camp.

To this point Zimmerman raises another objection, to which I already alluded above:

> *"In the article he wrote with Franco Deana and cited throughout the body disposal study, he had admitted to outdoor burnings in the area outside of the camp, but only for the period prior to the building of the crematoria in March 1943. This area, as noted by Mattogno, is visible on the May 31, 1944 photo. The problem is as follows: since there already was an area available for these burnings, why was it necessary to create a second area near Krema V?"*

Perhaps "the problem" exists only in Zimmerman's mind. Before Krema II came into operation, the area east of the second waste water treatment plant was also a burning zone simply because the victims of the typhus epidemic of the summer of 1942 could not be cremated in Krema I and were interred in this area in the four long common graves described above. The corpses were later exhumed from these common graves and burnt in the open in the vicinity.

The unusual length of the trenches – between 100 and 130 meters for a width of 10 meters – was due to the high level of the ground-water which did not allow those graves to be dug any deeper than one meter (the groundwater stood at a depth between 0.3 and 1.2 meters).[267]

In 1944 there was no reason to transport the corpses so far away. In my view, the courtyard north of Krema V was chosen as a burning area only because it was the zone within the camp most protected from indiscrete gazes. Besides, in this way the mortuary chambers for the accumulated corpses awaiting cremation became available.

---

[266] These two photographs were taken in the last ten days of August 1944.

[267] Cf. my article "'Cremation Pits' and Ground Water Levels at Birkenau," in: *The Revisionist*, 1(1) (2003), pp. 13-16.

14. Special Actions

On the question of "special actions" and "special treatments" I do not wish to waste paper for any Zimmerman. The interested reader will find the matter discussed in my book *Special Treatment in Auschwitz*.[23] I can only state that as usual Zimmerman knows nothing and has understood nothing about this subject.

Here I limit myself to discussing the document of December 16, 1942. In "Body Disposal" Zimmerman provided an interpretation of this document – be it only in an hypothetical way – which is clearly refuted by the text itself. He supposed that the SS had executed "some of the workers" while the text says that "all civilian workers" were subjected to this special action! Instead of admitting his error, in "My Response" Zimmerman even tried to confirm his interpretation by clutching at straws:

> *"Mattogno attacks me on this point because the memo states that the special action will take place among 'all civilian workers.' He writes: 'If the Zimmerman interpretation is correct, the Gestapo executed all civilian workers' (Reply, 10). Wrong. I would point out in this respect that it would be possible to carry out executions among all classes of civilian workers involved in the strike without executing all of the civilian workers."*

Certainly, "it would be possible," but *textually* "it is impossible." Zimmerman, with his usual deception, tries to pass off a simple logical possibility as a textual possibility. On the other hand, the text categorically excludes the interpretation of "classes." If he had to appeal to this rabbinical exegesis, poor Zimmerman just did not know how to respond! But he should not be discouraged by this: perhaps he will obtain better results by interpreting the text with *gematria*![268] Zimmerman also rejects Pressac's interpretation, which is the most reasonable, for the following reason:

> *"My problem with Pressac's interpretation is that the memo is marked 'secret.' I wondered why a memo that dealt with security checks would have such a marking."*

This "memo" is in reality a "telex" (*Fernschreiben*) addressed to Kammler in Berlin. It is true that it carries the inscription "secret," but not, as Zimmerman believes, on account of the actual "special action of the Gestapo with all civil workers," but because of the foreseen "completion" of the crematoria. In fact, this document did not have for its object "Special action of the Gestapo," but rather "completion of the crematoria," and this is the sole reason for sending it by telex. Bischoff informs Kammler that the previously fixed terms for completion of the crematoria could not be respected for the following reasons.

---

[268] A cabbalistic method in interpreting the meaning of words on base to their numerical value. In the Hebraic alphabet every letter corresponds to a number. Hence, if the numerical value of "Auschwitz" is 75 and that of "extermination" is equally 75, this coincidence then allegedly "proves" that Auschwitz was an extermination camp!

First of all, the building sites remained closed in December "an numerous days" "due to delousing and disinfestation." Secondly, the special action of the Gestapo starting on December 16 took quite a few days as the text tells us ("seit 16. Dezember," = since December 16), so the sites again remained closed. Finally, between December 23, 1942, and January 4, 1943, a permit for the civilian workers was under review, so that the building sites were again inactive. If the weather remained mild and if the availability of labor remained constant, Bischoff foresaw the completion of the crematoria on the following dates: Krema II: January 31, 1943; Krema III: March 31, 1943; Krema IV: February 28, 1943.[269]

On January 4, 1943, Bischoff informed Kammler that it was not possible to respect even these terms, and Kammler accepted this state of affairs on condition that the workers went ahead as quickly as possible. Bischoff had kept him informed on the progress of the work by means of telex.[270]

That Zimmerman has not understood anything of this, should not be surprising. But why should a document on the crematoria have been "secret?" In this regard Zimmerman writes:

> *"all documents relating to crematoria construction were under a blanket order of secrecy going back to June 1942, meaning that it was not necessary to label each document as such."*

Our professor then cites the document in question:

> *"Internal Decree (Hausverfugung:* [sic]*) No. 108.*
>
> *This is a reminder of decree Number 35 of June 19, 1942.*
>
> *As is stated in this decree SS-Lieutenant Colonel Dejaco* [271] *is personally responsible that all in and outgoing plans are registered in an orderly fashion in a specific book. All outgoing plans have to be signed by the person receiving them.*
>
> *Furthermore, all this work is related to econo-military tasks that must be kept secret.*
>
> *Specifically, the plans for the crematoria must be strictly controlled (strengstens zu beaufsichtigen). No plans are to be passed to the work brigade of others. During the construction work they are to be kept under lock and key... In particular attention should be paid to the regulations of D.V. 91 (secret matters/documents). (Vorschluss* [sic[272]] *–Sachen)."*

In this regard I observe the following:

1. This document refers *exclusively* to "plans" in general and to those for the crematoria in particular. It does not in the least mention the *ordinary* correspondence on the crematoria.

---

[269] APMO, BW 30/27, p. 49.

[270] RGVA, 502-1-313, p. 59.

[271] Actually, Dejaco was *SS-Untersturmführer* – second lieutenant – at the time. Another example of the crass ignorance of Zimmerman and his group of translators.

[272] Read: *Verschluß*.

Therefore Zimmerman's claim that there never appears any mention of "secret" in this correspondence consequent to the above order is unfounded. This cannot even be inferred for the "plans" of the crematoria themselves. The document does not refer to the *bureaucratic* question of affixing the "secret" stamp on these "plans," but to the *practical* problem of supervising them carefully.

As far as the crematoria are concerned, the motivation behind this arrangement was the fact that the Central Construction Office regularly entrusted the crematory plans to civilian firms, which carried out the work, and it was not known in what hands the plans might end up.

2. The crematoria had no privilege of secrecy over other buildings. A letter from the SS New Construction Office of Dachau of September 30, 1940, mentions the fact that "according to the order of Reichsführer-SS, all plans of buildings in concentration camps are to be considered as secret plans."[273]
3. Not even the concentration camps had any privilege of secrecy. In the "Destruction protocol on the destruction of 'secret matters' and 'secret state matters" of the Organisation Todt of January 30, 1945, we find among the "state secrets" destroyed documents such as "air-raid damage report," "ventilated air-raid shelter types," "construction material," "construction of an additional fire fighter shelter," "drink water supply," "bridge Oderfurt," "air-raid."[274]

If Zimmerman had adequate historical or documentary knowledge, then he would be aware that for the SS everything was "secret," as Pressac pointed out!

15. Appendix: The Fantasies of Daniel Keren

Daniel Keren is the author of a *Technical Discussion: Refutation of "Holocaust revisionist" claims concerning cremation.*[275] The only thing "technical" about it is the adjective. To all appearances he is associated with his compatriot Zimmerman who mentions him in note 181 of "Body Disposal" in a vain attempt to refute my study on cremation at Auschwitz, even though Keren has the good sense never to cite me. As to Keren's knowledge on thermotechnical matters in general and on the structure and operation of crematory ovens in

[273] RGVA, 502-1-280, p. 187: "*laut Befehl des Reichsführer-SS sämtliche Pläne über Bauten in Konzentrationslager als Geheimepläne zu betrachten sind.*" The letter was written because at the time of his transfer to Auschwitz, *SS-Obersturmführer* Fritzsch was pursuing various plans for Dachau.

[274] "*Vernichtungsprotokoll über die Vernichtung der 'Geheimen Sachen' und 'Geheimen Reichssachen',*" Vojenský Historický Archiv, Prague, Fond OT, 25/7, pp. 299-303.

[275] www.holocaust-history.org/~dkeren/cremation/discussion.shtml.

particular, he is still more ignorant than Zimmerman, so that our two "experts" form a nice pair: the blind leading the blind!

In his "technical" discussion, Keren repeats all of Zimmerman's absurd conjectures but adds some new ones. So here I will deal briefly with Daniel Keren's new "technical" conjectures.

15.1. "Burning more than one Corpse Simultaneously"

> *"There are many testimonies describing this 'technique' (see, for instance, Henryk Tauber's testimony). The 'Holocaust revisionists' claim that it is impossible; however, while it is certainly illegal today, there is no technical problem in burning a few corpses in the same muffle at the same time."*

Then he cites a 1994 book which mentions cases of multiple cremation in present-day crematoria.

Keren immediately begins with a lie: the "Holocaust revisionists" do not say that multiple cremation in the crematory coke ovens of Auschwitz-Birkenau is "impossible." Rather, he says that, in this way, an economically good cremation, one effectively saving time and fuel, is "impossible."

The example cited by this other naïve person cannot even remotely serve as a term of comparison, because he considers ultramodern installations heated with gas or liquid fuel and also because he does not specify the duration of such multiple cremations nor how much fuel they require.

In the face of chemical and physical laws, the declarations of Tauber are worth as much as those of Zimmerman.

15.2. "Running the Furnaces Continually"

Keren writes that the revisionists state that "continuous operation harms the furnaces." He objects saying that the truth is the contrary, as is indicated by the July 14, 1941, letter of Topf to the SS New Construction Office of Mauthausen (which Keren knows only through *Kalendarium* of Auschwitz!), which says (I cite from the original document):[276]

> *"The fact is that the fire-proof material lasts longer if an even temperature is maintained at all times in the oven."*

This dilettante confuses the inevitable wear of the oven's refractory masonry due to usage (number of cremations) with consecutive method of cremation. These are two completely different things. The assertion of Topf is most true in theory, but in practice a forced draft would have exposed the refractory masonry to a larger thermal load, and so to a greater wear. In fact, it was about

[276] Staatsarchiv Weimar, LK 4651: "*Die Tatsache besteht, dass die Schamottematerialen länger halten, wenn im Ofen dauernd gleichmässige Temperatur herrscht.*"

the guarantee for the oven – that is, the financial expenditure – for which Topf imposed the following conditions on its clients:[277]

> *"Guarantee for six months, for three month in case of day-and-night operation."*

As we have seen above, the "parts exposed to fire" were not covered by the guarantee, evidently because they wore down too easily.

15.3. "Saving Fuel"

Keren writes:

> *"'Holocaust revisionists' claim that not enough coke was delivered to Auschwitz, to cremate the number of people that historians agree were murdered there."*

This claim is allegedly false for two reasons, so Keren:

> *"Firstly, one has to know that many corpses in Auschwitz-Birkenau were burned in the open; this mainly took place in 1944, but during other periods as well."*

In reality the calculation on coke consumption as a function of the number of cremations – which I performed – deals with the period from March 15 to October 25, 1943, when burning in the open was *not* carried out. For this period the supply of coke (and wood) to the crematoria is exactly known and the corresponding fuel sufficed to cremate the detainees of the camp who had died, but was *absolutely insufficient* for the corpses of the alleged gassed. If Keren is undeceptive – something I doubt very much – let him read attentively paragraph 10.2. "The Number of Cremations in 1943: Coke Fuel Consumption" of my article "The Crematoria Ovens of Auschwitz and Birkenau."[8]

The second reason cited by Keren is this:

> *"Lastly, the Auschwitz-Birkenau furnaces used compressed air which was injected into them to enhance the burning. The fact that this can save a great deal of fuel was noted by the Engineer Mueller, who in 1937 planned a crematorium for the Dachau concentration camp."*

This incompetent person has understood nothing! The oven of the firm W. Müller of Allach was structured in such a way that air for combustion was introduced by means of a blower through the grill bars of the fire-resistant clay muffle, so from bottom to top. According to the constructor, with this system the quantity of air necessary for combustion of the corpses closely approached the theoretical minimum of air required for combustion. The presumed[278] sav-

[277] Topf, Allgemeine Lieferungsbedingungen A, p. 2: "*Gewähr auf die Dauer von 6 Monaten, bei Tag- und Nachtbetrieb von 3 Monate.*"

[278] I say "presumed" because experience teaches us that there is a great difference between theoretical statements or manufacturers' advertisements for the ovens and practice.

ing of fuel[279] depended on this very fact. Besides, the oven was provided with a furnace blower, which served to augment the capacity of the grills and so the hourly availability of heat for the oven. According to the constructor, it is true that in the case of numerous cremations, consecutive cremations could be carried out "without or nearly without additional fuel," but it is also true that a wood coffin of about 35 kg was foreseen for the cremation, which alone is equivalent to about 17.5 kg of coke!

The story of cremations without fuel is a fable, on which even Kurt Prüfer would have expressed irony in non-suspect times.

When engineer Hans Volckmann wrote in 1930 that the gas-heated oven conceived by himself and Karl Ludwig (the famous Volckmann-Ludwig oven, which became the most dangerous rival of the gas-heated Topf ovens), and which was installed in the Hamburg-Ohlsdorf crematorium, cremated 3,500 corpses in seven months[280] with a total coke consumption of hardly 103 m^3, Prüfer objected:

> *"It is maintained that 3,500 cremations have been carried out at Hamburg with a total coke consumption of 100 m^3* [to be exact, 103]. *This is disputable, first of all because, according to statements made independently to me in Hamburg by two stokers who run the oven, normal gas consumption is 7 m^3, perhaps even a little more.* […]
>
> *Should the assertions on cremation without supplementary gas be precise, the temperature of the exhaust gas*[281] *would have to be equal to the ambient temperature, which no technical expert on combustion can seriously maintain, since in thermal balance the inevitable losses of heat from the exhaust gas and the cold air which flows in when the coffin is introduced*[282] *are disadvantages which cannot be avoided."*

Therefore, not even the Volckmann-Ludwig gas oven – the best oven of the 1930's and 1940's – even with a continuous operation (for seven months, 12 cremations per day on average) – could cremate without supplementary fuel *apart from the heat supplied by the coffin*.[283]

On the other hand, the Birkenau three-muffle coke ovens had a rather crude system for delivering air for combustion. They were equipped with a single blower (*Druckluftanlage*) that served all three muffles without the possibility of regulating the flow of air into each muffle. The end-part of the air conduit

---

[279] The crematory ovens functioned with a coefficient of excess air of about 3 (= 3 times the theoretical air), and this was one of the inevitable reasons for the high consumption of these facilities.

[280] This figure is due to a printing error. The real figure was 2,500.

[281] Normally from 500 to 700°C, according to the type of oven.

[282] And when a corpse is introduced without a coffin.

[283] In practice, the Volckmann-Ludwig oven – which was advertised as a facility working without supplementary heat – needed on average the equivalent of about 22 (=(4,500×7 + 35×3,500) ÷ 7,000) kg of coke for each cremation!

was walled in over the bend of the muffle. The air emerged from the conduit by passing over four rectangular 10 cm × 8 cm apertures made in the refractory masonry, so from top to bottom, exactly the *opposite* principle of the Müller oven!

On the other hand, the eight-muffle ovens in Kremas IV and V were completely without blowers. But in spite of this, according to the Central Construction Office letter of June 28, 1943, referring to one muffle, they had exactly the same cremation capacity as the three-muffle ovens, as the following calculation shows:

– Three-muffle oven: 1,440 ÷ 15 = 96 corpses per muffle in 24 hours.
– Eight-muffle oven: 768 ÷ 8 = 96 corpses per muffle in 24 hours.

But then, what was the use of the *Druckluftanlagen?* Clearly none at all!

16. Conclusion

The fact that American Holocaust institutions, in spite of their enormous financial resources, have been reduced to placing their trust in naïve dilettantes like Zimmerman and Keren as the best "specialists" on cremation, is proof of the inexorable collapse of "Holocaust" history.

Professor Perjury

By Germar Rudolf

A new corny joke was added in 1999 to the debate around the *Leuchter Report*[1] on the alleged homicidal gas chambers of Auschwitz by Prof. James Roth from the Alpha Analytic Laboratories, Ashland, Massachusetts. I discuss this event here because Prof. Roth's allegations were widely publicized by the international media in connection with the libel case of British historian David Irving against Deborah E. Lipstadt.[2]

For his documentary movie *Mr. Death* on Fred A. Leuchter, Errol Morris also interviewed Prof. Dr. James Roth.[3] In 1988, Roth's laboratory had analyzed the masonry samples from the alleged gas chambers taken by Leuchter in Auschwitz for their cyanide content. During the trial against Ernst Zündel in Toronto that same year, for which the *Leuchter Report* had been produced, Prof. Dr. Roth himself was interrogated as an expert witness. Roughly ten years later Errol Morris interviewed Roth about this event. During this interview, Prof. Roth did all he possibly could to distance himself from the possible consequences of the analyses performed by his company. His interview gained importance only due to the fact that the Dutch cultural historian Prof. Robert van Pelt quoted Roth in his 1999 expert report prepared for the Irving trial. In it, van Pelt wrote about Roth's statements in Morris' movie:[4]

> *"Roth explained that cyanide will react on the surface of brick or plaster, penetrating the material not more than 10 microns, or 0.01 mm, or one tenth the thickness of a human hair* […]. *In other words, if one wants to analyze the cyanide concentration in a brick sample, one should take a representative sample of the surface, 10 microns thick, and no more."*

---

It can be shown that Prof. Dr. James Roth intentionally made a wrong statement, that is to say, he is a liar:

1. It is a fact that the walls of the disinfestation chambers in Auschwitz, Birkenau, Stutthof, and Majdanek are filled with cyanide compounds, and this not only superficially, but into the depth of the masonry, as I have proved by taking samples from different depths of the wall, compare in this regard especially my samples no. 11, 13, 17, 19b, and 23 in the Table 19 of my expert report (for an excerpt see the table above).[5] They prove that hydrogen cyanide can rather easily reach deep layers of plaster and mortar. But

[5] *The Rudolf Report*, Theses & Dissertations Press, Chicago 2003, pp. 254f. (www.vho.org/GB/Books/trr).

even the other samples taken from the surface prove that Prof. Roth's allegation is wrong: Provided that most of the cyanide detectable today is present in the form of iron cyanide (Iron Blue and other cyanoferrates), as Prof. Roth assumes himself, his thesis would mean that 10% to 75% of the iron content of these samples are located in the upper 10 micrometer of my samples (0.010 mm), that is, they are located in less then 1% of the entire sample mass, and the rest of the sample would have been massively deprived of iron. Of course, this cannot be the case, because there is no mechanism that could achieve this.

2. Furthermore, expert literature is detailed in that hydrogen cyanide
   a. is an extremely mobile chemical compound with physical properties comparable to water,[6]
   b. which can quite easily penetrate through thick, porous layers like walls.[7]
3. In addition, it is generally known that cement and lime mortar are highly porous materials, comparable for instance to sponges.[8] In such materials, there does not exist something like a defined layer of 0.01 mm beyond which hydrogen cyanide could not diffuse, as there can also be no reason, why water could not penetrate a sponge deeper than a millimeter. Steam, for example, which behaves physically comparable to hydrogen cyanide, can very easily penetrate walls.
4. Finally, the massive discolorations of the *outside* walls of the disinfestation chambers in Birkenau and Stutthof, as shown in my expert report,[9] are clearly visible and conclusive evidence for the fact how easily hydrogen cyanide and its soluble derivatives can penetrate such walls.

[7] L. Schwarz, W. Deckert, *Zeitschrift für Hygiene und Infektionskrankheiten*, 107 (1927), pp. 798-813; ibid., 109 (1929), pp. 201-212.

[8] DIN 4108 DIN 4108, part 3 to 5, deals with diffusion of steam into building materials. The most important coefficient for building materials is the so-called coefficient of diffusion resistance; this is a dimensionless number indicating, how much longer the diffusion of steam takes to penetrate a layer of certain materials compared to the time it takes to diffuse through the same layer of still air. This coefficient is valid not only for water vapor, but also for gaseous hydrogen cyanide as well as for any other gas. In the list of 100 different building materials compiled in DIN 4108 part 4, one can find lime and cement mortar with diffusion resistances from 15 to 35, in which case the resistance grows with increasing cement content, for gypsum plaster, the coefficient is 10, for brick walls 5 to 10, for glass wool mats it is 1. That means, if a gas diffuses through a layer of still air with a speed of 1 cm per second, it does take 15 to 35 seconds to diffuse through a 1 cm thick layer of lime or cement mortar and 5 to 10 seconds to diffuse just as deep into a brick wall. (I am grateful to Mr. C.H. Christmann for this reference.) In this regard, compare also the analysis about the porosity of masonry in my expert report, op. cit. (note 5), graph 7, p. 183.

[9] Op. cit. (note 5), color section after p. 200.

As a professor of analytical chemistry, Prof. Roth must know this, so one can only wonder why he spreads such outrageous lies. As proof that this is indeed a lie, I refer the reader to what Prof. Roth himself stated while testifying under oath during the second so-called Zündel trial:[10]

> *"In porous materials such as brick or mortar, the Prussian blue* [recte: hydrogen cyanide] *could go fairly deep as long as the surface stayed open, but as the Prussian blue formed, it was possible that it would seal the porous material and stop the penetration."*

Prof. Roth might have felt obligated to attack Leuchter in order to avoid becoming himself a target of certain lobby groups who already managed to destroy Leuchter's career. But that does not change the fact that he either lied during his interview with Errol Morris or that he made knowingly false statements during his testimony under oath, that is to say: he committed perjury. My suspicion of Prof. Roth's dishonesty is supported by another statement Prof. Roth made during this interview: if he had known where Leuchter's samples originated from, his analytical results would have been different.[11] Does that mean that Prof. Roth manipulates his result according to whether or not he likes the origin of certain samples? Such an attitude is exactly the reason why one should never tell an "independent" laboratory about the origin of the samples to be analyzed, simply because "independence" is a very flexible term when it comes to controversial topics. What Prof. Dr. Roth has demonstrated here is only his lack of professional honesty.

One may be inclined to forgive Prof. Dr. Jan van Pelt that he used this statement by Prof. Roth during David Irving's libel suit against Jewish theologian Deborah Lipstadt, because van Pelt himself has no idea about chemistry.

Denying Evidence

The Phony "Holocaust" "Convergence of Evidence"

By Carlo Mattogno

Introduction

The book *Denying History. Who Says the Holocaust Never Happened and Why Do They Say it?* by Michael Shermer and Alex Grobman[1] is a critique of revisionism which has the ambition to place itself – as opposed to previous polemicists – on an objective and scientific platform.

These authors pretend to defend freedom of speech, but they are merely compiling page after page of their purported historical philosophy, embarking upon various excursions, which, beyond merely pretending to be scholarship, are simple fluff. This "multiyear" job (p. 2) required them to go from the United States to Europe for "research in the camps, in particular to Mauthausen, Majdanek, Treblinka, Sobibor, Belzec, Dachau, Auschwitz, and Auschwitz-Birkenau" (p. 127). We can well imagine that, with all the expenses paid by their financial backers, they couldn't simply put out a booklet of some tens of pages. Because this is what their product boils down to if you strip away the tinsel.

Denying History has grand ambitions, to "take up the contentions of the Holocaust deniers, point by point, and refute them, down to the smallest detail," according to Arthur Hertzberg (p. xiii), prefacing a contention clearly expressed by the authors:

> *"In the process we thoroughly refute the Holocaust deniers' claims and arguments, present an in-depth analysis of their personalities and motives, and show precisely, with solid evidence, how we know the Holocaust happened."* (p. 2)

Shermer and Grobman assert that their book is

> *"a thorough and thoughtful answer to all the claims of the Holocaust deniers* […]*"* (p. 257)

---

[1] Michael Shermer, Alex Grobman, *Denying History. Who Says the Holocaust Never Happened and Why Do They Say it?*, University of California, Berkeley, Los Angeles, London, 2002. In the following citations only the page numbers will be given for this book.

So, Shermer and Grobman refuted "thoroughly" *all* the theses of *all* the revisionists. This is absolutely false.[2]

The claims by these authors are infected right from the start by such a basic falsehood.

To such teachers of lies, I have previously dedicated four studies, in which I have refuted their false accusations one by one; they are:

– *Olocausto: dilettanti allo sbaraglio* (Holocaust: Fumblers make fools of themselves), Edizioni di Ar, 1996, 322 pages;
– *L "Irritante questione" delle camere a gas ovvero da Cappuccetto Rosso ad...Auschwitz. Risposta a Valentina Pisanty* (The "confusing question" of the gac chambers, or from Little Red Riding Hood to... Auschwitz."[3] Response to Valentina Pisanty), Graphos, Genoa, 1998, 188 pages;
– *Olocausto: dillettanti a convengo* (Holocaust: Fumblers' Get-Together), Effepi, Genoa 2002, 182 pages.
– *Olocausto: dilettanti nel web* (Holocaust: Internet Dilettantes), Effepi, Genova 2005, 132 pages.

To these I add my two responses to Professor John C. Zimmerman, which have been reprinted in the current book in a revised form (starting on p. 87).[4]

Nobody has ever answered the questions presented in the above works, while theses published in books by authors such as Pierre Vidal-Naquet, Deborah Lipstadt, Georges Wellers – three names among others – continue to be cited in the writings of "anti-deniers," although I have exposed them all as patently false long time ago. Their false theses are thus kept alive by a whole series of incestuous citations, a procedure, which Shermer and Grobman obviously attribute to revisionist historiography (p. 251).

Far from a supposed, unavowable anti-Semitic and neo-Nazi origin, the present work was born from my indignation at the falsifications of Shermer and Grobman, which I will document rigorously. I am also motivated by the pleasure I feel when unmasking these falsifications and in re-establishing historical truth.

Being quite aware that this work, too, will inevitably fall into the silent catacombs of established holocaust historiography, I hope that it may prove useful to some honest people free from prejudice. After all, they may be presented with new considerations different from the four works mentioned above. The present work also demonstrates how a single historical revisionist can demolish in a few weeks the "multiyear" work achieved with the collabo-

---

[2] See Chapter 2.

[3] The strange title finds its explanation in the fact that Italian anti-revisionist Valentina Pisanty, whose book *L'irritante questione delle camere a gas* is criticized by Mattogno in this work, is a professional fairy tale teller and expert on the interpretation and the history of the fairy tale of Little Red Riding Hood.

[4] Both articles were available on the Internet since 2000; they are now posted at www.vho.org/GB/c/CM.

ration of the world-wide holocaust establishment. For the historians who are part of this establishment, this is no doubt the most disconcerting effect. It goes well beyond the solid arguments that have brought about their embarrassed silence.

1. Revisionists and Revisionist Method

1.1. The Revisionists

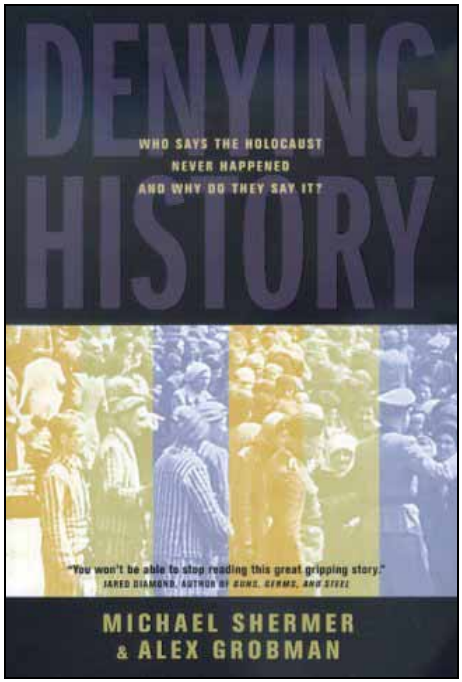
In contrast to their predecessors, Shermer and Grobman purport to be on a strictly scientific plane:

> *"We think it's time to move beyond name calling and present the evidence."* (pp. 16f.)

But with that, they show that they know very well the nature of previous criticisms of revisionism: insults and absence of proof!

They even pretend to reject the most worn out anti-revisionist arguments:

> *"The subtleties and complexities of the Holocaust denial movement deny such global labels as 'anti-Semitic' or 'neo-Nazi.' To resort to labels is to misunderstand what is really going on and therefore to swat down straw men."* (p. 16)



But then Shermer and Grobman simply cannot resist the temptation to resort to the labels of "anti-Semitic" and "neo-Nazi," alleging that, in their view, in revisionism "the anti-Semitic theme returns over and over" and that "it seems difficult to clearly separate the Holocaust denial movement from anti-Semitic sentiments." (p. 87)

And then sweeter and deeper:

> *"Holocaust deniers, in our opinion, find empowerment through the rehabilitation of those they admire and the denigration of those they perceive to be squelching their admiration* [...]. *The history of the Holocaust is a black eye for Nazism. Deny the veracity of the Holocaust, and Nazism begins to lose this stigma."* (p. 252)

This is the actual significance of the formula, according to which revisionism is "the rewriting of the past for present personal or political purposes" (p. 2), which the authors are pleased with (see p. 34 and p. 238). Therefore Shermer and Grobman bring back through the window the trite defamations they pretended to have chased out through the door. And the insults re-enter also: Nobody "in their right mind would say that the Holocaust never happened" (p. 40), ergo...

Let's not even take into account that revisionism "is an affront against history and how the science of history is practiced" (p. 251), and "a looking-glass world where black is white, up is down, and the normal rules of reason no longer apply." (p. 1)

Shermer and Grobman admit that revisionists "are highly motivated, reasonably well financed [if only that were true] and often well versed in Holocaust studies. [...]. The deniers know a great deal about the Holocaust" (pp. 17f.). Indeed, they have found the American revisionists they have encountered to be "relatively pleasant" (p. 40), which seems a little strange for alleged neo-Nazi anti-Semites who are not "in their right mind"!

But the truth regarding historical revisionism is an entirely different thing. Every deceptive attempt to force revisionist historians into the worn-out category of anti-Semites and neo-Nazis is invariably made "for personal or political reasons" and is as misleading as the title of the very book by Shermer and Grobman: *Denying History*. What revisionist historians deny is not "history," but the distorted interpretation of it as dished up by Holocaust historians. Revisionism, born from denying this distortion, is the reassertion of historical truth.

The revisionist activity of Paul Rassinier began as a denial of the lies, with which the concentration camp literature of the post-war period was studded.[5] It was motivated by an indignation when facing such lies and a desire to re-establish truth. That is one of the most important motivations driving revisionist historians: indignation at the imposture of Holocaust historians. The Holocaust historians misuse their positions of power to trick unaware readers, and they can only maintain such positions by tricking uniformed readers. My motivation in exposing the fraudulent *Denying History* was my indignation at the Shermer/Grobman imposture and my desire to reaffirm historical truth.

As we see in their introduction, the authors claim to have refuted "thoroughly" *all* the theses of *all* revisionist historians, and in regard to this they maintain:

> *"We tried to check the accuracy of our assumptions about the deniers by meeting and interviewing the major players of the Holocaust denial movement, and reading their literature carefully."* (p. 4)

[5] Cf. in this respect Paul Rassinier, *The Holocaust Story and the Lies of Ulysses*, The Institute for Historical Review, Costa Mesa, California, 1978, pp. 107-209.

For them, revisionism is confined to M. Weber, D. Irving, R. Faurisson, B. Smith, E. Zündel and D. Cole (pp. 46-71).

Arthur Butz is already too hard a bone to chew for Shermer and Grobman. Therefore they limit themselves to liquidating his work *The Hoax of the Twentieth Century* as "the book that has become the Bible of the movement" (p. 40), which evidently is true only in their narrow provincialism. The same thing goes for their judgment of Mark Weber as the one who "with the possible exception of David Irving […] has the most knowledge of Holocaust history" (p. 46). Shermer and Grobman, in their America-centric megalomania, have forgotten three really significant details:

1. They have only addressed the works of *a part* of American revisionism (ignoring for example F.P. Berg, S. Crowell, B. Renk, T. O'Keefe, W. Lindsey, M. Hoffman. R. Countess).
2. American revisionism is only *one small part* of world-wide revisionism.
3. American revisionism, with all due respect for its history, as far as research goes, is far from being the most important part of world-wide revisionism. That most important part is European revisionism. But for Shermer and Grobman, European revisionism apparently means only Robert Faurisson, of whose theses they have considered only an insignificant part, and moreover, as we shall see in the following paragraph, in a shameless misrepresentation!

The truth is that European revisionism currently means the journal *Vierteljahrshefte für freie Geschichtsforschung* (PO Box 118, Hastings TN34 3ZQ, England), with its founder Germar Rudolf and his co-workers (as well as the parallely published English journal *The Revisionist*). European revisionism also means, citing only the most important ones, Jürgen Graf, Jean-Marie Boisdefeu, Enrique Aynat, Henri Roques, Pierre Marais, Serge Thion, Pierre Guillaume, Udo Walendy, Ingrid Weckert, Hans Jürgen Nowak, Werner Rademacher, Walter Sanning, and Wilhelm Stäglich.[6]

In the "Essential Revisionist Bibliography," which I included in the 1996 study *Olocausto: dilettanti allo sbaraglio* (pp. 308f.), there are 33 titles, but Shermer and Grobman have considered a mere four, of which three are American! And although Shermer and Grobman selected only this modest section of revisionism, they still had to struggle for years just to give an appearance of a scholarly response:

> *"This problem came to our attention in talking to the top Holocaust scholars in the world. In many cases we have had to go to great lengths during this multiyear project to get answers to our questions."* (p. 2, emphasis added)

[6] See the revisionist online database at http://www.vho.org/search/d/ for a list of each author's contributions.

So "the top Holocaust scholars in the world" didn't even know how to respond to the arguments of minor revisionist scholars carefully selected by the authors! We figure that – according to their deceptive premises – if they would have had to correctly answer all the arguments of revisionism, their "project" would have taken decades!

1.2. The True Historical Method and the Alleged Method of Revisionists

In Chapter 9, Shermer and Grobman present a long and inflated excursus on the "Rape of Nanking" – an alleged war crime during the Japanese invasion of the Chinese city of Nanking in December 1937 – whose historical reconstruction

> *"culminated on May 3, 1946, when the International Military Tribunal for the Far East opened what became known as The Tokyo War Crimes Trial."* (p. 236)

In other words, the presumed fact was "reconstructed" in order to demonstrate inhumane Japanese ferocity and to morally justify the atomic devastations of Hiroshima and Nagasaki as well as the carpet bombing of Tokyo and other Japanese cities by the Americans.

After this diversion, our authors finally return to their topic, with their ten hinges of a scientific method:

> *"1. How reliable is the source of the claim? Deniers may appear quite reliable as they cite facts and figures, but closer examination often reveals these details have been distorted or taken out of context.*
>
> *2. Has this source made other claims that were clearly exaggerated? If an individual is known to have stretched the facts before, it obviously undermines his or her credibility.* [...]
>
> *3. Has another source verified the claim? Typically deniers will make statements that are unverified or verified only by another denier.* [...] *Outside verification is crucial to good science and good history.*
>
> *4. How does the claim fit with what we know about the world and how it works?* [...].
>
> *5. Has anyone, including and especially the claimant, gone out of the way to disprove the claim, or has only confirmatory evidence been sought? This is what is known as 'confirmation bias,' or the tendency to seek confirmatory evidence and reject disconfirming evidence.* [...].
>
> *6. In the absence of clearly defined proof, does the preponderance of evidence converge on the claimant's conclusion or a different one? Deniers do not look for evidence that converges on a conclusion; they look for evidence that fits their ideology. In examining their various eyewitness accounts of the gassing of prisoners at Auschwitz, for example, we find a consistent core to the stories, leading to a strong theory of what happened.*

Deniers, in contrast, pick up on minor discrepancies in the eye-witness reports and blow these up as anomalies that disconfirm the theory. Instead of reviewing the evidence as a whole, they focus on any detail that supports their point of view.

7. Is the claimant employing the accepted rules of reason and tools of research or only ones that lead to the desired conclusions? [...].

8. Has the claimant provided a different explanation for the observed phenomena rather than just denying the existing explanation? [...].

9. If the claimant has proffered a new explanation, does it account for as many phenomena as the old explanation does? [...].

10. Do the claimant's personal beliefs and biases drive the conclusions or vice versa?" (pp. 248-250)

And here is the alleged behavior of revisionists as per Shermer and Grobman:

"Deniers are routinely unreliable in their selection of the historical facts. They often make outrageous claims. The claims are rarely verified by other sources, and when they are, these sources are often incestuous. Deniers almost never attempt to disprove their claims and, instead, seek only confirmatory evidence. They generally do not play by the agreed-upon rules of historical scholarship, offer no alternative theory to account for the historical data, and thus can muster no convergence of evidence for their nonexistent theory [sic]. *Finally, as we have demonstrated with a preponderance of evidence, Holocaust deniers' personal beliefs and biases dictate their conclusions."* (p. 251)

In this study I will demonstrate, "with a preponderance of evidence," that the authors have outlined here a perfect description of themselves and their methods. But before entering into the heart of this discussion, some general observations are in order.

To begin with, it would be much too easy to find the entire work of Shermer and Grobman as failing in terms of their first point, that is to say, as being based upon their *selection* of authors and revisionist arguments, and thus amputating and distorting the entire thematic picture.

In their work, the authors have adopted a magical formula: "convergence of evidence," allegedly adopted by Holocaust historians and allegedly neglected by revisionist historians. That formula was invented by Robert J. van Pelt in his expert opinion as part of the Irving-Lipstadt trial and known as *The Pelt Report*.[7] As no evidence exists of extermination of Jews in homicidal gas chambers, van Pelt collected all the available "indications" (including those by

[7] Robert J. van Pelt, *Pelt Report*, introduced during the civil case before Queen's Bench Division, Royal Courts of Justice, Strand, London, David John Cawdell Irving vs. (1) Penguin Books Limited, (2) Deborah E. Lipstadt, Ref. 1996 I, No. 113 (www.holocaustdenialontrial.com/evidence/van.asp).

J.-C. Pressac), illicitly promoted them to "evidence" and then invented a "convergence of evidence," which is nothing but scientific imposture.

As an example, let's look at the "convergence of evidence" regarding Auschwitz adopted by the authors. The eyewitness testimonies all have a "solid nucleus" according to Shermer and Grobman, converging toward reality of homicidal gassings. Revisionist historians, on the other hand, attack "smaller discrepancies" and "any detail" in order to demolish the entire testimony.

It is the very opposite that is true. First of all, Shermer and Grobman as well as most Holocaust historians, ignore the *complete texts* of these eyewitness testimonies and only present anthologies[8] by carefully selecting passages of the testimonies in order to create an illusory "convergence," while purging all the absurdities and contradictions that they contain.

A typical example of this "convergence" is offered to us by G. Reitlinger. Describing the alleged homicidal gassings in Birkenau, he appeals:

a) to Ada Bimko for so-called "railwagons" transporting the corpses to the ovens;
b) to Miklos Nyiszli for the gassing process;
c) to Charles Sigismud Bendel for the emptying of the gas chambers.[9]

Examining the narration of Reitlinger, it seems that all the witnesses describe the same structures and the same facts, but reality is very different.

Ada Bimko never put foot in a crematorium. She invented a fanciful story of some visit to a crematorium and allegedly "saw" a gas chamber equipped with "two huge metallic containers containing gas" and rail tracks that led directly to the furnace room.[10] The unprepared "eyewitness" in fact believed that alleged homicidal gassings occurred with a gas similar to methane (therefore inventing the two containers) and that, in accordance with the so-called Vrba-Wetzler report, a narrow-gauge track ran from "the gas chambers" to "the ovens."[11]

---

[8] For example the book by Georges Wellers, *Les chambres à gas ont existé*, Gallimard, Paris 1981, and the collective work by E. Kogon, H. Langbein, A. Rückerl et al. (eds.), *Nationalsozialistische Massentötungen durch Giftgas*, S. Fischer Verlag, Frankfurt/Main 1983, from which I quote (Engl.: *Nazi Mass Murder*, Yale University Press, New Haven 1993.)

[9] Gerald Reitlinger, *The Final Solution. The Attempt to Exterminate the Jews of Europe 1939-1945*, Vallentine, Mitchell, London 1953, 1965, pp. 150-152.

[10] Raymond Philips (ed.), *Trial of Josef Kramer and Forty-four Others (The Belsen Trial)*, William Hodge and Company Limited, London-Edinburgh-Glasgow 1946, pp. 66-78.

[11] The rather fantastic report contains a description of crematoria II and III of Birkenau with totally invented drawings: Vrba and Wetzler place the alleged homicidal gas chamber (*Leichenkeller I*) – which was half underground – on the same level as the furnace room and connect it to the latter by means of a narrow-gauge railway which never existed; they furthermore describe 9 ovens placed around a chimney, whereas those crematoria had 5 ovens of 3 muffles each placed in a line. For the design of the crematoria and their actual plan cf. my study *Olocausto: dilettanti allo sbaraglio*, Edizioni di Ar, Padua 1996, pp. 293f., and "Auschwitz 27 gennaio 1945 – 27 gennaio 2005: sessant'anni di propaganda. Genesi, svi-

Actually, in none of the Birkenau Crematoria the rooms, to which official historiography attributes the function of homicidal gas chambers, were connected to the respective oven rooms via rail tracks and little wagons. Therefore we are dealing with a grossly false testimony.[12]

M. Nyiszli and C.S. Bendel, two self-styled members of the so-called "*Sonderkommando*"[13] of Birkenau who allegedly lived in the same places at the same time (not to go more deeply into details), described the alleged gas chambers of Crematoria II and III of Birkenau, which actually measured 30 by 7 m and were 2.41 m high, as being 200 m long (Nyiszli[14]) and as being 10 meters long, 4 meters wide, and 1.60 meters high (Bendel[15]). Is it really just a minor "detail" that of these two witnesses describing a room of an actual length of 30 m, one claims a length of 200 m and the other claims a length of 10 m?

And what about the fact that Nyiszli had published in the Hungarian newspaper *Világ* a whole series of entirely fabricated articles purporting to be his testimony at the IG-Farben trial?[16] Another minor "detail"? And what about the many historical falsifications that I have exposed in an appropriate study?[17] More minor "details"?

Another example of false "convergence" is the description of eyewitnesses Filip Müller and Miklos Nyiszli regarding the gassing process: Müller had simply plagiarized Nyiszli's testimony (using the German translation, which appeared in the magazine *Quick* of Munich in 1961 with the title "*Auschwitz. Tagebuch eines Lagerarztes*"), who had invented the scene he described on the – erroneous – assumption that the Zyklon B used for the gassings was based on chlorine and therefore had a much higher density than air.[18] So we have a "convergence," alright, but of a lie. Another "convergence" of a lie is

---

luppo e declino della menzogna propagandistica delle camere a gas," *I Quaderni di Auschwitz*, no. 5. Effepi, Genova 2005, pp. 24-27.

12 Cf. in this respect my study "*Auschwitz: due false testimonianze*," Edizioni La Sfinge, Parma 1986, pp. 19-25.

13 The term has no documentary basis. No known document refers to the personnel assigned to the crematoria as "*Sonderkommando*," whereas there existed at Birkenau at least 11 "*Sonderkommandos*" unrelated to the crematoria. In this respect see C. Mattogno, *Special Treatment in Auschwitz*, Theses & Dissertations Press, Chicago 2004, pp. 101-103.

14 Miklos Nyiszli, *Auschwitz. A Doctor's Eyewitness Account*, Fawcett Crest, New York 1961, pp. 44f. The Hungarian original reads: "*ez a terem olyan nagyságú*, *mint a vetkezőterem*" ("this hall is just as big as the undressing room"), that is: 200 m long. (*Dr. Mengele boncolóorvosa voltam az auschwitz-i krematóriumban*, Oradea, Nagyvárad, 1946, p. 34).

15 NI-11593, pp. 2 and 4.

16 Cf. C. Mattogno, *Olocausto…*, op. cit. (note 11), p. 51.

17 C. Mattogno, *"Medico ad Auschwitz": anatomia di un falso*, Edizioni La Sfinge, Parma 1988.

18 In this respect, cf. C. Mattogno, *Auschwitz: un caso di plagio*, Edizioni La Sfinge, Parma 1986; Engl.: "Auschwitz: A Case of Plagiarism," *Journal of Historical Review*, 10(1) (1990), pp. 5-24.

the "tall tale" of so-called wire mesh devices allegedly used to introduce Zyklon B into the alleged homicidal gas chambers of Crematoria II and III, ostensibly manufactured by Michał Kula and allegedly "seen" by Henryk Tauber – devices that never existed![19] So this is how they fabricate "convergence of evidence!" We shall present other examples.

Point 2 of the methodic principles of Shermer and Grobman reads that "if an individual is known to have stretched the facts before, it obviously undermines his or her credibility." In other words, if an individual has lied once, that individual is no longer credible. Quite so, but just look at how these Holocaust historians disregard this principle with their witnesses!

To stay with Auschwitz, one can assert with certainty and without fear of refutation that none of these witnesses – and I emphasize *none* – has told the truth about the crematory ovens of Birkenau. But all of them – and I once again emphasize *all* – have shamelessly lied about the operation and about the cremation capacity of these systems, topping with the apex of ridiculous absurdities such as Dov Paisikovic (that the cremation of one corpse took four minutes!),[20] Stanislaw Jankowski alias Alter Feinsilber (that 12 corpses were cremated in every muffle at a time!),[21] and of Miklos Nyiszli (that the capacity of Birkenau crematoria was 20,000 corpses per day!).[22]

Rather, the Holocaust historians sometimes even try to cover the lies of "their" witnesses with other lies, as did for instance R.J. van Pelt with respect to A. Bimko, the Vrba-Wetzler report, or B. Polevoi's article.[23]

What about verification of sources? Here we have a book of over 300 pages, which not only claims to have refuted all the theses of all the revisionists, but purports to have demonstrated that the alleged Holocaust really happened. The authors generally rely upon secondary sources, as far as testimonies are concerned. The same goes for their documents. Altogether, they cite only four!

---

[19] In this respect, cf. my article "The Elusive Holes of Death" starting on p. 279 of this book, especially chapter page 2.7.2., starting on p. 303. It was first published in English in *The Revisionist* as three separate papers: C. Mattogno, "'No Holes, No Gas Chamber(s),'" *The Revisionist* 2(3) (2004), pp. 387-410; C. Mattogno, "The Openings for the Introduction of Zyklon B," 2 parts, *The Revisionist* 2(3) (2004), pp. 411-436.

[20] Rijksinstituut voor Oorlogsdocumentatie, Amsterdam, c[21]96 ("*die Leichen verbrannten in etwa 4 Minuten*"); cf. L. Poliakov, *Auschwitz*, Julliard, Paris 1964, p. 162.

[21] Jadwiga Bezwinska, Danuta Czech (eds.), *Inmitten des grauenvollen Verbrechens. Handschriften von Mitgliedern des Sonderkommandos*, Verlag des Staatlichen Auschwitz-Birkenau Museums, 1996, p. 37 ("in one of these ovens 12 corpses could be accomodated").

[22] Miklos Nyiszli, op. cit. (note 14), p. 44: "This meant that several thousand people could be cremated in a single day." This translation falsifies the original text which clearly sets out the figure "20,000," repeated immediately following as "húszezer," i.e. "twenty thousand" (again falsely translated as "several thousand"). Nyiszli Miklos, *Dr. Mengele boncolóorvosa voltam az auschwitz-i krematóriumban*, Oradea, Nagyvárad, 1946, p. 38.

[23] *Olocausto: dilettanti nel web*, Effepi, Genova 2005, pp. 63-65; "Auschwitz 27 gennaio 1945…," op. cit. (note 11), pp. 47f.

Since their published methods impose upon Shermer and Grobman the obligation to verify sources, one would expect they had checked their references. Let's take a look.

On page 107 they mention *SS-Standartenführer* Paul Blobel in connection with the so-called "Aktion 1005" (more on this in chapter 3.2.3.), for which they cite document PS-3197 (note 20 on page 272), but the correct reference is NO-3947, sworn statement of Paul Blobel dated June 18, 1947.

On page 175, Shermer and Grobman state:

> *"On November 26, 1945, at the first Nuremberg trial, the Nazi physician Dr. Wilhelm Hoettel* [sic] *testified* […]*"*

In reality Wilhelm Höttl never testified at Nuremberg; the authors take for a "testimony" a simple "affidavit" drawn up on November 26, 1945 (Document PS-2738, as they indicate on page 277, note 5).

On page 186 the authors present a passage of a speech by Hans Frank, head of the General Government (occupied Poland) dated October 7, 1940. The reference they give is PS-3363 (note 28 p. 278). But in reality that speech (to which we shall return in chapter 3.7.1.) really occurred on December 20, 1940, and the actual document is PS-2233!

On page 194, Shermer and Grobman state there was a report by Himmler to Hitler dated December 29, 1942, which they reference as "N.D. 1120, prosecution exhibit 237" (note 47 p. 279). But in reality this refers to document NO-511.

This is how Shermer and Grobman respect their obligation to verify their sources!

As an example of their failure to comply with point 4 of their methodic decalogue, we have these authors stating:

> *"the deniers' elaborate conspiracy theories about how the Jews have concocted the Holocaust history in order to extract reparations from Germany and support for Israel from Americans."* (p. 249)

Previously Shermer and Grobman had already written that "some deniers" assert that

> *"there was a conspiracy by Zionists to exaggerate the plight of Jews during the war in order to finance the State of Israel through war reparations."* (p. 106)

As a source for this foolish "tall tale," to which no revisionist historian would subscribe, Shermer and Grobman present the following in their Note 13 on page 271:

> *"See P. Rassinier, Debunking the Genocide Myth: A Study of the Nazi Concentration Camps and the Alleged Extermination of European Jewry (Los Angeles, Noontide Press, 1978)"* (note 13 on p. 271)

Now that reference does not cite any page because that "tall tale" was invented by the authors. It is nothing other than a passage from the person who wrote the preface to the book, Pierre Hofstetter, who in fact spoke of:[24]

> *"*[…] *the entire Zionist establishment which has built the State of Israel on 'the myth of the six million.'"*

That is, the Zionists have taken advantage of, not created, this "myth."

Concerning Robert Faurisson, Shermer and Grobman present even more dishonesty; on page 100 they write:

> *"In a 1987 publication, for example, he* [Faurisson] *claimed that British Holocaust historian Martin Gilbert had misstated the size of a gas chamber in order to make it fit an eyewitness account of the number of Jews gassed there on a particular occasion. Faurisson failed to take into account the simple fact that eyewitness details may be inadvertently inaccurate (in this case possibly exaggerated) and thus perhaps Gilbert's source was incorrect."*

In other words, this is claimed to have been a "blunder" by Faurisson. We verify this according to the teachings of the methodic decalogue of the authors. In a report of May 6, 1945, Kurt Gerstein wrote that from 700 to 800 people were placed into a gas chamber of 25 square meters and 45 cubic meters,[25] which would mean that 28 to 32 persons could occupy a square meter! Here is how Martin Gilbert put this in 1979:[26]

> *"About seven to eight hundred people in an area of about a <u>hundred square meters</u>."* (emphasis added)

Therefore Martin Gilbert did not "misstate" the size of the alleged gas chamber, but falsified the data contained in the original document because it is so absurd. As for the authors, it is precisely they who have made the big "blunder," because, in the first place, they didn't verify Gilbert's source and in the second place they invented the "tall tale" of another source which he used!

Continuing with Shermer's/Grobman's assault against Prof. Faurisson:

> *"He made a similar blunder over his analysis of the famous Gerstein document. Kurt Gerstein was an SS officer involved in ordering Zyklon-B gas used for both delousing and homicide who, before he died in captivity after the war, gave testimony to the homicidal use of the fumigant. Faurisson and others looked for internal contradictions in his confession, claiming, for example, that the number of victims packed into the gas chambers could not have physically fit. It turns out that Faurisson was basing his estimates on the number of people who fit comfortably into a subway car; others (including deniers) have since disproved his estimates."* (pp. 59f.)

---

[24] For the text see: www.vho.org/aaargh/engl/RassArch/PRdebunk/PRdebunkIntro.html.

[25] PS-2170, p. 5.

[26] Martin Gilbert, *Final Journey: The Fate of the Jews in Nazi Europe*, Mayflower Books, New York 1979, p. 91.

The reference is to the book by Pierre Vidal-Naquet, *Assassins of Memory* (1992), 65-74, (Note 65, page 267). In reality, in this book there is not a trace of this silly "tall tale," which has been invented by Shermer and Grobman. Those authors are not even shrewd enough to realize that this is their "blunder" regarding the same passage of the same document of their previous citation! Now, in order to demonstrate the impossibility that in their presumed gas chamber, where 28 to 32 people were claimed to have been compressed onto each square meter, was there really any need of a comparison with a subway car? Both Martin Gilbert and the Jewish historian Leon Poliakov intuitively understood, so much so that they both falsified the data of Kurt Gerstein![27]

But the methods of the adversaries of revisionism are not aberrant merely in the hermeneutical field. Here are other examples from Shermer and Grobman themselves. They recount that on February 27, 1993, Mark Weber was

> *"the victim of a Simon Wiesenthal Center sting operation in which the researcher Yaaron Svoray, calling himself Ron Furey, met with Weber in a café to discuss The Right Way, a magazine invented to trick neo-Nazis into identifying themselves."* (pp. 46f.)

Therefore the prestigious Wiesenthal Center is devoted to deceit and lies! By a singular coincidence, one of the authors of *Denying History*, Alex Grobman, is "founding editor-in-chief of the *Simon Wiesenthal Annual*"! (From their own book cover.)

The second case concerns the former Jewish revisionist David Cole. In 1998, Robert J. Newman published an announcement on the web page of the notorious *Jewish Defense League* entitled "David Cole: Monstrous Traitor," which was formulated as a reward for getting him dead or alive.[28] David Cole understood perfectly (he "was deadly afraid for his life, that someone would find him and shoot him") and he hastened to retract everything (pp. 72f.).

To the lies and deceit, threats are also added – not from street hooligans, but from two "prestigious" (or notorious?) Jewish associations!

2. The "Convergence of Evidence" of the Gas Chambers

2.1. The Six Levels of "Convergence of Evidence"

In chapter six, concerning mainly Auschwitz, but also including Majdanek and Mauthausen, the authors purport "proving gas chambers and crematoria were used for genocide" (p. 126). They present six elements of proof, which "converge on this conclusion," as they claim (p. 128).

Let's examine these "proofs":

---

[27] Leon Poliakov, too, has falsified the 25 m² in the original document, by writing 93 m² instead. *Breviaire de la haine*, Calmann-Lévy, Paris 1979, p. 223.

[28] See www.vho.org/GB/c/DC/censtraitor.html

1. *Written documents* – orders for Zyklon B (the trade name of hydrogen cyanide, which is absorbed in gypsum pellets), architectural blueprints, and orders for building materials for gas chambers and crematoria.
2. *Zyklon B gas traces* [sic!] on the walls of the gas chambers at several camps.
3. *Eyewitness testimony* – survivor testimonies, Jewish *Sonderkommando* diaries, and confessions of guards and commandants.
4. *Ground photographs* – not only of the camps, but also of burning corpses (photos taken secretly and smuggled out of Auschwitz).
5. *Aerial photographs* – indicating prisoners being moved toward gas chamber/crematorium complexes, and matching those of ground photographs corroborating gas chambers and crematoria structures.
6. *The extant ruins of camps* – examined in light of the above sources of evidence (pp. 127f.).

Before refuting these presumed converging proofs regarding Auschwitz, Majdanek and Mauthausen, it is appropriate to explore their nature and their value.

Regarding the orders for Zyklon B, the authors say nothing. They simply limit themselves to repeating the phrase "orders for Zyklon-B gas" (p. 133), which constitutes their "convergence of evidence"! But even if they had articulated their argument better (something they evidently were not in a position to do), this "evidence" can only be glaring nonsense. Since Zyklon B is well known to have been used in all German concentration camps for disinfestation, how could it be deduced from *orders* that this insecticide was used for mass murder?

As an example, getting back to Kurt Gerstein, who was "involved in ordering Zyklon-B gas" (p. 59), he [Gerstein] presented 12 invoices from Degesch in his name concerning the supply of 2,370 kg of Zyklon B from February 16 to May 31, 1944, 1,185 kg for Auschwitz and 1,185 kg for Oranienburg.[29] How can we conclude that the supply of Zyklon B to Auschwitz is "proof" of mass extermination, if no such extermination was practiced at Oranienburg (Sachsenhausen) in homicidal gas chambers using Zyklon B?

The authors say nothing either on "architectural blueprints and orders for building materials for gas chambers and crematoria," an intentionally deceptive phrase, because it insinuates that *documents* exist concerning homicidal gas chambers, which is false. As for crematorium ovens, there is abundant documentation, but there is no evidence that they were used for the cremation of allegedly gassed persons. Indeed, the contrary conclusion emerges with certainty from their own study: neither the coke supply nor the life-time of the refractory masonry of the muffles could have allowed the cremation of more than the number of corpses of registered prisoners who died of natural caus-

[29] PS-1553.

es,[30] and this is one converging proof of the *absence* of homicidal gas chambers, on which Shermer and Grobman stay tellingly silent. The topic of "Zyklon-B gas traces" will be discussed below.

I have already shown various examples of the way Holocaust historians create "convergence" of testimonies: first of all, by extrapolating single passages from testimonies, keeping quiet about the obvious absurdities they contain, which reduce their credibility and render them unacceptable according to point 2 of our authors' methodic decalogue. Secondly, they silently pass over the enormous contradictions concerning essential issues, which such testimonies present. We shall see later another case of false "convergence" when we come to "cremation pits."

The "ground photographs," including those that show "bodies burning," do not prove anything regarding alleged mass extermination in homicidal gas chambers, because the practice of burning corpses out in the open at Birkenau was put into effect when the crematoria were temporarily out of service and when there was a lack of coke for running the ovens, as I have demonstrated elsewhere.[31] It is not by accident that Shermer and Grobman have later dropped this "evidence."

The air photographs shall be examined below. Finally, as for "the extant ruins of the camps," they demonstrate less than nothing with respect to alleged homicidal gassings, all the more so in view of the authors' singular ignorance in this respect.

With this now exposed, let us move on to a detailed examination of their "proofs."

2.2. Auschwitz Gas Chambers

2.2.1. The "Zyklon-B Traces"

The treatment of this "evidence" begins with the Shermer and Grobman paragraph labeled "Zyklon-B Traces" (p. 129). As I have indicated several times, this foolish phrase is a result of ignorance of terminology regarding this issue. Obviously, "Zyklon-B traces" are in reality *cyanide* traces, which is a very different thing. On this topic, the foremost authority – not only among revisionists – is Germar Rudolf, a chemist by profession, and author of a meticulous scientific study on the "gas chambers" of Auschwitz,[32] which examines

[30] In this respect cf. C. Mattogno, "The Crematoria Ovens of Auschwitz and Birkenau," in: Germar Rudolf (ed.), *Dissecting the Holocaust. The Growing Critique of "Truth" and "Memory,"* 2nd ed., Theses and Dissertations Press, Chicago, 2003, pp. 373-412 (the first edition of this volume appeared in 2000, edited by G. Rudolf under the pen name Ernst Gauss).

[31] Cf. my article "An Accountant Poses as Cremation Expert" beginning at p. 87 in this book (a previous version is online at www.vho.org/GB/c/CM/Risposta-new-eng.html).

[32] Germar Rudolf, *The Rudolf Report. Expert Report on Chemical and Technical Aspects of the 'Gas Chambers' of Auschwitz*, Theses & Dissertations Press, Chicago 2003. The first Ger-

the issues of the structures and procedures of the disinfestation systems at Auschwitz (Rudolf's chapter 5.2.) and the formation and stability of Iron Blue (also know as Prussian Blue or ferric ferrocyanide, chapter 6).

Moreover, Rudolf collected at Birkenau various masonry samples from the disinfesting gas chambers and from the alleged homicidal gas chambers, the chemical analysis of which resulted in a maximum of 13,500 mg/kg for the former (disinfestation chamber of BW 5b) and of 6.7 mg/kg for the latter (*Leichenkeller* or underground morgue 1 of Crematorium II). These results are reported in Rudolf's chapter 8, together with the results of all previous chemical analyses and a thorough refutation of arguments of the supporters of the existence of homicidal gas chambers.

Now, Shermer and Grobman liquidate this fundamental study with a couple of irrelevant quotations, even deforming the family name of Rudolf, whom they call "Rudolph." Having to choose between a preliminary study, which unavoidably presented dubious aspects (*The Leuchter Report*[33]) and the essential one, which is unquestionably scientific, Shermer and Grobman concentrated on the former and silently passed over the latter, thus selecting the one that is convenient to their thesis. But even when discussing the *Leuchter Report*, Shermer and Grobman propose arguments, which make anyone minimally informed in this matter wonder about Shermer's and Grobman's competence. On page 181 Shermer and Grobman write as follows:

> *"Faurisson indicates that there are traces of Zyklon-B in general buildings that were fumigated as well as in the gas chambers; so he concludes that traces of Zyklon-B prove nothing about the homicidal use of gas chambers. According to the pharmacist and extermination camp expert Jean-Claude Pressac, however, Faurisson's defense does not make sense since buildings and morgues are normally disinfected with antiseptics, whether solid (lime, lime chloride), liquid (bleach, cresol), or gas (formaldehyde, sulfur anhydride)"* (p. 181, emphasis added)

Well, if there is something here that "does not make sense," it is just such an answer, because although Faurisson did say "*disinfection* gas chambers," he clearly meant "*disinfestation* gas chambers," and with this play on words, these Holocaust historians constructed alleged "confusing evidence"!

In the construction of such "proof" there is no lack of some bad faith, because, for example, Danuta Czech also uses the term "*Desinfektion*" (disinfection) in *Kalendarium of Auschwitz* to indicate the disinfestation (or delousing)

with Zyklon B,[34] but no official historian has ever indicated that this "does not make sense"!

2.2.2. The Presumed Solubility of Iron Blue

On page 182 the authors assert that the ruins of the alleged homicidal gas chambers have been "completely exposed to the elements for over half a century." Therefore – they insinuate – the Iron Blue which formed on the walls had dissolved. They then bring back an argument by David Cole, who

> *"*[…] *acknowledges that the extant ruins have been exposed to the elements but then wonders why Zyklon-B blue staining remains on the outside of the brick gas chamber at Majdanek, against which the Nazis beat clothing and blankets to remove the gas residue."* (p. 132)

The authors comment:

> *"Wouldn't these blue stains have washed away in the weather as at Auschwitz? His question sounds reasonable, but when we visited Majdanek we could see that the blue staining on the outside bricks is minimal. Moreover, a roof overhang has protected the bricks from rain and snow, so that the bricks at Majdanek are nowhere near as weathered as the open rubble at Auschwitz."* (p. 132)

It is true that the Iron Blue stains on external walls of two disinfestation chambers situated behind barrack "*Bad und Desinfektion I*" of Majdanek are faint. But it is not only wrong to claim that the Nazis had beaten clothing and blankets on these walls in order to remove gas residuals, it also contradicts the two authors' own assertion that these two premises "were for the express purpose of gassing prisoners" (p. 163). We shall return to this issue.

It is moreover false that the wall at issue was protected (for decades, according to the authors, otherwise, their point would be dull) by an overhang or canopy. This overhang was in fact already in a state of being dismantled as of the camp's liberation in July 1944. The wall at issue was therefore already exposed to the elements at war's end,[35] and so it has remained until today.

But in the response of the authors it is not so much what they say, but rather what they do *not* say that is surprising. They are silent about the fact that right there in Birkenau, a little more than 300 meters from the ruins of Crematoria II and III, on the two external walls (North and South) of the disinfestation gas chambers of building BW 5b immense and intense Iron Blue stains exist (less so on the walls of the delousing chamber of BW 5a). This was already noted by Pressac, who also photographed them![36] G. Rudolf's compre-

---

[34] In this respect cf. my study *Olocausto…*, op. cit. (note 11), pp. 154f.

[35] Cf. the photographic album *Majdanek*, Krajowa Agencja Wydawnicza, Lublin 1985, photograph 67.

[36] J.-C. Pressac, *Auschwitz: Technique and operation of the gas chambers*, The Beate Klarsfeld Foundation, New York 1989, pp. 59f. (http://holocaust-history.org/auschwitz/pressac/technique-and-operation/pressac0059.shtml).

hensive compilation of evidence proving the extraordinary long-term stability of Iron Blue against environmental influences is met with total silence as well.[37] Therefore the authors not only deliberately hide evidence here, which refutes their untenable hypotheses, but try to confirm them with bogus evidence.

2.2.3. Vanished Doors and "Locks"

On page 132, Shermer and Grobman, anticipating their treatment of the alleged Mauthausen homicidal gas chamber, write:

> *"When a question or a statement has no grounding in evidence, it becomes just a rhetorical device and requires no answer. Consider, as yet another example, Cole's claim that at Mauthausen the door of the gas chamber does not lock. True, the present door does not lock, but that is irrelevant because it is not the original door. All we had to do to find out that fact was ask."*

Subsequently they add that "the gas chamber's original door is now in a museum." (p. 168).

Therefore "the" door to the gas chamber is not original: the original is to be found "in a museum" and to know all about it, all one needs to do is "ask"! As is seen, Shermer and Grobman, who want detailed analysis on the reliability of revisionist sources, bring in an absolutely reliable source: the answer by an unnamed person to their question.

It is also necessary to note that the spirit of observation of the authors is not very sharp, given that even though they visited the alleged gas chamber at Mauthausen (of which they also published one of their photographs), they are not aware of the fact that the room has *two* doors: but then why do they assert that "the door" to the premises is not original? Here is a typical example of an affirmation that "has no grounding in evidence" and therefore becomes "just a rhetorical device"!

A device that moreover reveals the unique ignorance of Shermer and Grobman, as well as of David Cole, who all seriously believe that the gas chamber had a "lock"! In reality, the gas-tight doors had levers closing against angle irons set into the steel frame of the door, such as are quite visible on all the disinfestation chambers at Majdanek. Shermer and Grobman also saw them, and even made a photograph, shown on their page 167, figure 29, but they have understood nothing of their functioning.

2.2.4. The "Reconstruction" of Auschwitz Crematorium I

On page 132, Shermer and Grobman write:

> *"What about the 'evidence' that Cole, Leuchter and Faurisson do present, such as their 'finding' that the residue from Zyklon-B in the gas*

[37] G. Rudolf, 2003, op. cit. (note 32), pp. 170-180.

chamber at Crematorium I at Auschwitz (the original camp converted from a Polish army barracks) does not reach a level consistent with extermination? Significantly, they fail to mention in their writings that this building was reconstructed using both original materials and those from other buildings. Who knows what they actually 'tested' in their research?"

Here Shermer and Grobman resort to one more "pious" lie: as we know, Crematorium I was never demolished and never reconstructed. The source they cite, the book of Deborah Dwork and Robert Jan van Pelt (note 35 on page 275), says in fact that yes, Crematorium I was "reconstructed," but explains that this refers to a presumed restoration to the original state with the reconstruction of the chimney, of two crematorium ovens, and with the realization of four openings for the introduction of Zyklon B through the roof of the mortuary chamber (the alleged gas chamber),[38] which was never destroyed. In order to keep people from discovering these "pious" falsehoods, the authors then committed a "pious error" by citing the reference to that work as "pp. 274 to 278" instead of p. 364!

2.2.5. An Original "Gas Chamber" – Although Reconstructed!

And here the final pseudo-reasoning, as worthy a conclusion as those previously:

"David Cole, in his documentary of his visit to Auschwitz, dramatically proclaims that he got the museum director to 'confess' that the gas chamber was a reconstruction and thus a 'lie' thrust upon an unwitting public. We see this as classic denier hyperbole and ideological flag waving. No one at Auschwitz – from the guides to the director – denies that the gas chamber there is a reconstruction. A visitor has only to ask." (p. 133)

This may even be true if it refers to the time when the authors visited the camp towards the end of the 1990s, but it was not true in 1992, when David Cole went to Auschwitz. Naturally Shermer and Grobman know this very well, because in the documentary video at issue, Cole did not do anything other than to "ask" a guide, by the name of Alicia. Here are the essential parts of their conversation:[39]

"Here, in front of the gas chamber, I asked Alicia about the authenticity of that building.

Cole: Now, let's start again talking about this building here.

Alicia: This is a crematorium/gas chamber.

Cole: But this is a reconstruction?

---

[38] D. Dwork, R.J. van Pelt, *Auschwitz 1270 to the present*, W.W. Norton & Company, New York, London 1996, p. 364.

[39] David Cole, Bradley Smith, *David Cole Interviews Dr. Franciszek Piper, Director, Auschwitz State Museum*, VHS Video, 1992, distributed by CODOH, P.O. Box 439016, San Diego, CA 92143, USA (www.vho.org/GB/c/DC/gcgvcole.html); *Journal of Historical Review* 13(2) (1993), pp. 11-13.

Alicia: It is in [its] *original state.*

Now there Alicia has very clearly represented the gas chamber as being in its original state. Once inside, I asked her specifically about the holes in the ceiling.

Cole: Are these the original four holes in the ceiling?

Alicia: It is original. Through this chimney was dropped Zyklon B."

Already in 1995, Krystyna Oleksy, civil employee of the director of the Museum, declared to journalist Eric Conan on the subject of the presumed gas chamber:[40]

"For the time being, we leave it as it is and we don't tell visitors. It's too complicated."

This means the guides *were ordered* not to tell visitors that the premises were (poorly) restructured, in order to make people believe that it is a homicidal gas chamber in its original state! Here we are not facing a "classic denier hyperbole," but a classic disingenuous argument of Shermer and Grobman.

2.2.6. Documents

Let us now move on to the alleged "corroboration" by documents and ground photographs (p. 131). The authors bring up the famous letter of January 29, 1943, from "Sturmbannführer" (Major) Bischoff to "Heinz" Kammler (p. 137). Karl Bischoff was head of Central Construction Office of the Waffen-SS and Police Auschwitz, but he held the rank – indicated in the letter[41] – of SS-*Hauptsturmführer* (Captain), while Kammler, head of Office Gruppe C of SS-WVHA, had the first name Hans.

They then quote a section of text from the letter, in which the German word *Öfen* (ovens) is rendered as "furnaces." At this point the authors, instead of examining the original document, have relied on a second-hand source: Gerald Reitlinger (note 38 on p. 275).

As far as the term "*Vergasungskeller*"[42] is concerned, which they translate as "gassing cellar," even Jean-Claude Pressac opined that it is "irresponsible" to assert that it designates a homicidal gas chamber as such, because:[43]

"though 'gas chamber' was correct, there was no proof that it was 'homicidal.'"

On p. 137, the authors write:

---

[40] E. Conan, "Auschwitz: la mémoire du mal," in: *L'Express*, January 19, 1995, p. 57: "Pour l'instant, on la laisse en l'état et on ne précise rien au visiteur. C'est trop compliqué" (www.fpp.co.uk/Auschwitz/docs/Conan.html).

[41] APMO (Archive of the National Museum of Auschwitz-Birkenau), BW 30/34, p. 100.

[42] In this respect cf. my article "The Morgues of the Crematoria at Birkenau in the Light of Documents," *The Revisionist*, 2(3) (2004), pp. 271-294.

[43] J.-C. Pressac, *Auschwitz…*, op. cit. (note 36), p. 503.

"On March 6, 1943, Bischoff refers to a gas-tight door for Crematorium III, similar to that of Crematorium II, which was to include a peephole of thick glass."

Actually, the original[44] is dated March 31, 1943. The authors show only a portion of it, but falsify the translation of the term "*Leichenkeller I*" (underground morgue 1) which becomes simply "cellar I." The source given in note 39 on p. 275 is J.-C. Pressac's first study of Auschwitz, which shows the original documents.[45]

At the end, the authors comment:

"Why would they need a peephole with thick glass if all that was happening in this room was the delousing of clothing? Although in itself the existence of the peephole does not 'prove' anything, it is one more finding that dovetails with the idea that these chambers were used for killing people." (p. 137)

That fallacious conclusion is squarely refuted by the very book from which they obtained the document mentioned. Pressac has, in fact, published a photograph of a gas-tight door of the disinfestation chamber using hydrogen cyanide at the so-called *Kanada I* delousing and storage barracks complex, BW 28, "*Entlausungs- und Effektenbaracken*," with this comment:[46]

"The gas-tight door of the Kanada I delousing gas chamber. Its construction, by the DAW [= Deutsche Ausrüstungswerke]*, is very rudimentary. It has peephole, a handle to open it* […]*"*

Pressac even shows an enlargement of this peep-hole.[47] And a peep-hole was also set in the gas-tight door of the disinfestation chamber of Block 1 at the Auschwitz camp, of which Pressac presents six photographs.[48] According to the regulations in effect in Germany during these times, it was prohibited to enter a delousing room without a companion. Who ever entered such a room, had to be observed by at least one person, who can come to the rescue in case of an emergency. This explains why delousing chamber doors had peep holes.[49]

Thus, the authors here not only violated their own methodic rules by exclusively looking only for confirmatory evidence, but they deliberately ignored evidence that refutes their erroneous conclusions by selecting from Pressac's book only those parts which fit in with their theses!

49 "*Dienstanweisung für die Bedienung der Blausäure-Entwesungskammer im K.L.M. Unterkunft Gusen*," Öffentliches Denkmal und Museum Mauthausen. Archiv, M 9a/1.

2.2.7. "Eyewitness Accounts"

A further convergent "proof" comes from "eyewitnesses to mass murder" (p. 137). The authors mention the famous "confession" of Pery Broad – which he drew up on July 13, 1945, and handed over to the British Intelligence Services – and state:

> *"In April 1959 Broad was called to testify at a trial of captured Auschwitz SS members and acknowledged the authorship of the memoir, confirmed its validity, and retracted nothing."* (p. 137)

But at the Frankfurt Auschwitz trial, Broad declared:[50]

> *"In 1945, I wrote a report on Auschwitz and handed it to the English at the British camp of Munsterlager. There, a copy of my report was made. I have glanced through the photocopy presented to me here. Some sections are mine; some sections may have been added by others, some sections, finally, are false. I am surprised that such things should stem from me."*

After reading the report, Broad said:[51]

> *"I recognize individual portions as being unmistakably mine, but not the document in its entirety."*

It is certainly true that Broad recognized as authentic those portions of the report that speak of gassings,[51] but if he had ventured to question the authenticity of those portions, he faced the possibility of a much harsher sentence.[52]

According to the authors, revisionist historians have noticed that the duration of a homicidal gassing was four minutes for Broad and twenty minutes for Höss and conclude, surprisingly but true, that

> *"because of such discrepancies, deniers dismiss Broad's account entirely."* (p. 138)

In fact, this document is considered of doubtful value even by such people as Pierre Vidal-Naquet and Jean-Claude Pressac. The former has written:[53]

> *"In the documentation on Auschwitz there are statements which give the impression of adopting entirely the language of the victors. This is the*

---

[50] H. Langbein, *Der Auschwitz-Prozess. Eine Dokumentation*, Europa Verlag, Vienna 1965, p. 537.

[51] Ibid., p. 539.

[52] During the trial Pery Broad was heavily incriminated by several witnesses to have committed severe crimes. He was therefore arrested on May 30, 1959, and kept in custody during the ongoing investigations and the entire trial itself, which commenced in 1964. On August 20, 1965, he was sentenced by the Frankfurt District Court to four years imprisonment, which was considered served with the time he had spent in jail since 1959. His sentence was for 22 counts of participation in selections and executions, that is to say, for collective assistance to collective murder. And so in Frankfurt the convicted mass murderer Pery Broad left the courtroom as a free man, just as he had after the war; cf. G. Rudolf, "From the Files of the Frankfurt Auschwitz Trial, Part 5," *The Revisionist* 2(2) (2004), pp. 219-224, here 223f.; ibid., "…Part 6," *TR*, 2(3) (2004), pp. 327-330, here p. 330; cf. also ibid., Part 7, *TR* 3(1&2) (2005), in preparation. Editor's remark.

[53] P. Vidal-Naquet, *Gli assassini della memoria*, Editori Riuniti, Roma 1993, p. 27.

case, for example, of SS-man Pery Broad who, in 1945, drew up for the English a memorandum on Auschwitz where he had been active as a member of the Politische Abteilung, i.e. of the Gestapo. He speaks of himself in the third person."

And Pressac notes:[54]

"Historically, this account is not exploitable in its present version, despite its 'true' and all too 'striking' atmosphere, since it has been rewritten by and for the Poles and diffused exclusively by them."

Pressac then states that the Auschwitz Museum is not in possession of the original and that nobody knows where it is. In his second book on Auschwitz, Pressac asserts:[55]

"[P. Broad] *gave himself up to the English in May* [1945] *and started to work for them. On the basis of his recollections he drew up a report on Auschwitz, the strange format of which is said to have been suggested to him by a Pole in London who had been in touch with him at Munsterlager. Released in 1947, he continued to work for the English. He blamed everyone else to save his own skin, testified at Nuremberg and at Hamburg in the trial of Bruno Tesch."*

The authors, hence, who (rightly) demand from the revisionist historians the reliability of their sources, base themselves in this case on a document, of which no one has ever seen the original, which is written in an apologetically Polish style, and which is recognized even by its presumed author as having been somewhat altered. But for Shermer and Grobman, this is a reliable source!

Then, the authors move on to the convergent "proof" of Rudolf Höss' "confessions." They claim:[56]

"Höss made his statement on April 5, 1946, <u>probably</u> unaware of Pery Broad's memoir (and vice versa)." (p. 139, emphasis added)

They tell us that

"after Höss was found guilty and sentenced to death, he wrote a 250-page autobiographical manuscript that corroborates both his previous testimony and Broad's statement." (p. 139)

In fact, the sentence in the Höss trial was pronounced on April 2, 1947, and he was executed on April 16, but his notes date from the period between November 1946, and February 1947. It is really unbelievable that the authors should be unaware of such basic dates in the historiography of the holocaust.

[54] J.-C. Pressac, *Auschwitz…*, op. cit. (note 36), p. 162.

[55] J.-C. Pressac, *Les crématoires d'Auschwitz. La machinerie du meurtre de masse*, CNRS Éditions, Paris 1993, p. 131.

[56] How is Broad, who made his statement in 1945, supposed to have known about Rudolf Höss's confession extorted a year later? Editor's remark.

They then forget to relate that Höss had already made a first "confession," to the English, with reference to which, in his notes written while in Polish custody, he states:[57]

> *"My first interrogation ended in a confession, given the persuasive arguments used against me. I do not know what the statement contains, although I did sign it. But alcohol and the whip were too much, even for me."*

Martin Broszat, the editor of the original German version of Höss' notes, mentions in a footnote:

> *"It is a typescript of 8 pages which Höss signed on March 14, 1946 (Nuremberg Document NO-1210). As far as the contents are concerned, it does not materially differ in any point from what Höss declared or wrote at Nuremberg or Krakow."*

Therefore, the first "confession" made by Höss, the one which contains the essential elements of all later "confessions," was formulated by his English interrogators!

The authors forget, furthermore, to present another argument at variance with their thesis: The fact that Höss was tortured by the English has now been historically verified,[58] having been admitted even by his torturer (Bernard Clarke) and accepted as true by J.-C. Pressac ("arrested by the English in March, 1946, he was violently beaten and ill-treated several times, almost to death")[59] and by Fritjof Meyer ("after three sleepless nights, tortured, whipped after every answer, naked and forced to drink alcohol […]").[60]

Finally, the authors refer to the diary of Dr. Johann Paul Kremer (p. 139) whose "*Sonderaktionen*" (special actions) – as I have explained elsewhere[61] – have nothing to do with exterminations. The authors draw attention to the fact that "at the trial of the Auschwitz camp garrison in Krakow *in December 1947*" Dr. Kremer clarified that "*Sonderaktion*" meant homicidal gassing. They show part of Dr. Kremer's interrogation, which did not take place "in December" of 1947 but on August 18.

Already in the indictment (*akt oskarżenia*) at the initiation of the trial of the camp garrison of the Auschwitz camp, the Prosecutor of the People's Su-

[61] C. Mattogno, op. cit. (note 13), pp. 75-87.

preme Tribunal of Warsaw had established that "*Sonderaktion*" was synonymous with gassing:[62]

> *"During his brief stay at Auschwitz, the accused Kremer took part 14 times in assassinations (gassings). Between 2 and 28 September he participated in 9 similar 'Sonderaktionen.'"*

Under the circumstances, if Dr. Kremer had dared to object to the prosecution's view, he would have been considered an inveterate Nazi criminal, condemned to death and executed. Kremer chose to help the prosecution, and it was a winning gamble: he was inevitably condemned to death (he had participated in the "selection" of detainees) but pardoned and released in 1958.

And this is the surprising conclusion of the authors:

> *"The convergence of the accounts from Broad, Höss and Kremer is additional proof that the Nazis used gas chambers and crematoria for mass extermination."* (p. 140)

Hence, a report written or manipulated by the British Secret Service and by the Poles, of which no one has ever seen the original, "confessions" drawn up by the British Secret Service and imposed by torture, and finally admissions already incorporated into an indictment by the Polish prosecution of a Stalinist show trial and opportunistically taken over by a defendant constitute, for the authors, "converging proofs" – a most incredible statement!

In matters of "convergence," the authors state that the revisionist historians

> *"still have the problem of explaining why the two accounts coincide so well."* (p. 139)

Leaving aside the fact that the two testimonies are far from "coinciding so well," it would not really be a "problem" should they coincide with their claim that mass exterminations were carried out in gas chambers at Auschwitz.

Already during the war the British Secret Service was aware of the fanciful reports by various Polish resistance movements, which came to the attention of the Secret Service of the *Delegatura* (the secret agents in Poland of the Polish government in exile in London). Immediately after the end of the war, various national commissions for the investigation of NS war crimes were set up, and the first sketches of the story of exterminations at Auschwitz began to emerge.

Furthermore, the report of the Soviet investigation commission on Auschwitz appeared in *Pravda* on May 7, 1945, and at the same day in an English translation entitled "The Oswiecim Murder-Camp."[63] Thus, the British Secret

Service also possessed this source, which at that time constituted the best guide to what the captured Nazis had to "confess."[64]

This is the real reason for the "convergence" of the accounts by Broad and Höss with respect to the alleged homicidal gassings at Auschwitz!

2.2.8. Air Photos

The authors then move on to another alleged element of proof, the air reconnaissance photographs which, according to them, as we have seen above, "corroborate the structure of the gas chambers and crematoria."

Nothing could be farther from the truth, as far as the "structure of the gas chambers" is concerned.

The authors publish a series of photographs to substantiate their claim of a "convergence of proof" of the alleged extermination, but these pictures do not really demonstrate anything at all. Let us look at the more important ones, starting with number 16 of the series.

> *"This aerial photograph from August 25, 1944, shows the distinct features of Crematorium II (including the long shadow from the chimney) and the adjacent gas chamber (bottom center, at a right angle to the crematorium). On the roof of the gas chamber, note the four staggered shadows, openings through which the Zyklon-B pellets could be poured, as described in eyewitness accounts."* (p. 145)

As has already been noted by other authors,[65] on the photograph of August 25, 1944, the spots on the roof of morgue 1 of crematorium II are some 3 to 4 meters long, those on the roof of morgue 1 of crematorium III cover an area of at least 3 square meters; the alleged introduction chimneys for Zyklon B, however, are claimed to have stood only some 40 to 50 cm[66] above the concrete surface of the roof. On the other hand, the smokestack of crematorium II, which was about 16 m high, casts a shadow of about 20 m on the ground, therefore the alleged chimneys for Zyklon B would, likewise, have cast a shadow some 60 cm long.

But that is not all. All the spots have an axis running north-south, whereas the shadow of the smokestack runs northeast-southwest. Finally, in the air photo taken on May 31, 1944, there is only one spot on the western edge of the roof of morgue 1 of crematorium II.[67]

[66] J.-C. Pressac, *Auschwitz*..., op. cit. (note 36), p. 253.

[67] Mission: 60 PRS/462 SQ. Exposure : 3056. Can : D 1508, 31 May 1944, NA; in this respect, see chapter 2: "No Holes, No Gas Chamber(s)" of my contribution "The Elusive Holes of

The interpretation of the four spots as Zyklon B introduction openings is so inconsistent that one of the best specialists for this aspect among the supporters of the reality of the gas chambers, Charles D. Provan, has written:[68]

> *"No matter what one thinks of the authenticity of the smudgy marks, it is impossible to view them, whether authentic or not, as 'vents.'"*

Let us move on to Shermer's and Grobman's photograph 17, still on p. 145:

> *"Note two sides of the rectangular underground gas chamber structure that protrudes a few feet above the ground, directly below the chimney of Crematorium II. On the gas chamber roof are four small structures that match the shaded markings in the aerial photographs in figure 16."*

Such a "coincidence" exists only in the fantasy of the authors. As Jean-Marie Boisdefeu has shown by means of a diagram, the objects appearing on the roof of the alleged gas chamber are three and not four in number (the fourth was outside its surface) and all three are grouped together in the southern half of the roof, which is in disagreement with the location of the spots in the photograph of August 25, 1944, as well as with the testimonies.[69] Hence, the three objects are not introduction chimneys for Zyklon B.

Charles D. Provan, too, has come to this conclusion, drawing his own diagram on the photograph with the result that:[70]

> *"the objects are therefore not poison gas chimneys."*

I have since dealt with this question in a specific article, which demonstrates that the alleged introduction chimneys have never existed and which also refutes, among other things, the alleged discoveries by Daniel Keren, Jamie McCarthy and Harry W. Mazal.[71]

Shermer's photograph 18 on p. 146 shows the unloading of deported Hungarian Jews from a train. Photographs 19 and 20 (pp. 147f.) are enlargements of three air photos taken in rapid succession on August 25, 1944. The two reproductions of photograph 19 are reversed! A group of persons is moving between BW5a and 5b (on the left) and the two kitchen barracks in front along the line separating sectors BIa and BIb of Birkenau (but the authors do not know elementary things like that).

The column moves along the road, which ran through sector BII of the camp in an east-west direction. Therefore they had to have BW 5a and 5b on

their right and the kitchens on their left. On the photographs in question, it is the opposite. Therefore they are shown mirror-reversed.

Photograph 20 shows, on three images, three groups of persons walking along the eastern edge of sector BIa: one group is between barrack 27 and the camp fence, another group walks along the road between barracks 24 – 30 (on the right) and 22 – 28 (on the left), a third group is partly walking parallel to the second and partly along the curve to the right between barracks 24 – 30. Of course, the authors do not realize this, just as they do not know that the three images are printed the wrong way around with respect to all Birkenau plans, i.e. with the crematoria at the bottom and the eastern fence at the top.

All these photographs demonstrate nothing more than the fact that columns of detainees were moving around at Birkenau.

Photograph 21 (p. 149) is, however, interpreted by the authors in a more pretentious way:

> *"Finally, figure 21 appears to be a group of people moving toward Crematorium V, offering yet another evidence that indicates the reality of mass murder (see also figure 22)."* (p. 146)

We notice immediately that these two images, too, have been printed upside down with respect to the Birkenau plans: crematoria IV and V appear at the bottom rather than at the top. What is more serious, however, and almost incredible is that the authors confuse crematorium V with crematorium IV! It is necessary to turn the book upside down to re-establish the normal orientation with crematoria IV and V at the top and the "*Effektenlager*" (the so-called *Kanada*) on the left.

Areas enclosed by a rectangle on the two images show a column of people. This column was on the road which separated the "*Effektenlager*" (on the left) from crematorium IV (on the right), in front of barracks 2 – 8 to be precise. On the right, the road ran along a copse of birch-trees, located to the west of crematorium V, in which there was a fire-protection basin.

Contrary to what the authors think, this photograph proves absolutely nothing with respect to the "reality of mass murder." If they had gone into the matter a little more deeply, the authors would have known that the so-called Auschwitz Album even shows persons under the trees, near the basin.[72]

I have already shown elsewhere that the hypothesis that these people were waiting to be gassed is not in any way more convincing than the one that they were waiting to depart from the camp (as might be shown by the fact that they had with them heavy backpacks, bags, and cooking utensils).[73]

In her memoirs, Elisa Springer, who was deported to Auschwitz in early August 1944, describes what happened after they left the train:

---

[72] Anne Freyer, Jean-Claude Pressac (eds.), *L'Album d'Auschwitz*, Éditions du Seuil, Paris 1983, pp. 194, 198-203.

[73] Cf. my article "Die Deportation ungarischer Juden von Mai bis Juli 1944. Eine provisorische Bilanz," *Vierteljahreshefte für freie Geschichtsforschung*, 5(4) (2001), pp. 388-389.

> *"Once we had reached an area with some grass on the edge of a birch-wood, we had to lie down and we stayed there all night, trembling, and in the mud.* […] *In the early morning, some SS-men arrived with several detainees in their striped uniforms and ordered us to get up on the double and to leave the copse."*

Then Dr. Mengele separated those fit for work from the unfit and the former (among them Elisa Springer) were led to the *Zentralsauna* for a bath and delousing.[74] The witness does not say that those unfit were "gassed," she only allows it to be understood, but then this tale is part of the basic equipment of the witnesses, in the same way as the tale of the chimneys spouting flames.[75]

Figure 22 on p. 150 represents, according to the authors, crematorium V "with the gas chambers at the far end of the building," whereas it actually shows crematorium IV, seen from the west. Of course, the claim that the photograph shows gas chambers at all does not result from the image which, as such, does not prove anything.

2.2.9. Interpreting Air Photos

The authors then dedicate a section to "interpreting the air photos" (p. 150), in which they again show an astonishing lack of knowledge regarding even the most elementary facts of holocaust history. They affirm that, in May of 1944, as a preparation for the deportation to Auschwitz of "half a million Jews" (to be precise, the number of deportees was 437,402 of whom at least 39,000 were deported to places other than Auschwitz[76]), Werner Jothann, "*SS-Obersturmführer* (Lieutenant Colonel[77])," ordered *inter alia* the installation of "elevators in Crematoria II and III to move the bodies from the gas chamber to the crematoria" (pp. 150f.), which is, however refuted by their most important source.[78]

They claim, furthermore, that the air photos cannot show proof of the alleged extermination for the following reason:

> *"The undressing, gassing, and cremation were <u>all</u> done inside the crematoria buildings. It was highly unlikely that an Allied plane would have flown over at the same time as smoke was coming out of chimneys or from an open-pit burning."* (p. 151, emphasis added)

75 In this respect cf. my chapter "Una testimone dell'ultima ora: Elisa Springer," in: *Olocausto*..., op. cit. (note 11), pp. 138f.

76 C. Mattogno, op. cit. (note 73), p. 387.

77 *SS-Obersturmführer* (First Lieutenant, not Lieutenant Colonel!) Werner Jothann was head of the Central Construction Office at Auschwitz. He had succeeded the previous head, *SS-Sturmbannführer* Bischoff, on October 1, 1943.

78 Jothann's "*Dringendes Telegramm*" of May 12, 1944, reads: "Installation of the 2 lifts can not [sic!] be done," J.-C. Pressac, op. cit. (note 55), p. 89, p. 100.

To refresh the memories of the authors, the official picture of the alleged extermination of the Hungarian Jews, drawn up by one of their principal sources, Franciszek Piper, is the following:[79]

> *"For example, in the initial stages of the extermination of Hungarian Jews, crematorium V had to be shut down due to a breakdown of the chimneys. As a result, some bodies were incinerated in crematorium IV. The remainder was burned at the rate of about 5,000 corpses in 24 hours in the incineration pits of bunker 2, which was reactivated in the spring of 1944."*

The witnesses' statements, though, are even more devastating. During the deportation phase of the Hungarian Jews there existed in the north yard of crematorium V five "cremation trenches" according to Tauber[80] and Müller (the latter gives the dimensions of two of them as 40-50×8 m),[81] three trenches according to Bendel (12×6 m),[82] whereas for Nyiszli no such trenches ever existed.

The so-called "Bunker 2" had four gas chambers and four cremation trenches for Müller,[83] whereas Nyiszli[84] has no gas chambers but only two cremation trenches some 50 × 6 m, in which 5,600 to 6,000 corpses were burned each day. Again, we have here an excellent example of converging evidence!

To sum up, during the period in question there should have existed (and be visible on the air photos) three or four "cremation trenches" in the north yard of crematorium V and 2 or 4 trenches in the area of the so-called "Bunker 2" (outside the camp, at some 200 m to the west of the *Zentralsauna*).

The authors tell us that they addressed themselves "to Dr. Nevin Briant, supervisor of Cartographic Applications and Image Processing Applications at NASA's Jet Propulsion Laboratory in Pasadena, California (operated by the California Institute of Technology)" and had him analyze the air photos of Birkenau "by digital technology," adding:

> *"The photographic negatives were converted to digital data in the computer, then enhanced with software programs used by NASA for aerial and satellite imaging."* (p. 143)

However, in spite of all this sophisticated technology, the authors say nothing about the presence of *mass* "cremation trenches" in the air photos, whereas they did devote seven enlargements to proving the presence of columns of marching persons in the camp!

---

79 F. Piper, "Gas Chambers and Crematoria," in: I. Gutman, M. Berenbaum (eds.), *Anatomy of the Auschwitz Death Camp*, Indiana University Press, Bloomington/Indianapolis 1994, p. 173.

80 J.-C. Pressac, *Auschwitz*..., op. cit. (note 36), p. 500.

81 F. Müller, *Sonderbehandlung. Drei Jahre in den Krematorien und Gaskammern von Auschwitz*, Verlag Steinhausen, Munich 1979, p. 207 and 211.

82 Raymond Philips (ed.), op. cit (note 10), p. 131.

83 F. Müller, op. cit. (note 81), p. 231.

84 M. Nyiszli, *Auschwitz*..., op. cit. (note 14), pp. 68-71.

It is obvious that the NASA experts did not find any trace of such trenches, for otherwise the authors would have pounced on such an opportunity to publish enlargements as "converging evidence" for the alleged exterminations carried out at Auschwitz.

Actually, on the photographs of May 31, 1944, a smoking area does indeed appear in the north yard of crematorium V, but it is *a single* smoking area with a surface of only 40 to 50 square meters!

However, as I have previously demonstrated in the article "Supplementary Response to John C. Zimmerman on his 'Body disposal at Auschwitz'"[31] already mentioned, if the thesis of the mass extermination of Hungarian Jews were true, there should appear on the photographs of May 31, 1944 – in view of the impossibility of burning the corpses in the crematoria – cremation trenches having a total surface area of some 7,600 square meters, as opposed to the 40-50 m² that can effectively be seen!

From this we can see clearly why the authors have opted for keeping quiet with respect to the "cremation trenches." It is impossible that the minute area with smoke in the yard of crematorium V should have escaped the attention of the NASA experts. Yet they did not mention it anyway. The photographs of May 31, 1944, do not only refute the testimonies but also the objective reality of the alleged mass extermination of the Hungarian Jews.

As we have seen above (p. 179), if that extermination were true, some 9,500 corpses would have had to be burned *in the open* between May 16 and 31, 1944! The authors, who do not know or act as if they do not know such data, refer to the Auschwitz *Kalendarium* and claim that on May 31 a single convoy of Jews arrived at Auschwitz, of whom only 100 were selected for work while the others were gassed, and comment:

> *"For this day we do not know how many Jews were killed in the gas chambers, what time they were killed, or if they were cremated that day or the next day."* (p. 152)

They forget about the second transport of Hungarian Jews registered in the *Kalendarium*, from which 2,000 deportees were registered and the remainder "murdered in the gas chambers."[85] They go on to add a totally incredible explanation:

> *"It is reported that between May 16 and May 31 the SS acquired eighty-eight pounds of gold and white metal from false teeth, so it is possible that bodies were not cremated until after this process was completed, which would have been after May 31 for those arriving that day."* (p. 152)

---

[85] D. Czech, *Kalendarium der Ereignisse im Konzentrationslager Auschwitz-Birkenau 1939-1945*. Rowohlt Verlag, Reinbek bei Hamburg 1989, p. 789.

For this, the authors give no source, and that is quite understandable. This item of information stems, in fact, from one of their main sources in which one can read:[86]

> *"According to a secret report smuggled out of the camp at the start of the extermination of Hungarian Jews in May 1944, the SS took delivery of 40 kg (80 pounds) of gold and 'white metal' (probably platinum)."*

Hence, it is an arbitrary conclusion on the part of the authors that the alleged booty of precious metal (for which there exists no document) was brought in "between May 16 and May 31." If they had checked their source in accordance with their methodic decalogue, they would have noticed that the report in question is dated June 15, 1944, and refers to the period of May 25 to June 15, 1944.[87]

Thus, the trickery of the authors failed to impress us. But even assuming that the story of the teeth were true and that the period were the one indicated by the authors, how could anyone seriously deduce from the extraction of the teeth that the corpses were not burned until May 31? With what distorted logic can anyone believe that the corpses were not burned by and by as the teeth were removed, which is, after all, exactly what the official historiography claims to have been the case?[88] In the face of such logic, the authors' claim of using "the accepted rules of reason" rings decidedly hollow.

According to the documents regarding the deportation of the Hungarian Jews, 33,187 of them were deported between May 28 and 31. This figure is the difference between the 217,236 deported up to May 31[89] and the 184,049 deported up to May 28.[90]

As I have shown elsewhere,[91] there are two possibilities for the arrivals at Auschwitz on the days that concern us here: either 12,900 Jews, in round figures, arrived on May 30 and 9,050 arrived on the 31st, or vice versa. In the case most favorable to the authors, we have 9,050 arrivals for May 31, with some 8,200 (= 9,050×0.91) gassed and burned.

As the theoretical maximum capacity of the Birkenau crematoria (assuming that baby bodies were cremated as well) stood at 1,040 corpses in 24 hours,[92] it follows that on May 31, some 7,150 corpses would have been burned in the open air. On May 30, about 11,700 (= 12,900×0.91) Jews are claimed to have been murdered, with about 10,700 of them burned in the open air.

92 C. Mattogno, op. cit (note 30), p. 398.

To burn the average daily number of corpses, 9,500, by applying Müller's absurd method, one would have needed an area of about (9,500×320÷1,200=) roughly 2,500 square meters!

Looking once more at the photograph of May 31, 1944, if the story of the extermination of the Hungarian Jews were true, the image should show the following *permanent* elements:

– at least 2,500 square meters of "cremation trenches"
– at least 5,000 cubic meters of earth removed during the digging of the trenches[93]
– at least 1,800 tons[94] of wood for the corpses to be burned on May 31, without counting the reserve for the following days.

But what do these photographs actually show? If we follow the authors, they show only columns of people marching in the camp! Beyond that, there is only the "smoking gun" of an area 40 – 50 m² in size, which they prefer not to mention.

This tiny area is 50 times smaller than what would have been needed according to the false statements of the witnesses, and over 180 times smaller than what would really have been required for burning such an enormous quantity of corpses in the open air!

Here we have, then, another good example of "converging evidence" *against* mass extermination, about which the authors preferred to remain silent.

Let us read on. On p. 159, the authors present a photograph showing a section of the roof, made of reinforced concrete, of morgue 1 (the alleged gas homicidal chamber) of crematorium II at Birkenau, saying:

> *"The extant hole in what remains of the gas chamber may be one of the openings through which the SS guards poured Zyklon-B gas pellets."*

Actually, as I have demonstrated in two specific studies of this aspect, this gap has nothing to do with the alleged Zyklon B introduction openings *which never existed*.[19]

2.2.10. Himmler's Visit to Auschwitz

I will conclude this section with another one of those false "convergent proofs," which the authors have adopted:

> *"Gassings began in 1941, and Himmler witnessed his first gassing on July 18, 1942."* (p. 150)

Here we have another classical example of incestuous sources! The claim that Himmler witnessed a homicidal gassing at Auschwitz on July 18, 1942, is

[93] Actually, the volume would be higher because the excavated earth increases in volume by about 25 percent. G. Colombo, *Manuale dell'ingegnere*, Hoepli, Milano 1916, p. 190.

[94] Based on about 200 kg per corpse. Cf. the study on the alleged mass cremation at Treblinka in: C. Mattogno, J. Graf, *Treblinka*, Theses & Dissertations Press, Chicago 2004, pp. 145-153, in particular p. 151f.

based solely on Rudolf Höss' "testimony," and we have already seen how it was extorted from him and what value it has.

Even though the authors, justly, require of revisionist historians a scrupulous verification of the sources and the search for evidence against their own theses, in this case, much like most others, neither they nor any other official historian has ever gone to the trouble of verifying Höss' assertion: he said something useful for the common cause of the holocaust, thus everyone is happy.

There exist, however, several documents – starting with Himmler's own diary – which allow us to check the truth. And the truth is that Himmler not only did not witness any homicidal gassing, but could not even have done so, because the schedule of his visit to Auschwitz is in absolute disagreement with any schedule for the arrival of Jewish transports at Auschwitz and alleged homicidal gassings![95]

2.3. Gas Chambers at Majdanek

The authors dedicate a section to "the contingent history of Majdanek" (p. 161f.), in which they deal with the alleged homicidal gas chambers of this camp. Of course, they completely ignore the study on Majdanek, which I have written together with Jürgen Graf[96] and in which we have devoted a long chapter[97] – since 2000 also available in English[98] – to this topic, demonstrating on the basis of documents that the alleged gas chambers were planned and built as a "disinfestation installation using the hydrogen cyanide disinfestation system" (*Entwesungsanlage nach dem System der Blausäure-Entwesung*)[99] and that they were never used as homicidal gas chambers.[100]

Without a precise knowledge of the installations it may not be possible to understand the arguments of the authors and my replies, hence I shall first set out the essential data for the alleged gas chambers at Majdanek on the basis of the Polish-Soviet expertise dated August 4-23, 1944:

---

Number	Location and designation	Dimensions	Area m^2
Chamber I	Barrack 41, located in SE	4.50 m × 3.80 m	17.1
Chamber II	Barrack 41, located in NE	4.50 m × 3.80 m	17.1
Chamber III	Barrack 41, *Entlausungskammer* in W	9.27 m × 3.80 m	35.2
Chamber IV	Barrack 4, *Gaskammer,* adjacent to shower room		107.7
Chamber V	Barrack 28, drying room	11.75 m × 6 m	70.5
Chamber VI	Barrack 28, drying room	11.75 m × 6 m	70.5
Chamber VII	Crematorium, housed between mortuary and autopsy room	6.10 m × 5.62 m	34.9

Chamber VII was located in the crematorium. Jean-Claude Pressac has written in this respect that the assistant director of the Museum had told him that this gas chamber "was used very little, really very little." According to the French historian this "means, plainly speaking, that it was not used at all."[101]

In order to make people believe that this was indeed a homicidal gas chamber, the Poles had opened up a rough rectangular aperture in the roof without any closure and even without cutting the steel rebars of the concrete![102]

The authors leave that room aside and start their journey with the two rooms of barrack 28 (chambers V and VI), writing:

> *"The first two gas chambers, which apparently used both Zyklon-B and carbon monoxide, were built in the middle of the camp, near a laundry and crematorium, and housed in a wooden shack."* (p. 162)

The information is taken from Pressac's article mentioned above. However, its author arrived at a quite different conclusion:[101]

> *"It is likely that these two makeshift gas chambers were used for disinfesting clothing with Zyklon B (hydrocyanic acid). The laundry, located nearby, is another argument in favor of this interpretation."*

The authors then quote an "analysis" by the historian Michael Tregenza who affirms that these chambers "used both HCN [Zyklon-B] and CO [carbon monoxide] gas, although this has not been officially confirmed," but concludes:

> *"Current theory, however, tends to favor these chambers as disinfection facilities only* […]*"* (p. 162)

The authors comment:

> *"But this theory does not explain the use of carbon monoxide, which is useless against lice. Its only plausible use is against human beings."* (p. 162)

[101] Ibid., p. 153. The quotation is taken from the article by J.-C. Pressac, "Les carences et incohérences du rapport Leuchter," in: *Journal J*, December 1988, p. IX.

[102] J. Graf, C. Mattogno, op. cit. (note 96), photograph XXI on p. 311.

In fact, there is no document and no witness statement on the use of those two rooms for homicidal purposes. According to the witnesses, executions were carried out by striking the victims in the back of the neck with an iron bar in a suitable room of the crematorium.

Michael Shermer[105]

On the other hand, according to the Holocaust historians, carbon monoxide was never used in chambers V and VI, but only Zyklon B. In the most complete exterminationist work on the Majdanek camp, Czeslaw Rajca, who deals with the "direct extermination" of the detainees, devotes a single line (!) to chambers V and VI, claiming that prior to October of 1941, "the detainees were murdered with Zyklon B in a gas chamber made of wood, which was located near the bath [actually it was the laundry]."[103]

Even though a Polish-Soviet Investigative Commission had been concluded that this room in barrack 28 served as a drying room for the laundry nearby, this commission invented the story of homicidal gassings in this room by concluding that "in reality" the two rooms were homicidal gas chambers because of the presence of two ventilation chimneys with lids on the roof for the removal of the warm air! The two chimneys immediately became Zyklon B introduction openings, as is shown by the legend of the well-known photograph of a Soviet soldier in front of one of them holding the lid in his hand.[104]

Shermer and Grobman admit that chamber IV, which was located in the barrack presently labeled "*Bad und Desinfektion*," was not a homicidal gas chamber:

> *"The original block measures 9.2 meters by 3.62 meters by 2.05 meters high. Casual inspection of the large gas chamber room shows that its use was for delousing clothing and blankets, not for mass extermination, since the doors to it open in, they do not (and cannot) lock, and there is a large glass window (about 30 by 60 centimeters, or 1 by 2 feet) that could easily be broken. The window frame appears to be original, since the wood from*

[103] Cz. Rajca, "Eksterminacja bezpośrednia," in: T. Mencel (ed.), *Majdanek 1941-1944*, Wydawnictwo Lubelskie, Lublino 1991, p. 270.

[105] www.ntskeptics.org/2002/2002december/shermergeivett.jpg

which it is constructed is saturated with blue Zyklon-B stains (as is the rest of the room)." (p. 162)

However, as late as 1997, a sign in five languages in this room asserted:[106]

"Eksperimental [sic] *gas chamber for exterminating prisoners with cyclone B thrown into the chamber through holes in the ceiling."*

If a "casual inspection" is enough to convince anyone that this room was never used as a homicidal gas chamber, why has it been bandied about for decades as a homicidal gas chamber?

Furthermore, the arguments used by the authors had already been expounded by me – in a much more cogent way – in 1998. In the study of Majdanek mentioned above, I had in fact published the plans and documents concerning the gas chambers and explained the results of an on-site inspection, including the fact that the window frame showed traces of Iron Blue.[107] Being that of a "negationist," my demonstration was completely ignored, obviously, whereas the explanations of the authors – superficial and partly in error as they are[108] – will no doubt be accepted as God's truth.

Thus, only chambers I, II, and III of the installation to the east of barrack "*Bad und Desinfektion*" remain as potential homicidal gas chambers. The authors say:

"The SS then built the two smaller concrete gas chambers with iron doors (in the back of the building and at that time separate from the other rooms), and these additions, we believe, were for the express purpose of gassing prisoners. Why else would the SS have built these new rooms that featured peepholes and locking doors, components not found in any delousing chamber? […] *Finally, we know that carbon monoxide was employed in the Bad und Desinfektion I gas chambers, pointing to their use for mass homicide."* (p. 163)

A few pages further along, the authors, commenting on photograph 29 on p. 167 of their book (it is chamber III, the one on the left, coming from the barrack "*Bad und Desinfektion*"), write the following:

"The latter includes a locking steel door with peephole and gas detector, and the room itself contains floor-to-ceiling Zyklon-B staining."

Speaking of this chamber and its companion, Tregenza notes:

"These two chambers were adapted yet again for use with CO gas, which can only be used for extermination purposes – CO is useless for disinfection purposes, and is fatal only for warm-blooded animals. What we

[106] Sign seen and photographed by me in June of 1997.

[107] J. Graf, C. Mattogno, op. cit. (note 96), pp. 149-153.

[108] Only one of the two doors closed towards the inside (the one on the south side), furthermore, as I have already noted, the gas-tight doors did not have "locks" but locking levers (each door of chamber IV had three of those). Cf. the color photographs outside of the text in the book *Concentration Camp Majdanek*, op. cit (note 96).

are looking at, then, is a chamber where people, not clothes, were gassed." (p. 165)

So now here we are, at last, in front of two allegedly real homicidal gas chambers! Reality, though, is quite different. Contrary to what the authors believe – who rely on misbegotten sources in this case more than ever, something they always blame others for doing – the installation in question was planned and built as a disinfestation unit.

The original project, of which a later drawing has been preserved – the drawing by the Construction Office of the POW camp Lublin (Majdanek) with the title *"Entwesungsanlage. Bauwerk XII*^{A}" (disinfestation unit, building XIIA) dated August 1942 – shows a rectangular block measuring 10.76 m × 8.64 m × 2.45 m housing two disinfestation chambers (*Entlausungskammern*) 10 m × 3.75 m × 2 (height) meters, each with two doors 0.95 by 1.80 meters facing each other in such a way that each of the smaller sides of the building showed two doors placed side by side, 3 meters apart.[109]

Let us briefly review the beginnings of this unit:

– May 27, 1942: Amt IIB of WVHA requests an *Entwesungsanlage* (disinfestation plant) for "*Bekleidungswerk Lublin"* (Lublin garment works).
– June 19, 1942: Chief of the Central Construction Inspection of the SS-WVHA, *SS-Sturmbannführer* Lenzer, passes on to the Construction Inspection of the Waffen-SS and Police Government General (occupied Poland) the request mentioned above, "for the construction of a disinfestation plant using the disinfestation system with hydrogen cyanide" (*zum Bau einer Entwesungsanlage nach dem System der Blausäure-Entwesung*)
– July 10, 1942: The head of Central Construction Office sends on to Construction Inspection of the Waffen-SS and Police Government General the administrative documents concerning "disinfestation unit" (*Entwesungsanlage*).
– July 10, 1942: The "explanatory report for the construction of a disinfestation unit for the Lublin fur and garment workshop" (*Erläuterungsbericht zur Errichtung einer Entwesungsanlage für die Pelz- und Bekleidungswerkstätte Lublin*) is drawn up.
– July 10, 1942: The "cost estimate for the construction of a disinfestation barrack for the Lublin fur and garment workshop" (*Kostenanschlag über Errichtung einer Entwesungsbaracke für die Pelz- und Bekleidungswerkstätte Lublin*) is drawn up.
– August 1942: Drawing for "POW camp Lublin. Disinfestation plant. Building XIIA"(*K.G.L. Lublin. Entwesungsanlage. Bauwerk XIIA*) is executed

[109] The plan is reproduced in: J. Graf, C. Mattogno, op. cit. (note 96), document 31, p. 288.

– September 11, 1942: Central Construction Office places an order for two "hot air heaters" (*Heissluftapparate*) with the company Theodor Klein for the "disinfestation plant" (*Entwesungsanlage*).
– October 22, 1942: The list of buildings (*Bauwerke*) finished contains the entry "construction of a disinfestation plant" (*Erstellung einer Entwesungsanlage*) for the Lublin fur and garment workshop (*Pelz- und Bekleidungswerkstätte Lublin*).

Later on, the chamber on the east side (to the right, coming from the *Bad und Desinfektion I* barrack) was divided up by means of a central partition.

No document and no account from a witness prove that this unit was used for a homicidal purpose.

Elsewhere I have shown images and explained the operation of the closures of those doors.[110] The presence of a peephole in the doors does not prove anything, because the doors of the disinfestation cells were equipped with peepholes.

When they speak of an alleged "gas detector" in one of the doors (!),[111] the authors show all their tragic ignorance in matters of disinfestation (and alleged homicidal gas chambers). The door in question (photograph on p. 167) has actually two closure levers on the left, one near the top, one near the bottom, and a handle in the middle, a hole for a thermometer in the center, a peephole (below the hole) and a metal plate at bottom right.[112]

But what about the carbon monoxide unit? Let us underline, first of all, that no official historian has ever explained why the SS in the camp, which had at its disposal two alleged homicidal gas chambers using Zyklon B with air heaters, would have split chamber II in two, using only the first room (of some 17 m²) as a gas chamber with carbon monoxide and equipping chamber I, which worked with Zyklon B, also with a carbon monoxide unit – and all this in a camp which never ran low on Zyklon B. The documentation concerning the supply of Zyklon B is complete; the camp received a total of 6,961 kg of this product.[113]

---

[110] Cf. the color photographs of the doors of these rooms in my article "Auschwitz: The Samuel Crowell Bomb Shelter Thesis: A Historically Unfounded Hypothesis," online: www.vho.org/GB/c/CM/Crowell-final-eng.html.

[111] The gas testing device for Zyklon B residues, called *Gasrest-Nachweisgerät für Zyklon B* was a chemical apparatus using chemicals and paper indicators. The description and a photograph of such a device are given in my study "Auschwitz: The End of a Legend," in: G. Rudolf (ed.), *Auschwitz: Plain Facts*, Theses & Dissertations Press, Chicago 2005, pp. 160f and 182-186; see also my paper "The 'Gas Testers' of Auschwitz" in *The Revisionist*, 2(2) (2004), pp. 140-154.

[112] The author inspected and photographed the door in 1997. A color photograph is reproduced in op. cit. (note 110), Fig. 8 (and 9, an enlargement).

[113] J. Graf, C. Mattogno, op. cit. (note 96), chapter VIII, "Zyklon B Deliveries to the Concentration Camp Majdanek," pp. 193-208. Cf. in particular the summary table on p. 204.

There is, however, another much more cogent argument: there is no evidence that the pipes in the two rooms mentioned above were used for the introduction of carbon monoxide. Two steel cylinders in an adjoining room are the only "proof" in this respect. A sign in five languages tells us that

> *"from here, the supply of carbon monoxide to two chambers was regulated."*

But what proof is there that the two cylinders did actually contain carbon monoxide? None. On the two cylinders preserved to this day we actually can still read the following engraved inscription:[114]

> *"Dr. Pater Victoria Kohlensäurefabrik Nussdorf Nr 6196 Full. 10 kg* [illegible] *und Fluid Warszawa Kohlensäure* [illegible] *Fluid Warszawa Lukowski. Pleschen 10,1 kg CO_2 gepr."*

These two cylinders therefore did not contain carbon monoxide (i.e. CO) but *Kohlensäure* (carbon dioxide, CO_2) which, as most know, is not a toxic gas.

Of course, neither the authors, nor their source, Tregenza, nor any other official historian has ever gone into this minor detail, which is certainly not irrelevant. Instead, quoting each other in an incestuous way, they have continued to wrongly tell the world that the two cylinders contained toxic carbon monoxide!

2.4. Gas Chamber at Mauthausen

The authors then address the gas chambers at Mauthausen. Let us look at the "converging evidence" they have selected.

At the present time, the room measures 3.59 by 3.87 meters or 13.89 m² and is 2.42 m high.[115] It is equipped with

- two metal doors, gas-tight, with peephole
- a water pipe with 16 shower heads
- a water outlet in the floor with metal grid
- a heater consisting of 5 horizontal tubes
- a tiled section some 1.5 m high all around
- a metal plate which closes a round opening in the ceiling.

The authors qualify the room as a "camouflaged shower" (p. 168) and speak of "fake showerheads" (p. 172), which is wrong because the showers are real and were operational. The water on the floor went out by way of a proper sewer. Their assertion is based not on the shower installation in the room but on a simple deduction:

> *"It makes little sense to argue (as deniers do) that the adjoining gas chamber (figure 32) was either a shower room or a delousing chamber.*

[114] Ibid., p. 145. On-site inspection by the author and confirming letter from the director of the archive of the Museum of Majdanek sent to the author on January 30, 1998.

[115] On-site measurements by the author.

> *First, a shower and delousing chamber already existed at the front of the camp (where we would expect to find them); second, why would the Nazis have placed either a delousing room or a shower room next to a dissection room and crematorium?"* (p. 172)

Thus, in the strange logic of the authors, because there already was a shower installation near the entrance into the camp, no showers could have been installed anywhere else! Along the same lines, one could argue that because with buildings BW 5a and 5b there already existed two shower rooms at Birkenau (which are actually nowhere near "the front of the camp") the 50 showers in the *Zentralsauna* had to be fake!

The same goes, obviously, for the "delousing chamber." In this case the deductions of the authors make even less sense, because what they call, rightly, a "delousing chamber," and show in a photograph on p. 169, is really an autoclave which, as its name *Dampf-Desinfektionsapparat* (steam disinfection apparatus) clearly says, worked with *steam* and not with Zyklon B. Therefore the existence of this type of device excludes even less the possibility of a *Zyklon B disinfestation unit* elsewhere in the camp. This is yet another example of how the authors apply the "accepted rules of reason"!

The authors then turn their attention to the heater, the tubes of which are similar to those that exist "in an office at Auschwitz" (p. 171f.) and state:

> *"The pipes in the gas chamber appear to have been installed to heat the room to hasten the rapid evaporation of the hydrocyanic acid from the Zyklon-B pellets."* (p. 172)

The sources they mention in note 85 on p. 277 are the classic work by Hans Maršálek concerning Mauthausen (they give his name as J. Marszalek, confusing him with Józef Marszałek, the Polish author of a book on Majdanek!) plus five more titles on Majdanek – but here we are dealing with the gas chambers at Mauthausen!

Of course, the reference to the book by Maršálek does not give the page number, as usual, just to make it difficult for curious readers who might want to check if what they say is correct. And in fact, what they write is not what is in the source. In it we read:[116]

> *"In this room* [the room next to the gas chamber] *there was a table, a gas mask and a gas introduction device connected to the gas chamber by means of a tube. The hot brick was put into the gas introduction device, its function was to speed up the transformation of the crystals* [sic] *of Zyklon B into liquid gas* [in flüssiges Gas]."

In a little book dedicated to the alleged homicidal gassings at Mauthausen, Hans Maršálek has explained in detail how the gas chamber is supposed to have worked: In the room next to it, there was a device for the introduction of

[116] H. Marsàlek, *Die Geschichte des Konzentrationslagers Mauthausen. Dokumentation*, Österreichische Lagergemeinschaft Mauthausen, Vienna 1980, p. 211.

the gas (a kind of metal box with a gas-tight lid) hooked up to a tube inside the gas chamber, one meter long with a slot, 80 cm long and ½ cm wide.

The SS would put a brick into the muffle of the nearby crematorium, and when it was red hot, they placed it on the bottom of the gas introduction device, sprinkled the contents of a can of Zyklon B on it and closed the lid.[117]

In that way, the hydrogen cyanide allegedly evaporated immediately and the vapors entered the gas chamber through the slotted tube.[118] The gas mixture was removed by means of a ceiling fan in a corner of the room.

Hence, the heater had no function for the alleged homicidal use of the gas chamber – but then why was it there at all? And why were there operational showers?

As I have shown elsewhere,[119] the Mauthausen gas chamber could not have operated in the way described. Actually, it was initially a disinfestation chamber using hydrogen cyanide equipped with a *Degesch* air circulation device suitable for this room and identical to the one in the disinfestation plant (and alleged gas chamber) at Sachsenhausen, which also possessed real showers. Hence, both gas chambers could also be used as showers.

The authors then ask with feigned ingenuousness "why would the Nazis have placed either a delousing room or a shower room next to a dissection room and crematorium" (p. 172). Precisely for the hygiene of the personnel assigned to handling the corpses! Actually, between the alleged gas chamber and the furnace room there was a mortuary with a refrigeration unit and a dissecting room. After all, this personnel handled the corpses of detainees, many of whom had died from contagious diseases, so they would have needed to take showers more quickly and frequently than anyone else. And that also went for the disinfestation of their clothes. Needless to say that the disinfestation unit also served the rest of the camp.

The authors then have the audacity to conclude:

> *"All the evidence from these various sources points to this macabre conclusion"!* (p. 172)

and add:

> *"It is not enough for deniers to concoct an alternative explanation that amounts to nothing more than denying each piece of freestanding evidence. They must proffer a theory that not only explains all of the evidence but does so in a manner superior to the present theory. This they have not done. Our conclusion stands on this bedrock of scientific history."* (p. 172)

---

[117] H. Maršàlek, *Die Vergasungsaktionen im Konzentrationslager Mauthausen*, Österreichische Lagergemeinschaft Mauthausen, Vienna 1988, p. 10.

[118] Since mixtures of hydrogen cyanide and air with more than 6 vol.% of HCN are explosive, Zyklon B spread directly onto a red-hot brick would have led to an explosion of the device, not to a successful gassing. Editor's remark.

[119] C. Mattogno, "KL Sachsenhausen: Stärkemeldungen und 'Vernichtungsaktionen' 1940 bis 1945," in: *Vierteljahreshefte für freie Geschichtsforschung*, 7(2) (2003), pp. 173-185.

This is exactly what I have done in this chapter, demonstrating on the one hand the total historical inconsistency of the theories proposed by the authors and re-establishing, on the other hand, the historical truth on the basis of documents.

3. "Convergent Documentary Evidence" of the Holocaust

3.1. The Definition of the "Holocaust"

If we want to express correctly the theses of revisionism, then we must, first of all, give a correct definition of the "Holocaust." In this respect, the authors write:

> *"When historians talk about the 'Holocaust', what they mean on the most general level is that about six million Jews were killed in an intentional and systematic fashion by the Nazis using a number of different means, including gas chambers. According to this widely accepted definition of the Holocaust, so-called Holocaust revisionists are in effect denying the Holocaust, since they deny its three key components – the killing of six million, gas chambers, and intentionality."* (p. XV)

This definition is acceptable, with the restriction that the essential factors are the gas chambers and the intentionality, that is, the planned and systematic assassination of Jews as such. The numerical aspect is less relevant because – as a principle – the six million do not demonstrate the reality of a planned extermination carried out in gas chambers. As the authors correctly say, but with a different meaning,

> *"whether it is five or six million is central to the victims, but from the point of view of whether the Holocaust took place it is irrelevant."* (p. 174)

What counts is not the number of victims but whether they were killed according to a governmental plan involving mass extermination in gas chambers. I will come back to this question in chapter 3.4.

3.2. The Liberation of the Camps

However, the authors then go on and act as if they had forgotten their definition and toss into the kettle of the Holocaust anything they can put their hands on.

Thus, on p. 173, after having reported G.M. Gilbert's description of the "Nazi leaders' reactions to a film of concentration camps liberated by Americans," they declare:

> *"This raw description at the Nuremberg trials of some Nazi leaders' shock and horror at the scope and scale of the Holocaust gives us some indication of just how far beyond belief the mass murder was even to the perpetrators."*

Hence, the situation prevailing in Germany in the spring of 1945, when the country was in utter chaos, when epidemics ravaged the camps and decimated the inmate population, becomes a "proof" of the Holocaust, a "proof" of an *intentional* "mass extermination."

Alex Grobman[123]

The lack of foundation of this argument and the bad faith of those who expound it are all too evident. It is well known that in the western concentration camps the peaks of mortality among the detainees were tragically reached *after* the end of the alleged mass extermination program.

For example, at Buchenwald, of the 32,878 deaths among the detainees registered in the camp hospital, a solid 12,595 occurred in 1945, over a period of three months and a half, as compared to 20,283 in the preceding six years,[120] at Dachau, there were 27,839 deaths with 15,384 in the first five months of 1945 and 12,455 in the five years prior to that,[121] at Mauthausen, out of the 86,024 deaths registered, 36,043 took place between January and May 1945 and 49,981 during the preceding seven years,[122] and at Sachsenhausen, with 19,900 deaths, 4,821 of them occurred in the four months of 1945 and 15,079 during the five earlier years.[119]

If we follow the official line of thought, then the alleged order given by Himmler putting an end to the extermination of Jews was said to have been issued in October of 1944, as is well-known,[124] so that, in practice, the detainees started dying by the masses after the end of mass exterminations.

3.3. The Einsatzgruppen

Just as unfounded is the thesis of the authors that "the *Einsatzgruppen* prove the Holocaust happened" (p. 182). Actually, the shootings carried out by the *Einsatzgruppen* do not at all prove the existence of an extermination plan, nor are they denied as such by the revisionists.

[120] 1937 and 1940-1944. *Konzentrationslager Buchenwald. Bericht des internationalen Lagerkomitees Buchenwald*, Weimar undated, pp. 84f.
[121] G. Neuhäusler, *Wie war das im KZ Dachau?*, Karmel Heilig Blut Dachau, Munich 1981, p. 27.
[122] H. Maršàlek, op. cit. (note 116), pp. 156-158.
[123] www.fasspr.com/fsb/images/AlexGrobman.jpg
[124] *IMT* document PS-3762; *IMT*, vol. XXXII, p. 68.

With respect to the first point, the concomitant policy of the National Socialists with respect to the Jews in the West excludes that the *Einsatzgruppen* were following a general order to exterminate Jews as such. Christopher R. Browning, writing on the alleged order to exterminate all Russian Jews, has this to say concerning the matter:[125]

> *"However, Nazi policy towards the Jews was not immediately changed by it. One went on to talk about emigration, expulsion and plans for a future resettlement."*

Emigration of Western Jews was actually prohibited only on October 23, 1941,[126] and, as we shall see later, the Wannsee conference was convened for December 9, 1941,[127] precisely to inform the competent authorities of this fact and of its implications.

Let us move on to the second point. What revisionism objects to is

a) that the *Einsatzgruppen* had the order to exterminate the Jews because they were Jews, and
b) the number of those shot.

In a study of Treblinka, which I wrote together with Jürgen Graf, I have brought forward valid arguments in support of these two arguments.[128] For example, the "*Braune Mappe*" (June 1941) is explicit that *Sowjetjuden* (bolshevist Jews) were to be shot, but not the rest of the Jewish population, which was to be moved to ghettos. And the section "Directive for the treatment of the Jewish question" in this document opens with the following lines:[129]

> *"All measures concerning the Jewish question in the eastern territories will be handled on the basis that the Jewish question in general will be solved after the war for Europe as a whole*."

In the study mentioned above I have moreover expounded a number of points proving the unacceptability of the figures quoted in the *Einsatzgruppen* reports. For example, in the summary of the activity of *Einsatzgruppe A* (October 16, 1941, to January 31, 1942) the number of Jews present in Latvia at the arrival of the German troops is 70,000, but the number of Jews shot is reported as being 71,184! Furthermore, another 3,750 Jews were alive in work camps. In Lithuania, there were 153,743 Jews, of which 136,421 were allegedly shot, whereas 34,500 were taken to the ghettos at Kaunas, Wilna, and Schaulen, but the total of those two figures is 170,921 Jews!

[126] T-394 (document 1209 of the Israeli police)

[127] PS-709; NG-2586-F.

[128] C. Mattogno, J. Graf, *Treblinka*, op. cit. (note 94), chapter VII, pp. 203-231.

[129] "*Richtlinien für die Führung der Wirtschaft in den besetzten Ostgebieten*" (Grüne Mappe), Berlin, September 1942. EC-347. *Der Prozess gegen die Hauptkriegsverbrecher vor dem internationalen Militärgerichtshof* (*IMG*), Nuremberg 1948, vol. XXXVI, p. 348.

The 34,500 Jews in the ghettos – according to this report – were persons fit for work (all others having been shot), but according to the census carried out in May of 1942, there were 14,545 Jews in the Wilna ghetto; their names (complete with date of birth, profession, and address) have been published by the Jewish Museum at Vilnius. This source shows that out of the 14,545 Jews listed, some 3,693 (25.4% of the total) were children. Had they come back to life?

The activity and situation report no. 6 of the *Einsatzgruppen* for the period of October 1-31, 1941, mentions the shooting of 33,771 Jews at Kiev (Babi Yar) on September 29 and 30, but such a massacre never took place, and the story of its gigantic pyres is completely false. The only "proof" that the Soviets found on the site was a pair of worn-out shoes and some rags, which they diligently took pictures of, and in their Babi Yar album they claimed about them:[130]

> *"Remains of shoes and clothing of the Soviet citizens shot by the Germans at Babi Yar"!*

Let us not say anything about the ghost-like "Action 1005," which the authors talk about on p. 107, that is to say, the alleged unearthing and burning of the corpses from the mass graves under the direction of Paul Blobel. In spite of the enormous activity (to put it mildly) – 2,100,000 corpses unearthed from thousands of mass graves and burned in hundreds of places spread out across a territory of more than 1,200,000 square kilometers over thirteen months – there is neither documentary nor material evidence!

3.4. The Six Million

In the section "How many Jews died and how we know" (p. 174), the authors bring forward the hollow and deceptive argument of the six million:

> *"To challenge the deniers we can begin with a simple question: If six million Jews did not die, where did they all go?"* (pp. 174f.)

But whether or not six million Jews did in fact disappear, this is exactly what the fuss is all about.

With this in mind the authors mainly rely on the affidavit of Wilhelm Höttl of November 26, 1945, about which we have already spoken and in which Höttl stated that Eichmann had told him that the number of Jews killed "must have been greater than six million" (p. 175).

However, an assertion based on mere hearsay has no value among historians, and the authors know this. They therefore invoke the "confirmation" by German political scientist Wolfgang Benz, editor of a statistical study,[131] even

[130] This photo is reproduced in the appendix to my book *Olocausto: dilettanti nel web*, op. cit. (note 23).

[131] W. Benz (ed.), *Dimension des Völkermords. Die Zahl der jüdischen Opfer des Nationalsozialismus*, R. Oldenbourg Verlag, Munich 1991.

managing to make a mistake as far as the publisher is concerned (note 6 on p. 277).

Needless to say, the authors fail to mention the best revisionist study in the field of statistics, Walter N. Sanning's work, even though it first appeared in the United States![132]

In a comparison of the working methods used in the study edited by W. Benz and in Sanning's book, Germar Rudolf[133] has shown that out of the 6,277,441 Jewish victims that Benz arrives at, 533,193 are totally invented[134] inasmuch as they result from a double count, whereas for Sanning only 1,113,153[134] Jews have apparently disappeared. No less important is the fact that out of Benz' total of 6,277,441 victims, fewer than three million concern the alleged extermination camps – i.e. the Holocaust in the strict sense of the term – and Benz can attribute to the massacres of the *Einsatzgruppen* only part of the ca. 3.3 million remaining dead.[135]

Raul Hilberg, the most authoritative official historian, arrives at 5,100,000 Jewish victims, of whom only 2,700,000 are attributed to the alleged extermination camps.[136] In their own table on p. 128, the authors assign 3,062,000 victims to the "extermination camps," but neglect that – according to Franciszek Piper – the presently accepted figure for Auschwitz, 1,100,000 victims, actually contains some 100,000 non-Jews,[137] so that their effective total should be 2,962,000.

How reliable the official statistics and the historians who prepared them really are can be deduced from a statement by the authors:

> *"For example, they* [the "deniers"] *often cite the fact that Franciszek Piper, the head of the Department of Holocaust Studies at the Auschwitz-Birkenau State Museum, has refined the number killed at Auschwitz from four million to a little more than one million, arguing that this proves their case. But they fail to note that at the same time the numbers have been revised up – for example, the number of Jews murdered by the Einsatzgruppen during and after the invasion of the Soviet Union. The net result of the number of Jews killed – approximately six million – has not changed."* (p. XVI)

[134] Ibid., p. 203.

[135] Ibid., pp. 205f.

[136] R. Hilberg, *The Destruction of the European Jews*, Holmes & Meyer, New York 1985, p. 1219.

[137] F. Piper, *Die Zahl der Opfer von Auschwitz*, Verlag des Staatlichen Museums in Oświęcim, 1993, p. 202.

Let us look at the problem in terms of figures. Because four million out of the total of six were originally attributed to Auschwitz[138] and because those four million have later been reduced to one million, the remaining three million killed must be attributed to the *Einsatzgruppen* and so the total of six million "has not changed." That is a stupid lie.

In the book of W. Benz mentioned above there is a comparison of statistical data compiled by Wellers, by Reitlinger, by Hilberg, and from the *Holocaust Encyclopedia*.

For the Soviet Union (activity of the *Einsatzgruppen*) the book gives a minimum figure of 750,000 (G. Reitlinger) and a maximum number of 2,100,000 (Benz).[139]

It is, hence, true that starting in 1953, the number of victims attributed to the *Einsatzgruppen* has been "revised up," but only by 1,350,000 victims. So the question arises as to where the remainder of the invented victims at Auschwitz (3,000,000 – 1,350,000 = 1,650,000) should be moved. These 1,650,000 false victims ought to have been deducted from the total of six million, but by a stroke of cabbalist magic, the total "has not changed."

No less surprising is the fact that, from the same sources concerning the Soviet Union, some scholars such as Benz derive a total of 2,100,000 deaths, whereas others arrive at less than half that figure. Raul Hilberg, in fact, writes:[140]

> *"The adjusted deficit is therefore still 850,000 – 900,000, and from this number one must deduct at least five categories of victims that are not attributable to the Holocaust: (1) Jewish Red Army soldiers killed in battle, (2) Jewish prisoners of war who died in captivity unrecognized as Jews, (3) Jewish dead in Soviet corrective labor camps during 1939-1959, (4) civilian Jewish dead in the battle zone, particularly in the besieged cities of Leningrad and Odessa, and (5) deaths caused by privation among Jews who had fled or who had been evacuated for reasons other than fear of German anti-Jewish acts."*

Hilberg assumes that between 100,000 and 200,000 Jews fall into those five categories, which means that the number of victims of the Holocaust for the Soviet Union would be somewhere between 650,000 and 800,000, i.e. between 1,300,000 and 1,450,000 less than Benz' figure.

The causes of death considered by Hilberg, together with yet others (such as Jews who died as partisans, or an increase in natural mortality), also apply to western Jews, and in particular to those from Poland. The Korherr report states that for Germany, Austria, and Bohemia-Moravia alone, the Jewish

---

[138] Although it is true that Polish historiography never claimed that all four million Auschwitz victims were Jews, the witnesses, for instance H. Tauber, reported about four million people having been "gassed," und it is claimed that almost exclusively Jews have been gassed.

[139] W. Benz (ed.), op. cit. (note 131), p. 16.

[140] R. Hilberg, op. cit. (note 136), p. 1218.

population diminished by 82,776 on account of an increase in the mortality up to December 31, 1942.[141] What about the rest of Europe and the period up to 1945? One final observation as to the reliability of the official statistics: How was the category of Jewish survivors arrived at after the Second World War?

In France, a survivor was defined as a person who registered with the Ministry for Veterans before the end of 1945.[142] In Poland, the list of survivors was established on June 15, 1945,[143] and it is clear that in order to be registered, those persons also had to sign in with some official agency. A similar practice applied throughout the whole of Europe.

But how many survivors preferred not to go back to their native country? And how many preferred not to declare that they were alive and Jewish at all? And how can we be sure that the first statistics and later census data were not manipulated?

The figures are, therefore, not as easy to arrive at as the authors would have us believe. And as they themselves admit, figures are irrelevant to the question of whether or not the Holocaust ever took place.

Therefore, let us move on to other "converging proofs."

3.5. The Wannsee Protocol

The authors cite the so-called Wannsee Protocol as "further evidence that Hitler ordered the Final Solution" (p. 216). In their self-proclaimed demonstration for this topic the authors employ the whole arsenal of those pseudo-historical tricks, for which they have always blamed the revisionist historians.

They summarize, first of all, the four parts, into which the document[144] is divided. The first section lists the officials who participated in the meeting. The second part is a run-down of the activities to date in the area of "the final solution of the Jewish question in Europe." For this part, the authors furnish a most tendentious summary, putting the stress on "forcing Jews out" of the German living space, but in a mafia-like kind of omission they say nothing about the type and scope of such actions. I quote from the protocol:[145]

> *"In pursuance of these endeavors, an accelerated emigration of the Jews from the territory of the Reich was seen as the only temporary solution and was accordingly embarked upon in an intensified and systematic manner.*

[144] NG-2586-G. Photocopy of the original in: R.M. Kempner, *Eichmann und Komplizen*, Europa Verlag, Zürich 1961, pp. 133-147.

[145] Ibid., p. 3 of the original.

On instruction of the Reich Marshal [i.e. Göring]*, a Reich Central Office for Jewish Emigration was established in January 1939; its direction was entrusted to the Head of the Security Police and the Security Service (SD). Its particular tasks were:*

a) to take measures for the preparation of increased Jewish emigration,

b) to direct the flow of emigration,

c) to speed up the emigration process in individual cases.

The aim of this task was to purge German living space of Jews by legal means."

The document goes on to say that as a consequence of this policy, in spite of difficulties, roughly 537,000 Jews were compelled to emigrate between January 30, 1933, and October 31, 1941. Of these,

– ca. 360,000 left the *Altreich* (Germany with its 1937 borders) after January 30, 1933.
– ca. 147,000 left the *Ostmark* (Austria) after March 15, 1938,
– ca. 30,000 left the Protectorate of Bohemia and Moravia (Czechia) after March 15, 1939.[146]

As these data are in total contradiction with Hitler's alleged homicidal intentions towards the Jews and with the preconceived theses of the authors, they simply keep quiet about them!

What the authors write with respect to the third part of the document is a real masterwork of scientific disfiguration:

"In part III we glimpse a smoking gun. Eichmann announces that a new plan has been devised: 'Another possible solution of the problem has now taken the place of emigration, i.e., the evacuation of the Jews to the East.' Evacuation is a not-so-veiled code for sending them to their death in the eastern camps. Why make this assumption? Eichmann had just described the first two attempts at solving the Jewish question, both of which he said were inadequate, followed by 'another solution.'" (p. 219f.)

For the authors, the new solution is imbedded in the well-known passage of the document, which speaks of the deportation of Jews to the east and which end in the following way:

"The remnant that eventually remains will require suitable treatment; because it will without doubt represent the most resistant part, it consists of a natural selection that could, on its release, become the germ-cell of a new Jewish revival. (Witness the experience of history)." (p. 220)

The authors comment:

"The 'evacuation of the Jews' Eichmann describes cannot mean simple deportation to live elsewhere, since the Nazis had already been deporting Jews to the east, and Eichmann indicates this was inadequate. Instead, he outlines a new solution. Shipment to the east will mean, for those who can

[146] Ibid., p. 4 of the original.

work, work until death, and (as we know from other sources) for those who cannot work, immediate death. What about those who can work and do not succumb to death? 'The remnant that eventually remains will require suitable treatment'. Suitable treatment can only mean murder." (pp. 220f.)

The entire argument is built upon a vulgar trick of interpretation. With reference to the tasks of the central agencies of the Reich in charge of Jewish emigration, the document says:[146]

"The aim of this task was to purge German living space of Jews by legal means. The disadvantages of such expediting emigration methods were evident to all agencies concerned."

The document, therefore, does not speak of "the first two attempts at solving the Jewish question" – it refers only to emigration into other countries – nor does it call both attempts "inadequate," but says merely that emigrations presented "disadvantages" and that various factors, especially financial ones, rendered emigration difficult.[146]

Then, in a flagrant distortion, the authors declare that "the Nazis had already been deporting Jews to the east, and Eichmann indicates this was inadequate," thereby transforming the emigration to other countries into "the evacuation of the Jews to the east" and grafting on to this alleged deportation the false description of being "inadequate"!

The "assumption" that "evacuation is a not-so-veiled code" is an arbitrary and unfounded assertion refuted by the documents, starting with the memo[147] written by the head of the Germany department in the German Foreign Office, dated August 21, 1942, which the authors obviously do not even mention, and by numerous Jewish transports from the Old Reich, Austria, the Protectorate, and Slovakia, which went to Lublin from March 1942 onwards.[148]

The claim that "evacuation" stood for sending the Jews to their death "in the eastern camps" (i.e. Belzec, Sobibor, and Treblinka) is moreover absurd, because at the moment of the conference none of those camps existed yet.

What should one think of the expression "suitable treatment"? In this case, too, the authors can only claim that this stands for assassination by deforming the sense of the text: If those who are left over after "natural reduction" were to be released, "they would turn into a germ cell of renewed Jewish revival" – thus, they must not be released.

The interpretation by the authors rests instead on the assumption that the expression "in case of release" should be read as "in case they are allowed to live," and this is precisely where they try to lead the reader by the nose.

Finally, let us look at a few other serious points the authors have astutely left out in their effort to obscure the meaning of the document and to distort it at will.

---

[147] Cf. C. Mattogno, J. Graf, *Treblinka*, op. cit. (note 94), chapter VI, "National-Socialist Policy of Jewish Emigration," pp. 179-201.

[148] Ibid., pp. 242-245.

I have already drawn the readers' attention to the policy of Jewish emigration and to the 537,000 Jews who *did* emigrate from the territories under German jurisdiction between 1933 and October 1939. I will now discuss three more such aspects.

The aim of the meeting was to inform the authorities involved about the end of the emigration policy directed towards third countries and about the beginning of deportations to the east:[149]

> *"In the meantime, the Reichsführer-SS and Head of the German Police* [i.e. Himmler] *has forbidden any further emigration of Jews in view of the dangers posed by emigration in wartime and the looming possibilities in the East. As a further possible solution, and with the appropriate prior authorization by the Führer, emigration has now been replaced by evacuation to the East. This operation should be regarded only as a provisional option, though in view of the coming final solution of the Jewish question it is already supplying practical experience of vital importance"*

Upon the Führer's orders, then, Jewish emigration was supplanted by their evacuation to the occupied eastern territories but *only as a provisional option*, and it is clear that a physical extermination cannot reasonably be interpreted as a provisional option. That is why the authors have conveniently chosen not to mention this passage.

Let us move on to their second omission:[150]

> *"The evacuated Jews will first be taken, group after group, to so-called transit ghettos from where they will be transported further to the East."*

If the deportation of the Jews stood for their liquidation "in the eastern camps," then what where the transit ghettos? Another "codeword"? I will come back to this question at the end of this section.

The third omission concerns a passage, which flies right in the face of the "assumption" the authors have made. If this assumption were true, the first victims of the "evacuations" would have been those unfit for work, in particular the aged. But this is what the document actually says in this respect:[151]

> *"The intention is not to evacuate Jews over the age of 65 but to send them to an old people's ghetto; Theresienstadt has been earmarked for this purpose."*

Thus we have here an excellent example of the trickery and the deliberate omissions practiced by the authors and aimed at distorting the meaning of a document and deceive their readers!

Before we conclude, let us address those transit ghettos. On pp. 204f., the authors produce the English translation of a letter written by Himmler to *Gauleiter* Arthur Greiser of September 18, 1941. The document states explicitly

---

[149] NG-2586-G, p. 5 of the original.

[150] Ibid., p. 8 of the original.

[151] Ibid.: "*Es ist beabsichtig, Juden im Alter von über 65 Jahren nicht zu evakuieren, sondern sie einem Altersghetto – vorgesehen ist Theresienstadt – zu überstellen.*"

that in order to follow Hitler's wishes, Himmler was implementing the deportation of the Jews from the old Reich and the Protectorate into those eastern areas (*Ostgebiete*), which had been occupied by the Germans two years earlier, as a first step (*als erste Stufe*) and, if possible, during 1941. In the following spring they were to be moved still further east (*noch weiter nach Osten abzuschieben*).

Himmler intended to deport 60,000 Jews from the old Reich and the Protectorate to the Lodz ghetto "for the winter" (*für den Winter*) while waiting, precisely, to deport them even further to the east in the spring of the following year (p. 264),[152] because Lodz was to be used as a transit ghetto. This demonstrates that the transit ghettos of the Wannsee protocol were, purely and simply, transit ghettos.

Thus we have here a document – one of many – describing unmistakably the deportation of Jews to the east as a true deportation without any homicidal intentions (in September of 1941 the alleged extermination camps in the east did not yet exist). But for the authors this becomes an allegedly converging "proof" of Hitler's decision to go ahead with the mass extermination of the European Jews. And this in spite of the fact that the authors are absolutely aware of the absurd nature of their conjecture:

> *"Witte* [153] *concludes: 'This terminology already represents the virtual death sentence for those Jews due for deportation, irrespective of the fact that at this point there were no extermination camps ready."* (p. 205)

Such a conclusion is an insult to the science of history and to the "accepted rules of reason."

3.6. "Ausrottung" and "Vernichtung"

As "convergent proofs" of the reality of the Holocaust the authors go on to produce the usual array of quotations from major NS officials, in which the evidence is said to be the use of terms like "*vernichten*" or "*Vernichtung*" (annihilate or annihilation) and "*ausrotten*" or "*Ausrottung*" (exterminate or extermination).

The authors devote a particular section ("The *Ausrotten* of the Jews," p. 205) to an attempt at proving that these terms, which were part of the violent NS rhetoric, did in fact mean physical extermination.

As is well known, the official historiography's traditional starting point of such fallacious interpretations is an extrapolation of Hitler's so-called "prophecy" in his speech of January 30, 1939:[154]

---

[152] For the text of the document and its historical setting cf.: C. Mattogno, J. Graf, *Treblinka*, op. cit. (note 94), pp. 194-196.

[153] German Historian Peter Witte as quoted by Shermer and Grobman.

[154] Max Domarus, *Hitler Reden und Proklamationen 1932-1945*, R. Löwit, Wiesbaden 1973, vol II, second part, p. 1058: "*sondern die Vernichtung der jüdischen Rasse in Europa.*"

"I shall again make myself a prophet today: If the international Jewish financiers, inside or outside of Europe, were to be able to push the peoples once more into a world war, the result will not be the bolshevization of the Earth and, hence, the victory of Judaism, but the annihilation of the Jewish race in Europe."

No one among those brave extrapolators ever quotes the lines that follow and that clearly explain the terms of this threat:[154]

"[…] *for the time in which the non-Jewish peoples were defenseless in the face of propaganda is coming to an end. National Socialist Germany and fascist Italy possess the institutions which will allow, if necessary, to explain to the world the essence of a question, of which many people are instinctively aware, but which is still unclear to them in scientific terms."*

Thus, the "annihilation of the Jewish race in Europe" consisted simply in showing the other peoples those German and fascist institutions, which spread the "scientific knowledge" about the "Jewish question."

In his speech of January 30, 1941, Hitler said:[155]

"I will not forget the indication I have given once before to the German Reichstag, on 1st September 1939 [actually on January 30, 1939]. *The indication that if the rest of the world were to be precipitated by Judaism into a general war, entire Judaism will have finished the role they have been playing in Europe."*

Thus, if the Jews were no longer able to play their role in Europe, the "*Vernichtung*" announced in 1939 was nothing but a political "annihilation."

This interpretation is confirmed by Hitler's words used in his speech at the Berlin *Sportpalast* of January 30, 1942:[156]

"We realize that this war can only end like this: either the Aryan peoples will be exterminated (ausgerottet werden) *or Judaism will vanish from Europe* (das Judentum aus Europa verschwindet). *On September 1, 1939* [actually, on 30 January 1939], *I have told the German Reichstag once before – and I shy away from risky prophecies – that this war will not end the way the Jews think, that is with the Aryan peoples of Europe being exterminated* (ausgerottet werden), *but that the result of this war will be the annihilation of Judaism* (die Vernichtung des Judentums). […] *And the day will come when the worst enemy of mankind will have finished his role, perhaps at least for a thousand years."*

Does this mean that Hitler literally believed the "Aryan peoples" would be *physically annihilated* in case the war was lost?

This quotation confirms, moreover, that the "*Vernichtung*" of the Jewish race in Europe in the speech of January 30, 1939, was not physical extermination, because here the text speaks of a Judaism that vanishes "from Europe" in

[155] Ibid., p. 1663: "*das gesamte Judentum seine Rolle in Europa ausgespielt haben wird!"*
[156] Ibid., p. 1828f.

case of victory. This, together with the end of the political role of the Jews in Europe, can only be explained by the plans to deport the Jews into the occupied eastern territories, which were considered to be extra-European.

On February 24, 1942, Hitler comes back to this argument. After having asserted that the "plot" (*Verschwörung*) of the plutocrats and the Kremlin was aimed at one and the same objective – "the extermination (*die Ausrottung*) of the Aryan peoples and races," Hitler says:[157]

> *"Today, the ideas of our National Socialist revolution and those of fascism have conquered large and powerful states, and my prophecy will be fulfilled that this war will not bring about the annihilation of Aryan mankind – it is the Jew who will be exterminated."*

In his notes, Henry Picker writes for July 21, 1942:[158]

> *"*[…] *because – Hitler envisioning to have thrown the Jews out of Europe down to the last man at the end of the present war – the communist danger from the east would then have been exterminated with root and branch."*

This figurative meaning of the verb "*ausrotten*" and of the associated noun appears also in the speech of September 30, 1942, in which Hitler said:[159]

> *"On September 1, 1939* [actually, on January 30, 1939]*, I said two things during the session of the Reichstag. First of all* […] *and, secondly, if Judaism were to provoke an international world war for the extermination* (zur Ausrottung) *of the Aryan peoples of Europe, not these Aryan peoples of Europe would be exterminated* (ausgerottet werden) *but Judaism."*

In his speech on November 8, 1942, Hitler paraphrased his "prophecy" of January 30, 1939, in the following manner:[160]

> *"You will remember the Reichstag session in which I declared: If Judaism has the illusion of being able to provoke an international world war with the aim of the extermination* (zur Ausrottung) *of the European races, the result will be not the extermination* (die Ausrottung) *of the European races, but the extermination* (die Ausrottung) *of Judaism in Europe!"*

Hitler went on again to explain the meaning of this "*Ausrottung*": the awareness of the Jewish peril by the European peoples and the introduction, in those nations, of an anti-Jewish legislation modeled on the German one:[160]

> *"In Europe, this danger has been recognized and the nations are adhering one by one to our legislation."*

Picker, *Hitlers Tischgespräche im Führerhauptquartier*, Wilhelm Goldmann Verlag, Munich 1981, p. 449: *"Denn – da er* [Hitler] *mit Beendigung dieses Krieges auch den letzten Juden aus Europa hinausgeworfen haben werde – wäre dann die kommunistische Gefahr aus dem Osten mit Stumpf und Stiel ausgerottet."*

[159] Max Domarus, op. cit. (note 154), p. 1920.

[160] Ibid., p. 1937.

Finally, in his speech of February 24, 1943, Hitler declared:[161]

"This fight, therefore, will not end – as it is intended – with the annihilation (mit der Vernichtung) *of the Aryan* [part of] *mankind but with the extermination* (mit der Ausrottung) *of Judaism in Europe."*

Here we even have the perfect equivalence of the terms "*Vernichtung*" and "*Ausrottung*" with both being applied to the European peoples.

To summarize: Either Hitler believed in a physical extermination not only of the German but of all European peoples (!) in the event of a German defeat – a decidedly grotesque assumption – or else he was using the terms "*Vernichtung*" and "*Ausrottung*" in the figurative sense *also* when applied to Jewry, which is patently obvious when we look at the various quotations and their context.

And that this is indeed the correct interpretation – if we still need a further confirmation – is stated explicitly by a historian above suspicion, Joseph Billig, former researcher at the Paris Center for Contemporary Jewish Documentation:[162]

"The term 'Vernichtung' (annihilation, destruction) referred to the absolutely negative attitude towards a Jewish presence in the Reich. Being absolute, this attitude embraced the readiness, if necessary, to go to extreme ends. The term in question did not mean that one had already reached the stage of an extermination nor did it signify that there was a deliberate intention to arrive there.

A few days before the speech quoted [the speech of January 30, 1939], *Hitler received the Foreign Minister of Czechoslovakia. He reproached his guest for the lack of energy on the part of the Prague government in its efforts to reach an understanding with the Reich and recommended to him, in particular, energetic measures against the Jews.*

In this regard, he declared for example: 'Over here, they are being annihilated' (bei uns werden sie vernichtet). Are we to believe that, during a diplomatic conversation, which would be recorded in the archives of the Ministry of Foreign Affairs, Hitler would have confidentially alluded to a massacre in the Third Reich – which, moreover, would have been incorrect for that moment in time?

Two years later, on January 30, 1941, Hitler returned to his 'prophecy' of 1939. But this time, he explained the meaning as follows: '... and I do not wish to forget the indication I have given once before in the Reichstag, namely that if the rest of the world (die andere Welt) is driven into a war, Judaism will have completely ended its role in Europe…'

[161] Ibid., p. 1992.
[162] Joseph Billig, *La solution finale de la question juive*, Klarsfeld, Paris 1977, p. 51.

In his conversation with the Czechoslovak minister, Hitler mentioned England and the United States which, in his opinion, would be in a position to offer regions suitable for Jewish settlers.

In January of 1941 he stated that the role of the Jews in Europe would come to an end and added that this would come about because the other European peoples would understand this need for their own countries. At that time, one believed in the creation of a Jewish reserve. But for Hitler such a reserve was acceptable only outside of Europe. [Thus] *we have just noted that, on January 30, 1941, Hitler did nothing but announce the liquidation of the role of the Jews in Europe."*

3.7. Extrapolated Quotations

Having set up a historical and contextual frame, let us now move on to quotations that the authors have extrapolated.

3.7.1. Hans Frank

"Hans Frank proves the Holocaust happened" (p. 186)

The authors quote a speech by H. Frank given on October 7, 1940, in which the following sentence appears:

"I could not eliminate (ausrotten) *all lice and Jews in only one year."* (p. 186)

Actually, the speech was given on December 20, 1940, the term "*ausrotten*" has been invented by the authors (the German text has "*hinaustreiben*" = to drive out), and the reference of the document (I have already mentioned this) is wrong (it is PS-2233 and not PS-3363).[163] Hence, we have one falsification and two errors in one swoop!

The speech, to which the authors assign the date of December 13, 1941, was actually given on December 16. This speech also contained the passage quoted by them later, and for which they publish the German text (note 30 on p. 278):[164]

"Currently there are in the Government General [occupied Poland] *approximately 2 ½ million, and together with those who are kith and kin and connected in all kinds of ways, we now have 3 ½ million Jews. We cannot shoot these 3 ½ million Jews, nor can we poison them, yet we will have to take measures which will somehow lead to the goal of annihilation, and that will be done in connection with the great measures which are to be discussed together with the Reich.*[165] *The territory of the General Government must be made free of Jews, as is the case in the Reich. Where and how this will happen is a matter of the means which must be used and*

[163] *IMG*, op. cit. (note 129), vol. XXIX, pp. 415f.
[164] Ibid., p. 503.
[165] Recte: "from the Reich" ("*vom Reich her*").

created, and about whose effectiveness I will inform you in due time." (pp. 186f.)

The authors comment:

"If the Final Solution meant only deportation out of the Reich, why does Frank refer to attaining 'the goal of annihilation' of Jews through means other than shooting or poisoning? The phrase 'die irgendwie zu einem Vernichtungserfolg führen' underlines the murderous intent." (p. 187)

Even if this interpretation were correct – which it is not – the passage demonstrates only "homicidal *intentions*," whereas the authors invoke it as proof of the fact that the Holocaust *happened*! This means that from alleged intentions they deduce the reality of a *fact*!

But this interpretation is unfounded. The quotation actually fits in with the policy of deportations of Jews followed by the National Socialist regime. It must be considered in the light of other statements, which the authors obviously prefer to keep silent about, in order to reveal its real significance.

In Frank's *Dienst-Tagebuch* (official diary) we have on July 17, 1941, the following entry:[166]

"The Governor General no longer wishes any further creation of ghettos, because, in keeping with an explicit statement by the Führer on 19 June [1941]*, the Jews will in a not too distant future be moved out of the Government General, and the Government General is to be nothing but a transit camp, so to speak."*

On October 13, 1941, H. Frank and *Reichsminister* Rosenberg had a meeting, in which they touched upon the deportation of Jews from the Government General:[167]

"The Governor General then spoke of the possibility of the expulsion of the Jewish population from the Government General into the occupied territories. Reichsminister Rosenberg remarked that such aspects had already been brought to his attention by the Paris military administration.[168]

At the moment, though, he did not see any possibility for the implementation of such transfer plans. However, for the future, he was ready to favor Jewish emigration to the east, all the more so as it was already in-

---

[167] Jüdisches Historisches Institut Warschau (ed.), *Faschismus – Getto – Massenmord*, Röderberg-Verlag, Frankfurt/Main 1960, p. 252.

[168] A clear reference to the proposal made by *SS-Sturmbannführer* Carltheo Zeitschel on August 22, 1941 – later approved by the *Führer* – to resolve the "Jewish question" by deporting the Jews under German jurisdiction to the eastern occupied territories (Centre de Documentation Juive Contemporaine, V-15). Cf. C. Mattogno, J. Graf, *Treblinka*, op. cit. (note 94), pp. 184f.

tended to send to those sparsely settled eastern territories especially the asocial elements existing within the territory of the Reich."

On the other hand, if we follow the passage quoted by the authors, the Government General was to become "free of Jews" (*judenfrei*) "as is the case in the Reich" (*wie es das Reich ist*), but the greater Reich – as we have seen – had only become "*judenfrei*" (to some extent) through the emigration (*Auswanderung*) of some 537,000 Jews to other countries. It is therefore clear that Hans Frank did nothing but emulate Hitler's "annihilation" rhetoric with the same meaning.

3.7.2. Joseph Goebbels

"Joseph Goebbels proves the Holocaust happened" (p. 187)

The authors come up with two quotations, by which they intend to demonstrate that "the Holocaust happened" on the meager basis of the use of the term "*Vernichtung.*"

The first quotation is taken from a note dated August 19, 1941, in which Goebbels, referring to Hitler's "prophecy" of January 30, 1939, says that "should Jewry succeed in again provoking a new war, this would end with their annihilation (*Vernichtung*)" (p. 187).[169]

We have already seen that the authors' interpretation is groundless, being based, as it is, on some sort of superstition associated with that word, independent of context. The most significant example of this kind of treatment is presented by them on p. 214, where they deal with Albert Speer, who had written a three page statement on Richard Harwood's brochure *Did Six Million Really Die?*.[170] For the English translation, he added a *written explanation* that he actually meant "looking away" when using the word "*Billigung*" (approval), rather than any "knowledge of an order or its execution." But Shermer and Grobman claim to know better what Speer intended to say, because they write:

"Yet, according to our German-English dictionary, Billigung actually means approval […]*"*

This surely is a case of "Dictionary *über alles*"! Obviously, this superstitious, blind believe in dictionaries merely serves to distract from the actual meaning of these extrapolated quotations and, of course, the authors glossing over any proofs opposing their interpretation in order to bolster their deception.

---

[169] M. Broszat, op. cit. (note 166), p 749f.: *"Der Führer ist der Überzeugung, daß seine damalige Prophezeiung im Reichstag, daß, wenn es dem Judentum gelänge, noch einmal einen Krieg zu provozieren, er mit der Vernichtung der Juden enden würde, sich bestätigt."*

[170] Richard Harwood, *Did Six Million Really Die?*, Historical Review Press, Richmond, Surrey, 1974.

Let us return to Goebbels, though. On August 20, 1941, after a visit to Hitler's HQ, Goebbels noted in his diary:[171]

> *"Moreover, the Führer has promised me that he can expel the Berlin Jews to the east as soon as the war in the east is over."*

And on September 24, 1941, Goebbels had a talk with Heydrich at Hitler's HQ. The next day he wrote in his diary: the Jews in the east[172]

> *"are all to be moved, finally, into the camps built by the Bolsheviks."*

These considerations also apply to a note by Goebbels – which the authors assign to February 24, 1942, but which is actually dated February 14 – purportedly saying that the Jews "shall experience their own annihilation together with the destruction of our enemies" (p. 187).

Here the authors use a sleight of hand in the translation. The original text says: "*Sie werden mit der Vernichtung unserer Feinde auch ihre eigene Vernichtung erleben*,"[173] i.e. "together with the annihilation of our enemies they shall experience their own annihilation." It is clear that the "annihilation of our enemies" did not necessarily imply the total physical extermination of the enemies. The authors have understood this full well, so much so, in fact, that they have translated the term "*Vernichtung*" by "annihilation," when applied to the Jews, but by "destruction" when applied to the enemies.

The reference to Goebbels speech of September 23, 1942, is another proof of the authors' use of dubious and unverified sources, quite at variance with their methodic rules on the acceptability and the verification of sources. Actually, the speech in question had been

> *"transcribed and passed along by the Polish resistance to the British Foreign Office in May 1943."* (p. 188)

David Irving has identified "the actual Polish origins of it, and the people who have provided it, the Polish Intelligence Service" (p. 189) but still, according to the authors, "that does not invalidate the gist of the speech"! (p. 189).

Because the expression "physical extermination" appears in that speech, the authors – for their personal and political reasons – have decided to close their eyes to criticism and rational thought:

- there is no proof that the speech was ever given,
- there is no proof that, if the speech was indeed given, Goebbels used that expression,
- there is no certainty that, if the speech was given and Goebbels did speak of the Jews, the English rendition of the Polish translation of the words attributed to Goebbels actually corresponds to what he said.

But still, for the authors, "that does not invalidate the gist of the speech"!

---

[171] M. Broszat, op. cit. (note 166), p. 750.
[172] Ibid., p. 751.
[173] Ibid., p. 758.

As I have demonstrated above, they themselves have falsified a quotation of Hans Frank by substituting the term "*ausrotten*" (annihilate) for "*hinaustreiben*" (drive out), but obviously such an underhanded act "does not invalidate the gist of the speech."

We then have the well-known quotation from Goebbels' notes of March 27, 1942:

> *"Beginning with Lublin the Jews are now being deported eastward from the Government-General. The procedure is pretty barbaric, and one that beggars description, and there's not much left of the Jews. Broadly speaking one can probably say that sixty percent of them will have to be liquidated, while only forty percent can be put to work."* (p. 190)

The authors comment:

> *"On March 7, 1942, Goebbels noted in his diary that there were still eleven million Jews in Europe. If, as he notes twenty days later, sixty percent of these 'will have to be liquidated,' we have a close approximation of the six million figure, from just about as high a leader in the Nazi regime as can be found."* (p. 190)

To start at the beginning: It is true that in his note of March 7, Goebbels referred to eleven million Jews, but the authors are careful not to say in what context. Actually, the note says:[174]

> *"The Jewish question will now have to be solved within the framework of all of Europe. In Europe, there are still 11 million Jews. They must, first of all, be concentrated in the east. At a given time, after the war, an island will have to be assigned to them, maybe Madagascar. Anyway, there will not be peace in Europe as long as the Jews are not completely excluded (ausgeschaltet) from the European territory* […]*"*

We notice immediately that the concentration of the eleven million Jews in the east did not, in fact, imply their extermination, given that after the war they were to be assigned an island.

Secondly, the figure of eleven million has been taken from the table of statistics that appears on p. 6 of the Wannsee Protocol. Hence, Goebbels was quite aware of the onset of the new policy of deporting the Jews to the east, which Heydrich had announced during that meeting.

With this said, let us take a closer look at the note of March 27, 1942. It refers, no doubt, to this policy of deportations to the east, but Goebbels' statement about the 60% liquidation rate not only has no documentary parallel, it is actually refuted by the facts, as we will see further below.

Secondly, the deportations of Polish Jews to the eastern limits of the Lublin district had already started in early January 1942.[175] One of the first reports

---

[174] R. Manvell, H. Fraenkel, *Goebbels, eine Biographie*, Verlag Kiepenheuer & Witsch, Köln/Berlin 1960, p. 256.

[175] Cf. C. Mattogno, J. Graf, *Treblinka*, op. cit. (note 94), pp. 233-245.

dates from January 6, 1942, and refers to the "transfer (*Aussiedlung*) of 2,000 Jews from Mielec." The text says:[176]

> *"1,000 Jews arrive in the region of Hrubieszow, final destination* (Zielstation Hrubieszow)*. 1,000 Jews arrive in the region of Cholm, of whom 400 have final destination Wlodawa, 600 final destination Parczew. Ready for reception by January 15, 1942."*

A later report on this transfer informs the local authorities:[177]

> *"I ask you to make absolutely sure that the Jews* [arriving] *at the final destination are received and properly directed as established by you, and that we will not again have the problems encountered in other cases where the Jews arrive at the final destination without supervision and then scatter throughout the territory."*

The directives of the governmental office in charge of transfers, sent to the local authorities as an attachment from the district administrative supervisor Weihrauch, specify:[178]

> *"The Office of the District of Lublin, Department of Internal Administration and Department for Population and Welfare, is responsible to me with respect to the Jews being transferred receiving, to the extent possible, proper housing.*
>
> *The Jews to be transferred are to be allowed to carry bed sheets and blankets. They can, furthermore, carry 25 kg of other luggage and household goods. After arrival in their new settlement areas they must undergo medical observation for three weeks. Any case of disease suspected of being typhus must be immediately reported to the competent district medical officer."*

On March 22, a transfer of Jews was carried out from Bilgoraj to Tarnogrod, a village some 20 km to the south of this town. The corresponding report states:[179]

> *"An evacuation of 57 Jewish families with a total of 221 persons implemented from Bilgoraj to Tarnogrod. Each family was assigned a vehicle for the transport of movable goods and beds. Control and supervision were assured by the Polish police and by the special service command. Action proceeded as planned without incidents. Those evacuated were housed at Tarnogrod the same day."*

And that is taken to be as a "pretty barbaric" procedure?

As far as the split-up of the evacuees into 40% fit for work and 60% "to be liquidated" ("*liquidiert werden müssen*") is concerned, this is at variance both with the theses of the official historiography in respect to the "eastern exter-

[176] Dr. Józef Kermisz, *Dokumenty i materiały do dziejów okupacij niemieckiej w Polsce*, vol. II, "Akcje" i "Wysiedlenia," Warszawa-Łódź-Kraków, 1946, p. 10.
[177] Ibid., p. 11.
[178] Ibid., p. 15.
[179] Ibid., p. 46.

mination camps," in which a total extermination of Jews – including those fit for work[180] – is said to have been carried out, and with the German projects for Belzec of March 1942.

On March 17, 1942, Fritz Reuters, an employee of *Abteilung Bevölkerungswesen und Fürsorge* (Department for Population and Welfare) with the governor of the district of Lublin, wrote a memo, in which he described a meeting he had had the day before with *SS-Hauptsturmführer* Höfle, who was in charge of the transfer of Jews for the district of Lublin. On the subject of Belzec, the document says:[181]

> *"Finally, he declared that he could receive 4 – 5 daily transports of 1,000 Jews with final destination Belzec. These Jews will be moved beyond the border and will not return to the Government General."*

This document shows:

1. The Jews were to be split into those fit for work and those unfit.
2. Those fit were to be used for work.
3. Belzec was to be a sorting camp for the Jews fit for work "with a file denoting their professions." This project is obviously irreconcilable with the thesis that it was a camp for *total* extermination.
4. The Jews unfit for work would all be sent to Belzec. The camp is said to have been able to "receive 4 – 5 daily transports of 1,000 Jews," obviously unfit for work who would be sent on "beyond the border" and would not return to the Government General. Because of this, Belzec was named "final border station for the Zamosc region." This makes sense only in the context of a cross-border transfer.[182]

Therefore, the "liquidation" of 60% of the Jews evacuated stood for their removal into the eastern territories. In the Goebbels note, "liquidation" thus has the same meaning as Hitler's "*Vernichtung*" and "*Ausrottung*."

3.7.3. Heinrich Himmler

> *"Heinrich Himmler proves the Holocaust happened."* (p. 190)

This alleged "demonstration" consists of three quotations. The first one dates from January 1937. Himmler spoke of "Roman emperors who exterminated [*ausrotteten*] the first Christians." From this, the authors conclude that "*ausrotten* meant murder" (p. 191) and therefore, whenever Himmler spoke of "*Ausrottung*" it should be taken to mean assassination. We have here another fine example of the superstition attached to a word removed from its context!

The second quotation is – now hold your breath! – Himmler's alleged speech in his meeting with Rudolf Höss. Both the meeting itself and the con-

[180] With the exception of a few thousand Jews "selected" for the operation of the camps themselves.

[181] Ibid., pp. 32f.

[182] In this respect cf. my study *Bełżec in Propaganda, Testimonies, Archeological Research, and History*, Theses & Dissertations Press, Chicago 2004.

tents of that speech are based solely on assertions by the erstwhile Auschwitz commander!

The reference is to this most dubious document, in which Höss (or the British captors who tortured him) claimed that Himmler had declared in summer of 1941 (!) that the alleged "extermination camps in the east" already existed:[183]

> *"The extermination centers that presently exist in the east are in no position at all to cope with the great actions being planned."*

Needless to say, the authors are careful not to quote this passage, which by itself renders Höss' entire little tale absolutely worthless.

The third quote is that infamous sentence from the Posen speech, in which the term "*Judenevakuierung*" (evacuation of Jews) is made the synonym of "*Ausrottung*" in a section entitled "*Die Judenevakuierung*" (the evacuation of Jews):[184]

> *"I am now talking of the evacuation of the Jews, of the extermination of the Jewish people."*

And because Himmler had used the verb "*ausrotten*" in the sense of "assassinate" in January of 1937, it follows that in October of 1943 "*Ausrottung*" necessarily meant "assassination"!

Of course none of those self-styled specialists of historiographical method has ever asked themselves, if, by any chance, it might not be just the other way around, with "*Ausrottung*" standing for "*Evakuierung*." Actually, in Hitler's speeches examined above the "*Vernichtung*" or "*Ausrottung*" of the Jewish people was merely its political extermination by means of deportation or *evacuation* to eastern non-European areas.

As far as the reference to 100, 500, or 1000 corpses is concerned – "most of you will know what it means when 100 corpses are lying together, when 500 are lying there or when 1000 are lying there" – these figures have little to do with the alleged policy of physical extermination because the alleged extermination camps in the east allegedly produced several thousands of corpses every day.

Himmler's figures, on the other hand, fit in very well with German repressive activities such as those during the Warsaw ghetto uprising, in which some 7,500 Jews were killed. Officially, the Jews of the Warsaw ghetto were scheduled for a "*Judenevakuierung*" to the eastern territories.[185]

---

[183] M. Broszat (ed.), op. cit. (note 57), p. 157.

[184] PS-1919. *IMG*, op. cit. (note 129), vol. XXIX, p. 145. On p. 192, the authors present the original text: "*Ich meine jetzt die Judenevakuierung, die Ausrottung des jüdischen Volkes*"

[185] C. Mattogno, J. Graf, *Treblinka*, op. cit. (note 94), chapter IX, pp. 275-299. According to the Stroop report, 7,564 Jewish fighters were killed on the spot in the uprising of the Warsaw ghetto (April 1943). Ibid., pp. 283f.

Germar Rudolf had suggested another quite plausible interpretation of this passage.[186] According to this, this passage refers to those Germans with their "decent Jews," who did not understand the hard measures against the Jews, because they have never seen hundreds or thousands of corpses. Himmler said:

> *"All those who speak that way have never watched, have never faced it out."*

But no *Jewish* corpses can be meant by this, because if those Germans with their "great Jews" had seen hundreds of Jewish corpses, they would have understood the harsh anti-Jewish measures even less, or they may even have revolted against them. But Himmler's audience consisting of soldiers – all of them high-ranking soldiers of the SS, Waffen-SS, and Wehrmacht – understood such harsh anti-Jewish measures because they have seen many corpses. But even those soldiers would not have been inclined to better understand harsh measure against Jews by the mere sight of Jewish corpses. Harsh measures are only likely to be accepted, if one is convinced that they are just, that is: as punishment. But punishment for what? For the massive occurrence of death; for the Jews' alleged responsibility for the war. Just pay attention to the oft-repeated words of Hitler: "If the international Jewish financiers […] were to be able to push the peoples once more into a world war," then woe to them! Jewry, so Hitler, "has on its conscience the two million dead of the Great War [WWI], and now it has hundreds of thousands more" (see next chapter). These are the corpses that would allegedly have made the Germans, who think that Jews are nice people, accept the anti-Jewish measures. These are the corpses that made Himmler's audience understand why harsh measures against the Jews were justified und why Himmler and his listeners were emotionally hardened and did not give any mercy.

Obviously, the trick with those extrapolated quotations can only work if quotations that do not fit in with the authors' ideological or political prejudices are not mentioned, such as the declaration Himmler made at Bad Tölz on November 23, 1942:[187]

> *"The Jewish question in Europe has also completely changed. The Führer once said in a Reichstag speech: If Judaism ever causes a war of extermination of the Aryan peoples, it would not be the Aryan peoples who would be exterminated, but Judaism. The Jew is being evacuated from Germany; he now lives in the east* ["lebt im Osten"] *and works on our roads, our railways and so on. That process has been implemented coherently, but without cruelty."*

[187] Bradley F. Smith, Agnes F. Peterson (ed.), *Heinrich Himmler. Geheimreden 1933 bis 1945 und andere Ansprachen*, Propyläen Verlag, Frankfurt/Main 1974, p. 200.

3.7.4. Adolf Hitler

On p. 201, the authors discuss David Irving's old thesis that Hitler did not know about the alleged extermination of the Jews,[188] and say:

> *"His evidence for this is a quote from Hitler, recorded by Bormann's adjutant Heinrich Heim on the day of October 25, 1941:*
>
> > *'From the rostrum of the Reichstag I prophesied to Jewry that if war could not be avoided, the Jews would disappear from Europe. That race of criminals already had on its conscience the two million dead of the Great War, and now it has hundreds of thousands more. Let nobody tell me that despite that* [we] *cannot park them in the marshy parts of Russia! Our troops are there as well, and who worries about them! By the way – it's not a bad thing that public rumor attributes to us a plan to exterminate Jews.'"* (p. 201)

The authors call the presentation and Irving's call for a single document for or against his thesis a "snapshot fallacy" and continue:

> *"In Hitler's War Irving reproduces Himmler's telephone notes of November 30, 1941, after Hitler requested a meeting with him, showing that the SS chief telephoned Reinhard Heydrich (head of the RSHA) at 1:30 P.M. 'from Hitler's bunker at the Wolf's Lair* [Wolfschanze]*, ordering that there was to be 'no liquidating' of Jews (see figure 37).' Taking this 'snapshot' out of its historical context, Irving concludes: 'The Führer had ordered that the Jews were not to be liquidated'. But let's re-view this snapshot in the sequence of frames around it. As Raul Hilberg points out, a more accurate translation of the log is 'Jewish transport from Berlin. No liquidation'. In other words, Himmler is referring to one particular transport, not all Jews. And, ironically, says Hilberg (and Irving concurs in Hitler's War), 'that transport was liquidated! That order was either ignored, or it was too late. The transport had already arrived in Riga and they didn't know what to do with these thousand people so they shot them that very same evening.'"* (p. 201)

The note refers to the Jewish transport, which left Berlin for Riga on November 27, 1941.

Actually, it is the authors who avoid the task of inserting this "snapshot" accurately into its context. On the one hand, they keep quiet about Hitler's other declarations concerning the removal of the European Jews to non-European countries such as Madagascar,[189] or more generally to Africa[190] or to Russia.[191] They also say nothing about his intention of "evacuating all the

---

[188] See D. Irving, *La guerra di Hitler*, Edizioni Settimo Sigillo, Roma 2001, pp. 539f.

[189] H. Picker, op. cit. (note 158), p. 189 (July 24, 1942).

[190] Ibid., p. 340 (May 29, 1942).

[191] W. Jochmann (ed.), *Adolf Hitler. Monologe im Führerhauptquartier 1941-1944. Die Aufzeichnungen*, Albrecht Knaus, Hamburg 1980, p. 241 ("The Jew has to go away from Europe. The best thing is for them to go to Russia," January 27, 1942).

Jews from Europe after the war," expressed as early as August of 1940,[192] nor his declaration expressed "repeatedly" that he "wanted to see the solution of the Jewish question set aside until after the war" ("*die Lösung der Judenfrage bis nach dem Kriege zurückgestellt wissen wolle*").[193]

Thus, sending the Jews "into the marshy regions of Russia"[194] as mentioned in Hitler's declaration of October 25, 1941, fits squarely into this context, and the phrase "it's not a bad thing that public rumor attributes to us a plan to exterminate Jews" – the use of the term "rumor" clearly indicating that such a plan did, in fact, not exist – fits into the historical context of the policy of Jewish emigration. All this constitutes a nice convergence of proof against the theses of the authors.

Let us move on to Himmler's note of November 30, 1941. On the face of it, the author's interpretation appears flawless, but "the sequence of frames," into which they have inserted this "snapshot," is artificial. The real historical context is the following:

The "General Report for October 16, 1941, through January 31, 1942" (*Gesamtbericht vom 16. Oktober 1941 bis 31. Januar 1942*) of *Einsatzgruppe A* (the alleged tool for the extermination of Jewish transports from the Reich, including the one that left Berlin on November 27, 1941) contains a full section entitled "*Juden aus dem Reich*" (Jews from the Reich), in which it is said:[195]

> *"Starting in December of 1940* [actually: 1941]*, Jewish transports from the Reich arrived at short intervals. 20,000 Jews were directed to Riga and 7,000 to Minsk. The first 10,000 Jews evacuated to Riga were housed partly in a temporary reception camp, partly in a new barrack camp built in the vicinity of Riga. The other transports were settled mainly in a separate section of the Riga ghetto.*
>
> *The construction of the barrack camp is implemented by the use of all the Jews fit for work in such a way that those who survive the winter can be settled in this camp.*
>
> *Of the Jews coming from the Reich, only a very small portion is fit for work. Some 70% to 80% are women and children, as well as old people unfit for work. The mortality rate is going up continuously, also because of the extremely severe winter.*

---

[192] Documents on German Foreign Policy 1918-1945, Series D, Vol. X, London 1957, p. 484.

[193] PS-4025.

[194] This refers to the German project of 1941 to deport Jews into the swamps of the Pripyet area of Russia. Cfr. Götz Aly, *"Endlösung." Völkerverschiebung und der Mord an den Juden*, S. Fischer Verlag, Frankfurt/Main 1995, pp. 273-276.

[195] RGVA (*Rossiiskii Gosudarstvennii Vojennii Archiv*: Russian State War Archive), 500-4-92, p. 64.

The performance of the few Jews from the Reich who are able to work is satisfactory. They are preferred over the Russian Jews on account of their German language and their relatively more pronounced cleanliness.

The capacity of the Jews in trying to adapt their lives to the circumstances is extraordinary. The crowding of the Jews into minute living spaces, which is the case in all ghettos, obviously generates a risk of epidemics, against which measures in the widest way are being undertaken with the aid of Jewish doctors. In rare cases, contagious Jews have been removed and shot, under the pretext of taking them to a clinic or a Jewish hospital."

Hence, among the Jews deported to Riga from the Reich – including those of the transport of November 27, 1941 – only certain individuals with contagious diseases were killed in individual cases ("*in einzelnen Fällen*"), there were no general measures of "*mass* exterminations." Hence, if considered with this background in mind, a lot indicates indeed that the term "no liquidation" was referring to these individual cases, which Hitler forbade.

Conclusion

After piling up this enormous heap of falsifications, converging in their negation of the truth, the authors have the audacity to conclude in the hope that their book:

"has not only provided a thorough and thoughtful answer to all the claims of the Holocaust deniers, but also clearly presented the convergence of evidence for how we know the Holocaust (or anything in history) happened." (p. 259)

What the authors have really furnished is an amateurish and confused answer to a small part of the arguments of a small part of the revisionist scholars, and what they have clearly presented is only a convergence of contortions, omissions, and fallacious interpretations, which do nothing but demonstrate the total inconsistency of the "evidence" for the Holocaust.

And what the authors claim to have demolished is not historical revisionism but a ridiculous parody of historical revisionism. They have massacred their own methodic rulebook by showing the unreliability of their selection of historical facts, utilizing unverified and incestuous sources, never trying to refute their own theses but attempting only to find confirmatory evidence, and obscuring anything that might speak against their thesis. They grounded themselves on a purely fictitious "convergence of proofs" and subjected their findings to their personal convictions and prejudices.

In one respect the authors are absolutely right: in the conviction that "the truth will always win out when the evidence is made available for all to see."

This is true, above all, for the authors themselves who, like all of their ilk, put all their money on the ignorance of their readers: once the evidence for

their falsifications is made available and accessible to all, truth cannot but prevail.

The International Auschwitz Controversy

By Germar Rudolf

It was not before 1989, 44 years after the liberation of the POW and concentration camp complex known as Auschwitz, that an international dispute started about the actual number of victims who had died in this camp complex. For 44 years, the Polish authorities and with them most of the world's mass media had been claiming that some four million inmates had perished there, but in 1989 they suddenly changed their minds and reduced this figure drastically. As a consequence, the memorial plates on display in the camp Auschwitz-Birkenau were removed in 1990, which had propagated the four million figure in many languages. Following this dispute, an investigative commission was formed to come up with a more acceptable number of victims.[1] When this commission published its results in summer of 1990, they were widely distributed by the international media.[2] The most astounding admission came perhaps from a prominent Polish journalist, who stated that the old, exaggerated figure was an "anti-fascist lie."[3] New memorial plates were installed in Auschwitz in 1995, claiming an alleged "final" victim count of 1.5 millions.

However, this "final" verdict did not end the controversy about the actual death toll of Auschwitz. In 1993 and 1994, the French pharmacist Jean-Claude Pressac, then promoted by the international media as *the* expert on technical questions surrounding Auschwitz, reduced this figure twice, first down to 800,000,[4] then down to 700,000.[5] The next reduction down to some 550,000 followed in May 2002 by Fritjof Meyer, a leading journalist of Germany's

2 Daily press of July 18, 1990, *e.g.*: Krzysztof Leski, Ohad Gozani, "Poland reduces Auschwitz death toll estimate to 1 million," *London Daily Telegraph*, July 18, 1990; UPI, "Poland lowers Auschwitz toll," *Toronto Sun*, July 18, 1990. In Germany, it was the left-wing radical daily newspaper *die tageszeitung* which published the lowest new victim figure on July 18, 1990: 960.000.

3 "'Ich empfinde Verlegenheit.' Der polnische Publizist Ernest Skalski über die neue Auschwitz-Diskussion in Warschau" ("I feel embarrassed." the Polish author Ernest Skalski about the new Auschwitz discussion in Warsaw), *Der Spiegel* no. 30 (1990), p. 111.

4 "Total of the deaths: 775,000 (but this figure can be attended with gaps. This is why the global figure of 800,000 victims should be retained currently," Jean-Claude Pressac, *Les Crématoires d'Auschwitz. La Machinerie du meurtre de masse*, éditions du CNRS, 1993, p. 148.

5 "Total of the deaths: 631,000-711,000; [...] the number of the victims is evaluated at 630,000 to 710,000"; German translation of the work referred to in the previous note: *Die Krematorien von Auschwitz. Die Technik des Massenmordes*, Munich, Piper, 1994, p. 202.

biggest news magazine, the left-wing *Der Spiegel*. Meyer's article appeared in the German geopolitical magazine *Osteuropa*, which is published by the German Society for Eastern Europe under the directorship of Prof. Rita Süssmuth, who was once the president of the German parliament. Meyer came to his conclusions by de-commissioning the Auschwitz crematoria as locations of mass murder, that is to say, by claiming that the alleged homicidal gas chambers in those crematoria buildings were never really used as such.

Since this periodical has a very small circulation, the article went largely unnoticed by the public at large. Only a few German mainstream media took notice of it, so for example Sven Felix Kellerhoff in the German daily newspaper *Die Welt* of August 28, 2002. Other than that, Meyer's article had an echo only in small German right-wing publications.

The Polish Auschwitz Museum, however, reacted promptly to Meyer's new and radical reduction of the Auschwitz death toll and de-commissioning of the crematoria. Dr. Franciszek Piper, chief historian of the museum, wrote a rebuttal to Meyer's paper,[6] to which Meyer responded in turn.[7] A major German anti-fascist website posted links to these and related contributions by other authors on one of their web pages.[8]

Revisionists responded numerous times to Meyer's article,[9] Piper's rebuttal,[10] and Meyer's response in self-defense,[11] demonstrating that both the semi-revisionist Meyer and the dogmatist Piper ignore documentary and physical evidence contradicting their thesis. In a perfect example of pseudo-scholarship, the entire discussion ensuing between established Holocaust scholars was subsequently conducted without a single reference to these revisionist responses, not to mention addressing the points of critique made.

This controversy about the number of Auschwitz victims finally reached international pseudo-academic dimensions, when Meyer's paper was subjected to a detailed scrutiny by John C. Zimmerman – again under careful avoidance of mentioning revisionist contributions to the issue – in the prestigious English language magazine *Journal of Genocide Research*.[12] I will discuss this paper hereafter.

John C. Zimmerman is an assistance professor for accounting at the University of Nevada in Las Vegas. Defending the Holocaust Dogma is one of his spare time hobbies. In 2000, he published a "refutation" of Holocaust revisionism.[13] Many of Zimmerman's essays have been posted on the Internet mainly by the so-called Holocaust History Project (holocaust-history.org). With the paper discussed here, Zimmerman has been accepted as a kind of official Auschwitz expert. This raises the question, as to why the uncounted numbers of full-time Holocaust experts all over the world do not address the theses published by Fritjof Meyer. This even more so, as Carlo Mattogno has thoroughly documented the utter incompetence of Zimmerman in his contribution on this imposter in the present book.[14]

Right at the beginning of the paper at issue, Zimmerman states that he only bothers discussing Meyer's hypothesis because Meyer's victim number has the potential to get into the mainstream, where it could be quoted as an acceptable number by authors and historians not familiar with the demographics of Auschwitz (p. 249). And that has to be prevented, Zimmerman claims.

On pp. 250-255, Zimmerman tackles the questions: how many prisoners were deported altogether toward Auschwitz railway station, how many of them were registered in the camp, and how many of those not registered were either transferred elsewhere or killed by gas? Revisionists and exterminationists argue only what happened to those inmates, about whose fate we have no other evidence than general witness statements.

This lack of evidence is acknowledged by Zimmerman, who admits that in the years 1942-1944 numerous transports arrived in Auschwitz, bringing inmates that were never registered in the camp and for which there is "no information" about their fate. But in spite of this total lack of any information, Zimmerman claims that those prisoners were gassed. (p. 251)

"No information" means in plain English: no information also about their alleged fate of having been gassed.

That there are indeed cases where it can be shown that deportees sent to Auschwitz, but not registered there, were *not* killed by means of poisonous gas, is even admitted by Zimmerman. As an alternative to the claim of immediate extermination on arrival, he mentions that during 1944 thousands of Jews deported from Hungary and Poland were temporarily quartered in the transit section of the camp (*Durchgangslager)* before transferred to other camps. These inmates never received any registration numbers (p. 252). Of course, Zimmerman cannot come up with a single document indicating the mass murder of unregistered deportees, but he quotes a document which deals with the mass transfer of unregistered Jews to other camps. This is a memo written on May 29, 1944, by First Lieutenant Ferency, delegate of the Hunga-

[13] *Holocaust Denial. Demographics, Testimonies, and Ideologies*, University Press of America, Lanham, MD, 2000.

[14] "An Accountant Poses as Cremation Expert," starting on p. 87.

rian Ministry for the Interior for the deportation of Jews.[15] In it Ferency explains that 184,000 Jews had been deported the previous day and that the Security Police requested that the Jews get food for five days, because they were to be transferred by train to various labor camps after their selection at Auschwitz (p. 253).

Zimmerman argues that all those Jews not registered in Auschwitz and about whose fate we have no other evidence were gassed in Auschwitz.

It is necessary here to highlight Zimmerman's perverted way of arguing:

Only a few decades ago, it was considered a "certainty" that every transport arriving at Auschwitz was subjected to a selection process, during which those unfit for labor were separated and killed "by gas." That was especially true for the Jews deported from Hungary. During the past decades, however, it turned out that many assumed to have been exterminated had not been gassed after all, but were merely transferred to other camps. Zimmerman mentions a few cases himself. In their study about the Stutthof camp, Jürgen Graf and Carlo Mattogno have pointed out more such cases.[16]

In other words: inmates, about whose fate there was no information for many years, suddenly turned out to have been very much alive.

How is it then possible to claim, as Zimmerman does, that all those inmates died "in the gas," about whose fate we still have no information today?

Zimmerman is correct when claiming that many German authorities were instructed toward the end of the war to destroy their archives (p. 256). But that is a measure taken by all countries who are threatened to be occupied by enemy forces. If each and every such destruction of secret archival material would prove a Holocaust, then we would have one Holocaust after the other everywhere in the world.

Fact is, however, that the Auschwitz authorities did not do anything to hide or destroy any of the tens of thousands of documents of the Central Construction Office of Auschwitz, which would have, after all, contained the evidence of the mass murder claimed by Zimmerman. Fact is, however, that these documents do not only contain *no* evidence for mass murder at all, but to the contrary: they refute such claims.

It remains a fact that the absence of evidence cannot serve as proof for a claim. But that is exactly what Zimmerman is doing. That flies into the face of scientific methods.

An analysis of Zimmerman's chapter about the capacity of the crematoria in Auschwitz, starting at p. 255, quickly reveals how weak the basis is, upon which Zimmerman tries to erect his thesis. Comparable to the earlier works by Pressac, Zimmerman as well considers it unnecessary to consult technical ex-

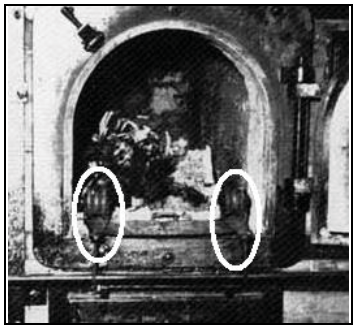
pert literature or to perform his own technical calculations when trying to solve a technical problem. He relies completely upon witness testimonies and documents, which he picks selectively without any critical analysis. It is also indicative that Zimmerman does not mention the works of his arch enemy Carlo Mattogno with a single word in this paper. Until recently, attempts in refuting Mattogno's works was one of Zimmerman's main objectives.[17] But when publishing in an allegedly scientific journal, he suddenly forgets the most important scientific principle: to mention and discuss contrary evidence and opinions. So much for Zimmerman's scholarly standards.

In order to justify his artificially increased capacity of the crematoria in Auschwitz-Birkenau, Zimmerman applies five sleights of hand:



1. He declares that the furnaces at Birkenau had a performance as similar ovens in other camps (Gusen camp, pp. 257f.). He ignores that the furnaces in Birkenau were inferior to those other ovens, because they did not have forced draft blowers and had different muffle grills.[18]
2. He claims that the emaciated corpses of Auschwitz could be cremated faster (p. 258), ignoring that, first of all, the claimed gassing victims would not have been emaciated – that would have been true only for inmates incarcerated for an extended period of time and suffering and/or dying from either serious diseases (diarrhea, typhus) or malnutrition. Additionally, emaciated corpses with a low body fat content do not burn faster than corpses with an average content of body fat.
3. He misinterprets a memo by Kurt Prüfer, the engineer responsible for constructing the Birkenau crematorium furnaces, stating that the Birkenau three-muffle ovens had a performance $^1/_3$ higher than those of double-muffle ovens, as a reduction of cremation time by $^1/_3$ (p. 258). Performance, however, is a physical term meaning energy per time and corpse. The time required for a cremation was not effected, but the energy, because the three-muffle ovens had only two fire places heating three muffles, so that almost the same energy was required to heat three muffles with three corpses as was required to heat two muffles with two corpses.
4. He repeats the legend that usually three, if not up to eight corpses were cremated at once in a single muffle in Birkenau, relying in this regard on the lying witness[19] Henryk Tauber (pp. 258f.) As proof that such an over-

[17] See www.holocaust-history.org/auschwitz/body-disposal/; ~/auschwitz/response-to-mattogno/. Mattogno's replies to this are printed in this volume, "An Accountant Poses as Cremation Expert," starting at p. 87. The original internet papers are posted at www.vho.org/GB/c/CM/jcz.html; www.vho.org/GB/c/CM/Risposta-new-eng.html.

[18] The gaps of the grills of the Birkenau ovens were only 50 mm wide, so that corpses had to almost completely incinerate before their remainders fell through the grill into the post-combustion chamber, making room for the next load of corpses.

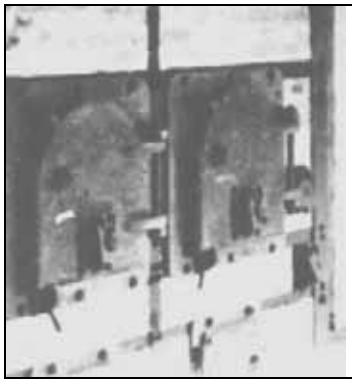
[19] See my analysis in *Lectures on the Holocaust*, Theses & Dissertations Press, Chicago 2005, pp. 451-456; see also my contribution about J.-C. Pressac in this book, pp. 25f.

loading of the muffles was possible in Auschwitz, Zimmerman quotes newspaper articles of the 1980s and 1990s reporting about cases where civil crematories had illegally cremated many corpses at once in order to gain an advantage in time and thus in efficiency over competitors. Zimmerman should have investigated the features of these modern crematoria and should have compared those to the ovens in Birkenau, which would probably have prevented his error. In comparison to the coke-fired ovens of Birkenau, modern crematoria have almost gigantic muffles, because:

Ill. 1: *Oven doors of the type used in the Auschwitz crematoria. Rollers to guide stretcher marked with white ellipses.*[20]

a) they have to accommodated quite large coffins at times – in Auschwitz corpses were cremated without coffins – and
b) almost all modern crematoria operate with gas burners embedded in the muffle walls, which work efficiently only when they have a minimum distance from the coffin.

But even in such cases, the cremation of multiple corpses at once can succeed only if the fuel consumption is increased accordingly, which, as Zimmerman himself writes, lead to a fire in one of the cases he quotes, because the overcrowded muffle lead to an overheating of oven and flues.



Documents as well as pictures of the ovens in Auschwitz prove that they had been designed for single corpse cremations only. For example, the oven doors were only 600 mm × 600 mm small (23.5 inches), the upper half of which was a rounded arch. The height of the oven door was further restricted by rollers at the bottom, on which the stretcher was pushed into the muffle (see illustrations 1-3). Hence, the doors alone are clear proof for the fact that these muffles were built for single corpse cremation. But there are also thermotechnical reasons why multiple corpse cremations cannot work: Several corpses in one muffle would have blocked the gas conduits in the muffle walls, through which the combustion gases flowed. Furthermore, the gas generator could not produce the heat required for the initial phase of dehydration, so the ovens would cool down drastically at the beginning. During the following phase of incineration, the burning corpses

[20] Taken from J.-C. Pressac, *Auschwitz: Technique and Operation of the Gas Chambers*, Beate Klarsfeld Foundation, New York 1989, p. 259, section enlargement (http://holocaust-history.org/auschwitz/pressac/technique-and-operation/pressac0259.shtml).

would produce too much heat, overheating the muffle.[21] As chief engineer Kurt Prüfer put it when two corpses were once inserted simultaneously:[22]

"The ovens could not keep up with this load"

5. Zimmerman doubts the times given by Meyer – who is in turn relying on Mattogno's statements – during which the crematoria were inoperable. He conjectures that repair orders for oven doors do not necessarily mean that the affected ovens had been shut down. This may or may not be the case.[25] Due to lack of more detailed information, we can currently only speculate about that. But the fact is that Mattogno has documented many cases where the crematoria were indeed inoperable – Zimmerman ignores them all – and in some cases, where Mattogno had only insufficient data, he has estimated cautiously. For long periods of time during the existence of the crematoria, we do not have any documents about their activities. But instead of following Zimmerman's method: "the lack of evidence proves that the crematoria did not operate," Mattogno assumed the worst case: Where there is no evidence, he assumes full operation of the ovens.

III. 2: *Oven doors of crematorium II in Birkenau.*[23]

III. 3: *Same doors – with humans around to compare sizes – at the crematorium in Buchenwald.*[24]

In various occasions, Zimmerman proves that he does not know the documents. For instance, he calls the operators of the ovens "Sonderkommando" (p. 254), even though they were never called that way.[26] He thinks that the construction of additional morgues through various camps proves that the

morgues of the crematoria could no longer be used as morgues, hence, that they served as gas chambers (p. 255). The fact is that these additional morgues served only to temporarily store corpses – mainly overnight and in order to keep rats out – before they were transported to the morgues of the crematoria.[27] Finally, Zimmerman repeats Meyer's mistake by misquoting a statement by former camp commander Rudolf Höss. In his statement, Höss did not claim that the crematoria could operate only eight to ten hours a day, as Meyer and Zimmerman claim (p. 260), but eight to ten weeks.[10]

Zimmerman's statements about the alleged open air incinerations in deep pits contain nothing new, perhaps apart from a reference to a more recently released British air photo of the Birkenau camp, where a small plume of smoke can be spotted rising from the back yard of crematorium V. Zimmerman claims that this smoke rises from a mass grave (p. 261).

It is true that smoke rises from a tiny area behind the crematorium V, but it is of course impossible to recognize what kind of a fire caused the smoke. And

[27] Cf. C. Mattogno, "The Morgues of the Crematoria at Birkenau in the Light of Documents," *TR* 2(3) (2004), pp. 271-294.

apart from this, the photo mentioned by Zimmerman is lacking all the evidence that should be there, should the theory of mass extermination in huge pits be true, as Zimmerman and his friends claim: gigantic pits to the west and north of the camp; gigantic stacks of fuel; fires with smoke plumes covering huge areas; considering the high water table in this swampy area, large areas around those fires would have turned into a huge morass. Nothing remotely similar to this can be seen on this or comparable photos.[28]

At the end, Zimmerman tries to salvage the credibility of the statement extracted from Rudolf Höss by the British by means of torture. He does that by claiming that he made similar statements while in Polish custody. Zimmerman claims that Höss was treated nicely while awaiting his lynching party in a Polish prison, but he missed the following lines in Höss' statement about his Polish captors:[29]

> *"During the first weeks the incarceration was quite tolerable, but all at once they* [the wardens] *were exchanged. From their conduct and their talks, which I could not understand but interpret, I could gather that they wanted to finish me off. I always got the smallest piece of bread and only a small ladle of thin soup.* […]
>
> *If the prosecutor had not intervened, they would have finished me of – not just physically, but first of all psychologically."*

Although he could cope with quite a lot, so he continued, the psychological torture he was exposed to by his wardens was too much for him.

Here we see the typical tactics "with a carrot and a stick," which was mastered in particular by the Stalinist henchmen, who held Höss captive: First an inmate is mistreated by the "evil" guys, and after that the "good" guys tell him that this will not happen again and that he will be just fine, if only he is cooperative with their demands. As is known, Höss was treated so well by the Poles that shortly thereafter he was dangling from the gallows.

The exactitude and reliability of Höss' statements and memoirs, as claimed by Zimmerman, can be deduced, i.a., from the following quotations:[29]

> *"Maintaining the fire at the pits, pouring the collected fat* [over the burning bodies …]. *They ate and smoked while dragging corpses* […]*"* (p. 126)
>
> *"The bodies were doused first with oil residues, and later with methanol.* […] *He also attempted to destroy the bodies with explosives,* […]*"* (pp. 157ff.)
>
> *"Half an hour after the introduction of the gas, the door was opened and the ventilation installation was turned on. Removal of the bodies began immediately* […]*"* (S. 166.)

[29] R. Höss, in: M. Broszat (ed.), *Kommandant in Auschwitz*, Deutsche Verlags-Anstalt, Stuttgart 1958, p. 151.

I do not have to make any further comment about such nonsense.[30]
So much about Zimmerman's exactitude and reliability.

[30] More about that in my expert report, *The Rudolf Report*, Theses & Dissertations Press, Chicago 2003, pp. 199-201.

The Elusive Holes of Death

By Carlo Mattogno

1. Introduction by Germar Rudolf

On August 28, 2002, Sven Felix Kellerhoff of the German daily newspaper *Die Welt* expressed his anger about the semi-revisionist theories of Fritjof Meyer, a leading editor of Germany's largest news magazines *Der Spiegel*. In 2002, Meyer had published an article, in which he reduced the death toll of Auschwitz down to half a million victims, and also decommissioned the gas chambers that were allegedly located in the crematoria of Auschwitz.[1] Kellerhoff called Meyer a "crown witness" for the "Holocaust deniers."[2] In early 2004, Meyer himself made an end – perhaps only temporarily so – to this public exchange. In an Open Letter of February 12, 2004, he declared, i.a.:[3]

> *"Now the impression grows that they* ["right-wing radicals" or "Auschwitz deniers"] *could succeed to instrumentalize my theses: for a propaganda of minimization. I therefore do not wish to continue this debate in this forum."*

In the following sentence, Meyer's mask drops, and he reveals himself as the left-wing extremist he is, who is promoting the use of violence as a means of solving conflicts:

> *"Considering the current dangers in Italy, France, Russia, and the U.S., it remains true that the fascists need to be beaten up wherever one encounters them."*

With this statement, Meyer has discredited himself utterly as a partner for any future discussion. But that did not, of course, mean that the entire discussion has ended with this epilogue. One of the most ambitious opponents of revisionism, John C. Zimmerman, has scolded Meyer harshly for his semi-revisionist stance.[2] The latest attack against revisionists came again from the above mentioned Sven Felix Kellerhoff, published in *Die Welt* of August 23, 2004. Under the headline "The Holes of Death," he quotes Robert Faurisson's provocative quip "No holes, no Holocaust" and writes:

---

1 F. Meyer, "Die Zahl der Opfer von Auschwitz. Neue Erkenntnisse durch neue Archivfunde," in: *Osteuropa. Zeitschrift für Gegenwartsfragen des Ostens*, No. 5, May 2002, pp. 631-641; for an English translation see online www.vho.org/GB/c/Meyer.html.

2 See the previous contribution in the present volume "The International Auschwitz Controversy," starting at p. 269, for more details and references.

3 www.idgr.de/texte/geschichte/ns-verbrechen/fritjof-meyer/meyer-040212.php

"The French revisionist Robert Faurisson repeats it over and over again; David Irving also used it in this sense. Despite the uncouth nature of this quip, the core of it is the question whether or not each of the smaller basement rooms of the crematoria II and III in the extermination camp Birkenau was used as a gas chamber.

In the larger basement room, situated along the axis of the crematorium building above ground, the victims had to undress before they were pressed, sometimes up to 1000 of them, into the small basement room of some 210 square meters, which was perpendicular to the other. Then SS men threw the poison, hydrogen cyanide bound on diatomaceous earth (Zyklon B), through openings in the ceiling into wire mesh columns in the basement. Within half an hour, the hydrogen cyanide evaporated due to the heat of the bodies and killed every human life."

The question of the alleged misuse of the basement rooms of crematoria II & III in the Auschwitz-Birkenau camp for mass murder with poison gas is in the very focus of revisionist discussion on the Holocaust. Many monographs and papers appeared about it,[4] one of which was solely dedicated to discuss the issue of the Zyklon B introduction holes.[5] Kellerhoff's summary of the revisionist viewpoint puts it well:

"Faurisson, Irving & Co. claim that there were no openings in the roof. Therefore, no Zyklon B could have been thrown into the murder chambers. Hence, the Holocaust is an invention."

Subsequently, however, Kellerhoff dares treading on the minefield of evidence, where he exposes his lack of competence when claiming, "a photo taken during the construction of the murder plant and two air photos taken by the Allies in August 1944" prove the existence of introduction holes. But this is definitely not the case, as I have repeatedly shown.[6] Kellerhoff's claim is based upon a false interpretation of these pictures, a fact which is admitted even by adherents of the gas chamber theses.[7]

The total lack of documents for the existence of these introduction holes as well as the total lack of any physical trace of these holes in the roof of the ruins of crematorium II in Birkenau, as it has been claimed for decades by re-

visionists, forced the Holocausters finally to tackle the issue. Sven Kellerhoff gladly announces the result of such research:

> *"In the journal 'Holocaust and Genocide Studies,' three coworkers of the research network 'Holocaust History Project'*[8] *exhaustingly clarify the question of the holes in the roof. Daniel Keren, Jamie McCarthy, and Harry W. Mazal have investigated the ruins of both gas chambers in Birkenau as well as the gas chamber in the Auschwitz main camp.*
>
> *Their result matches exactly the circumstantial evidence known and preserved so far: the smaller basement room of crematorium II had four openings in its roof measuring roughly 60 centimeters in square.* […] *The U.S. scientist could identify three of four openings in the ruins; the fourth is covered by debris. All alleged 'arguments' of the Auschwitz deniers are thus refuted on the basis of physically provable facts: The smaller basement rooms of both crematorium buildings were equipped with gas chambers and were used as such to kill hundreds of thousands of human beings. The case of the openings in the roof of the gas chamber in the crematorium of the main camp is a little more complicated.* […]*"*

As indicated above, the crematorium in the main camp is not the only case that is a little more complicated than Kellerhoff suggests. A final answer to this question will be given only after the arguments of both sides have been weighed objectively, something that Kellerhoff, with his dogmatic attitude, will probably never accept.

It is already indicative that the three authors mentioned by Kellerhoff – Keren, McCarthy, and Mazal – have never published before in the field of Holocaust research. They also refused to even take notice of a thorough study on this issue by revisionist scholar Carlo Mattogno,[5] which had been published in English on the internet as early as 2002.[9] Hence, Keren, McCarthy, and Mazal did not weigh arguments, but confirmed prejudices, which quickly gained the predicate of "scientific self-evidence" by the Holocaust lobby by virtue of having it published in the most renowned journal these genocide researchers have at their hands.

In the following, I give the word to the world's unchallenged expert on Auschwitz, Carlo Mattogno. This may result in Kellerhoff and his "hole heroes" losing their wits, which in turn might lead to them resorting to character assassination, something they are good at, since they have exercised it before.[10]

[8] D. Keren, J. McCarthy, H.W. Mazal, "The Ruins of the Gas Chambers: A Forensic Investigation of Crematoriums at Auschwitz I and Auschwitz-Birkenau," in: *Holocaust and Genocide Studies*, 9(1) (2004), pp. 68-103; cf. their website www.holocaust-history.org.

[9] During the years 2002 and 2003 on the website of Russ Granata, which does no longer exist; now this paper is posted at www.vho.org/GB/c/CM/noholes.html. It is an earlier version of the revised paper in this book, op. cit. (note 5).

[10] See my paper "Green sees Red " in this book staring at p. 69.

In concluding I may state that this episode in the controversy over the Holocaust between revisionists and exterminationists proves – to quote Galileo Galilei freely: Something moves after all!

The discussion about the reality of Holocaust claims, which the establishment wants to suppress so badly, is already going on. It has hit the scholarly journals of the establishment. There is no way back anymore, because we revisionists won't let go!

2. "No Holes, No Gas Chamber(s)"

When American expert for execution techniques Fred A. Leuchter presented his famous expert report on the gas chambers of Auschwitz and Majdanek to a Canadian court in 1988, he initially caused confusion: in his technical drawings of the morgues no. 1 of the crematoria II and III of Auschwitz-Birkenau, which allegedly served as "gas chambers," he had drawn in four openings in the roof, through which, according to witnesses accounts, the insecticide Zyklon B had been poured in order to kill hundreds of thousands of victims. It was only in a later edition of this expert report that Leuchter added a letter to the report, in which he explained that those four holes could not be found in the ruins of those crematoria.

The Swede Ditlieb Felderer was the first, in the 1970s, to raise the question whether or not there were any holes in those roofs, without which those basements could not have served as execution chambers in the way as testified to by witnesses.[1] Ever since then, this issue has been discussed intensely. Up to the current paper, this topic was most thoroughly treated by Germar Rudolf in his *Rudolf-Report*.[2] Inspired by Rudolf's arguments, Charles D. Provan compiled a study, which is analyzed by Carlo Mattogno in the following paper. Provan's study is based primarily on illustrations of the roof of this morgue as it looked like in 2000. To summarize Provan, he thinks that he has identified at least three holes in the roof of morgue no. 1 of crematorium II in Birkenau, which could have served as introduction holes in 1943/1944. Provan concludes therefore that the quip coined by Prof. Dr. Robert Faurisson, and sup-

ported by G. Rudolf with evidence – "No Holes, no Holocaust" – is untenable. Carlo Mattogno shows in the following that Provan's assertions themselves are untenable. All of his alleged holes are demonstrably the result of the destruction of the crematoriums during the retreat of German troops or were created only after war's end.

2.1. Introduction

Charles D. Provan is the author of a pamphlet entitled, "No Holes? No Holocaust? A Study of the Holes in the Roof of morgue 1 of Krematorium 2 at Birkenau."[3] First of all Provan emphasizes the importance of the problem of the holes for the introduction of Zyklon B into the presumed homicidal gas chamber of crematorium II. This question, raised by historical revisionists, obtained much prominence in 2000 during the trial *David Irving versus Penguin Books Ltd. and Deborah E. Lipstadt.* It was also discussed by Justice Gray in the written verdict.[4]

In his study, Provan analyzes the five categories comprising the evidence for these presumed holes, which are generally accepted by the supporters of the thesis of gas chambers at Auschwitz-Birkenau:

1. Witnesses and early historical testimony
2. Air photo evidence of the holes in the roofs of the gas chambers
3. The blueprints of morgue 1, Krematorium 2
4. German wartime photographs of morgue 1 of Krematoria 2 and 3
5. Physical evidence

In the first category Provan cites 16 testimonies from 9 major witnesses and 7 minor witnesses (pp. 3-9).

He then examines the statements of minor witnesses (pp. 10f.) in the following order: Egon Ochshorn, Dr. Friedmann, Janda Weiss, Rudolf Vrba and Alfred Wetzler, Ota Kraus and Erich Kulka, Werner Krumme and Alfred Franke-Gricksch. Provan concludes that these are unreliable. For the major witnesses (in order, Rudolf Höss, Henryk Tauber, Karl Schultze, Salmen Lewental, Konrad Morgen, Miklos Nyiszli, "Paul" Bendel, Josef Erber, and Filip Müller – all of whom were "eyewitnesses"), Provan provides no analysis: he assumes *a priori* that these are reliable. But these testimonies are in fact dubious as well, as we shall subsequently see.

As to the rest, Provan bases his arguments on only four testimonies:

---

[3] Op. cit. (note 7). Ch. Provan distributed this spiral-bound, photocopied brochure for the first time in June 2000 during the 13th IHR conference in Irvine, California, and has posted it subsequently on the Internet: www.revisingrevisionism.com; the following page numbers refer to the photocopied edition. The slogan "No Holes, No Holocaust" is attributed to Robert Faurisson.

[4] Royal Courts of Justice, verdict of Justice Gray of April 11, 2000, points 7.91-7.94 (www.holocaustdenialontrial.com/).

1. Henryk Tauber for the arrangement and number of holes for the introduction of Zyklon B (two on the east side and two on the west side of morgue 1).
2. Karl Schultze for the dimensions of the holes (cm 25 cm × 25 cm).
3. Konrad Morgen for the crudeness of the extermination facilities.
4. Rudolf Höss for the transformation of the crematoria into instruments of mass extermination without the knowledge of the head of the Central Construction Office.

The other testimonies served as confirmation of these four principal views.

Before examining in detail Provan's arguments, let us verify the credibility of the major witnesses cited by him.

2.2. The Major Witnesses Cited by Provan

2.2.1. Josef Erber

This testimony is cited by Provan and dealt with by Gerald Fleming in his book *Hitler and the Final Solution*.[5] The text cited by Fleming is taken in turn from a letter that Josef Erber wrote to him on September 14, 1981.[6] The declaration of the witness is therefore already suspect on account of the late date. In the first edition of the above book, which appeared in German with the title *Hitler und die Endlösung*, Fleming quotes from the original text of Erber's letter:[7]

> *"Two inpours* [*Einschütten*] *were in each of these gassing rooms (of Krematorium one and two in Birkenau, G.F.): inside four iron pipes each from the floor to the roof. These were surrounded by steel wire mesh, and inside was a sheet metal with a low edge. To this a wire was attached, with which the sheet metal could be pulled up to the roof. An iron lid was attached to each inpour* [*Einschütte*] *at the roof. If the lid was raised, the tin container could be pulled up and the gas could be poured in. Then the container was lowered and the lid closed."*

What sort of thing is an "inpour" (*Einschütte*)? The verb "*einschütten*" means "pour in(to)" as a technical term; "to feed," "to charge" or "to load." If, as it seems, the "*Einschütte*" was a mechanism, it must concern a device for pouring or feeding. Yet, according to the text, there were two "*Einschütten*" in each "gas chamber" of crematoria II and III. These devices are clearly inconsistent with those described by Henryk Tauber, and moreover it is difficult to imagine how they were made. So difficult is it that Provan himself, in order to make the text intelligible, wrote "rooms" (note 24 on p. 7) where Fleming,

---

5 University of California Press, Berkeley Los Angeles, 1994, pp. 187f.
6 Ibid., p. 188.
7 Limes Verlag, Wiesbaden/Munich 1982, p. 204.

translating the German term "*Einschütten*," wrote "ducts." Even so, the original text categorically excludes this interpretation.

In conclusion, the testimony of Josef Erber is unreliable.[8]

2.2.2. Konrad Morgen

Provan cites two statements made by this witness (p. 5). The first deals with the affidavit made by Morgen on July 13, 1946, document SS-65. There the witness states:

> *"In this moment, an SS man in a gas suit stepped over the outer air duct and poured a can with hydrogen cyanide into the room."*

Morgan talks about a single "air duct," which contradicts the description accepted by Provan. The term "air duct" is moreover inappropriate in that the presumed holes for introducing Zyklon B had nothing whatsoever to do with ventilation. In crematoria II and III there were in fact a "*Belüftungsschacht*" (aeration duct) and an "*Entlüftungsschacht*" (de-aeration duct) which connected morgue no. 1 to the ventilators, blowing and drawing, and situated in the attic of the structures.[9]

The second citation is inferred from the deposition of Morgen at the trial of Oswald Pohl. The witness confirms here that Zyklon B was introduced into the "gas chamber" through a "special shaft" (p. 5): again, a single introduction device.

How reliable this witness is for the presumed "gas chambers" becomes clear upon examining what he declared during the August 8, 1946, hearing of the Nuremberg trial:[10]

> *"By 'Extermination Camp Auschwitz' I did not mean the concentration camp. It did not exist there. I meant a separate extermination camp near Auschwitz, called 'Monowitz.'"*

A little later he confirmed this:[11]

> *"These trucks drove off, but they did not drive to the Concentration Camp Auschwitz, but in another direction to the Extermination Camp Monowitz, which was a few kilometers away."*

One could imagine a slip of the tongue: Morgen was thinking of Birkenau but said Monowitz. But that he was thinking literally of Monowitz is revealed by the following statement:[12]

---

[8] A member of the "Zimmerman Aid Committee" claims that my conclusion is misleading. I answered this absurd accusation in C. Mattogno, *Olocausto: dilettanti nel web*, Effepi, Genova 2005, pp. 22-25.

[9] Plan 933 of January 19, 1944, in J.-C. Pressac, *Auschwitz: Technique and Operation of the Gas Chambers*, The Beate Klarsfeld Foundation, New York 1989, pp. 280f. (http://holocaust-history.org/auschwitz/pressac/technique-and-operation/pressac0280.shtml).

[10] *IMT*, vol. XX, p. 449.

[11] Ibid., p. 503.

[12] Ibid., p. 504.

"The Extermination Camp Monowitz lay far away from the concentration camp. It was situated on an extensive industrial site and was not recognizable as such and everywhere on the horizon there were smoking chimneys."

In fact, there is no doubt about it: in an "extensive industrial site" full of chimneys, he found Monowitz, certainly not Birkenau. Now if Konrad Morgen is an "eyewitness," how could he confuse Birkenau with Monowitz? It seems that he had seen precisely nothing, but spoke – for the most part incoherently – from hearsay. Therefore, as far as we are concerned, Konrad Morgen is a completely unreliable witness.

2.2.3. "Paul" Bendel

Provan cites via Pressac the short text "Les Crématoires. 'Le Sonderkommando'" carrying the signature "Paul Bendel,"[13] which appeared in a book published in 1946. Here the author states that the "*chambres à gaz*" ("gas chambers") in each of crematoria II and III were "*au nombre de deux*" ("in number two") and adds:[14]

"Made of reinforced concrete, one had the impression when entering that the ceiling would fall on one's head, so low it was. In the middle of these chambers two pipes surrounded by wire mesh and with an exterior valve served for the emission of gases."

Provan notices that the presence of two gas chambers is in accord with the declaration of Tauber, according to whom "at the end of 1943, the gas chamber was divided into two by a brick wall to make it possible to gas smaller transports." (note 20 on p. 6) Therefore Bendel would confirm Tauber. However, matters are not that simple.

It is known that morgue no. 1 of the crematoria II and III measured internally 30 m × 7 m × 2.41 m.[15] At the trial of Bruno Tesch, Bendel testified that "each gas chamber was 10 meters long and 4 meters wide" and that each had a height of 1.60 m:[16]

"Q. You have said that the gas chambers were ten meters by four meters by one meter sixty centimeters: is that correct? A. Yes."

Previously, on October 21, 1945, Bendel had declared:[17]

"There were 2 gas chambers, underground, roughly 10 meters long, 5 meters wide and 1 ½ meters high, each one."

---

[13] Bendel called himself "Charles Sigismund." Another member of the "Zimmerman Aid Committee" incredibly suggested that there are two different Bendel witnesses, one with the name "Paul," the other with the name "Charles Sigismund"! Cf. C. Mattogno, op. cit. (note 8), p. 53.

[14] *Témoignages sur Auschwitz*, Paris 1946, p. 161.

[15] J.-C. Pressac, op. cit. (note 9), p. 286.

[16] NI-11953. Interrogation of March 2, 1946.

[17] NI-11390.

Nevertheless, even if morgue 1 of the crematoria II and III had been divided exactly in two, this would have given rise to two localities each measuring 15 m × 7 m × 2.41 m. How can these measurements be reconciled with the quite different ones given by Bendel, that is, 10 m × 4 m × 1.6 m or 10 m × 5 m × 1.5 m?

I well understand that an estimate with the naked eye can be subject to a considerable margin of error, but how could Bendel claim that the ceiling had a height of barely 1.5 or 1.6 m? Here we are no longer dealing with an estimate, since any person of medium height would have had to stoop in order to enter these fictitious places. In the actual localities, however, he would have had more than 60 to 70 cm of space above his head before touching the ceiling. An error in good faith is therefore impossible. But even the errors relative to the length and width of the localities, considering their modest dimensions, are difficult to explain.

Whatever the case, it is impossible for Bendel to have entered a "gas chamber" with a height of 1.5 or 1.6 m, since such localities did not exist, and it is just as impossible that he could have made such a gross error. Therefore he is an unreliable witness.

Strangely, Bendel makes no mention of the presumed "undressing room" (morgue no. 2), even though it had a ceiling 11 cm lower than that of morgue 1![18]

2.2.4. Miklos Nyiszli

Provan cites two passages from the statements of this witness (pp. 5f.). The first goes back to July 28, 1945, and the other to October 8, 1946. Nyiszli mentions four "ventilation valves" equipped with "perforated tubes," which popped out above the "gas chamber" of crematorium II in "concrete chimneys" closed with "concrete lids." "Chlorine gas" was introduced into these "valves."

In 1946 Nyiszli published a book of memoirs in Hungarian with the title *I was Dr. Mengele's Anatomist at an Auschwitz Crematorium*,[19] of which there was an English translation published in the USA. Among other things it contains an detailed description of the basement of crematorium II:[20]

> *"The room*[21] *into which the convoy proceeded was about 200 meters long:*[22] *its walls were whitewashed and it was brightly lit.* [...].

---

18 The ceiling of morgue 2 was 2.30 m high. J.-C. Pressac, op. cit. (note 9), p. 286.

19 *Dr. Mengele boncolóorvosa voltam az auschwitz-i krematóriumban*, Copyright by Dr. Nyiszli Miklos, Oradea, Nagyvárad, 1946.

20 *Auschwitz. A Doctor's Eyewitness Account*, Fawcett Crest, New York 1961, p. 44f.

21 It concerns morgue 2, the alleged "undressing room."

22 In the Hungarian original, op. cit (note 19), p. 33: "length about 200 meters."

Making his way through the crowd, an SS opened the swing-doors of the large oaken gate at the end of the room. The crowd flowed through it into another, equally well-lighted room. This second room[23] *was the same size as the first*[24] *but neither benches nor pegs were to be seen. In the center of the rooms, at thirty-yard intervals, columns rose from the concrete floor to the ceiling. They were not supporting columns, but square sheet-iron pipes, the sides of which contained numerous perforations, like a wire lattice.* [...]

The Deputy Health Officer held four green sheet-iron canisters. He advanced across the grass, where, every thirty yards,[25] *short concrete pipes jutted up from the ground. Having donned his gas mask, he lifted the lid of the pipe, which was also made of concrete. He opened one of the cans and poured the contents – a mauve granulated material – into the opening. The granulated substance fell in a lump to the bottom. The gas it produced escaped through the perforations, and within a few seconds filled the room in which the deportees were stacked. Within five minutes everybody was dead."*

The English translation omits the following phrase from the last passage:[25]

"A beszórt anyag Cyclon, vagy Chlór szemcsés formája, azonnal gázt fejleszt, amint a levegövel érintkezik!"

That is:

"The scattered substance is Cyclon or chlorine in granular form, the gas develops immediately, hardly coming into contact with air!"

Let us recapitulate. Miklos Nyiszli, in contradiction to the plans and the ruins of the crematoria, maintains that morgue 2 had a length of 200 meters, while in reality it measured 49.49m,[26] and that likewise morgue 1 had a length of 200 meters, while in fact its length was 30 meters. In the "gas chamber" there were four devices for the introduction of Zyklon B, but they were separated from each other by 30 meters – the entire length of the site!

Perhaps the omission in the English translation of the above passage from the original Hungarian happened by chance, but the fact remains that it gives rise to another absurdity: as everyone knows, the toxic agent of Zyklon B was not chlorine, but rather hydrogen cyanide.

The description given by witness Nyiszli presents many more incredible blunders. For example, he maintains that there were four elevators in the basement of crematorium II:[27]

"Four good-sized elevators were functioning [here]*"*

---

23 Morgue 1, the alleged "gas chamber. "

24 In the Hungarian original, op. cit (note 19), p. 34: "This room has the same size as the undressing room."

25 In the Hungarian original, op. cit (note 19), p. 35: "30 meters, the one from the other."

26 J.-C. Pressac, op. cit. (note 9), p. 286.

27 M. Nyiszli, op. cit. (note 20), p. 47; op. cit (note 19), p. 37.

It is well known that there was but a single elevator.

In addition, he maintains that in the furnace room of crematorium II there were 15 single ovens:[28]

"Each of these fifteen ovens was housed in a red brick structure."

In crematorium II (and III) there were in fact 5 ovens, each with 3 muffles, and so there were five brick structures, not fifteen.

Nyszli claims to have spent eight months[29] (from May 1944 to January 1945) in the so-called "Sonderkommando" of the crematoria; that is, for six months his lodging was located on the ground floor of crematorium II.[30] He should then have had a perfect knowledge of crematorium II. So how could he have been so grossly mistaken in good faith about the dimensions of the facilities, the number of elevators and the structure of the ovens? And, since he was a medical man who presumably assisted at various "gassings," how could he maintain that the toxic agent of Zyklon B was chlorine?

It is therefore evident that this witness is absolutely unreliable.[31]

A final observation: according to Nyiszli there was a single gas chamber in crematorium II, while according to Tauber the "gas chamber" was subdivided into two at the end of 1943. On the other hand, there is the witness Bendel, who, in his own words, became a member of the so-called "Sonderkommando" of the crematoria in June 1944.[32] In the same period and in the same place, Bendel "saw" two "gas chambers"[33] of 10 meters' length, while Nyiszli saw one "gas chamber" there of 200 meters' length. How can these statements be reconciled?[34]

---

[28] M. Nyiszli, op. cit. (note 20), p. 43; op. cit (note 19), p. 32.

[29] M. Nyiszli, op. cit. (note 20), p. 149.

[30] Ibid., p. 37. After November 18, 1944, Nyiszli was transferred from Crematorium II to Crematorium V. Ibid., p. 139 and 146.

[31] Provan tried to justify Nyiszli's errors by claiming that this book is a novel without historical value: C.D. Provan, *Journal of Historical Review*, 20(1) (2001), pp. 20-29, but his explanation is untenable; see my remarks in "Vulgärer Berufsbetrüger" in: *VffG* 6(2) (2002), pp. 231f.

[32] C.S. Bendel, op. cit. (note 14), pp. 161f.

[33] This assertion is not a "confirmation" of the claim that *Leichenkeller* 1 of crematory II had been divided in two rooms (as Tauber claims), because Bendel claims that every crematory had two gas chambers: "In each crematorium there were generally two gas chambers." Raymond Philips (ed.), *Trial of Josef Kramer and Forty-four Others (The Belsen Trial)*, William Hodge and Company Limited, London/Edinburgh/Glasgow 1946, p. 135.

[34] For a more general critique of Nyiszli's statement see C. Mattogno, *"Medico ad Auchwitz": Anatomia di un falso*, Edizioni La Sfinge, Parma 1988.

2.2.5. Filip Müller

The testimony of Filip Müller is pitifully late, going back only to 1979. He describes in the following way the devices for the introduction of Zyklon B:[35]

> *"The Zyklon B gas crystals*[36] *were thrown through openings in the concrete ceiling, which ended in hollow sheet metal columns in the gas chamber. These were perforated equidistantly, and inside of them a spiral ran from top to bottom, to achieve a distribution of the grainy crystals as equally as possible."*

This description is very vague. Müller indicates neither the number nor the shape nor the dimensions nor the positions of either the holes or the columns. This last point takes on major significance from the fact that Filip Müller published a plan of crematorium II complete with "criminal" captions:[37] an excellent but lost opportunity to indicate the positions of the holes in the ceiling of morgue 1!

From such a witness, who claims to have spent "three years in the crematoria and gas chambers of Auschwitz" (as the subtitle of his book informs us), one expects something better than this dull description.

But this should not surprise us. As I have indicated elsewhere, here as in many other important places of his book, Filip Müller has done no more than plagiarize the account given by Miklos Nyiszli, of which the German translation appeared in 1961 in the magazine *Quick* published in Munich, Bavaria.[38]

In this specific case Müller has added on his own the odd idea of the spiral – as though Zyklon B could evaporate during the few seconds it spent spiraling down this chute before arriving at the long floor!

2.2.6. Salmen Lewenthal

This witness is even more vague than Filip Müller. From the passage cited by Provan (p. 5), one cannot even gather the number of "small upper doors."

I will subsequently return to the witnesses Höss, Schultze and Tauber.

2.3. The Air Photos

In paragraph III (pp. 12-14) Provan examines the photographs taken by the United States Air Force during the war. In some of the photographs of the roofs of morgue 1 of crematoria II and III, such as in the one taken on August

---

35 Filip Müller, *Sonderbehandlung. Drei Jahre in den Krematorien und Gaskammern von Auschwitz*. Verlag Steinhausen, Munich 1979, p. 96.

36 Zyklon B was not constituted of "crystals," but an inert support base – during the 1940s normally gypsum with a small amount of starch – soaked in hydrogen cyanide.

37 Filip Müller, ibid., p. 287.

38 *Auschwitz: un caso di plagio*, Edizioni La Sfinge, Parma 1986; English translation: "Auschwitz: A Case of Plagiarism," *The Journal of Historical Review*, 10(1) (1990).

25, 1944, there appear irregular dark patches that – as Provan recalls – Brugioni and Poirier have interpreted since 1979 as "vents used to insert the Zyklon-B crystals." Since then, these patches have become a "proof" of the existence of devices for introducing Zyklon B into the presumed homicidal gas chambers.

Provan is not in agreement with the interpretation of Brugioni and Poirier and maintains:

> *"No matter what one thinks of the authenticity of the smudgy marks, it is impossible to view them, whether authentic or not, as 'vents.'"* (p. 13)

Provan concludes:

> *"So we are hesitant to use the aerial photographs as proof that there were roof vents for Zyklon B."* (p. 14)

In fact, the interpretation of Brugioni and Poirier creates insuperable difficulties. The first is that these patches are not shadows. At the second (1988) trial of Zündel, Kenneth R. Wilson, an expert in photogrammetry and aerial triangulation, testified – according to Barbara Kulaszka's report – that in the air photo of May 31, 1944, "the patches on top of the morgue at crematorium II were flat and had no elevation." As for the photograph of August 25, 1944, "he determined that the patches were not shadows but did not have any elevation."[39]

In the second place, as other authors have since pointed out,[40] in the photograph of August 25, 1944, the patches on the roof of morgue 1 of crematorium II have lengths of 3-4 meters, and those on the roof of morgue 1 of crematorium III have a minimum area of three square meters. Moreover, all the patches have their axis oriented in a north-south direction, whereas the axis of the chimney's shadow is aligned in a north-east/south-west direction. Finally, let me add that in the air photo of May 31, 1944 (see Ill. 4), there appears a single dark patch at the western edge of the roof of morgue 1 of crematorium II.[41]

Crematorium II of Birkenau, May 31, 1944

Since the above patches were not shadows, what then were they? Kenneth R. Wilson advanced the hypothesis that they were "discolorations on the surface of the roof."[42] John C. Ball claimed that these are not discolorations of

the roof but of the negative, that is, marks that had been put onto the negative by a forger.[43]

There are, however, less radical explanations. For example, the marks may have been by some kind of flat vegetation on the roof, because the morgues were covered with earth to keep them cool. However, this does not explain why these marks are visible on some photos but not on others.

Another explanation could be that the soil covering the morgues had to be removed temporarily for repair purposes. The roofs of morgue 1 of crematoria II and III were made of reinforced concrete 18 cm thick,[44] insulated from rainwater by a layer of bitumen, which was protected from atmospheric agents by a thin layer of cement. It is conceivable that this thin layer of concrete had been damaged, resulting in leaks,[45] which could have led the Central Construction Office to have the soil removed in order to perform the reparations necessary. But it seems more likely that such a soil removal would have been done in large areas, but not in areas merely 3 m long and 1 m wide. There is also no documentary evidence for such repair works.

A final possibility is that the morgues were not at all covered with earth at the time these photos were made, and that the marks indicate areas were the upper concrete layer had been damaged and the lower layer of black bitumen emerged, creating the patches which are seen on the air photos.

2.4. The Plans of Morgue 1 of Crematorium II

Referring to Robert Faurisson's discovery of the fact that the presumed gas chamber of crematorium II is designated "morgue 1" in the original plans of crematorium II in Birkenau, and that no holes in the ceiling are displayed for this locality, Provan notes:

> *"Though these two discoveries are important, let us observe that they are in agreement with an interrogation which took place over 50 years ago."* (p. 15)

Next Provan cites an extract from the interrogation that Rudolf Höss underwent on April 1, 1946, which he summarizes and comments upon as follows:

> *"Note that Höss mentioned several times that he was forbidden to discuss the execution of the Jews with anyone. Upon his return to Auschwitz he began working on the plans for extermination facilities by instructing*

[44] Measurement by the author among the ruins of Morgue 1 of Crematorium II.

[45] Whoever has worked in the field of building construction knows that a thin layer of cement covering a large area, if it cannot be reinforced with a scaffolding of iron rods, inevitably tends to disintegrate.

his construction chief (whose name was Bischoff). He ordered Bischoff to begin work on a large crematorium, the plans of which were sent to Himmler. Subsequently, Höss figured out the changes needed to convert the crematorium into a homicidal facility, and sent them to Himmler. The changes were approved." (pp. 15f.)

In concluding, he writes that the "gas chamber" was called "morgue 1" and that no holes were described for the introduction of Zyklon B:

"since the man in charge of it was not permitted to know of its real purpose, and therefore did not draw them on the plans." (p. 16)

Provan's conclusion is therefore based on the statements of Rudolf Höss. But are his statements reliable? To answer this question let us now examine the context in which they are placed.

Höss maintained that he received the order to exterminate the Jews in Berlin from Himmler personally in July 1941.[46] On that occasion Himmler explained that

"the extermination camps in Poland that existed at that time were not capable of performing the work assigned to them."[47]

Then, to a specific query of the interrogator, Höss responded:

"There were three camps: first, Treblinka, Belzak [sic] *near Lemberg and the third one was about 40 kilometers in the direction of Kulm. It was past Kulm in an easterly direction."*

The third "extermination camp" should have been Sobibór. Nevertheless, the geographic direction given by Höss is mistaken since "Kulm" corresponds to the Polish "Chelmno," while the neighboring city of Sobibór is "Chelm," which in German is called "Cholm."

Therefore, when Höss claimed that Himmler had informed him that

"the camps in Poland were not suitable for enlargement and the reason why he had chosen Auschwitz was because of the fact it had good railroad connections and could be enlarged"[48]

and ordered him

"to look at an extermination camp in Poland and eliminate in the construction of my camp the mistakes and inefficiency existing in the Polish camp,"[49]

he understood that, according to Himmler, in July 1941 there already existed the "extermination camps" of Treblinka, Belzec, and Sobibór, exactly as Höss described them during the interrogation of March 14, 1946, when he declared:[50]

---

[46] Testimony of Rudolf Höss taken at Nuremberg, Germany, on April 1, 1946, 1470 to 1730 by Mr. Sender Jaari and Lt. Whitney Harris, pp. 17-19.

[47] Ibid., p. 20.

[48] Ibid., p. 26.

[49] Ibid., p. 25. Provan cites this passage on p. 15.

[50] NO-1210.

"I was ordered to see Himmler in Berlin in June [sic] *1941 and he told me, approximately, the following: The Führer ordered the solution of the Jewish question in Europe. A few so-called extermination camps are existing in the general government (Belzek* [Belzec] *near Rava Ruska, eastern Poland, Tublinka* [Treblinka] *near Malina* [Malkinia] *on the river Bug, and Wolzek*[51] *near Lublin."*

Let us now turn to the interrogation of April 1, 1946. Höss declared there that he had visited the Treblinka camp before constructing his extermination facilities at Auschwitz. The purpose of his visit was precisely to "eliminate in the construction" of his "camp the mistakes and inefficiency" of Treblinka. Höss describes at length the presumed extermination procedure at Treblinka, specifying

"at that time the action in connection with the Warsaw Ghetto was in progress, and I watched the procedure."[52]

Also this description reproduces what Höss declared at the interrogation of March 14, 1946:[50]

"I visited the camp Treblinka in Spring 1942 to inform myself about the conditions. The following method was used in the process of extermination. Small chambers were used equipped with pipes to induce exhaust gas from car engines. This method was unreliable as the engines, coming from old captured transport vehicles and tanks, very often failed to work. Because of that the intakes could not be dealt with according to the plan, which meant to clear the Warsaw Ghetto. According to the Camp Commandant of Treblinka 80,000 people have been gassed in the course of half a year."

Rudolf Höss recounted the same story also at the interrogation of April 8, 1946:[53]

"I had the order to create extermination facilitations in Auschwitz in June 1941. At that time, three other extermination facilities already existed in the Government General: Belzek, Treblinka, and Wolzek. These camps were under the jurisdiction of the Einsatzkommando of the Security Police and the SD. I visited Treblinka to determine how the exterminations are being executed. The camp commander of Treblinka told me that he has liquidated 80,000 within half a year. His main task was the liquidation of all the Jews from the Warsaw ghetto. He used carbon monoxide gas, and according to him his method was not efficient. When I erected the extermination building in Auschwitz, I therefore used Zyclon B, a crystalline blue acid [sic]*, which we threw into the death chamber through small openings."*

So Höss affirmed that in June or July 1941 there were already in existence the camps of Belzec and Treblinka, and that he had visited the Treblinka camp

---

[51] This camp never existed. It should correspond to "Sobibór," but it is absolutely incomprehensible how Höss could have transformed "Sobibór" into "Wolzek."

[52] Testimony…, op. cit. (note 46), p. 27.

[53] PS-3868.

"in Spring 1942," but before the construction of the "extermination building" at Auschwitz; that is, at the latest before the installation of the so-called "Bunker 1" – which should have entered into service on March 20, 1942,[54] or in May 1942, according to Pressac.[55]

Nonetheless, the Belzec camp was opened on March 17, 1942,[56] and Treblinka on July 23, 1942.[57] In conclusion, these two camps did not exist in 1941; therefore the statements that Höss attributes to Himmler are false. What is more, since Höss could not have visited Treblinka before the start of the presumed extermination at Auschwitz, his account of it is false.

Thus, the declarations of Höss cited by Provan are contained in this context of manifest historical falsehood. Why then should one believe in their truthfulness?

Hence the context leads one to seriously doubt the reliability of the declarations of Rudolf Höss which Provan cites.

Let us now examine the substance of Rudolf Höss' statements. He maintains:[58]

> *"I immediately got in touch with the chief of a construction unit and told him that I need a large crematorium."*

This took place in June or July 1941 on his return to Auschwitz from the meeting with Himmler in Berlin. Nonetheless, the first plan of the new crematorium – the future crematorium II – was drawn up by SS-Untersturmführer Dejaco on October 24, 1941,[59] that is, three or four months later, which is hard to reconcile with the adverb "immediately." The second plan of the crematorium was realized in November 1941 by the architect Werkmann of the SS Main Office Budget and Buildings.[60] This shows that the construction of this facility was not a local secret affair. Höss then states that he "changed" the plans "in accordance with the real purpose" of Himmler's instructions – that is, he modified the original plans, thus transforming a simple hygienic and sanitary facility into an instrument for extermination – and sent these plans so modified to Himmler, who approved of them.[61] The definitive plan for the

crematorium was completed at Auschwitz in January 1942.[62] Yet according to Pressac, the first presumed "criminal" modification of these plans can be found in plan no. 2003 of December 19, 1942.[63] Therefore, Höss would have had to have waited twelve months before initiating the criminal modification of the crematorium! I say "initiating" because, as Provan states, the holes in the ceiling of morgue 1 of crematorium II would have been made between the end of January 1943 and the middle of March 1943 (pp. 18f), so that Höss would have had to wait at least another month before carrying out this indispensable modification in order to use the above locality as a homicidal gas chamber. I shall return to this essential point in chapter 2.6.

On the other hand, the claim of Rudolf Höss that he created at Auschwitz installations for extermination without informing the head of the Central Construction Office beforehand is decisively nonsensical, considering our knowledge of the structure, functions, and duties of this office.[64] This is even truer of the presumed "criminal" modifications to crematorium II. In fact, if Bischoff had transformed the so-called "Bunker 1" by May 1942 into a homicidal gas chamber (and in June the so-called "Bunker 2"), and if the mass extermination of the Jews had begun by July 4 at the latest,[65] then Himmler's "secret" at Auschwitz was revealed and Bischoff could not but have been perfectly informed of it. If so, why then did Höss have to continue transforming crematorium II into an extermination facility, gradually and secretly, without the knowledge of Bischoff who now knew the "secret"?

All this is nonsensical; so the statements of Rudolf Höss are false also on this score.

These assertions are not only false, but they are also contradictory, because in his declaration given at Krakow on January 29, 1947, Rudolf Höss stated:[66]

> *"Plans for the gas chambers, in which people in Oswiecim were poisoned with Cyklon B, were made by Karl Bischoff, chief of the Construction Office of the concentration camp, and by me. The project was later discussed with the chief of Office Group C, Dr. Ing. Kammler. The construction of the gas chambers was performed by the camp's Construction Office under the direction of its chief, Bischoff."*

This is exactly the opposite of what Höss said in the declaration of April 1, 1946, quoted by Provan.

A final observation: A further "criminal" modification of the basement of crematorium II was supposed to be the change of the entrance staircase to

---

[66] R. Höss, Deposition. Krakow, January 29, 1947. NI-7183, p. 3.

morgue 2. Even though this entrance was less important to the extermination process than the holes in the ceiling of morgue 1 (because the victims could enter the basement through the entrance on the north side of the crematorium),[67] this staircase modification does appear in the plan attached to the documentation on the "negotiation of handing over" of the crematorium to the Kommandantur.[68] But then why do the much more important holes for introducing Zyklon B not appear in this plan?

In conclusion, while it is true that the plans for the crematoria are "in accord with [the respective passages of] the statement of Höss" (p. 30), these "statements" are not "in accord" with historical reality. Therefore Provan's arguments are altogether untenable.

2.5. The Terrestrial Photographs of Morgue 1

In paragraph V, "German wartime photographs of morgue 1 of crematoria 2 and 3," Provan analyzes the four photographs adduced by Pressac as proof of the existence of chimneys for the introduction of Zyklon B on the roof of morgue 1, and Provan comes to the conclusion that in reality these prove nothing.

Photograph 1 (negative number 20995/507 from the Auschwitz Museum):

"Try as we might, we cannot see any of these openings on the photograph." (p. 17)

Photograph 2 (negative number 20995/494 from the Auschwitz Museum):

"It is our conclusion therefore, that whatever they are, they are not the Zyklon B insertion chimneys spoken of by the eyewitnesses." (p. 18)

Photograph 3 (negative number 20995/460 from the Auschwitz Museum):

"Since the object, whatever it is, isn't on the roof at all, this is conclusive evidence that it was not a Zyklon B introduction chimney." (p. 18)

Photograph 4 (negative number 20995/506 from the Auschwitz Museum):

"The roof is covered with snow, and no vents for Zyklon B are visible. Since the picture is dated from January 20-22, 1943, we can deduce that any holes for Zyklon B insertion must have been put in after that date." (p. 18)

On the subject of photograph 1, some additional remarks can be made, which I owe mainly to Jean-Marie Boisdefeu. Jean-Claude Pressac[69] believed that he was able to see on this photograph "openings for the introduction of Zyklon B" on the roof of morgue 1 (see Ill. 1, p. 317). The image was taken from the sewage treatment plant, which was located south of crematorium II and was composed of twelve decantation basins arranged in three rows of four

[67] The one appearing in plan 2003 of December 19, 1942.
[68] J.-C. Pressac, op. cit. (note 9), pp. 311f.
[69] J.-C. Pressac, op. cit. (note 9), p. 341.

basins each in an east-west direction (or four columns of three basins in a north-south direction). The photographer stood in front (to the south) of the installation, at the third decantation basin (counting from the east) of the first row (from south). The photograph shows, in fact, three decantation basins (in front) and the two foot-bridges which ran along the first two columns of basins (on the right).

The crematorium had ten pairs of windows.[70] There were eight dormer windows on the roof, somewhat off-set with respect to the pairs of windows. The center of the photograph is roughly below the first pair of windows, at an angle of about 15 degrees, which causes the left edge of the photo to be practically perpendicular to the line of the crematorium building.

On the far left of the photograph, the field of view ends with the eighth pair of windows and the sixth dormer window on the roof. An air photo taken on May 31, 1944, shows the sewage treatment plant and crematorium II with its morgue (see Ill. 2). In the reproduction shown on p. 317, I have marked "A" the point where the photographer stood, "B" is the left hand edge of the field of view and "C" its center. Morgue 1, "L," was mainly outside of the field of view and could not be seen on the photograph: the only portion visible is the south-eastern corner, but for less than one meter of its width, as is clearly shown by the drawing of the southern façade of the crematorium, of which I present the section which interests us here (Ill. 3). I have marked (8, 9, 10) the eighth, ninth, and tenth window, as well as (6, 7) the sixth and seventh dormer window and ("A") the left hand edge of the field of view of the photograph in question. Hence, the object which Pressac has taken to be an opening for the introduction of Zyklon B is below the first window of the eighth pair of windows (from east), i.e. completely outside of the surface of the morgue and in the position marked "B" in Ill. 3.

2.6. The Arguments of Pressac and Van Pelt

To Germar Rudolf's observation that forcing openings through the finished roof of morgue 1 "would truly be an incredibly stupid piece of bungling,"[71] Provan responds:

> *"We do not see why this would be so. We have already seen that Höss could not even tell his SS architect about the building's real purpose, and we can observe that all of the blueprints call that gas chamber 'morgue 1.'* [...] *So we see no problem with this method being the method of creating Zyklon B holes in the roof of morgue 1."* (p. 19)

---

[70] Cf. the drawing of the southern façade of the crematorium 1173-1174(r) in: J.-C. Pressac, op. cit. (note 9), pp. 274f.

[71] G. Rudolf, *Das Rudolf Gutachten*, 2. ed., Castle Hill Publishers, Hastings 2001, p. 88; Rudolf, *The Rudolf Report*, op. cit. (note 2), p. 125.

This statement deserves an adequate response.

As I have shown in chapter 2.4., Provan's hypothesis regarding the criminal transformation of the crematoria without the knowledge of the head of the Central Construction Office is completely untenable. Therefore this cannot explain why the roof of morgue 1 was constructed without holes for introducing Zyklon B.

Hence, the question of why the ceiling of morgue 1 of crematorium II was constructed without holes for introducing Zyklon B remains unsolved, but is far more serious than Provan thinks. In fact, this is in blatant contradiction to the thesis of the transformation of crematorium II in the criminal sense – a thesis which Provan himself adheres to.

Pressac maintains that crematorium II, like crematorium III, was planned and constructed as a normal facility for hygienic and sanitary purposes,[72] but at the end of October 1942 the Central Construction Office decided to transfer the presumed homicidal gassing activity from the so-called "Bunker" to the crematoria of Birkenau. In fact, from the end of 1942 the original plans of the basement underwent various modifications, in which Pressac sees "criminal traces" of the transformation of the basement for homicidal purposes with the installation of a gas chamber in morgue 1 and of an undressing room in morgue 2. The modification Pressac emphasizes most is that in plan 2003 of December 1942: the corpse chute is not included on it. This implies, the French historian tells us, "the unique possible access to the morgue became the north stairway, which implies that the dead will have to descend the stairs on foot."[73]

Pressac's interpretation has been accepted in its general line of argument by all western historians who support the existence of homicidal gas chambers at Auschwitz, such as Robert Jan van Pelt, who took it up in his book *Auschwitz 1270 to the Present* (written in collaboration with Debórah Dwork),[74] where he quotes, without even giving a source, the following comment of Pressac:[75]

"The victims would walk to their death."

I have shown elsewhere, however, that the corpse chute appears on numerous panes of 1943, proving that it was *not* removed:[76]

[75] *Auschwitz 1270 to the Present*, W.W. Norton & Company, New York London 1996, p. 324. Plan 2003 of December 19, 1942, is published by the two authors as Plate 17 in the appendix "Plates. Blueprints of Genocide."

[76] *Auschwitz: The End of a Legend. A Critique of J.-C. Pressac*, Institute for Historical Review, Newport Beach, CA, 1994, pp. 55f.; republished in G. Rudolf (ed.), *Auschwitz: Plain Facts*, Theses & Dissertations Press, Chicago, IL, 2005, pp. 150f.: Plan 2136 of Central Construction Office of February 22, 1943, for crematorium III: J.-C. Pressac, op. cit. (note 9), p. 305; Plan 2197 of Central Construction Office of March 18, 1943, for crematorium II:

In this context, another "criminal trace" cited by Pressac is the term "special basement." In this regard he writes:[77]

> *"To inform Bischoff, Wolter wrote a note on this subject entitled 'De-aeration for the crematoria (crematoria I and II)' in which he designated the 'basement 1 for corpses'* [Morgue 1] *of crematorium II as a 'special basement' (Sonderkeller)."*

This note, written on November 27, 1942, by SS-Untersturmführer Wolter, would have formed part of the presumed plan of the Central Construction Office to transfer the activity "with gas" in Bunkers 1 and 2 to a locality in the crematorium equipped with artificial ventilation and would constitute the first "criminal blunder"– that is, the first indication of "an abnormal use of the crematoria that is inexplicable except as a massive treatment of human beings with gas."[77] Therefore, the term "special basement," which appears in this note, would be a secret code designating a homicidal gas chamber. Pressac's argument is based solely on the presence of this term.

Wolter, in the note under discussion and referring to what engineer Prüfer had told him on the telephone, wrote:[78]

> *"Within about 8 days the firm* [Topf] *will have a mechanic free who can install the de-aeration system when the ceilings of the special basements are ready; also the forced draft blowers for the five three-muffle ovens."*

As we have seen above according to Pressac, the term "special basement" designated "the 'basement 1 for corpses' of crematorium II."

Nevertheless, in this document the term "special basements" is in the plural, and moreover the possibility that it refers also to the "basement 1 for corpses" of crematorium III can be excluded. Although this document has for its object the "de-aeration for the crematoria" [*Entlüftungen für Krematorien*] (that is, for crematoria II and III) in reality it refers only to crematorium II. In fact, it was only in crematorium II that construction work had progressed to the point that within a short period of time the roofs of the basements would be finished. Indeed, by January 23, 1943, the reinforced concrete ceilings of cellars 1 and 2 in crematorium II had already been completed, while in the corresponding localities of crematorium III only the work of isolating the floor from the water-bearing stratum (aquifer) had been finished.[79] Furthermore, the reference to the installation of the "forced draft blowers" only makes sense with respect to crematorium II, in which the five 3-muffle ovens as well as the

77 J.-C. Pressac, op. cit. (note 55), p. 60.

78 Note of SS-Untersturmführer Wolter of November 27, 1942. RGVA, 502-1-313, p. 65.

79 Report no. 1 referring to construction work done on the crematoria and drawn up on 23 January 1943 by Bischoff for Kammler. RGVA, 502-1-313, pp. 54f.

smoke conduits had already been completed, whereas in crematorium III the chimney had been raised up only to the crematorium ceiling.[79] On the other hand, there were two basement rooms in crematorium II for which a "de-aeration system" was foreseen, namely, morgue 1 *and* morgue 2. The first was also furnished with an aeration system, the second only with a de-aeration system, which was installed between March 15 and 21, 1943.[80] It is therefore clear that the "special basements" in Wolter's note were the two morgues of crematorium II. These basements were "special" precisely because they were the only two morgues thus equipped with a "de-aeration system" among the six basements into which the basement of the crematorium was subdivided.[81]

The term "special basement" also appears in a document formerly unknown to Pressac. In the "Construction Report for the Month of October 1942" drawn up by Bischoff on November 4, 1942, one reads referring to crematorium II:[82]

> *"Constructing concrete pressure plate in special basement, walled up the de-aeration ducts and started the inner basement wall."*

The "concrete pressure plate" was the layer of concrete at the floor of the cellars that served to balance the groundwater pressure.[83]

If, as seems likely, the term "special basement" refers in this context to morgue 1, then its use is explained by the fact that this locality, being equipped with a system for both aeration and de-aeration, was probably – as Pressac himself hypothesizes – intended:[84]

> *"to take corpses several days old, beginning to decompose and thus requiring the room to be well ventilated."*

Let us suppose that Pressac's interpretation of the criminal transformation of the crematoria is correct. Let us concede that this "special basement" was morgue 1, and that this was a secret code indicating a homicidal gas chamber.

Then let us see what the consequences of this postulation are regarding the question of the openings we are examining in the roof of morgue 1 of crematorium II.

Pressac maintains that at the end of October 1942 the Central Construction Office decided to transfer the presumed homicidal gassing activity from the so-called Bunker 1 and 2 "to a locality of the crematorium equipped with artificial ventilation, as was practiced in December 1941 in the morgue of cre-

84 J.-C. Pressac, op. cit. (note 9), p. 284.

matorium I."[85] This is how he explains the way, in which the presumed homicidal gassing was carried out in this crematorium [crematorium I]:[86]

> *"Three square holes were made and located in the ceiling of the 'morgue'*[87] *to allow for the introduction of Zyklon B, which was poured directly into the locality whose two access doors had been made gastight."*

As photograph 20995/506 of Auschwitz Museum demonstrates, and as Provan himself admits, the ceiling of morgue 1 of crematorium II was constructed without holes for the introduction of Zyklon B.

If then the "special basement" of crematorium II designated a homicidal gas chamber to be realized according to the model of crematorium I, why did the Central Construction Office not anticipate the holes in the reinforced concrete roof of morgue 1 during the construction of its scaffolding by carpenters?

Therefore, one must imagine that the Central Construction Office, although having planned the transformation of morgue 1 into an homicidal gas chamber at the time when only the concrete floor in this locality had been laid for protection against the water-bearing stratum, would have constructed a ceiling without holes – an essential device for gassing with Zyklon B – and then later, with hammer and chisel, made four holes for Zyklon B in the reinforced concrete roof of the locality which was 18 cm thick!

Unfortunately for Pressac, the technicians of the Central Construction Office were not that idiotic. In fact, as we shall see in chapter 2.7., at the time of laying the concrete they prepared the round hole in the reinforced concrete ceiling of morgue 2 for the passage of piping for the de-aeration system, and they did the same thing in the ceiling of the furnace room for the five intake openings for hot air.

In conclusion, not only is the postulation regarding perforations in the ceiling of morgue 1 to create holes for the introduction of Zyklon B an "inconceivably stupid error," as Germar Rudolf says, but it is also decisively senseless and totally against one of the cornerstones of the thesis of Pressac, van Pelt and Provan himself.

2.7. Archaeological Proofs

In March of 2000 Provan went to Birkenau and made a series of inspections of the ceiling of morgue 1 of crematorium II, which he then documented together with 18 photographs (pp. 37-41).

He mentions eight holes, three of which – numbers 2, 6 and 8 – he considers to be original (pp. 25-26 and 30), that is, chiseled in by the SS in 1943 in

---

[85] J.-C. Pressac, op. cit. (note 55), p. 60.
[86] Ibid., p. 34.
[87] The morgue of the crematorium.

order to introduce Zyklon B into the "gas chamber," so that "the 'No Holes, No "Holocaust"' argument is no longer possible to make, since there are three suitable areas where there are holes in the roof, in accord with eyewitness testimony, with the fourth unobservable."(p. 31)

Let us examine his arguments.

2.7.1. Provan's Two Assumptions

Provan's conclusion rests on the assumption that the presumed holes for introducing Zyklon B measured 25 cm × 25 cm, according to a statement of Karl Schultze (p. 30).

Karl Schultze participated with Heinrich Messing in the installation of the "de- and aeration system" in crematorium II. His dispatch to Auschwitz for this purpose was announced in advance on February 24, 1943, by the Topf firm for the first of March.[88] He worked with Messing in morgue 1 until March 13th, the date on which the ventilation system was definitely put into operation.[89] The day after the first presumed gassing took place,[90] so that the columns described by Tauber had already been installed.[91] By contrast, Schultze mentions no columns, limiting himself to saying:[92]

"In the ceiling were four square openings 25 x 25 centimeters."

Provan fails to notice this contradiction.

2.7.2. The testimony of Michał Kula

The above assumption is moreover categorically belied by the witness Michał Kula. It is necessary to specify that the existence of the holes in question is based exclusively on testimonies, and in this respect the quintessential witness is Michał Kula, inmate no. 2718. I will explain why. First let us see what he declared during his cross-examination on June 11, 1945:[93]

"Among other things made in the locksmith's workshop were the fake showers intended for the gas chambers, as well as the columns of wire netting for introducing the contents of cans of Zyklon into the gas chambers. This column had a height of 3 meters with a square cross-section (width) of about 70 cm. Such a column was constituted of three nets, one inside the

89 *Arbeits-Bescheinigung* of Messing for the week March 8-14, 1943. APMO, AuII-BW 30/31, p. 26.

90 D. Czech, op. cit. (note 54), indicates erroneously the date of March 13th (p. 440).

91 Regarding this Provan writes: "The Pressac date for the beginning of gassing at Krematorium 2 is about the middle of March, 1943, so this would be the latest date for the 'installation' of introduction holes" (pp. 18f.).

92 "Protokolle des Todes," *Der Spiegel*, 40/1993, p. 162. The passage cited by Provan is in English translation on p. 4.

93 Trial of Höss, vol. 2, pp. 99f.

other. The outside net was made of 3 mm iron wire stretched over angle irons measuring 50 mm x 10 mm. These angle irons were found all over the net and the upper and lower parts were linked by an angle iron of the same type. The mesh of the nets was square, measuring 45 mm. The second net was constructed in the same way and was inserted into the interior of the first at a distance of about 150 mm. The mesh of this net was square and measured about 25 mm. Both nets on angle irons were connected by an iron bar. The third part of the column was movable. It was an empty column made of a thin zinc lamina with a square section of about 150 mm. At the top it terminated in a cone and below in a flat square base. Angle irons of sheet metal were welded onto a thin bar of sheet metal at a distance of about 25 mm from the edge of this column. On these angle irons a thin net was stretched with square mesh of about 1 mm. This net ended at the base of the cone and from there toward the upper extension of the net ran a framework of sheet metal along the full height to the vertex of the cone. A can of Zyklon was poured from above into the distribution cone and thus a uniform distribution of the Zyklon on all four sides of the column was obtained. After evaporation of the gas the entire central column was withdrawn and the evaporated silica removed."

Kula was a member of the "inmate locksmith shop" as a turner. His number appears in a document with a stamp dated February 8, 1943, and having for object "Inmate locksmith shop. Listing of inmates," in which the numbers of the 192 detainees who belonged to this workshop are recorded.[94] The inmate locksmith shop was one Kommando of various work shops of the Central Construction Office specializing in various building sectors, in which the Kommandos of inmates operated, usually specialized workmen.

The Kommandos of the workshops did their work in all construction sites, including the crematoria. Following the practice of 1942, the head of construction or leader of construction, who needed the service, first submitted a request to the materials administration with the correct, numbered form. If the request was authorized, the head of workshop imparted the task to the Kommando concerned by means of the appropriate numbered form, in which the type of work to be done was indicated. The Kommando, which carried out the work, then compiled a work-card, in which the job number, the Kommando, the consignee, the commencement, and the end of the work was indicated. On the back of the card the materials used were listed and the cost of the materials plus the work. The inmate locksmith shop had a different card, on which was recorded: the inmate detail, the object of the work, the customer, the start and end of the work, the name of the detainee, his qualification, and the time it took him to do the work. The back of the card was not different from the other card model. The Kommandos were subdivided into inmate details that operated

[94] RGVA, 502-1-295, p. 63.

under the responsibility of the head of the detail and of an Ober-Capo. If the service of the work was the manufacture of any object, the consignee signed a numbered receipt upon receiving said object.

On February 8, 1943, the 192 detainees of the inmate locksmith shop, who were under the authority of SS-*Unterscharführer* Kywitz, were subjected to the D.A.W. (Deutsche Ausrüstungswerke = German equipment works).[94] Beginning from the next day, the orders that had been placed with the workshop were noted in a register, which comprised the following headings: date of arrival of orders, serial number of D.A.W., reference, object, number of used working hours, start and end of the work. Then relative data was extracted from the work-cards. The register also contained an indication of the number and date of the orders based on appropriate forms. The Central Construction Office supplied these workshops with the necessary material and issued a delivery order in their favor. When the work was done, D.A.W. sent the Central Construction Office the relative invoice.[64]

The numbered form, in which the type of work to be carried out was indicated, bore, as a rule, the plan that showed the form and size of the object to be constructed and listed the necessary materials. An example appears in order no. 67 of March 6, 1943, see Ill. no. 7 and 8.[95]

This order appears in the register of the inmate locksmith shop in the following terms:[96]

> *"8. March 43. no.165. POW camp. crematorium BW. 30 b and c. Object: 64 pieces stone screws made of round iron 5/8" Ø according to sketch as provided. Delivery time: urgent! Constr. Off. order. no. 67 of March 6, 43. Completed: April 2, 43."*

So if Kula really built the above contraption, then it was the object of a specific order of the Central Construction Office, in which there was a sketch indicating the structure and exact dimensions of the device's various parts, and Kula constructed it on the basis of this sketch. Having therefore studied the sketch and then having created the device, Kula was the person who best understood it and who could best describe it. Consequently, in this respect he is the number one witness.

On the other hand, the description of the device for introducing Zyklon B that was supplied by Henryk Tauber in his deposition of May 24, 1945, agrees with that of Kula, as can be seen from the following translation made from the original text:[97]

> *"The vault of the gas chamber rested on concrete pillars along the center of its length. On the left and on the right of these pillars there were four columns. The outside part of these columns was made of grills of thick steel*

---

[95] APMO, BW 1/31/162, pp. 328-328a.
[96] The trial of Höss, vol. 11, p. 86.
[97] The trial of Höss, vol. 11, cross-examination of Henryk Tauber of May 24, 1945, pp. 129f.

wire that went up to the ceiling and into the exterior. Inside[98] *this part was a second net with smaller mesh and holes, and in its interior a third* [net] *was planted. In this third net a box was moved by means of which, using a steel wire, the powder – from which the gas had by now evaporated – was withdrawn."*

Consequently, compared with the testimony of Kula, the testimony of Karl Schultze is totally insignificant, because – as we have seen above – he only mentions the holes but not the columns and hence did not see the columns at a time when they would necessarily have been present, or because he was a chance witness. Additionally, his testimony was made while he was in Soviet custody, where his two colleagues died, one of them during the interrogation![99]

In conclusion, if the columns measured 70 cm × 70 cm, the holes in the ceiling of morgue 1 of crematorium II could not have measured 25 cm × 25 cm.

The second assumption, upon which Provan bases his conclusions, is the "rule of architecture," according to which

"when violent stress is put on a concrete structure, cracks show up passing through holes made previous to the violent force, since the holes makes the structure weaker in that location." (p. 26)

Provan has distorted a "rule" mentioned and applied by Germar Rudolf in his analysis of the openings in question:[100]

"An opening pierced through the concrete in the roof of either morgue 1 ('gas chamber') in consideration at a later time would inevitably have had the consequence, when the building was blown up, that the breaks and fissures caused to the roof by the explosion would have run preferentially through these holes.

The reason for this is that explosions exert extraordinarily great forces, and that the formation of cracks is favored by any weakness in the structure, since the tension peaks attain very high values in the vicinity of acute angles (notch effect, see Fig. 48). Such holes, in particular, which would already have damaged the structure of the concrete due to their incorporation following completion of the structure, represent not only points of likely fracture, but points of inevitable fracture."

---

98 "Za," literally "behind."

99 Together with the Topf engineers Kurt Prüfer and Fritz Sander, Schultze had been abducted by the Soviets and interrogated by the KGB. Sander died already at the beginning of the interrogation following a heart attack, Prüfer died a few years later following a brain hemorrhage. The value of confessions gained by the KGB with such interrogation methods is close to zero. See Jürgen Graf, "Anatomie der sowjetischen Befragung der Topf-Ingenieure," *Vierteljahreshefte für freie Geschichtsforschung*, 6(4) (2002), pp. 398-421. Editor's remark.

100 R. Kammerer, A. Solms (ed.), op. cit. (note 2), pp. 27f.; G. Rudolf, op. cit. (note 71), p. 89 (German), op. cit. (note 2), p. 126f. (Engl.).

2.7.3. Provan's Analysis of "Criminal" Hole no. 2

Provan adopts this "rule" in the following way to explain hole no. 2:

> *"According to the testimony of the witness Schultze, the Zyklon B holes were only some 25 cm square when he saw them (in 1943). We do not see why a small hole couldn't be made much larger after suffering a violent shock of a massive explosion, so violent as to lift the entire southern end of the roof into the air high enough to smash a hole in the roof at Pillar 1 on the way down. If some of the holes in the nearby oven room were entirely destroyed in the explosion, we think it reasonable to suppose the cause for Hole 2 being so large now, is the same demolition work. Bear in mind that the explosions which occurred were strong enough to open holes in the ceiling where none had been before, and one will recognize the power to make a smaller hole bigger. So we posit a smaller hole originally, made larger by the explosives."* (pp. 27f.)

This hypothesis is unfounded, because it is not covered by the rule mentioned, which concerns only cracks emanating from existing weak spots, not that existing holes would be increased in their size. Provan's hypothesis is also refuted by the facts.

The explosion in morgue 2 of crematorium II was still more violent than that in morgue 1 since it destroyed nearly all the roof of the locality, except for a small part at the east end. Now it is precisely on this part of the roof that there is a round hole through which passed the piping for the de-aeration (*Entlüftung*) of morgue 2 (see Ill. 9-11).

This hole, with a diameter of 38 cm,[101] has not suffered any damage from the explosion: its edges have remained intact (see Ill. 11). Especially round holes, which have been planned from the started and are reinforced, are not weak spots of the reinforced concrete, in particular because they do not have any acute angles.

Also the ventilation holes that existed in the reinforced concrete ceiling of the furnace room in crematorium III, which have been planned in from the start and whose edges were reinforced, have also remained intact or are damaged, but in such a way that their rectangular form remains clearly recognizable. These holes measured 80 cm × 50 cm,[102] were 5 in number, and each was placed on the ceiling above the central muffle of each crematory oven.[103] As Pressac has noted, these are clearly visible in a photograph of crematorium II

[101] Measurement of the author. Pressac publishes 5 photographs showing the same hole, but the diameter he gives is erroneous (25 cm). J.-C. Pressac, op. cit. (note 9), p. 365.

[102] Measurement by the author of the ruins of Crematorium III.

[103] See the Topf plan D 59366 of March 10, 1942, "Schnitt b-b" where one reads: "These openings are located above the center of each oven." J.-C. Pressac, op. cit. (note 55), document 15 (plate).

taken at the beginning of 1943.[104] Illustrations 12 and 13 show the first two holes from the west, one intact, the other slightly damaged.

Pressac has published a photograph in which all five holes appear (Ill. 14). Starting from the hole nearest the lens (from the east), the first is damaged but recognizable as a hole. The second is indistinct since from it emerges one of the reinforced concrete pillars that supported the attic of the furnace room. The remains of a pillar also jut out from the first hole. The two holes are linked by a long crack that was evidently caused by the collapse of this part of the ceiling on these two pillars. The third hole appears to be slightly damaged; the fourth and fifth are intact.

Therefore, of five[105] holes originally placed on two reinforced concrete roofs that were blown up by the SS and of which we have visual documentation, three remain intact, one is slightly damaged and the other has suffered more serious damage but is nonetheless easily recognizable as a hole: the rectangular squaring and the straight internal edges are still clearly visible.

It is a matter of fact that cracks, if they formed at all, would primarily run through acute angles, but that properly planned and reinforced holes have a lower tendency to form such cracks. It would be different with holes which would have been incorporated after the roof was finished, i.e., by damaging the concrete and the reinforcement structure. But even in such cases one would expect only cracks running through the acute angles of such a hole, but not with an enlargement of the entire hole. There would be no reason for that.

We can see from these considerations that Provan's "rule" was a distortion and falsification of Rudolf's statements, which are simply not applicable in the way Provan suggests.

Hence Provan's conclusion that the existing hole no. 2 in the roof of morgue 1 was enlarged from a smaller hole due to the explosion is totally untenable.

Such a conclusion is also untenable from a technical point of view. The reinforcement of the ceiling of the morgue consisted of a dense lattice of iron rods arranged in the longitudinal and transversal senses, as can be seen in a photograph published by Pressac,[106] of which an enlarged section appears in Illustration 15.

The violent action caused by an explosion is due to the enormous pressure it causes. For example, TNT creates an impact force of 8,100 kg per square meter. Though huge, such a pressure cannot volatize the thick plaiting of iron rods that are found inside the presumed original hole no. 2 of 25 cm × 25 cm

[104] J.-C. Pressac, op. cit. (note 9), p. 367.

[105] The second hole in the attic of the furnace room is too indistinct to judge how much it has been damaged. Moreover, the damage has been caused by the collapse of the attic onto a supporting pillar.

[106] J.-C-Pressac, op. cit. (note 9), p. 338.

(= 625 cm^2).[107] Provan measured this hole to be 89 cm × 52 cm (p. 26), so about 4,630 cm^2. It follows that the explosion would have volatized about 4,000 cm^2 of reinforced concrete and iron bars, leaving only insignificant traces. Nevertheless, all the other holes photographed by Provan – and also others not photographed – show most plainly the remains of the iron bars in the reinforcement, which therefore have not been volatized at all.

Having established that hole no. 2 could not have been enlarged from an originally smaller one, let us now consider another essential question.

As I showed above, by far the most important witness of the presumed columns for introducing Zyklon B is Michał Kula.

He declared that such columns had a square cross-section of 70 cm × 70 cm and a height of 3 meters, so that they ran across the ceiling and protruded above it by 41 (=300-241-18) cm. In order to install such an apparatus it was necessary to make a slightly bigger hole in the reinforced concrete ceiling, let us say of 75 cm × 75 cm.

However, when I measured it in June 1990, hole no. 2 had a trapezoidal form of the longest side being 86 cm and a maximum width of 50 cm (see Ill. 16). The side opposite the longest ran obliquely for 52 cm toward the interior, ending in the shape of a tooth; it then continued parallel to the opposite longest side for a further 40 cm. A distance of 43 cm separated the tooth from the opposite side.

Between 1992 (Ill. 17) and 1997 (Ill. 18), the hole has been coarsely enlarged and squared by blows with a chisel.

As can be seen from a comparison of the Illustrations 19-21, hole no. 2 appearing in the photograph of 1945 has been successively enlarged, especially in its eastern part.

Because the longest sides of the hole measured 50 cm × 86 cm in 1991 and this hole was smaller in 1945, it could not have contained a column with square section 70 cm × 70 cm, so that this hole is absolutely incompatible with the essential testimony of Kula.

When and by whom was this hole made? Illustration 5 was taken by Stanislaw Kolowca, who was engaged on May 29, 1945, as a press photographer by the examining magistrate Jan Sehn.[108] It was published as photograph no. 70 in the court record of the trial of Rudolf Höss[109] and probably goes back to June and July of 1945.

In the expert report on the crematoria of Auschwitz-Birkenau made by Prof. Roman Dawidowski on behalf of Jan Sehn and finished on September 26, 1946, it is stated that on the 12th of May and the 4th of June of 1945 in-

[107] , Clara Giua-Lollini, *Dizionario di chimica generale e industriale*, UTET, Torino 1949, vol. II, under the headword "Esplosivi," p.178.
[108] AGK, NTN, 93, p. 29.
[109] Ibid., p. 45.

spections in the areas of crematorium IV and crematorium II were carried out, where there were discovered:[110]

> *"2 damaged shutters from the ventilation apertures of the gas chamber in this crematorium / zinc sieves 7 cm x 18 cm – order no. 162."*

In this regard, the expert toxicological report made by Dr. Jan Z. Robel on December 15, 1945, specifies that:[111]

> *"4 complete and 2 damaged shutters from ventilation apertures were received on May 12, 1945; these were found during inspection of crematorium II in Birkenau and originated from the ventilation apertures of the gas chamber* [morgue no.1] *in this crematorium."*

The inspection of this presumed gas chamber must have been very thorough, because it led to the discovery of the above six shutters.[112] Moreover, these were not found by accident but were searched for, because Jan Sehn knew of the ventilation system for morgue 1 either from the crematory plans later analyzed by Dawidowski or from the register of the locksmith workshop, from which could be seen that this workshop manufactured 50 shutters of this type for crematorium II.[113]

Nevertheless, Prof. Dawidowski did not mention any holes in the ceiling of this locality in his specialist report that listed nearly all the "criminal traces" that were later taken up by Pressac (including various photographs and eight plans of the crematoria). As for the presumed devices for the introduction of Zyklon B, he limited himself to stating:[114]

> *"Then an SS-man wearing a gas mask opened from the outside the trapdoors of the apertures in the ceiling of the gas chamber and poured the contents of cans of Zyklon B into the evaporation column of* [wire] *nets, which was situated beneath these holes."*

Why did Prof. Dawidowski not mention the most important evidence, that of hole no. 2 in the ceiling of morgue 1? If it existed, this hole could not have escaped the notice of Jan Sehn during his inspection of May 12, 1945. In my opinion, the hole was made during the investigation, ordered by Jan Sehn in order to gain access to the interior of this morgue, because the entry area had collapsed. Sehn hoped to discover proof or evidence of the presumed criminal activity of the SS in this locality. However, it cannot be excluded that the Soviets had previously made it for the same purpose.

A final observation: Pressac has published a sketch of the device described by Kula in the chapter dedicated to the witness Tauber, which Provan has read

---

[110] Ibid., p. 30.
[111] Ibid., p. 72.
[112] Photographs of two of these shutters have been published by Pressac, op. cit. (note 9), p. 487, where they are called "galvanized sheet coverings."
[113] "18.2.43. Nr. 83. [...]. 50 Stick (sic) Blechsiebe 7 x 18 cm. Liefertermin 17.2.43." Trial of Höss, vol. 11, p. 83.
[114] Trial of Höss, vol. 11, p. 45.

with particular care and from which he has taken two citations. As Illustration 22 shows, this drawing indicates both the dimensions of the device (0.7 m × 0.7 m × 3 m) and the documentary source.[115]

Furthermore, the work *Anatomy of the Auschwitz Death Camp*, which Provan knows well since he cites it in note 35 on p. 10, has a chapter written by Franciszek Piper with the title "Gas Chambers and Crematoria," where one reads in connection with the testimony of Michał Kula:[116]

> *"Zyklon B was distributed in the gas chamber through four introduction columns custom-made in the metalwork shops of the camp. They were shaped like pillars and made of two wire grids with a movable core. Cross sections of the pillars, 3 m high, formed a square, each measuring 70 cm."*

In spite of this, Provan never mentions it in his study. Why? And why did he fall back on the irrelevant testimony of Karl Schultze? Evidently it is because the evidence of Kula regarding measurements does not agree at all with any measurements for the holes that are found in the ceiling of morgue 1 of crematorium II today.

2.7.4. Hole No. 7

Study of hole no. 7 allows one to better understand the transformation over the years of hole no. 2. Provan accepts the revisionist argument that this hole

> *"cannot be a Zyklon B insertion hole, for the simple reason that up until a few years ago, the rebars originally running west to east were merely cut at the western end and pulled up and over toward the east. (This was true, though now only one of these rebars remains intact; the rest, as we have observed, have been removed). The Germans would have never constructed a poison gas aperture like this, since it could not be airtight."* (p. 26)

In fact, in 1990 this hole was as it appears in Illustration 23. From the eastern edge of the concrete on the roof of the morgue, five iron bars of length up to 40 cm are bent back; moreover, two transverse iron bars delimit the northern and southern sides of this hole (see Ill. 24) whose edges show evident traces of chiseling.

These iron bars were still intact in 1991 (see Ill. 25) and in 1992 (see Ill. 26). In 1997 only two iron bars remained,[117] and the hole had been crudely squared (Ill. 27). Finally, in 2000 there remained only one single iron bar (Ill. 28).

---

[115] J.-C-Pressac, op. cit. (note 9), p. 487.

[116] Israel Gutman, Michael Berenbaum (eds.), Indiana University Press, Bloomington and Indianapolis 1994, p. 167.

[117] G. Rudolf mentions in his expert report that Australian revisionist Fredrick Toben broke off one of these bars in spring 1997 in a failed attempt to bend it back; German ed.: op. cit. (note 71), note 241, p. 228; Engl. ed.: op. cit. (note 2), note 262, p. 125.

Having established that this was not a hole for the introduction of Zyklon B and that it was not made by the SS, the question remains: who made it and why?

It is certain that this hole and also hole no. 2 were made after the collapse of the locality's roof and were later tampered with to make them look like holes for introducing Zyklon B. In order to complete this theater, a concrete cover from one of the inspection manholes for the sewer of the crematorium (Ill. 29) – that Pressac had earlier found next to this hole[118] – was dropped into hole no. 2.

In conclusion, if there really were four 70 cm × 70 cm square holes in the ceiling of morgue 1, what need would there have been, even for research purposes, to create new holes, even smaller ones?

2.7.5. The "Criminal" Holes No. 6 and No. 8.

Let us consider the holes regarded by Provan as "criminal." Hole no. 6 (Ill. 30 and 31) is a crack clearly caused by the collapse of this part of the roof onto supporting pillar no. 6, exactly like hole no. 1. This does not even have a definite shape like holes no. 2 and no. 7.

Hole no. 8 (Ill. 32) forms a part of a long fracture in the roof of the morgue, due to the fact that this part of the roof separated from the exterior wall (evident in the background of Ill. 33) and collapsed onto Pillar 6 (that appears around the right of the fissure) and Pillar 5, not visible, which is found to the left, under the roof, in connection with the start of the fracture.

This fracture continues to the right of pillar 6 in a large crack in which the lattice of iron rods of the reinforcement is clearly visible (Ill. 34).

Hole no. 8, like no. 6, is a simple fracture without definite shape. Moreover, as can be seen in the enlargement in Illustration 32, a good half of its area (the upper part) is crossed by four iron bars, which confirms on the one hand that we are dealing with a fracture caused by the collapse of the roof, and, on the other, which excludes the possibility that it was an introduction hole for Zyklon B, as Provan admits is the case for hole no. 7. In fact, accepting the revisionist thesis, he denies that this hole served for introducing Zyklon B precisely because of the previous presence on its edges of the reinforcing iron bars (p. 26).

2.7.6. The "Chimneys"

There is another important problem, to which Provan has not paid the slightest attention: the question of the little "chimneys" supposedly constructed on the roof of morgue 1 of crematorium II and whose purpose was to house and protect the metallic nets for introducing Zyklon B – chimneys,

[118] J.-C. Pressac, op. cit. (note 9), p. 229, caption for l document 46.

which, as we have seen above, protruded by 41 cm above the level of the roof. According to Tauber, these chimneys were closed "with a concrete cover" (p. 4), so they must have been made from bricks – something otherwise obvious – and these bricks had to be held together with either cement or lime mortar. Nevertheless, inside the holes now existing in the reinforced concrete roof there is no trace of these "chimneys," and it is impossible that the explosion, which destroyed morgue 1, caused a disappearance of all the bricks and mortar from which they were made.

2.7.7. The Hypothesis of Robert Jan van Pelt

In his report for the Irving-Lipstadt trial, van Pelt provided a peculiar argument to explain the absence of holes in the roof of morgue 1. In fact, he takes it to be "logical" that these holes for the introduction of Zyklon B were closed again by the SS before they blew the roof of the crematorium sky-high![119]

Therefore, the SS would have worried about the Soviets finding traces of the holes for the introduction of Zyklon B and then have left in their hands 5,800 eyewitnesses to the alleged homicidal gassing as well as the entire archives of the Central Construction Office![120]

And all this without taking into consideration the fact that the closure of a big hole in a roof of reinforced concrete would have left easily visible traces, as can be seen in the ceiling of the morgue of crematorium I! When at the end of 1944 this crematorium was transformed by the SS garrison physician[121] into a "gas tight surgery room," round holes for the ventilation piping were made in the ceiling of the former morgue, then subdivided into small rooms. In fact, the August 26, 1944, letter of chief of air protection SS *Obersturmführer* Josten mentioned:[122]

> *"Manufacture of the openings in the masonry necessary for the heating ovens, as well as for the ventilation outlets and intakes and pipes."*

But since the external wall of the morgue was covered with earth (just like the opposite wall on the side of the furnace room), it is clear that holes for the piping of the ventilation system were made through the ceiling. They were subsequently closed again, but in the ceiling of the locality there remain traces still easily recognizable, as can be seen from Illustration 35.

In morgue 1 of crematorium II, a large area of the ceiling is preserved around pillar no. 1, a zone in which the first hole for the introduction of Zyk-

---

[119] *The Pelt Report*, expert report introduced during the trail, op. cit. (note 4), p. 295.
[120] D. Czech, op. cit. (note 54), p. 995.
[121] The relative plan 4287 of September 21, 1944, is titled "*Ausbau des alten Krematorium. Luftschutzbunker für SS Revier mit einem Operationsraum*" (Conversion of the old crematorium. Air-raid shelter for SS hospital with a surgery room). RGVA, 502-2-147, p. 20.
[122] RGVA, 502-1-401, p. 37.

lon B should be found. Yet from the inside, the ceiling shows no sign of having been closed again, and this should have been even more evident because the ceiling still preserves the outline of planks used for the original carpentry work. Illustration 36 shows a section of the ceiling of morgue 1 (east side).

Van Pelt's hypothesis is therefore totally untenable.

2.8. The Reliability of Witnesses Tauber and Kula

Having established that there are no introduction holes for Zyklon B in the reinforced concrete roof of morgue 1 of crematorium II, and that there never were any, it remains to explain the concordance between the testimonies of Kula and Tauber.

It must first be established whether the devices described by the two witnesses were effectively constructed.

If Kula had really built the device he describes, then it was ordered from the inmate locksmith shop of the Central Construction Office by means of a specific order, as we have seen in chapter 2.7. But if this is true, this order ought to appear in the register of the locksmith shop.

On July 25, 1945 – some months after witnesses Tauber and Kula had been heard – the examining magistrate Jan Sehn drew up a record, in which he summarized all orders relating to the crematoria that had been found in the above register:[123]

> *"There are in the book, among other things, the following entries that refer to work done by the locksmith shop in relation to the construction and maintenance of the crematoria."*

Then follows the list of entries of the orders of the Central Construction Office relating to the crematoria. Yet in this long list – which contains 85 orders – the device described by Kula is missing.

Because the first entry is an order slip of the Central Construction Office dated October 28, 1942,[123] the absence of the device described by Kula is not for chronological reasons. Its absence is neither for reasons of "secrecy," since in the register various orders are recorded relating to gas-tight doors,[124] which are claimed to have been ordered for the alleged gas chambers in the crematoria.

On the other hand, even one piece of work carried out by Kula personally appears in the register. In fact, Jan Sehn writes at the end of his list:[125]

> *"Moreover, under the current number 433 of the book there is an entry dated May 20, 1943, with the following drift:*

[123] Trial of Höss, vol. 11, p. 82.
[124] Order 323 of April 16, 1943, Trail of Höss, vol. 11, p. 92. Other references on pages 84 ("4 gas-tight doors"), 90 ("gas tight doors"),
[125] Trial of Höss, vol. 11, p. 97.

'X-ray station women's camp: object: 2 pieces connection pieces for rubber hose. Delivery time – urgent. Hand to Prof. Schumann. Worker: Kula. Finished: 21.5.43.'

Compare the interrogation record of witness Michał Kula dated June 11, 1945."

Jan Sehn knew therefore perfectly well that Kula's statements about the columns for introducing Zyklon B had no documentary basis and were therefore false. But when at the hearing of March 15, 1947, Kula testified as a witness during the Höss trial[126] and once again provided the above description of the columns,[127] nobody confronted him with the fact that the relative order did not appear in the register of the locksmith shop. And the reason for this is easy to understand.

Moreover, something even more surprising is that during his interrogation on June 11, 1945, Kula made explicit reference to the above work done for Dr. Schumann, giving the exact number of the relative order in the register of the locksmith shop:[128]

"From the book of the locksmith shop it emerges that at the time I had to repair this pump / running no. 433."

Hence, he already knew this register, but then why did he not indicate any "running number" for the above-mentioned columns? In this case the response is also easy to comprehend.

It is finally necessary to establish if the testimonies of Kula and Tauber on this matter are independent of each other. Seeing that the descriptions of the columns given by these two witnesses coincide and that these columns were never constructed, it is clear that we are dealing with a concordance of falsehood, so that the question of independence of the testimonies becomes irrelevant. It remains a fact, however, that Tauber and Kula remained at Birkenau until the 18th and 21st of January 1945 respectively, and, considering the close contact that detainees maintained (above all those who belonged to various resistance movements in the camp), the independence of the testimonies seems exceedingly dubious.

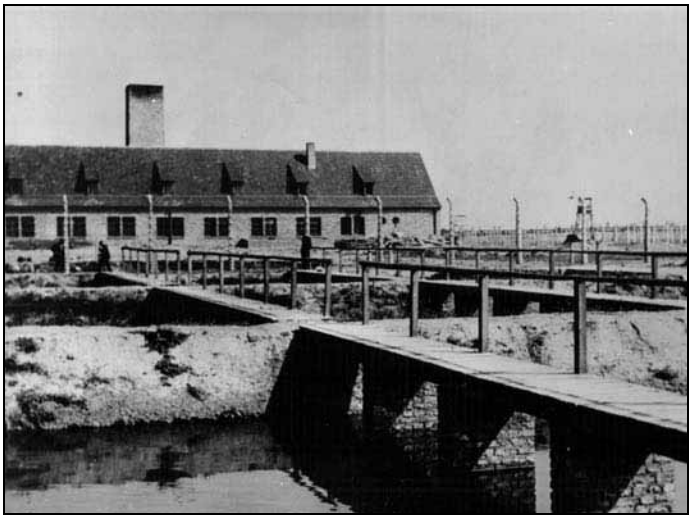
2.9. Conclusions

The thesis of holes for introducing Zyklon B in the reinforced concrete roof of morgue 1 of crematorium II is based exclusively on statements made by self-styled eyewitnesses, in particular by Michał Kula, and there is neither documentary nor material proof to support it. In their turn, these statements

[126] AGK, NTN, 107, p. 467-523.

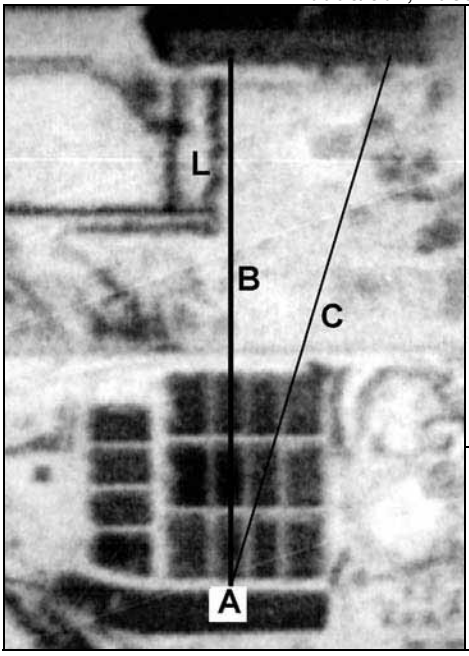
[127] In this deposition Kula said that the columns had a height of 2.5 meters, since he believed that the ceiling of Morgue 1 had a height of only 2 meters. Ibid., p. 498.

[128] Trial of Höss, vol. 2, p. 83.

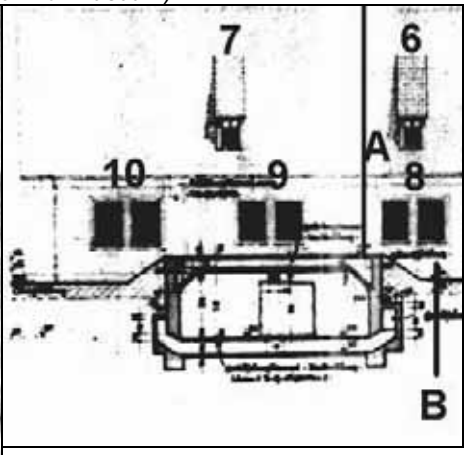


have no verification, either documentary or material, so they are totally unreliable. In its present state, the roof of morgue 1 of crematorium II shows no holes for the introduction of Zyklon B, nor is it possible that they were later closed without leaving any trace. Therefore these holes never existed. This does not justify the slogan "No Holes? No Holocaust," but fully justifies the following conclusion:

No holes, no homicidal gas chamber in crematorium II.



No homicidal gas chamber in crematorium II,
no homicidal gas chamber at Auschwitz.



No Holes, No Gas Chambers!

3. Detailed Study of Crematorium I

3.1. Transformations of Crematorium I (1944 – 1947)

During a visit to Auschwitz on July 16, 1944, SS-*Obergruppenführer* Pohl approved the "Installation of a gas-tight surgery and fragment-proof shelter in the former crematorium for the garrison surgeon,"[1] which became work-site BW 98M.

On August 26, 1944, SS *Obersturmführer* Heinrich Josten who held the post of "chief air-raid warden" wrote to the camp commander a letter on the subject of "modification of the old crematorium for air-raid protection purposes."[2] This project, entitled "Modification of old crematorium. Air-raid shelter for SS sick-bay with a surgery" (Plan no. 4287) was drawn up on September 21, 1944.[3]

On October 17, 1944, SS *Sturmbannführer* Karl Bischoff, Head of Waffen-SS and Police Building Inspectorate "Silesia," wrote a letter to the Central Construction Office requesting that the work, "on account of the urgency," be undertaken immediately without going through the usual bureaucratic formalities.[4]

On November 2, 1944, SS *Obersturmführer* Werner Jothann, head of Central Construction Office, drew up an "Explanatory note re: transformation of the old crematorium into an air-raid shelter with surgery for SS sick-bay at concentration camp Auschwitz O/S. BW 98M."[5]

The same day, he also compiled a "cost estimate for the transformation of the old crematorium into an air-raid shelter with surgery for SS sick-bay at concentration camp Auschwitz O/S. BW 98M," arriving at a total amount of

4,300 RM,[6] and drew a "Location sketch construction of an air-raid shelter for SS sick-bay."[7] The work was completed during the second half of November.

Plan no. 1241 of April 10, 1942, tells us that crematorium I had a morgue measuring 17 by 4.60 m, connected to a "washing room" of 4.17 by 4.60 m, and a "room for laying-out of corpses" of 4.10 by 4.60 meters.[8]

This morgue, according to the official historiography, had been transformed into a homicidal gassing chamber as early as September 1941 by equipping it with two gas-tight doors and by opening up in the flat roof an undetermined number of holes for the introduction of Zyklon B. These openings, in fact, numbered two according to Stanisław Jankowski[9] and Hans Stark,[10] six according to Pery Broad[11] and Filip Müller.[12] For his part, Rudolf Höss, in the session of March 12, 1947, of his trial, speaks of only one such opening:[13]

> *"The gassing occurred in this way: a hole was opened in the ceiling, and through this opening the gas was dropped in – a crystalline mass."*

Finally, the alleged workman for the openings – the detainee Czesław Sułkowski – who should have been the person best informed about their number, size, shape, and position, actually knew nothing in this respect. In his declaration of September 28, 1971, he, in fact, limited himself to an evasive statement, saying:[14]

> *"We had first set up an oven in the crematorium. I myself did the openings in the ceiling of the morgue where the first Soviet POWs were gassed. I saw these Russians when they were taken* [there]. *They stood in the street near the block leader's room between the present hotel and the crematorium, hundreds of them, naked, waiting to be gassed. I saw SS* [men] *dropping the gas through the openings into the morgue."*

The transformation of the crematorium into an air-raid shelter, on the basis of plan no. 4287 of September 21, 1944 (see Ill. 2), was done by splitting the morgue into four rooms by means of three partitions. In the first room, on the south side, which functioned as an airlock, an entrance from the outside was opened up and a small vestibule was installed measuring two by two meters.

13 AGK, NTN, 105, pp. 110-111.

14 APMO, Oświadczenia, t. 74, pp. 6f.

Furthermore, the "vestibule," which lay behind the main entrance to the crematorium, was closed by means of a partition and the other walls were reinforced, resulting in another airlock of 3.87 by 3.45 meters.

According to the letter from Josten already mentioned, "7 pcs. doors gas-tight and fragment-proof"[15] had been planned, but Jothann's estimate of November 2, 1944, mentions "6 pcs. simple interior doors."[16] Actually, for reasons of economy, the camp administration had apparently only three "gas- and fragment-proof" doors installed – those of the two airlocks (still existing) and the one of the access to the oven room, which leaned against a wall of the room oven until 1993. It had probably been removed by the Germans themselves when they changed the layout of the air-raid shelter at some point in 1944 by walling up the door leading into the former oven room. The six partitions were equipped with ordinary doors and the two small cabinets of the toilet received two doors measuring 70 by 200 cm according to the plan no. 4287 and Josten's letter of August 26, 1944: "2 pcs. doors single 70 by 200 cm."[17]

But then what happened to the two alleged gas-tight doors of the alleged homicidal gas chamber? One of them – the one which separated the morgue from the furnace hall – is said to have been dismantled and temporarily replaced by a standard gas-tight air-raid shelter door like the two outer doors.[18] The other, which separated the washing room from the laying-out room, is said to have been removed and replaced with an ordinary door[19] – and all this in a gas-tight air-raid shelter, in which every single door had to be "gas- and fragment-proof"!

Needless to say, at the liberation of the camp not the slightest trace was found of the two gas-tight doors of the alleged homicidal gas chamber, and no trace of them exists in the documentation of the Central Construction Office.

Between 1946 and 1947, the Poles, in an effort to reconstitute the "original state" of the alleged homicidal gas chamber, demolished not only the three partitions mentioned above, but also the one, which separated the morgue from the washing room. In the space thus obtained, they created four openings in the roof – the alleged openings for the introduction of Zyklon B – into which they inserted small wooden casings with lids (see Ill. 11-13). Today, the alleged gas chamber of crematorium I is, therefore, 21.32 m long, i.e. 4.32 m longer than the original room. The Poles also created an opening in the wall linking the morgue with the furnace room (which had been walled up by the SS at some point in 1944), but moved it half a meter out of the original position of the door and gave it a rather crude shape.

[15] RGVA, 502-1-401, p. 34.
[16] RGVA, 502-2-147, p. 12a.
[17] RGVA, 502-1-401, p. 34.
[18] It would have found a logical place in the small vestibule of the lock (*Schleuse*) which remained without a door and where there is only a light wooden door today.
[19] The present door even has a window. Cf. document 14.

3.2. The Alleged Openings for Introducing Zyklon B

3.2.1. Jean-Claude Pressac's Interpretation

In 1989, J.-C. Pressac published one photograph from a series taken by Stanisław Luczko,[20] probably in May 1945 (see Ill. 6). It shows the flat roof of crematorium I. The French historian gave it the title "Dance on the roof of the old crematorium" and commented as follows:[21]

> *"View of the roof of Krematorium I, looking south-north, 1945 (May?). The chimney has not yet been rebuilt. The features of the roof are:*
> – *two ventilation chimneys for the furnace room (two-tone with a dark cap)*
> – *two other brick chimneys, probably for ventilating the air-raid shelter in view of their newly-built appearance*
> – *in addition, on a line parallel to – and to the left of – that on which the two brick chimneys are built, it is possible to see THREE places where the former traps for introducing Zyklon-B have been filled, thus indicating that the morgue had been used as a gas chamber.*
>
> *Above the stage, dominated by a red star with the hammer and sickle, fly the flags of Poland (left) and the Soviet Union (right), with lamps mounted above them.*
>
> *This photograph proves that a dance was organized in 1945 on the roof of Krematorium I, and that people actually danced above the homicidal gas chamber. This episode appears almost unbelievable and sadly regrettable, and the motives for it are not known. This photo also proves that the present covering of roofing felt and the zinc surround of the roof are not original."*

Hence, Pressac undertakes to demonstrate the 1941 creation of three openings in the ceiling of the morgue on the basis of a photograph taken in 1945. Let us look into this question more closely.

The ex-detainee Adam Żłobnicki made the following declaration in a statement given on November 18, 1981:[22]

> *"I remember perfectly well that the openings for the introduction of Zyklon B, which were located on the flat roof of this crematorium, were also remade.*[23] *The reconstruction was made easier by the fact that at the locations of the former insertion openings there remained clear traces after the sealing of the former openings with cement. At these very points, the*

[20] APMO, sygn. 5149. Cf. document 6.
[21] J.-C. Pressac, op. cit. (note 3), p. 149.
[22] APMO, Oświadczenia, t. 96, p. 59.
[23] Earlier, the narrator had spoken of the reconstruction of the chimney of crematorium I that was carried out between late 1946 and early 1947.

openings were re-established and the little chimneys[24] *were raised. This work, too, was done in 1946 – 1947."*

The four shafts constructed by the Poles after the war are located as indicated in document 5. They consist of two parallel pairs along the internal (A-B) and the external (C-D) wall of the morgue. The shafts C and D are 82 cm away from the external wall, shaft A is 90 cm, and shaft B 85 cm away from the internal wall. Hence, the shafts are the corners of an irregular parallelogram with a height of 2.40 m.

What is interesting here is that in the present state of the room shaft D is 5.10 m from the wall with the door to the outside; shaft C is 7.10 m away from the opposite wall, which separated the washing room from the laying-out room; shaft B is 7.10 m away from the wall of the little vestibule near the entrance; and shaft A is 5.10 m from the opposite wall.

Such an arrangement makes sense only in relation to the *present* state of the morgue. It is, in fact, clear that the position of the shafts was based on their distance from the short, transverse walls of the present hall, by rationally subdividing the available length of 21.3 meters: The shafts A and D are 5.10 m, the shafts B and C 7.10 m away from the wall. Oddly enough, the respective distance of shaft B was apparently not measured from the outer wall, but from the wall separating the vestibule. As a result, shaft B was shifted 2 m against shaft D. But at the time when the alleged original shafts are said to have been broken through the ceiling of the morgue, the wall forming the vestibule did not exist, whereas a wall separating the washing room from the morgue was still in place. This means that the locations of today's shafts make sense only when considering the current layout of this room of crematorium I. Hence, these shafts have no relation to the original state of this room.

Considering the *original* structure of the morgue (see Ill. 3), such an arrangement of the shafts is altogether senseless because shaft D would still be at 5.10 m from the wall, but shaft B would be 9.1 m away from it, while shaft A would be only 0.7 m away from the partition towards the washing room, and shaft C some 2.8 m from it.

The irrationality of such an arrangement becomes all the more apparent if we consider that, as a result, the rear half of the morgue, adjoining the washing room, with its surface area of (8.5 m × 4.60 m =) 39.1 m² would have been equipped with three shafts (A, B, C), whereas the other half of equal dimensions would have had only one (D)!

Let us now look at the 1945 from published by Pressac. The three dark spots (designated 1, 2, and 3 in Ill. 6) are aligned parallel to the two brick ventilation chimneys, of which the first one (the one closest to the camera) is located on top of the morgue. Furthermore, the first dark spot appears to the right of the first chimney (S2 in Ill. 4 and 5), whereas in the reconstruction by

[24] The small wooden casings set in the ceiling panels of the morgue

the Auschwitz Museum the alleged opening for the introduction of Zyklon B closest to this ventilation chimney (point "B," see Ill. 3-5) is to its left. If these dark spots were the traces of the alleged Zyklon B introduction openings and if, as the witness Żłobnicki tells us, the present openings were created at the same locations where traces of the original openings appeared, why was no opening made at the point where dark spot no. 1 can be seen? Inversely, the Auschwitz Museum had an opening made (point "C" in Ill. 3-5) at a point where the photograph in question shows no dark spot.

When the crematorium was transformed into an air-raid shelter for the SS sick-bay, the work sheet specified, i.a., "creation of ducts and wall openings for the heating ovens and the intake and outlet of the ventilation system" and, more specifically, "5 pcs. wall openings for devices."[25]

Today the walls surrounding the morgue show no traces of openings. What is more, the outside wall was and still is covered by an earth embankment, as is the rear wall as well, with the exception of the narrow passage through this embankment leading to the entrance door. On the other hand, the front wall is completely bare and has only one window on the side of the morgue. Finally the wall between the morgue and the furnace hall shows no traces of openings either, and it would have made no sense, anyway, to pierce it for the installation of stovepipes or ventilators.

Thus it is clear that the five openings mentioned above were created in the ceiling of the rooms that had been turned into an air-raid shelter.

In the ceiling of the morgue, in its present state, there are two rectangular ventilation shafts, one in a corner of the former laying-out room (the later surgery room, marked as S1 in Ill. 4 and 5), the other in a corner of the second air-raid shelter room seen from the entrance (S2). Due to their location right at the wall, it is generally assumed that these shafts were added during the transformation of the building into an air-raid shelter.

In addition to these two shafts, one can still distinguish the traces of four *circular* openings that have been crudely walled up.[26] They originally had a diameter of about 35 cm. The corresponding traces are situated (as measured from their centers) at 1 m, 7.2 m, 8.5, and 18.30 m from the rear wall of the morgue (where the entrance is today), and at distances of 1.0 m and 1.4 m from the wall between the morgue and the furnace hall (see Ill. 3-5, 7-10).

Because the morgue was 17 m long, the fourth opening is located in the ceiling of the room, in which the corpses were washed in 1942 (the washing room). That is the first proof that those openings had nothing to do with the alleged

---

[25] "Kostenüberschlag zum Ausbau des alten Krematoriums als Luftschutzbunker für SS-Revier mit einem Operationsraum im K.L. Auschwitz O/S – BW 98 M," RGVA, 502-2-147, p. 126.

[26] The left-most room in Ill. 3-5, which originally served as a laying-out chamber and in which today the Kori oil-fired oven from the crematorium at Trzebinia is preserved, is not open to tourists. I have therefore been unable to ascertain whether its ceiling shows traces of any further openings.

Zyklon B introduction devices. The second proof is their shape – circular instead of square.

We therefore have six original openings in the ceiling of the rooms under investigation, four of which have been walled up at some point. The document mentioned above, however, refers only to five openings to be added.

From other documents it can be deduced that there must have been a ventilation opening in the ceiling of the morgue, when it was actually used to store corpses.[27] It can be assumed that opening no. 1 was this ventilation opening, first of all because intelligent design suggests putting a ventilation opening at one end of a long room, and second because the area around opening 1 turned into a vestibule on the building's transformation into an air-raid shelter, for which a ventilation opening was not required.

3.2.2. The Interpretation by the Holocaust History Project

Of late, three members of the Internet-based Holocaust History Project – Daniel Keren, Jamie McCarthy, and Harry W. Mazal – have considered the photograph published by Pressac with the aim to "correct some common misconceptions about the crematorium I gas chamber, specifically about the location of the Zyklon holes."[28]

Even these authors rule out the possibility that the traces of the openings 3 and 4 correspond to the rectangular shaped spots visible on the above mentioned post-war photo as published by J.-C. Pressac, because they have a circular shape:[29]

> *"At two other locations holes were sealed, but these were circular ventilation openings."*

The authors affirm that there were originally five holes for the introduction of the Zyklon B in the roof of the crematorium, a figure which is at odds with all the testimonies. On the photograph in question, they identified the traces of a fourth dark spot in the roofing felt on the roof of the crematorium (see document 6, spot no. 4.), which had obviously escaped J.-C. Pressac's attention. They then state that four of the alleged five holes for the introduction of Zyklon B, which the Poles had created in the post-war years, were sunk exactly where the aforementioned dark spots were located, and labeled them Z3 [= 3 in my document 6], Z2 [= 2] and Z4 [= 4]; dark spot Z1 [= 1] was not reopened, according to the authors, whereas dark spot Z5, which they place between Z3 and Z2, does, in fact, not appear on the photograph.

---

[27] C. Mattogno, *Auschwitz: Crematorium I*, Theses & Dissertations Press, Chicago 2005, docs. 2 and 9; RGVA, 502-1-327, pp. 191f., 502-1-312, p. 111.

[28] D. Keren, J. McCarthy, H.W. Mazal, "The Ruins of the Gas Chambers: A Forensic Investigation of Crematoriums at Auschwitz I and Auschwitz-Birkenau," in: *Holocaust and Genocide Studies*, vol. 9, n. 1, spring 2004, pp. 97-99.

[29] Ibid., p. 98.

The authors claim to have identified the traces of an alleged opening Z1 on the ceiling of the morgue, and provide a photograph of it.[30] It is what remains of the opening which I called no. 2. However, it was not square – as the authors affirm – but round and was not located at the site of Z1 but some 2 m away from it toward shaft B (see Ill. 3-5, 8).

Dark spot Z1 was located practically on the perpendicular of dark spot Z4, as results from the extension of the respective sides (see document 6), and was thus on the prolongation of the axis A-B in front of the present opening D (see docs. 3-5). In this area there is no trace of a walled-up opening in the ceiling of the morgue.

Hence, no opening in the roof of the morgue – current or former – corresponds to dark spot Z1. But then, why should dark spots Z2, Z3, and Z4 correspond to such openings? As a matter of fact, spot Z2 is too far away from ventilation shaft S2 to be identical with today's shaft "B," and spot Z3 is too close to ventilation shaft S1 – probably located over the washing room – to be identical with today's shaft "A." Spot Z4, on the other hand, appears to be too far away from the wall to be identical with today's shaft "D," which is only 82 cm away from the wall.

The authors claim that, when the crematorium was converted into an air-raid shelter, the alleged Zyklon B introduction openings were sealed again,[31] but this assertion, which they owe to Franciszek Piper,[32] has no documentary basis and is disproved by the cost estimate of November 2, 1944, mentioned above, which not only does not mention any kind of closing up of holes, but specifies the creation of five openings in walls, i.e. in the ceiling, as I have pointed out above. If there would have been holes already in the roof, the SS would have used those instead of weakening the roof even further by adding more holes.

The authors furthermore speak of the chemical proof:[31]

> *"As at the other gassing installations in the camp, cyanide compounds can still be detected in the chamber's walls, as forensic examinations by the Cracow Institute for Forensic Research demonstrate."*

They refer here to the article by Jan Markiewicz, Wojciech Gubała, and Jerzy Łabędź.[33] Of the seven brickwork samples taken in the alleged gas chamber (numbers 16 – 22), three gave negative results (samples 18, 19 and

21) and the others showed a maximum content of 292 micrograms (0.292 milligrams) of cyanides per kilogram of material.[34]

Leaving aside the strange decision by the Polish scientists to drop the Iron Blue (or Prussian Blue) from the cyanide compounds to be detected by chemical analysis (which explains the extremely low values they found compared to the samples taken by Germar Rudolf and Fred Leuchter),[35] another point on which the Polish chemists can be taken to task is that they did not indicate exactly from where they took their samples.

Fred Leuchter has done this. The plan of crematorium I in appendix III of his report[36] shows the locations in the present morgue from which he took his 7 samples. One of them, sample no. 28, contained 1.3 milligrams (1,300 micrograms) per kilogram of substance, a value of the same order of magnitude as the other samples, except for one of them.[37] As opposed, however, to those samples, which were taken in the space that originally belonged to the morgue, sample no. 28 – as has already been pointed out by Enrique Aynat[38] – was taken by Leuchter from the wall separating the washing room from the laying-out room, which was not part of the original morgue and thus not part of the alleged gas chamber.

Therefore, the presence of cyanides in sample no. 28 cannot be explained by homicidal gassings, but only by normal disinfestations (or by analytical uncertainties or variations[39]). This raises, of course, the question, what evidentiary value similar cyanide residues can have in the first place.

3.3. Conclusion

The four openings now in the roof of the morgue are not original, and the dark spots, which appear on the photograph published by J.-C. Pressac, were not traces of openings (as borne out by the fact that no trace of a square opening on the ceiling corresponds to any of these dark spots).

Furthermore, sealing any openings in the roof of the crematorium would hardly have left depressions of such clarity. Leveling of the surface of an opening that has been filled with sand mortar and cement needs only a simple wooden board larger than the hole itself; but if one had wanted to create such

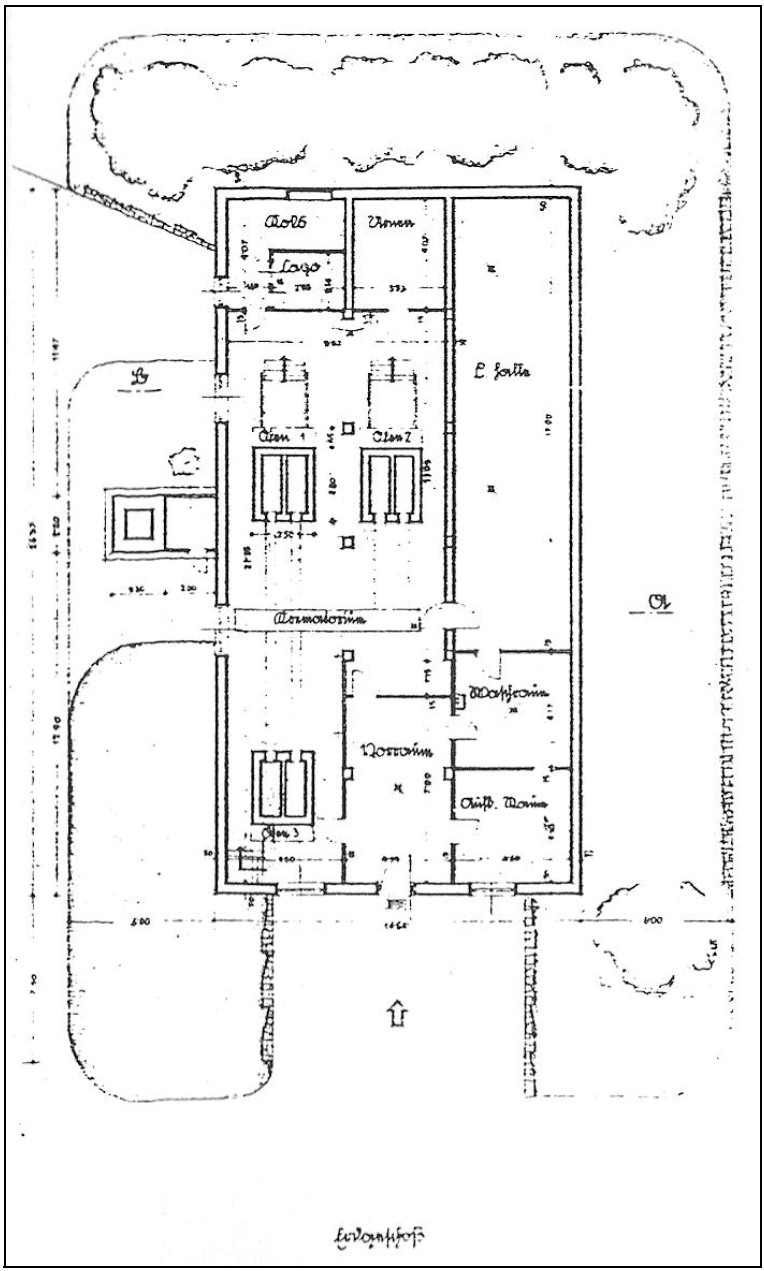
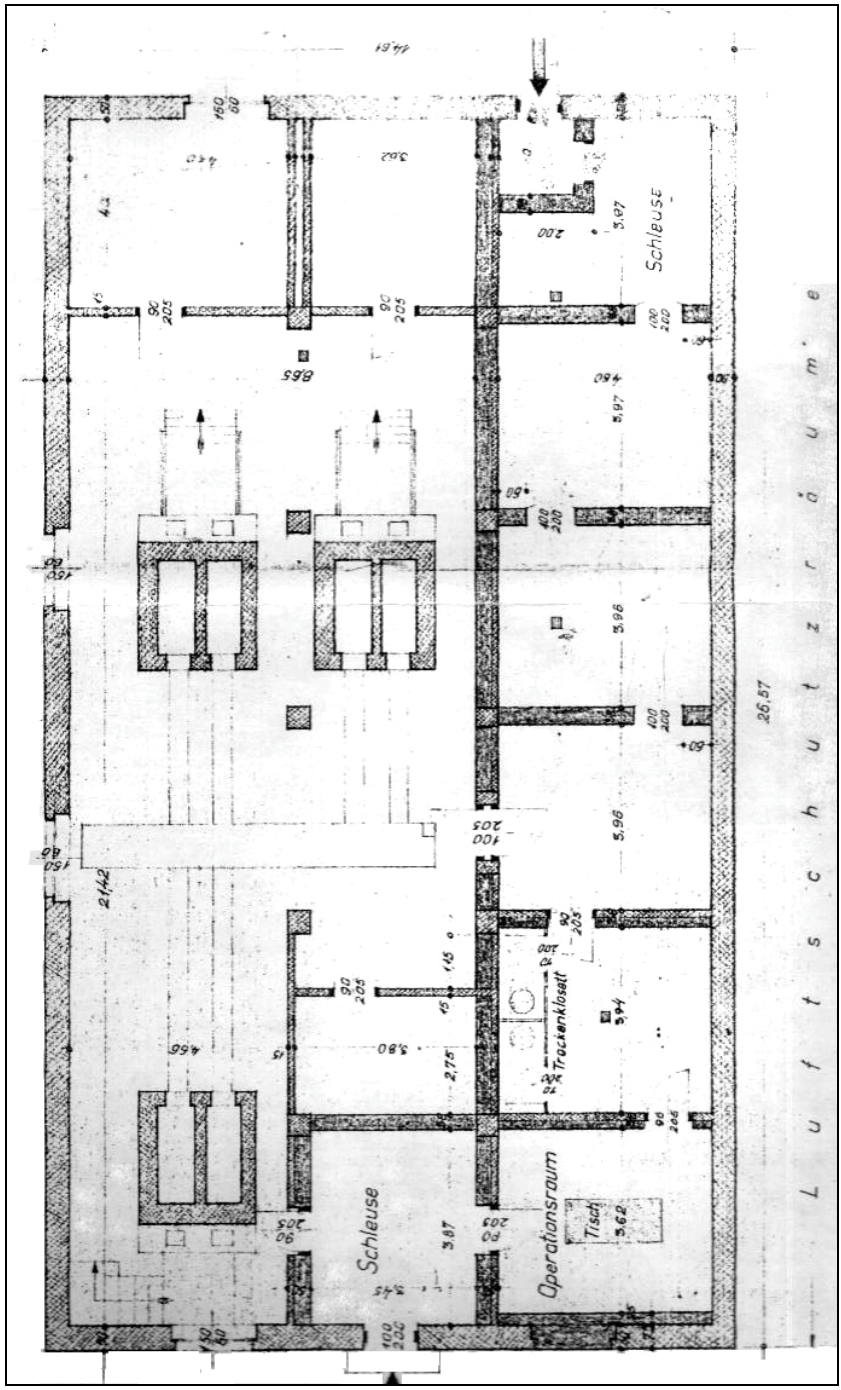
depressions, it would have been necessary to painstakingly scratch out the cement from the surface of the hole filled with mortar. It would have amounted to a form of sabotage on the part of the bricklayer Kommando to leave such obvious traces of the alleged openings. No detainee would have risked that because on the inside, on the ceiling of the morgue, obvious traces of the closure of the holes would have remained apparent anyway.

The detainees of the roofing detail would have had to perform a similar kind of sabotage by shaping the roofing felt to fit exactly the profile of the alleged quadrangular depressions in the cement.



The explanation of the dark spots is much simpler: they were caused by compression of the roofing felt, which had become soft from sunlight, under the weight of a flat and heavy object such as a cement vase or other decoration from the Soviet-Polish dance frolic – and that explains why the fold in the roofing felt is so marked along the edges instead of being slightly concave.

3.4. Summary



1. There is no proof that the alleged openings for the introduction of Zyklon B ever existed in the ceiling of the morgue of crematorium I.
2. There is no proof that the morgue was ever equipped with two gas-tight doors.
3. In contradiction with any kind of logical planning, these alleged gas-tight doors are said to have been later removed by the SS when the crematorium was converted to a gas-tight air-raid shelter and replaced by one normal door and one standard gas-tight door (such as it currently exists in the crematory).
4. The traces of cyanides present in the walls of the morgue do not prove that the room was used as a homicidal gas chamber.
5. The number of openings made by the Poles after the war (four) is at variance with all available testimonies. This also goes for the number (five) adopted by the members of the Holocaust History Project.
6. The Polish "reconstruction" of both the location of the openings and the structure and dimensions of the Zyklon B introduction shafts has neither basis in documents nor in witness statements. In fact there are no documents, and no witness has furnished any information on these.
7. There is no proof that the four dark spots visible on the roof of crematorium I in the photograph published by Pressac are traces of former openings that were later sealed; on the contrary, no trace on the ceiling of the morgue corresponds to any of these dark spots.
8. The remaining traces of former openings in the ceiling are circular and are no doubt connected to the transformation of the crematorium into an air-raid shelter.

9. The openings created by the Poles make sense, geometrically speaking, only in the context of the present state of the morgue, but are totally asymmetric and irrational when seen in the context of its original state. This is further proof that they have nothing whatsoever to do with any alleged original openings.

4. Detailed Study of Crematorium II

4.1. Introduction

In the spring of 2004, Daniel Keren, Jamie McCarthy, and Harry W. Mazal published, as part of the Holocaust History Project, an article entitled "The Ruins of the Gas Chambers: A Forensic Investigation of Crematoriums at Auschwitz I and Auschwitz-Birkenau."[1] In that study, the authors deal with the alleged openings for the insertion of Zyklon B on the roof slab of underground morgue 1 of crematorium II at Birkenau and of the morgue of crematorium I at Auschwitz. To the second part of their "forensic investigation" on crematorium I of the main camp I have dedicated the previous chapter 3 in this volume, in which I have demonstrated that the claims of the authors are completely inconsistent.

In the present article, I shall examine the thesis brought forward by the authors regarding morgue 1 of crematorium II.

Before we go into the matter itself, it must be stated that the authors have not mentioned, even in passing, my article "No Holes, No Gas Chamber,"[2] which is the most detailed revisionist study of this topic to date. They have preferred to bypass my evidence and my arguments which, therefore, retain their full demonstrative force.

Obviously, the authors' decision to remain quiet about my article is a conscious and easily understandable move, just as their decision to remain quiet about Charles D. Provan's text "*No Holes? No Holocaust*?"[3] – which is still the most serious treatment of this question on the Holocaust side – although in this case their motivation was different: they wanted to take advantage of Provan's observations convenient to their thesis and at the same time shun his criticisms of the official thesis.

First published as "Die Einfüllöffnungen für Zyklon B – Teil 2: Die Decke der Leichenhalle von Krematorium I in Auschwitz," *Vierteljahreshefte für freie Geschichtsforschung*, 8(3) (2004), pp. 275-290; translated by Henry Gardner; first Engl. publication as "The Openings for the Introduction of Zyklon B – Part 2: The Roof of Morgue 1 of Crematorium II at Birkenau" in: *The Revisionist* 2(4) (2004), pp. 420-436, slightly revised version.

1 *Holocaust and Genocide Studies*, 9(1), spring 2004, pp. 68-103.

2 See chapter 2 of this contribution.

3 C.D. Provan, "*No Holes? No Holocaust? A Study of the Holes in the Roof of Morgue 1 of Krematorium 2 at Birkenau*." Printed by: Zimmer Printing, 410 West Main Street, Monongahela, PA 15063. © 2000 by Charles D. Provan; online: www.revisingrevisionism.com.

Actually, while the authors add no new element of proof to Provan's study, they take over his argumentative structure in terms of testimonies, and terrestrial and air photos (Provan's pp. 3-5).

4.2. A Deceptive Method

The authors' method is simplistic and deceptive: they start from the supposedly accepted fact that on the roof of morgue 1 of crematorium II at Birkenau there had existed four openings (with external protective chimneys and internal devices for the introduction of Zyklon B) and then claim to identify them on photographs and in the ruins of the building.

Deviating from Provan, the authors neither present nor analyze all the testimonies available in this regard, but base themselves almost exclusively on Henryk Tauber's deposition of May 24, 1945, which, moreover, they know only through Pressac[4] and without quoting even a single line from it! The fact that they do not mention the most prominent witness on the question of the Zyklon B introduction devices either – Michał Kula – is not really surprising. His testimony is too much at variance with their alleged "findings," and so they just ignore him!

Let us analyze, first of all, Tauber's deposition:[5]

> *"The vault of the gas chamber rested on concrete pillars which were arranged lengthwise in the center. There were four columns right and left of these pillars. The outer part of these columns was made of a grid of thick wire which extended to the ceiling and to the outside. Within*[6] *this part there was a second netting with smaller mesh and openings and on the inside of this a third, dense, netting. In this third netting a can moved by means of a wire, with which the powder was extracted from which the gas had now evaporated."*

However, when he was first interrogated by the Soviets on February 27-28, 1945, Tauber had declared:[7]

> *"The Zyklon gas diffused into the* [gas] *chamber through mesh columns which had a rectangular cross-section with walls of a double grid."*

Therefore, the alleged device was not yet constituted by a triple mesh, but a double one, and did not yet have a square cross-section, but a rectangular one.

---

4 It is the English translation of the French translation published by Pressac in: *Auschwitz: Technique and operation of the gas chambers*, Beate Klarsfeld Foundation, New York 1989, pp. 481-502 (http://holocaust-history.org/auschwitz/pressac/technique-and-operation/pressac0481.shtml ff.).

5 Höss trial, vol. 11, interrogation of Henryk Tauber on May 24, 1945, pp. 129f.

6 "Za," literally "behind."

7 Statement by H. Tauber on February 27, 1945. GARF, 7021-108-13, p. 5.

The strength of the authors' historical acumen and of their quest for the truth can be judged by their reference to another witness, Shaul Chazan (or Chasan):

> *"Were the wire mesh Zyklon insertion devices attached to the concrete support pillars? This hypothesis might appear reasonable, but we have found little support for it and strong evidence against it. Mr. Gideon Greif of Yad Vashem, an expert on the Auschwitz-Birkenau Sonderkommando, contacted at our request two Sonderkommando survivors who worked in Crematoriums II and III. Mr. Shaul Chazan and Mr. Lemke Phlishko both stated that the devices were not attached to the support columns."* (p. 72)

In the book of this alleged "expert on the Auschwitz-Birkenau Sonderkommando"[8] there is also Shaul Chazan's testimony. The dialog on the alleged Zyklon B introduction devices runs as follows:[9]

> "[Greif] *You said that the gas was poured in through openings in the ceiling. Did it drop to the floor or on the heads of the people?*
>
> [Chazan] *No, no, no: there were <u>several</u> openings there. From each opening a <u>round</u> grid column came down. The grid was made of <u>metal, full of holes</u>, from the window in the ceiling down to the floor, and the poison gas was dropped through this hollow pillar, in the form of little pebbles. Then the smell would spread, that was the gas.*
>
> [Greif] *Did the grid column through which the gas was dropped reach all the way down to the floor?*
>
> [Chazan] *Nearly to the floor. One had left a space which made it possible to clean there. One poured water out and brushed up the remaining pebbles."* (My emphases)

So this "eyewitness," who did not even know the number of alleged openings, speaks of a device with a circular cross-section, not a rectangular one, of perforated metal instead of wire mesh, and without a movable core for the recovery of the inert residue of the Zyklon B, because in his device, the grains of gypsum fell through the metal tube directly to the floor and were removed from below rather than from above. As anyone can see, this is a testimony in perfect "convergence" with Tauber's.

Apart from that, a pillar that did not reach the floor had to be fastened to the concrete pillars, because otherwise it would have been demolished by the hypothetical, panicking victims. Thus, if Gideon Greif did indeed get a testimony from Shaul Chazan recently about the question of how those wire mesh columns were fastened, this can only have been a directed answer agreed upon

---

[8] G. Greif has limited himself to interviews with seven self-styled survivors of the so-called "Sonderkommando," asking them banal questions, which show his very vague knowledge of the history of the camp. As a case in point, this "expert" did not even ask his partners how many Zyklon B holes there were!

[9] G. Greif, *Wir weinten tränenlos... Augenzeugenberichte der jüdischen "Sonderkommandos" in Auschwitz*, Böhlau Verlag, Cologne/Weimar/Vienna 1985, p. 237.

in advance. And by the way, who could seriously claim to remember more than 60 years later such minute details as the way certain equipment in a certain room was fastened?

I have stressed in chapter 2 that the "eye witness" Miklos Nyiszli, as early as 1946, had anticipated this version when he spoke of[10]

> *"square sheet-iron pipes, the sides of which contained numerous perforations, like a wire lattice."*

4.3. The Problem

The question of the openings in the roof slab of morgue 1 in crematorium II at Birkenau has three interdependent aspects, which are related to the alleged devices for the introduction of Zyklon B:

1) the brick chimneys with cement covers
2) the openings as such
3) the wire-mesh devices

The authors concentrate on the first two points, leaving completely aside the third, for which no material or documentary evidence has been found. While they do claim that in the context of the transfer agreement for crematorium II (March 31, 1943) the four "*Drahtnetzeinschubvorrichtung*[en]" (wire mesh push-in devices)[11] listed in the inventory of the basement constitute the "inner core" of the alleged devices (p. 69), they forget, however, that in this document[12] these parts are attributed to morgue 2[13] and not to morgue 1 (the alleged homicidal gas chamber) and that they are accompanied by "*4 Holzblenden*" (4 wooden blinds), which are claimed to be the lids of the chimneys for the Zyklon B. According to Tauber, however, the alleged lids were made of cement, and therefore the authors must have thought it would be safer not to mention these wooden covers at all.

In practice, as I have demonstrated in chapter 2, the alleged wire-mesh devices for the introduction of Zyklon B were never built, and so in this regard the "converging" testimonies of Kula and Tauber are actually in agreement

---

[10] See p. 288 of this book.

[11] The term "schub" is usually used in connection with drawers in German.

[12] RGVA, 502-2-54, p. 79.

[13] Pressac has noted that drawing 2197 of crematorium II, dated March 19, 1943, "indicates that morgue 1 had 16 lamps and 3 taps and morgue 2, 10 lamps and 5 taps," whereas the inventory attributes 5 taps to morgue 1 and 3 to morgue 2, therefore the two lines are inverted; hence, he ascribes an analogous inversion also to the 4 wire mesh introduction devices and to the 4 wooden covers, which would thus belong to morgue 1. (J.-C. Pressac, op. cit. (note 4), pp. 430 and 231). But as the number of lamps is correct for each one of the two morgues, nothing proves that the lines referring to the 4 wire mesh introduction devices and to the 4 wooden covers have been inverted; therefore, the irrefutable fact remains that these objects are attributed to morgue 2.

only in that they are both untrue.[14] And this demonstration, by itself, demolishes the claims of the authors.

As far as the first two aspects of the problem are concerned, the authors assume – on the basis of Tauber's testimony – that on the roof slab of morgue 1 there were four brick chimneys with cement covers,[15] which contained four openings arranged – in the same way as the chimneys – alternating to the left and to the right of the central beam, according to the drawing in Fig. 2a on p. 79 (see Ill. 1). Neither Tauber nor any other witness, however, ever stated that the chimneys and the holes were situated next to pillars 1, 3, 5, and 7 of the morgue, as the authors assume, and from this point of view their hypothesis has no correspondence in testimony.

The authors have, furthermore, evaded another and certainly not irrelevant question: that of the dimensions of the holes, clearly given by Kula. We shall later on elucidate why they prefer to remain silent on this point.

4.4. The Objects on the "Train Photograph"

In their effort to demonstrate the presence of the four presumed holes on the roof slab of morgue 1, the authors utilize three photographs – one terrestrial and two aerial.

The first is the well-known shot from the "Kamann" series of February 1943, which has been published and analyzed by Jean-Claude Pressac.[16] Because of the presence in the foreground of a small locomotive with several little cars, the authors call it the "Train Photograph."[17]

In its background, this photograph shows morgue 1 of crematorium II, on top of which there are four unidentifiable objects, which D. Keren and his colleagues take three to be the chimneys for the introduction of Zyklon B. As results from their Fig. 4 on p. 80, they claim to have identified the first two chimneys, starting from south. The third one is said to be "entirely occluded by the smokestack" of the engine (p. 71), whereas the fourth appears for them "just to the left of a locomotive's smokestack" (p. 71, see Ill. 2a.). The analysis of this photograph by the authors is extremely superficial and skirts purposely many essential elements.

---

[14] See chapter 2.7.2. The testimony of Michał Kula," starting on p. 303 of this volume.

[15] Höss trial, vol. 11, interrogation of Henryk Tauber on May 24, 1945, p. 139.

[16] J.-C. Pressac, op. cit. (note 4), p. 340. Cf. Ill. 2.

[17] The first analyses of this photo were made by Jean-Marie Boisdefeu (*La controvers sur l'extermination des Juifs par les Allemands*, vol. 1, Vrij Historisch Onderzoek, Berchem 1994, p. 168) and G. Rudolf (*Das Rudolf Gutachten*, 2nd ed., Castle Hill Publishers, Hastings 2001, p. 79; Engl.: *The Rudolf Report*, Theses & Dissertations Press, Chicago 2003, p. 113-116), though relying on low quality reproductions of this photo.

1. First of all, let us state that the presence of chimney #3 behind the smokestack of the locomotive is pure conjecture and does not result from the photograph.
2. Secondly, the claim that the three indistinct objects, which one can see on the roof slab of morgue 1, are introduction chimneys for Zyklon B, is likewise an undemonstrated and not demonstrable assumption, which is even, as we shall see under item 7, contrary to the evidence.
   The authors attempt to lend weight to their claim by bringing in two likewise known air photos of the Birkenau area taken on August 25, 1944, with which I shall deal in the next chapter. Anticipating their later arguments, they in fact state the following conclusion:
   > *"That the holes alternate in Crematorium II is supported by the aerial photograph, the Train Photograph, the physical findings, and Tauber's testimony:"* (p. 72)
3. Actually, the indistinct objects taken by the authors to be chimneys 1 and 2 for Zyklon B are both situated on the eastern half of the roof of the mortuary, as shown by the corresponding diagram (see Ill. 2b), which is at variance with their basic thesis.
4. If one calculates the position of objects 1 and 2 along the median of the surface of the morgue, it results from this diagram that they stood at 7.2 and 10.5 m from the southern end of the morgue. This is fully borne out by the diagram prepared by Provan, on which I have marked by numbers 1 and 2 the position of the respective objects (see Ill. 2i).
   This means that object 1 is situated next to pillar #2 and east of the central beam, whereas D. Keren et al. claim that the alleged chimney 1 is next to pillar #1 and west of the central beam. Object 2 is about 3.3 m away from object 1, whereas, according to D. Keren et al., the alleged chimneys 1 and 2 should be located about 7.6 m apart. In Illustration 1a, I have indicated on the diagram of D. Keren et al. the position of objects 1 and 2 with respect to their alleged Zyklon B chimneys 1 and 2.
5. According to D. Keren et al., object 4 should be located slightly in front of the last pillar of the morgue, hence some 4 m from the wall of the crematorium. Instead, it is touching the wall and its height is therefore 45 cm – half the distance between the pair of windows to its left and the plane of the morgue. The windows of the crematorium were, in fact, some 90 cm above the plane of morgue 1, as shown by drawing 1173-1174 (p)[18] and confirmed by the "Train Photograph." Thus the height of the object is half this distance.
   If instead the object had been at the position indicated by the authors, it would be even lower because of the perspective. Already on plan 936 of

[18] Data taken from the drawings of crematorium II published by J.-C. Pressac, op. cit. (note 4), pp. 286 and 325.

January 15, 1942,[19] and in the later ones as well, a layer of earth had been specified for the top of morgue 1. Plan 109/16a dated October 9, 1943, gives the exact thickness of this layer: 50 cm.[20] It follows that object 4, rising less than 50 cm above the concrete surface of the morgue, would have been buried in this layer of earth, therefore it could not have been a chimney for Zyklon B.

6. To the left of object 2 is another object on that roof. But because it obviously has a noticeably different shading and shape and because it is located at an inconvenient location, D. Keren et al. simply claim that this can *not* be a Zyklon B chimney. But if we are certain that there is at least one object on that roof which is *not* a Zyklon B chimney, is it not possible that objects 1, 2, and 4 were "other" objects as well?
7. What may these objects have been? The photograph in question does not allow us to solve this riddle, but there is another photograph, also from the Kamann series, taken a few weeks earlier, which shows the morgue of crematorium II in greater detail (see Ill. 3). On this photograph the alleged chimneys for Zyklon B do not appear at all. In chapter 2.6. of this paper I have already demonstrated that the hypothesis of a creation of holes in the ceiling of morgue 1 for the introduction of Zyklon B is technically absurd and also in total disagreement with one of the principal tenets of the official thesis shared also by the authors.[21]
   In the photograph just mentioned, there is an object with square sides, leaning against the wall to the left of the third pair of windows, which seems to be made up by a pile of boxes (see Ill. 3 and 3a). It is odd that the position of this object corresponds exactly to the alleged chimney 4 of the "Train Photograph." We may have here an alternative explanation of chimney #4.
8. Let us move on to the other two objects. D. Keren et al. assume as an established fact that they were rectangular in shape and answer D. Irving's hypotheses as follows:

   > *"David Irving has speculated that the holes are really 'drums containing sealant,' but it is obvious that this cannot be the case: a cylindrical object would produce a gradual light pattern, while the objects above display a sharp change between uniform light and uniform shadow."* (p. 71)

   Actually, this is anything but "obvious." As is shown by an enlargement of objects 1 and 2, they have a shape that is rounded at top and bottom (see Ill. 2c and 2d), which is absolutely incompatible with the shadow zones of a parallelepiped. This also results from a comparison with one of the venti-

[19] J.-C. Pressac, op. cit. (note 4), pp. 268f.

[20] Ibid., p. 329. The windows of the crematorium thus stood at hardly 40 cm above the surface of the layer of sand, which is confirmed by the photograph from the Kamann series of crematorium II in the summer of 1943. Cf. following section.

[21] See chapter 2.6. The Arguments of Pressac and Van Pelt," starting on p. 298 of this volume.

lation chimneys of the crematorium (Ill. 2e) and the chimney of the ovens (Ill. 2f).

It is therefore clear that the objects have a cylindrical shape.[22] But an object, cylindrical in shape, appears clearly just in front of the south wall of the morgue (see Ill. 2g). Its dimensions, considering that the cylinder is right against the wall, are compatible with the two objects located on top of the morgue. We have here, no doubt, drums that were used during the construction. A similar cylinder, identifiable as a metal barrel, appears also in a photograph, which shows the erection of the chimney of crematorium III (Ill. 2h). David Irving's hypothesis therefore remains the most probable one.

4.5. The Marks on an Air Photo of August 25, 1944

Let us move on to the second alleged proof of the existence of four chimneys for Zyklon B on the roof slab of morgue 1 in crematorium II. The two air photos of August 25, 1944,[23] in particular the one labeled 3185 (see Ill. 4), show on this surface four dark spots of irregular shapes which the authors explain as follows:

> *"The smudges are too large to belong just to the holes themselves. They probably correspond to the tamping down of a trail on the roof by the SS men detailed to introduce the canisters. The photograph shows the smudges alternating slightly, Holes 1 and 3 to the west, 2 and 4 to the east. A Sonderkommando survivor, Henryk Tauber, considered a reliable witness on technical issues, testified that the holes in Crematorium II were on alternating sides."* (p. 72)

The authors had the photographs analyzed by "an expert on aerial photo interpretation, Carroll Lucas," none other than the "expert" previously picked by that expert in trickery, John C. Zimmerman![24] A few pages on, they report his findings:

> *"It is impossible to observe the Zyklon holes themselves in any of the aerial photographs.* [...].
>
> *Mr. Lucas analyzed the two August 25 photos showing the roof of the Crematorium II.* [...]. *After careful study Mr. Lucas identified four small objects within the smudges, all slightly elevated above the level of the roof. Stereo imaging allows observation of even small objects in grainy images, very difficult or impossible to detect in separate images, as is well demon-*

---

[22] The camera stood a little distance above the level of the morgue and this explains the fact that the two objects also had a rounded top.

[23] Mission 60 PR/694 60 SQ. Can F 5367. Exposure 3185, 3186. NA.

[24] J.C. Zimmerman, *Holocaust Denial. Demographics, Testimonies and Ideologies*. University Press, Lanham, New York, Oxford 2000, p. 243; see my contribution "An Accountant Poses as Cremation Expert," starting on p. 87 of the present book.

strated by 'random dot stereograms.' In all probability, these correspond to the four 'chimneys' above the holes in the roof, as clearly visible in the Train Photograph. Thus, the aerial photographs add further support to the witness testimonies and to the Train Photograph. With regard to the dark smudges and related findings Mr. Lucas summarized his conclusions as follows:

a) 'The roof of the partially underground wing of the Crematorium contains four raised vents, possibly with covers larger than their exits'.

b) 'The four dark areas observed on the Crematorium II roof (on positive prints) are compacted soil, produced by the constant movement of personnel deployed on the roof, as they worked around the vents.' [...].

c) 'The thin dark lineation (on positive prints) interconnecting the dark areas is a path of compacted earth produced by personnel moving from vent to vent.'

d) 'The dark area connecting this path to the edge roof from the vent nearest to the Crematorium roof is an extension of the path which shows where personnel gained access to the roof – possibly using a short ladder leaned against the roof.'

e) 'The evidence provided by this analysis lends credence to the fact the vents existed and were used in a way consistent with statements from multiple witnesses.'" (pp. 95f.)

We will now look at the soundness of these observations.

I note, first of all, that the claim of the authors that "the photograph shows the smudges alternating slightly, Holes 1 and 3 to the west, 2 and 4 to the east" is wrong. It is sufficient to delineate the shape of the morgue and to draw in the central beam that ran through it lengthwise to see that, in reality, the four smudges are all on the eastern half of the roof slab, as is clearly shown in Illustration 4b. This deals the authors' thesis a decisive blow.

Their comment on Lucas' observations is really incredible: they state that "it is impossible to observe the Zyklon holes themselves," but still Lucas did identify "four small objects within the smudges," which, however, are "very difficult or impossible to detect in separate images." In other words "the four small objects" cannot be seen, but – in an act of faith – they still have to be there! Finally, these objects, invisible as they are, correspond "in all probability" to the chimneys for Zyklon B!

What are Lucas' observations?

a. He claims that the cover of morgue 1 shows "four raised vents, possibly with covers": but how can he make a statement like that if it is impossible to observe the four alleged objects in separate images? And how was he able to see even the covers (!) of the alleged chimneys?

   Here, our "expert" has been somewhat imprudent, because he uses the term "vents." Now, as the authors explain in the introduction, the alleged openings for the introduction of Zyklon B are "sometimes called vents" (p. 68)

in English. As the objects are invisible and hence unidentifiable, Lucas' statement is not technical but purely propagandist: he simply claimed to have seen what the authors wanted him to see. This ideological and propagandistic character of Lucas' declarations clearly shows through also in his further statements.

b. He claims that the smudges one can see on the cover of the morgue "are compacted soil, produced by the constant movement of personnel deployed on the roof, as they worked around the vents." Even assuming that this is technically sound – which, as we will see, it is not – we again run into the propagandist motivation: the smudges were caused by the personnel assigned to the gassings! How does he know that? An impenetrable mystery!
Let us analyze his technical explanation. The Birkenau area is known to be sandy. On the photograph in question the soil of the inner yard of crematorium II (but also at crematorium III) is white, except for areas with flower beds or vegetation. So, by what extraordinary physico-chemical phenomenon would the white sand have become black when it was repeatedly walked on by a pair of SS men?[25]
The authors come up with yet another and even more nonsensical explanation. The "inner core" of the columns, i.e. the alleged movable "can" into which the Zyklon B was poured, had been "temporarily removed and propped against the small chimney that housed the Zyklon insertion devices" (p. 97). But, according to Kula, this "can"

> *"was an empty column made of a thin zinc lamina with a square section of about 150 mm."*[26]

It was correctly drawn by Pressac.[27] But if the Zyklon B chimneys, which according to the authors measured "about 60 x 60 cm" (purely invented dimensions), are completely invisible in the photographs in question, how can anyone claim that devices 15 by 15 cm and at most one meter long could create smudges of some 3-4 m long and 1-2 m wide?

c. Lucas's statement that the four smudges are linked to "a path of compacted earth produced by personnel moving from vent to vent" is likewise propagandist. As long as the objection in relation to the change of color of compacted sand remains valid, on what grounds can one assume that the presumed compacting had produced "a path" and that it had been produced by the SS personnel allegedly assigned to the gassings?

d. Lucas claims furthermore to have identified, west of the fourth dark spot, the access "where personnel gained access to the roof." It takes some imagination to see in this extension of the smudge a footpath, all the more so

---

[25] According to M. Nyiszli, two SS men were assigned to the alleged gassings: *Auschwitz. A Doctor's Eyewitness Account*. Fawcett Crest, New York 1961, p. 45; *Im Jenseits der Menschlichkeit. Ein Gerichtsmediziner in Auschwitz*, Dietz Verlag, Berlin 1992, p. 36.

[26] See p. 304 in this volume.

[27] See Ill. 2, p. 332.

since this extension finishes half-way between the smudge and the outer edge of the morgue (see Ill. 4a). And if applied to morgue 1 of crematorium III, then it becomes totally absurd (see Ill. 4c): There the dark smudges run in a distinct angle, which would mean that the SS men were walking from one chimney to another in odd angles for some 3-4 meters, then suddenly leaping 3 to 6 meters to the next spot – without run-up!

That Lucas' observations have no technical relevance but are only propagandist in nature results finally from an important fact, to which he has obviously paid no attention at all. The ground of the yards in crematoria II and III consisted of the same sand which (presumably) covered morgues 1 and 2. From the point of view of the official historiography, if Lucas' explanation were true, the thousands upon thousands of Jews who had trodden this sand before being gassed in these two crematoria should have created a literal highway of dark sand, from the gate of the yard to the entrance of morgue 2, the alleged undressing room. But the air photos do not show even the slightest trace of supposedly compacted dark sand. But then how can anyone seriously argue that the smudges on morgue 1 have been caused by the sand being compacted under the boots of two men?

This shows how much the opinion of this "expert" is really worth.

The air photos of May 31, 1944, are known for not showing dark spots on the roof of morgue 1 of the crematorium. This is how the authors explain that fact:

> *"One possible explanation is that the camouflage in the Crematorium area in general, and the gas chamber in particular, changed over time.* [...]
>
> *It is therefore reasonable to assume that between May 31 and July 8, the earth banks were flattened and the roof covered with earth. This newly placed earth was compacted by the SS-men climbing onto the roof and walking between the holes."* (p. 96)

I will stress, first of all, that the conjecture of the authors regarding the nature and the development of the spots is unfounded. Secondly, the camouflage of the crematoria consisted merely of a fence to be built around them. The respective order was given to the Central Construction Office by SS *Brigadeführer* Hans Kammler, head of Office Group C at the SS-WVHA, by telegram on May 12, 1944.[28] On May 16th, SS *Obersturmführer* Werner Jothann, head of Central Construction Office, drew up a list of the quantities of steel needed for the fence,[29] which, according to the respective "situation map," was to be a rectangle of 100 m by 125 m around each of the crematoria II and III, and of 75 m by 100 m around crematoria IV and V.[30]

The air photos of May 31, 1944, show, for crematorium II, a fence that is nearly complete, except for the south-east corner (see Ill. 5). A letter from SS

[28] RGVA, 502-1-229, p.11.
[29] RGVA, 502-1-229, pp. 12f.
[30] RGVA, 502-1-229, p. 14.

Sturmbannführer Karl Bischoff (then head of Construction Inspectorate of the Waffen-SS "Schlesien"), dated May 17, 1944, explains that the fences were "Security measures (camouflage) of the crematoria in concentration camp II Auschwitz."[31] In this context, one cannot understand the sense of "camouflaging" the morgues 1 by covering them with sand. We have already seen that the earth cover was already specified in plan 936 of the crematorium, dated January 15, 1942. A further photograph from the Kamann series published by Pressac,[32] probably dating from the summer of 1943, shows the south-eastern corner of morgue I (cf. above, chapter 2.5., p. 297). This corner appears flat and clean whereas to its right one can clearly see a grassy surface on an inclined plane of sand which slopes down gently towards a point below the second pair of windows of the crematorium. From this we can deduce that at the time sand was banked up only against the sides of the morgue but there was none on top of it.

I have explained the spots on the morgues in chapter 2, assuming that in 1944 the roof was devoid of sand, as results clearly already from the first photograph of the ruins of morgue 1, dating from 1945.[33]

The air photo dated December 21, 1944, confirms this fact (see Ill. 6). It shows crematorium II being dismantled. Morgue 2 appears to be uncovered. The roof and a large portion of the chimney have been taken down. Morgue 1 shows quite angular contours, which means that the concrete cover was surely laid bare.

On the roof slab one can see two dark spots, more or less where spots 3 and 4 appeared in the photograph taken on August 25, 1944. Parallel to them there are two more spots along the eastern edge of the roof slab. Another, fainter spot appears roughly where the first spot shows up in the photograph of August 25, 1944, but it extends eastward into another equally faint spot. The second spot of the photograph of August 25, 1944, does not show up this time. Together, this confirms that the explanation of the spots given by the authors is completely unfounded.

4.6. The Openings in the Ruins of the Roof Slab of Morgue 1 in Crematorium II

The authors claim to have found "strong physical evidence" in the ruins of morgue 1 of crematorium II (p. 73) for three out of the four presumed holes for the introduction of Zyklon B.

Before we take a closer look at their "discoveries," it is necessary to make a few remarks.

---

[31] RGVA, 502-1-313, p. 4.
[32] J.-C. Pressac, op. cit. (note 4), p. 341; see Ill. 1 on p. 317.
[33] See p. 291 of this volume.

1. First of all, the authors refer to an "architectural rule," already distorted by Provan, according to which[34]

   > *"when violent stress is put on a concrete structure, cracks show up passing through holes made previous to the violent force, since the holes makes the structure weaker in that location."*

   The authors use Provan's untenable hypothesis and argue, that the violence of the explosion would have broken up the smooth edges of the alleged openings which, therefore, are no longer recognizable as such. Actually, as I have demonstrated by means of photographs, the smooth edges of the five rectangular ventilation openings in the ceiling of the furnace hall of crematorium III and of the round opening of the de-aeration tube in the ceiling of morgue 2 of crematorium II have remained practically intact in spite of the violent explosion, which ripped the rooms apart. The respective openings are perfectly identifiable as such.[35]
2. The identification of the alleged openings was done by the authors at home in their office, and in the most wilful manner: they have simply selected from the large number of holes and cracks of all shapes and sizes, which can be found in the ruins of the roof of morgue 1, those that are closest to their assumed pattern of the positions of the alleged openings for the introduction of Zyklon B.
3. In their fictitious identification, the authors have been careful to leave out the most important testimonial element regarding the dimensions of the alleged openings, because none of the holes they have so laboriously identified agrees with these dimensions.

   Michał Kula, the self-styled maker of the alleged wire-mesh columns for the introduction of Zyklon B, has in fact declared that they had a square cross-sectional area of 70 cm × 70 cm and were 3 meters high, thus rising through the ceiling and protruding from it by (300 – 241 – 18 =) 41 cm.[26] For the installation of such a device it was therefore necessary to make an opening in the reinforced concrete slightly larger than 70 cm × 70 cm. Any brick chimneys would have measured at least (12 + 70 + 12 =) 94 cm × 94 cm (and not 60 cm × 60 cm, as the authors assert), because the standard bricks of the type "Altes Reich" at the time had a thickness of 12 cm.
4. Finally, the authors assume that the ruins at the time of their investigations (1998 – 2000) were exactly the same as those at the end of 1944 when the SS blew up crematorium II – as we shall see, this is a totally unsound hypothesis.

---

[34] See p. 306 of this volume.
[35] See Ill. 10ff., p. 324ff.

4.6.1. Opening #1

The authors state:

> *"Hole 1 is the opening in the roof near Pillar 1 (Figure 11a). The pillar remains standing and protrudes through the surface of the roof (Figure 10b), which shifted as it collapsed. While it might appear at first glance that the opening could just as easily have been created by the explosion, careful examination proves thus was not the case. Portions of straight, flat edges and a 90-degree angle survive intact, though most of the concrete around the edge was damaged by explosion. The center of this hole is 4.1 m from the southern end of the roof slab, and 0.75 m west of the roof's center. We estimate its size approximately 0.5 m square; this places its eastern edge at 0.3 m west of the western edge of the central support beam."* (pp. 74f.)

This opening corresponds to Provan's opening #2. I have already amply demonstrated in chapter 2.7.3. that this is not an original opening but was produced by the Soviets or the Poles in 1945.[36]

I will add here that the claim of the authors that, in this opening, "portions of straight, flat edges and a 90-degree angle survive intact, though most of the concrete around the edge was damaged by explosion," is true, albeit on a very small scale, but, as I have demonstrated by means of photographs which I have taken over the years, this rough squaring of the hole was carried out between 1992 and 1997 by a pious pair of hands from the Auschwitz Museum wanting, in this way, to render the tale of the Zyklon B openings more credible.[37]

When it comes to the dimensions of the opening, the authors state that it measures about 0.5 meters square. In June 1990, this opening had a trapezoidal shape, the longest side measuring 86 cm, and a maximum width of 50 cm, the narrowest being 43 cm. However, as already stated, according to the witness Kula, the openings should have been at least 70 by 70 cm. One can thus easily see why the authors do not even in passing speak of Kula!

Van Pelt had already prepared a little sleight of hand to solve this problem. He had, in fact, presented a drawing,[38] which purports to show the make-up of the device described by Kula, but which actually contains a diverging and arbitrary element: a constriction of the column at the level of the ceiling, with the width of the device dropping from 70 cm in morgue 1 itself to 48 cm within the roof slab and on the outside.

Van Pelt writes that during the work on his book (published in 2002) he had Mazal, Keren, and McCarthy "as partners in a daily conversation," hence

---

[36] Chapter, 2.7.3., starting on p. 307.

[37] See p. 309.

[38] R.J. van Pelt, *The Case for Auschwitz. Evidence from the Irving Trial*, Indiana University Press, Bloomington/Indianapolis 2002, p. 208.

this trick is certainly the result of a joint strategy devised by the four "specialists" in order to leave aside Kula's declaration mentioned above.

4.6.2. Opening #2

Opening #2, as results from figure 12 reproduced by the authors on their p. 85, is the same as Provan's opening #6. Actually, we are dealing here with a simple fissure caused by the crash of this part of the ceiling onto the sustaining pillar #6; this is shown clearly by my Illustrations 30 and 31 (see p. 336f.). In an effort to create the illusion that this crack is instead an opening that existed before the explosion, the authors are obliged to use a tedious expedient: to draw into this shapeless crack a dotted square which is to show the outline of the presumed original opening. To this square, they assign sides of 0.5 by 0.5 meters (p. 75), again at variance with those given by Kula: 0.7 by 0.7 meters.

4.6.3. Opening #3

In this respect, the authors write:

> *"Hole 3's projected location is in an area of the roof that is badly damaged and covered with rubble."*

Unfortunately they had not received permission from the Auschwitz Museum to disturb the rubble (p. 75), so the presumed opening does exist, but it cannot be seen!

In reality here, too, the authors again take recourse to an ordinary trick. Their photograph of the area in question (figure 15 on p. 85) presents a very restricted field of vision and was taken from the west looking east. It is sufficient to widen the field of vision and to invert the position (from east looking west)[39] to realize that this area is not only not particularly "badly damaged" but that we have here two long cracks (one of which is Provan's opening #8). These cracks have so little in common with the alleged openings for Zyklon B that the authors preferred to remain quiet about them and would rather have us believe that an invisible opening #3 does indeed exist!

4.6.4. Opening #4

The identification of opening #4 is decidedly more fanciful. The authors explain:

> *"Hole 4 can be identified by a pattern in the rebar (Figure 16) at the very northern end of what remains of the roof.* [...] *Hole 4 can be identified by the unimpeded square opening set in the rebar in 1943. The surrounding edges were shattered by the explosion and the folding of the roof, leav-*

[39] See Ill. 32-34, pp. 338-340 in this volume.

ing only the telltale rebar latticework. Its measurements are 0.5 x 0.5 m. [...] *The deliberately looped rebar proves that this hole, as almost certainly the other three, was cast at the time the concrete was poured in January 1943."* (pp. 75f.)

Let us examine the photograph of this alleged Zyklon B opening (see Ill. 7 and 7a). The first thing that strikes the eye is the supporting pillar for the morgue ceiling, which protrudes from this hole. The vertical traces of the planking used in the construction of this pillar are clearly visible, as are the ends of the steel rods sticking out of its top. The crack is clearly the result of the ceiling crashing onto this pillar. In fact, as the authors concede, "the roof shifted considerably when it collapsed after the explosions," which means that the ceiling rose and then fell back with its central beam out of line with the row of pillars, some of which pierced the ceiling. This is borne out by the fact that next to the alleged opening 1 one can see the top of the first concrete pillar, which has pierced the roof of the morgue creating an opening of its own (see Ill. 8).

Secondly, this crack does not have proper sides, to say nothing of smooth edges, which would not have disappeared altogether as demonstrated by the vents of the furnace hall of crematorium III or the ventilation hole of morgue 2 in crematorium II.

Thirdly, in the square formed by the rebars, to which the authors attribute so much importance, the lateral bars have not been cut as would have been necessary to erect the brick chimneys around the opening, but only bent: in Illustration 7a, I have numbered 1-5 those that can be seen best, with "P" standing for the pillar.

The claim of the authors that this square of rebars is a direct proof that it was created in 1943 is frankly ridiculous. Over the years, the ruins of morgue 1 of crematorium II have undergone work and manipulations on several occasions. I will limit myself to the best documented ones. First of all, as early as 1946 the ruins of morgue 1 were the object of soundings and diggings undertaken by the expert Roman Dawidowski who worked under the orders of judge Jan Sehn.[40]

In 1968, a group of Germans did precise archeological research and diggings at this site. Pressac has published four photographs thereof.[41]

Furthermore, between 1990 and 2000 the alleged opening 1 – as I have already stated – was enlarged and squared. Provan's opening #7 has undergone similar manipulations: in 1990, it presented five rebars up to 40 cm long bent backwards; in 2000, the opening had been roughly squared and four of those rebars had been cut.[42]

How is it possible, then, to claim seriously that, in 1998, the status of the rebars in the alleged opening 4 reflects the original conditions? And how can

[40] See pp. 309f. of this volume.
[41] J.-C. Pressac, op. cit. (note 4), p. 265.
[42] See Ill. 23-28 on pp. 333-335 of this volume.

one take such stupidity to be a "proof"? The authors just did not know what to base themselves on to "demonstrate" the existence of the fourth alleged Zyklon B opening!

4.7. Robert Jan van Pelt's Hypothesis

In his brief for the Irving-Lipstadt trial, van Pelt has retained as "logical" that the alleged openings for Zyklon b in morgue 1 of crematorium II had been refilled by the SS before they blew up the ceiling of this room.[43]

The authors hold this hypothesis to be unfounded and support their opinion with these arguments:

> *"It has been further hypothesized that the difficulty of locating the four holes may have reflected their having been filled in before the destruction of the chamber. This does not seem likely for Crematoriums II and III. The original roof consisted of three layers: a thick stone aggregate concrete slab underneath; a thinner, finer sand-aggregate concrete mixture above; and waterproofing bituminous tar paper in the middle. It is unlikely that the SS would have thought it necessary to duplicate this work, or that they could have done so in four places without leaving a trace. There are considerable areas of the original ceiling visible from under the slab but these show no signs of tampering. In Crematorium I the holes were filled when the structure was converted to a bomb shelter for the SS (date unknown)."* (p. 73)

Let me stress right away that, on account of a kind of understandable reticence, Keren, McCarthy, and Mazal did not want to come out and say that the author of such nonsense was none other than their greatest expert on Auschwitz, Robert Jan van Pelt!

Much more important, though, is the fact that the arguments used by the authors are exactly those I had used in chapter 2 of this present paper, including the reference to the ceiling of the alleged gas chamber in crematorium I,[44] which presents clearly apparent traces of four round openings that have been filled in, but which have nothing to do with the alleged openings for the introduction of Zyklon B.[45] A case in point? Whichever way it is, the authors have recognized the full validity of my argumentation.

Lipstadt, Queen's Bench Division, Royal Courts of Justice, Strand, London, ref. 1996 I. No. 113., p. 295; *The Case for Auschwitz*, op. cit. (note 38), p. 406.

[44] See chapter 2.7.7. on p. 313 in this volume.

[45] See chapter 3 of the present article.

4.8. "Additional Findings"

The authors present further "additional findings," the most important of which, with respect to the presumed extermination, are the following three:

4.8.1. A Small Opening

The first is "a small rectangular 4 x 10 cm aperture" in the ceiling of the morgue (p. 93). The authors explain its function as follows:

> *"It was possibly fitted with a removable gasket that allowed the insertion of a detector to test the concentration of gas: it is known that the crematoriums were equipped for this purpose."* (pp. 93f.)

Aside from the fact that there is no proof of this opening being original, the authors' explanation is funny rather than unfounded, because they, like all the other nincompoops of their ilk, believe that a "detector" for hydrogen cyanide was some kind of mechanical device that could be placed into the "gas chamber." As all revisionist scholars know, the "Gasrestprobe" for hydrogen cyanide involved reactive cardboard strips soaked in a chemical solution, which was prepared on the spot.[46] Hence, that opening, if it really is original, could be used for anything but what the authors maintain.

4.8.2. Shower Heads

The second "discovery" consists in the finding, within the area of morgue 1, of a disc from "a probable false showerhead" (figures 22 and 23 on p. 88), of which no one knows when or by whom it was thrown where the authors found it. Scenarios like this are not uncommon.

As early as the 1980s, Pressac had found near the hole, which the authors take to be opening #1, a cement cover of one of the inspection shafts of the sewer in the crematorium, which I, in 1991, found in the opening.[47] As we have already seen, Tauber had stated that the presumed chimneys for the Zyklon B had cement lids, and one of his zealous admirers must have felt a duty to create a "converging proof" by means of this kind of arrangement!

As far as the tale of the fake showers is concerned, so cherished in the holocaust literature, I have already demonstrated in another article that the Central Construction Office, within the framework of the "special measures for the improvement of hygienic installations" in the Birkenau camp ordered by Kammler in early May 1943, had planned a "shower installation for detainees" in the basement of crematoria II and III and that the 14 showers, which are

[47] See Ill. 29 on p. 336 of this volume.

mentioned in the transfer agreement for crematorium III of June 24, 1943 (inventory of morgue 1), belonged to this project and were real, not fake.[48]

4.8.3. Pieces of Wood

The final "discovery" of the authors is a series of rectangular blocks set into the ceiling of the morgue:

> *"A number of small (approximately 10 x 15 x 4 cm), rectangular cast indentations can be seen in the ceiling of the gas chamber. At least six of these are visible in those portions of the ceiling presently accessible from below.* [...] *One important detail must be emphasized: the indentations containing the wooden blocks were purposely built into the ceiling of the gas chamber from the very moment the roof was built."* (p. 94)

These blocks had already been seen by Pressac in the 1980s: in his first book on Auschwitz he showed two photographs of them, assuming that they were wooden bases for fake showers.[49] The authors do not say so explicitly, but clearly want the reader to believe this. They claim, in fact, that "this fixture" – i.e. the disc of the alleged fake shower and the rectangular blocks – "undoubtedly formed part of the elaborate plan to keep the victims ignorant of their fate as long as possible" (p. 95). Is there any foundation to this explanation?

In June of 1990, having attentively read Pressac's first book on Auschwitz, I went to Birkenau for the first time, accompanied by two engineers. One of our very first investigations concerned precisely these blocks, which I photographed repeatedly, also during my later visits (Ill. 9 and 10). I identified eight of them inside the morgue (including the empty holes in the concrete, which had originally contained them, Ill. 11). They are arranged in two parallel lines to the right and left of the central beam, at a distance of about 1.65 meters from the beam and about 1.90 meters from one another. The dimensions vary slightly (10 cm × 11 cm; 9 cm × 12 cm), the thickness is 4 centimeters. The individual pairs of blocks (or empty holes in the concrete) are located lengthwise and alternating with respect to the pillars of the morgue. These blocks are set into the concrete, which means that they had been put there already when the concrete was poured. Therefore, when dealing with the woodwork for this job, the architects of the Central Construction Office took care of placing wooden blocks for fake shower-heads, but would have completely forgotten about installing openings for the introduction of Zyklon B!? Can anyone really dare to seriously utter such nonsense?

What was the use of those blocks? If we follow Pressac, the architects of the Central Construction Office had thought up 14 fake showers in a space of

---

[48] Carlo Mattogno, "The Morgues of the Crematoria at Birkenau in the Light of Documents," *TR* 2(3) (2004), pp. 276-278.

[49] J.-C. Pressac, op. cit. (note 4), p. 488.

210 square meters in an effort to "fool" some thousand persons: not really much to "fool" so many people!

The inspections of the mortuary in crematorium I supply us with the solution to this apparent mystery. Eight supporting beams of this hall present, in fact, in their center wooden blocks of the same type set into the concrete (see Ill. 12). The lamps that now light up this room are fixed to three of them.

Therefore, these blocks were simply the bases, to which the lamps of morgue 1 were attached. This is confirmed also by a document. Plan 2197[b](r) of crematorium II, dated March 19, 1943,[50] shows the pattern of the lamps for this hall: eight pairs of lamps are arranged in two parallel rows on both sides of the central beam, at equal distance from the pillars, i.e. at 1.90 meters from one another.

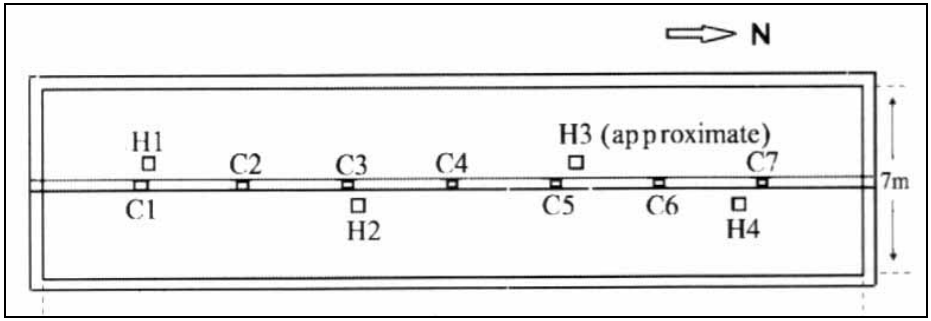
This corresponds to the positions of the blocks in question. As far as the width of the morgue is concerned, the lamps are situated next to the central beam, but it is reasonable to assume that they were actually located in the middle of each of the two halves of this room, i.e. at an intermediate distance between the beam and the opposite wall (3.3 meters), hence at about 1.65 m from the beam where, in fact, the blocks can be seen. If they had really been at the place shown in the drawing, they would have provided poor illumination for their section of the hall, and even worse for the other side, because the central beam, with its thickness of 55 cm, would have created broad shadow zones.

The strange placement on the drawing of the pairs of lamps right next to the central beam on either side may have the following explanation: in the western half of the morgue we also have a waste-water channel, which ran lengthwise between the central beam and the opposite wall in such a way that if the lamps had been drawn in at the location where the blocks are situated, the symbol (a small circle with an x in the center) for the seven lamps on this side of the room would have been superimposed on the lines of the channel and confusion might have resulted.

4.9. Conclusion

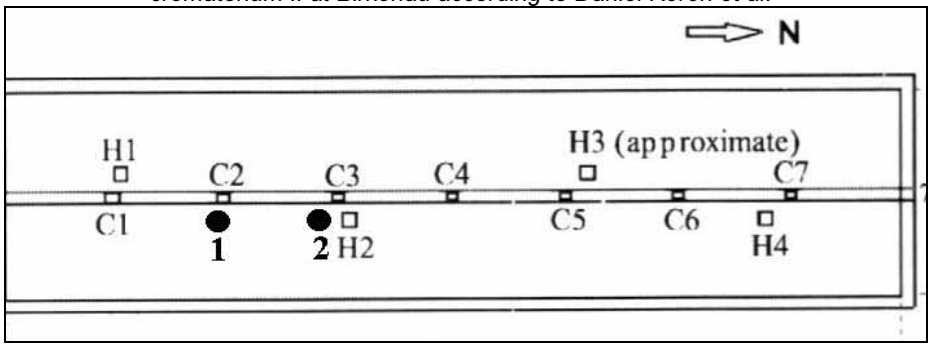
The authors claim to have furnished a concordance of evidence regarding the existence of the alleged openings for the introduction of Zyklon B in the ceiling of morgue 1 of crematorium II at Birkenau, on the basis of Tauber's testimony, the "Train Photograph" and their own archeological findings.

This concordance is, in practice, purely fictitious for the following reasons:



1. The wire-mesh devices for Zyklon B allegedly fabricated by Kula never existed, therefore Tauber who claims to have seen them, is a false witness like Kula.

[50] Ibid., p. 312.



2a. The "Train Photograph" shows fuzzy objects of irregular shape, which only with fanciful conjecture can be considered to be chimneys for the introduction of Zyklon B.
2b. The alleged chimney #3 does not appear on the photograph and its existence is an arbitrary conjecture.
2c. The three indistinct objects, which the authors take to be chimneys for Zyklon B, are all on the eastern half of the roof slab of the morgue, which is at variance with their basic theses.
2d. Object #3 can be identified as the object, which can be seen in the same position on the photograph of January 1943 and is therefore not a chimney for Zyklon B.
2e. Objects #1 and #2 had a cylindrical shape and could therefore not be chimneys for Zyklon B.
2f. Object #1 stands to the east of pillar #2 instead of to the west of pillar #1.
2g. Another object on the roof is ignored by Keren et al., because it does fit into their hypothesis neither by location nor by shape: it is not a Zyklon B chimney.
3a. On the air photos of August 25, 1944, the chimneys are absolutely invisible and only fanciful conjecture allows the authors to affirm that they existed.
3b. The explanation of the smudges present on the ceiling of morgue 1 is absolutely erroneous.
3c. The smudges were all on the eastern half of the roof slab of morgue 1, which again is at variance with the fundamental thesis of the authors.
4a. The alleged openings for the introduction of Zyklon B that the authors claim to have "discovered" are not original.
4b. Opening #1 was created in 1945 by the Soviets or by the Poles.
4c. Opening #2 is a simple crack caused by the crash of this part of the ceiling on sustaining pillar #6.
4d. Opening #3, according to the authors themselves, is invisible.
4e. Opening #4 was created by the pillar which protrudes from it.
4f. The alleged openings for the introduction of Zyklon B "discovered" by the authors all have dimensions in disagreement with those indicated by the witness Kula.
4g. All openings are irregular in shape and do not have properly crafted edges; the reinforcement bars have not been removed; there is no trace of mortar.
4h. There are no traces in the concrete (ceiling, pillars, floor) indicating that any steel columns for introducing Zyklon B had been fastened to it.
5. The blocks set into the ceiling of the morgue did not serve as bases for the fixation of fake showers, but for the attachment of lamps lighting up this room.

The alleged "forensic investigation" by Daniel Keren, Jamie McCarthy, and Henry W. Mazal thus has no value, be it historical or technical.

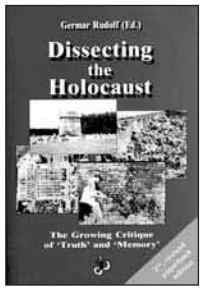
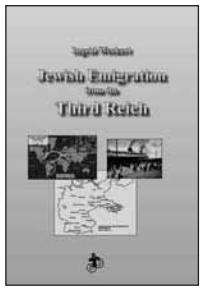
THE HOLOCAUST HANDBOOK SERIES . . .

This ambitious series of scholarly books addresses various topics of the so-called Jewish "Holocaust" of the WWII era. They all have a highly critical, if not skeptical attitude toward the commonly held views on this topic and are usually referred to as "revisionist" in nature. These books are designed to have the power to both convince the common reader as well as academics in this field. The following books have appeared so far:



Lectures on the Holocaust. Controversial Issues Cross Examined—updated and revised Second Edition. By Germar Rudolf. Between 1992 and 2005 German scholar Germar Rudolf has lectured to various audiences about the Holocaust in the light of new findings. Rudolf's sometimes astounding facts and arguments fell on fertile soil among his listeners, as they were presented in a very sensitive and scholarly way. This book is the literary version of Rudolf's lectures, enriched with the most recent findings of historiography. It is a dialogue between the lecturer and the reactions of the audience. Rudolf introduces the most important arguments for his findings, and his audience reacts with supportive, skeptical, and also hostile questions. The Lectures read like an exciting real-life exchange between persons of various points of view. The usual arguments against revisionism are addressed and refuted. This book resembles an entertaining collection of answers to frequently asked questions on the Holocaust. It is the best introduction into this taboo topic for both readers unfamiliar with the topic and for those wanting to know more. Softcover, 566 pages, B&W illustrations, bibliography, index, #538, ***$30*** minus 10% for TBR subscribers.



The Hoax of the Twentieth Century. By Arthur R. Butz. With this book Dr. Butz, Professor of Electrical Engineering and Computer Science, has been the first writer to treat the entire Holocaust complex from the revisionist perspective in a precise scientific manner. The Hoax exhibits the overwhelming force of historical and logical arguments which revisionism had accumulated by the middle of the 1970s. It was the first book published in the U.S. which won for revisionism the academic dignity to which it is entitled. It continues to be a major revisionist reference work, frequently cited by prominent personalities. This new edition comes with several supplements adding new information gathered by the author over the last 25 years. It is a "must read" for every revisionist and every newcomer to the issue who wants to learn about revisionist arguments. Softcover, 506 pages, 6"×9", B&W illustrations, bibliography, index, #385, ***$30*** minus 10% for TBR subscribers.

Distribution in the United States: Prices do not include S&H. Inside the U.S. add $5 on orders up to $50. Add $10 S&H on orders from $50.01 to $100. On orders over $100 add a flat $15 no matter the order size. Subscribers to The Barnes Review magazine may take 10% off book prices. Send order to TBR Book Club, P.O. Box 15877, Washington, D.C. 20003, call 1-877-773-9077 toll free to charge to major credit cards or visit www.barnesreview.com.

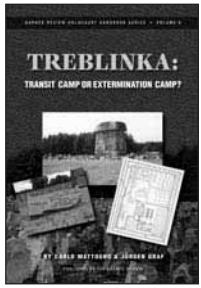
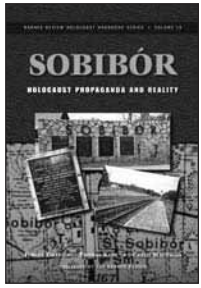
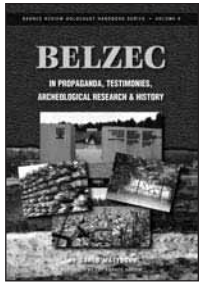
Distribution Australia/Asia: Peace Books, PO Box 3300, Norwood, 5067, Australia
For S&H on deliveries outside of America consult www.HolocaustHandbooks.com



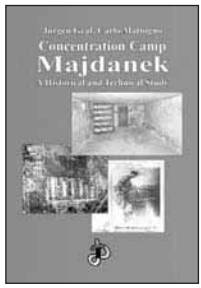
Dissecting the Holocaust. The Growing Critique of 'Truth' and 'Memory.' Edited by Germar Rudolf. *Dissecting the Holocaust* applies state-of-the-art scientific technique and classic methods of detection to investigate the alleged murder of millions of Jews by Germans during World War II. In 22 contributions—each of 30 pages—the 17 authors dissect generally accepted paradigms of the "Holocaust." It reads as exciting as a crime novel: so many lies, forgeries and deceptions by politicians, historians, and scientists. This is the intellectual adventure of the 21st century. Be part of it! "There is at present no other single volume that provides a serious reader with a broad understanding of the contemporary state of historical issues that influential people would rather not have examined." —Prof. Dr. A. R. Butz, Evanston, IL. "Read this book and you will know where revisionism is today. . . . Revisionism has done away with the exterminationist case." —Andrew Gray, THE BARNES REVIEW. Second revised edition. Softcover, large format, 616 pages, B&W illustrations, bibliography, index, #219, ***$30*** minus 10% for TBR subscribers.



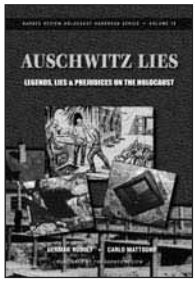
Jewish Emigration from the Third Reich. By Ingrid Weckert. Current historical writings about the Third Reich paint a bleak picture regarding its treatment of Jews. Jewish emigration is often depicted as if the Jews had to sneak over the German border, leaving all their possessions behind. The truth is that the emigration was welcomed and supported by the German authorities and occurred under constantly increasing pressure. Weckert's booklet elucidates the emigration process in law and policy, thereby augmenting the perceived picture of Jewish emigration from Germany. Softcover, 72 pages, index, #539, ***$8*** minus 10% for TBR subscribers.



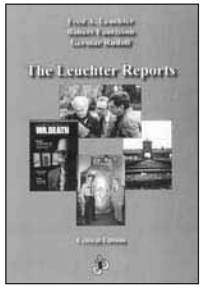
The First Holocaust. Jewish Fundraising Campaigns With Holocaust Claims During and After World War One. By Don Heddesheimer. Six million Jews in Europe threatened with a holocaust: this allegation was spread by sources like *The New York Times*—but the year was 1919! Don Heddesheimer's compact but substantive *First Holocaust* documents post-WWI propaganda that claimed East European Jewry was on the brink of annihilation (regularly invoking the talismanic six million figure). It details how that propaganda was used to agitate for minority rights for Jews in Poland, and for Bolshevism in Russia. It demonstrates how Jewish fundraising operations in America raised vast sums in the name of feeding suffering Polish and Russian Jews, then funneled much of the money to Zionist and Communist "constructive undertakings." *The First Holocaust* is a valuable study of American Jewish institutional operations at a fateful juncture in Jewish and European history; an incisive examination of a cunningly contrived campaign of atrocity and extermination propaganda two decades before the alleged WWII Holocaust—and an indispensable addition to every revisionist's library. Softcover, 142 pages, B&W illustrations, bibliography, index, #386, ***$15*** minus 10% for TBR subscribers.



Treblinka: Extermination Camp or Transit Camp? By Carlo Mattogno and Juergen Graf. It is alleged that at Treblinka in East Poland between 700,000 and 3,000,000 persons were murdered in 1942 and 1943. The weapons used were said to have been stationary and/or mobile gas chambers, fast-acting or slow-acting poison gas, unslaked lime, superheated steam, electricity, diesel exhaust fumes etc. Holocaust historians alleged that bodies were piled as high as multi-storied buildings and burned without a trace, using little or no fuel at all. Graf and Mattogno have now analyzed the origins, logic and technical feasibility of the official version of Treblinka. On the basis of numerous documents they reveal Treblinka's true identity: it was a transit camp. Even longtime revisionism buffs will find a lot that is new in this book, while Graf's animated style guarantees a pleasant reading experience. The original testimony of witnesses enlivens the reader, as does the skill with which the authors expose the absurdities of Holocaust historiography. Softcover, 365 pages, B&W illustrations, bibliography, index, #389, ***$25*** minus 10% for TBR subscribers.



Sobibor: Holocaust Propaganda and Reality. By Juergen Graf, Thomas Kues and Carlo Mattogno. Between 25,000 and 2,000,000 Jews are said to have been killed in gas chambers in the Sobibór camp in eastern Poland in 1942 and 1943. The corpses were allegedly buried in mass graves and later incinerated on pyres. This book investigates these claims and shows that they are not based on solid evidence, but on the selective use of absurd and contradictory eyewitness testimonies. Archeological surveys of the camp in 2000-2001 are analyzed, with fatal results for the extermination camp hypothesis. The book also thoroughly documents the general NS policy toward Jews, which never included an extermination plan. Softcover, 434 pages, B&W illustrations, bibliography, index. #536, ***$25*** minus 10% for TBR subscribers.

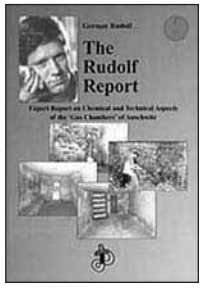


Belzec in Propaganda, Testimonies, Archeological Research and History. By Carlo Mattogno. Witnesses report that at least 600,000, if not as many as three million, Jews were murdered in the Belzec camp, located in eastern Poland, between 1941 and 1942. Various murder weapons are claimed to have been used: diesel gas chambers; unslaked lime in trains; high voltage; vacuum chambers etc. According to witnesses, the corpses were incinerated on huge pyres without leaving any traces. For those who know the stories about Treblinka this all sounds too familiar. The author therefore restricted this study to the aspects which are different and new compared to Treblinka, but otherwise refers the reader to his Treblinka book. The development of the official image portrait about Belzec is explained and subjected to a thorough critique. In contrast to Treblinka, forensic drillings and excavations were performed in the late 1990s in Belzec, the results of which are explained and critically reviewed. These findings, together with the absurd claims by "witnesses," refute the thesis of an extermination camp. Softcover, 138 pages, B&W illustrations, bibliography, index, #540, ***$15*** minus 10% for TBR subscribers.

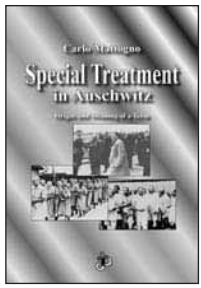
Concentration Camp Majdanek. By Carlo Mattogno and Juergen Graf. Little research had been directed toward concentration camp Majdanek in central Poland, even though it is claimed that up to a million Jews were murdered there. The only information available is discredited Polish Communist propaganda. This glaring research gap has finally been filled. After exhaustive research of primary sources, Mattogno and Graf created a monumental study which expertly dissects and repudiates the myth of homicidal gas chambers at Majdanek. They also critically investigated the legendary mass executions of Jews in tank trenches ("Operation Harvest Festival") and prove them groundless. The authors' investigations lead to unambiguous conclusions about the camp which are radically different from the official theses. Again they have produced a standard and methodical investigative work, which authentic historiography cannot ignore. Softcover, second edition, 320 pages, B&W illustrations, bibliography, index, #380, ***$25*** minus 10% for TBR subscribers.

Auschwitz Lies: Legends, Lies and Prejudices on the Holocaust. By Carlo Mattogno and Germar Rudolf. "French biochemist G. Wellers exposed "The Leuchter Report" as fallacious," but he exposed only his own grotesque incompetence. "Polish researcher Prof. J. Markiewicz proved with analysis that Zyklon B was used in the gas chambers of Auschwitz," but Markiewicz fabricated his results. "Chemist Dr. Richard Green showed that the revisionists' chemical arguments are flawed," yet Green actually had to admit that the revisionists are right. "Prof. Zimmerman proved that the crematories in Auschwitz could cremate all victims of the claimed mass murder." As an accountant, Zimmerman proved only his lack of knowledge. "Profs. M. Shermer and A. Grobman refuted the entire array of revisionist arguments." In truth they covered only a tiny fraction of revisionist arguments, and botched their attempt at refutation. "Keren, McCarthy and Mazal found the 'Holes of Death' proving the existence of the Auschwitz gas chambers." No, they twisted evidence to support their case and suppressed facts. These and other untruths are exposed for what they are: political lies created to ostracize dissident historians and keep the Western world in Holocaust servitude. Softcover, 398 pages, B&W illustrations, index, #541, ***$25*** minus 10% for TBR subscribers.

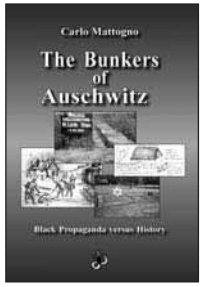
The Leuchter Reports: Critical Edition. By Fred Leuchter, Robert Faurisson and Germar Rudolf. Between 1988 and 1991, U.S. expert on execution technologies Fred Leuchter wrote four expert reports addressing whether the Third Reich operated homicidal gas chambers. The first report on Auschwitz and Majdanek became world famous. Based on chemical analyses of wall samples and on various technical arguments, Leuchter concluded that the locations investigated "could not have then been, or now, be utilized or seriously considered to function as execution gas chambers." Subsequently, this first "Leuchter Report" was the target of much criticism, some of it justified. This edition republishes the unaltered text of all four reports and accompanies the first one with critical notes and research updates, backing up those of Leuchter's claims that are correct, and correcting those that are inaccurate. Softcover, 227 pages, B&W illustrations, #431, ***$22*** minus 10% for TBR subscribers.



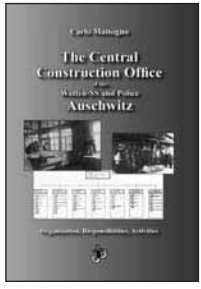
Auschwitz: Plain Facts—A Response to Jean-Claude Pressac. Edited by Germar Rudolf. French pharmacist Jean-Claude Pressac tried to refute revisionists with their own technical methods. For this he was praised by the mainstream, and they proclaimed victory over revisionists. In *Auschwitz: Plain Facts,* Pressac's works are subjected to a detailed critique. Although Pressac deserves credit for having made accessible many hitherto unknown documents, he neither adhered to scientific nor to formal standards when interpreting documents. He made claims that he either could not prove or which contradict the facts. Documents do not state what he claims they do. He exhibits massive technical incompetence and he ignores important arguments. *Auschwitz: Plain Facts* is a must read. Softcover, 197 pages, B&W illustrations, bibliography, index, #542, ***$20*** minus 10% for TBR subscribers.



The Giant With Feet of Clay: Raul Hilberg and His Standard Work on the "Holocaust." By Juergen Graf. Raul Hilberg's major work *The Destruction of European Jewry* is generally considered the standard work on the Holocaust. The critical reader might ask: what evidence does Hilberg provide to back his thesis that there was a German plan to exterminate Jews, to be carried out in the legendary gas chambers? And what evidence supports his estimate of 5.1 million Jewish victims? Juergen Graf applies the methods of critical analysis to Hilberg's evidence and examines the results in light of revisionist historiography. The results of Graf's critical analysis are devastating for Hilberg. Graf's *Giant With Feet of Clay* is the first comprehensive and systematic examination of the leading spokesperson for the orthodox version of the Jewish fate during the Third Reich. Softcover, 128 pages, B&W illustrations, bibliography, index, #252, ***$11*** minus 10% for TBR subscribers.

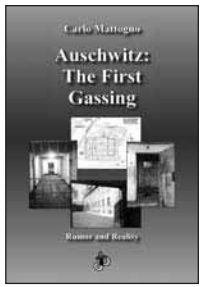


The Rudolf Report. Expert Report on Chemical and Technical Aspects of the 'Gas Chambers' of Auschwitz. By Germar Rudolf. In 1988, Fred Leuchter, American expert for execution technologies, investigated the alleged gas chambers of Auschwitz and Majdanek and concluded that they could not have functioned as claimed. Ever since, Leuchter's claims have been massively criticized. In 1993, Rudolf, a researcher from the prestigious German Max Planck Institute, published a thorough forensic study about the alleged gas chambers of Auschwitz that irons out the deficiencies and discrepancies of "The Leuchter Report." *The Rudolf Report* is the first English edition of this sensational scientific work. It analyzes all existing evidence on the Auschwitz gas chambers. The conclusions are quite clear: The alleged gas chambers of Auschwitz could not have existed. In the appendix, Rudolf describes his unique persecution. Softcover, 455 pages, B&W & color illustrations, bibliography, index, #378, ***$33*** minus 10% for TBR subscribers.

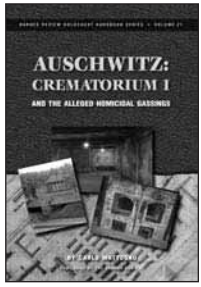


Distribution in the United States: Prices do not include S&H. Inside the U.S. add $5 on orders up to $50. Add $10 S&H on orders from $50.01 to $100. On orders over $100 add a flat $15 no matter the order size. Subscribers to The Barnes Review magazine may take 10% off book prices. Send order to TBR Book Club, P.O. Box 15877, Washington, D.C. 20003, call 1-877-773-9077 toll free to charge to major credit cards or visit www.barnesreview.com.

Special Treatment in Auschwitz: Origin and Meaning of a Term. By Carlo Mattogno. When appearing in German wartime documents, terms like "special treatment," "special action," and others have been interpreted as code words signifying the murder of inmates. While the term "special treatment" in many such documents did indeed mean execution, the term need not always have had that meaning in German records. This book is the most thorough study of this textual problem to date. Publishing and interpreting numerous such documents about Auschwitz—many of them hitherto unknown—Mattogno shows that, while "special" had many different meanings, not a single one meant "execution." This important study demonstrates that the practice of deciphering an alleged "code language" by assigning homicidal meaning to harmless documents is no longer tenable. Softcover, 151 pages, B&W illustrations, bibliography, index, #543, ***$15*** minus 10% for TBR subscribers.



The Bunkers of Auschwitz: Black Propaganda vs. History. By Carlo Mattogno. The so-called "Bunkers" at Auschwitz are claimed to have been the first homicidal gas chambers at Auschwitz specifically equipped for this purpose in early 1942. With the help of original German wartime files, this study shows that these "bunkers" never existed; how the rumors about them evolved as black propaganda created by resistance groups within the camp; how this propaganda was transformed into "reality" by historians; and how material evidence (aerial photography and archeological research) confirms the publicity character of these rumors. Softcover, 264 pages, illustrations, bibliography, index, #544, ***$20*** minus 10% for TBR subscribers.



Auschwitz: The Central Construction Office. By Carlo Mattogno. Based upon mostly unpublished German wartime documents from Moscow archives, this study describes the history, organization, tasks and procedures of the Central Construction Office of the Waffen-SS and Auschwitz Police. Despite a huge public interest in the camp, next to nothing was really known about this office, which was responsible for the planning and construction of the Auschwitz camp complex, including those buildings in which horrendous mass slaughter is erroneously said to have occurred. Softcover, 182 pages, B&W illustrations, glossary, #545, ***$18*** minus 10% for TBR subscribers.

Distribution in the United States: Prices do not include S&H. Inside the U.S. add $5 on orders up to $50. Add $10 S&H on orders from $50.01 to $100. On orders over $100 add a flat $15 no matter the order size. Subscribers to The Barnes Review magazine may take 10% off book prices. Send order to TBR Book Club, P.O. Box 15877, Washington, D.C. 20003, call 1-877-773-9077 toll free to charge to major credit cards or visit www.barnesreview.com.

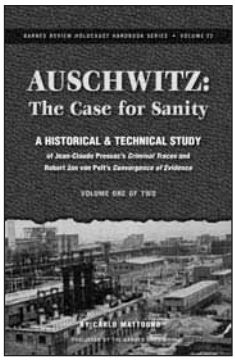
Auschwitz: The First Gassing—Rumor and Reality. By Carlo Mattogno. The first gassing of human beings in Auschwitz is claimed to have occurred on Sept. 3, 1941, in a basement room. The accounts reporting it are the archetypes for all later gassing accounts. This study analyzes all available sources about this alleged event. It shows that these sources contradict each other in location, date, preparations, victims etc, rendering it impossible to extract a consistent story. Original wartime documents inflict a final blow to the tale of the first homicidal gassing. Softcover, 157 pages, B&W illustrations, bibliography, index, #515, ***$16*** minus 10% for TBR subscribers.

Auschwitz: Crematorium I and the Alleged Homicidal Gassings. By Carlo Mattogno. The morgue of Crematorium I in Auschwitz is claimed to have been the first homicidal gas chamber in that camp. This study thoroughly investigates all accessible statements by witnesses and analyzes hundreds of wartime documents in order to accurately write a history of that building. Mattogno proves that its morgue was never used as a homicidal gas chamber, nor could it have served as such. Softcover, 138 pages, B&W illustrations, bibliography, index, #546, ***$18*** minus 10% for TBR subscribers.

Auschwitz: Open Air Incinerations. By Carlo Mattogno. Hundreds of thousands of corpses of murder victims are claimed to have been incinerated in deep ditches in the Auschwitz concentration/work camp complex. This book examines the many testimonies regarding these incinerations and establishes whether these claims were technically possible. Using aerial photographic evidence, physical evidence and wartime documents, the author shows that these claims are untrue. A must read. Softcover, 132 pages, B&W illustrations, bibliography, index, #547, ***$15*** minus 10% for TBR subscribers.



Concentration Camp Stutthof and its Function in National Socialist Jewish Policy. By Carlo Mattogno and Juergen Graf. The concentration camp at Stutthof near Danzig in western Prussia has never before been scientifically investigated by Western historians. Polish authors officially sanctioned by their Communist government long maintained that Stutthof was converted to an "auxiliary extermination camp" in 1944 with the mission to murder as many Jews as possible. This book subjects this concept to rigorous critical investigation based on literature and documents from various archives. It shows that extermination claims contradict reliable sources. Second edition, 128 pages, B&W & color illustrations, bibliography, index, #379, ***$15*** minus 10% for TBR subscribers.

NEW TWO-VOLUME SET

Auschwitz: The Case for Sanity:

A Historical & Technical Study of Jean-Claude Pressac's 'Criminal Traces' and Robert Jan van Pelt's 'Convergence of Evidence'

By Carlo Mattogno. Because Jewish theologian Deborah Lipstadt had called British historian David Irving a "Holocaust denier," he sued her for libel. In her defense Lipstadt presented Prof. Robert van Pelt as an expert to refute revisionist assertions about Auschwitz. Ever since van Pelt has been praised as the defeater of revisionism and foremost expert on Auschwitz. This book is the revisionist response to Prof. van Pelt and Pressac. It shows that van Pelt's study is "neither a scholarly nor a historical work; it is only a biased journalistic assemblage of poorly understood and poorly interpreted historical sources." This is a book of prime political and scholarly importance! 2 vols. (370 + 390 pages), softcover, B&W illustrations, glossary, bibliography, index. #551, ***$45*** minus 10% for TBR subscribers. Add $25 for a sturdy leatherette case to house the two volumes.

CURRENTLY IN PREPARATION:

Carlo Mattogno: ***Healthcare in Auschwitz***—An overview of the vast measures taken by the Auschwitz camp authorities to save the lives of their inmates. Irrefutably proven facts, incredible only for those who still believe in the establishment version. Softcover, estimated at 350 pages, softcover, 6"×9", B&W illustrations, bibliography, index.

Carlo Mattogno: ***The Crematory Ovens of Auschwitz***—An exhaustive technical study of the "core" buildings of the alleged "Holocaust"—and a refutation of mass murder claims based upon false concepts of those crematoria. Projected at two volumes. (Volume I: 550 pages; Volume II: 350 pages), softcover, 6"×9", B&W illustrations, bibliography, glossary, index.

Carlo Mattogno: ***Chelmno. Myth and Reality***—An overview of the mostly unsubstantiated claims and their juxtaposition to provable facts about this camp where thousands are said to have been murdered, mostly by noxious exhaust gases in trucks. Projected at 200 pages, 6"×9", B&W illustrations, bibliography, index.

Distribution in the United States: Prices do not include S&H. Inside the U.S. add $5 on orders up to $50. Add $10 S&H on orders from $50.01 to $100. THE BARNES REVIEW:

In the maverick tradition of one of the great historians of the modern era . . .

No topic is "too controversial" for The BARNES REVIEW, the most interesting history magazine published anywhere today. Commemorating the trailblazing path of the towering 20th Century revisionist historian, the late Harry Elmer Barnes, TBR's mission is to separate historical truth from propaganda and to bring history into accord with the facts. Founded in 1994 by veteran American nationalist Willis A. Carto—a personal friend of Barnes—*The Barnes Review* concurs with Rousseau's maxim that "Falsification of history has done more to impede human development than any one thing known to mankind." TBR covers all aspects of history from the dawn of man to recent events and also places a special focus on the philosophy of nationalism. As such, TBR proudly describes itself as a "journal of nationalist thought" and dares to be politically incorrect in a day when Cultural Marxism prevails in the mass media, in academia and in day-to-day life. TBR's editorial board of advisors encompasses historians, philosophers and academics from all over the face of the planet, intellectuals united in their desire to bring peace to the world by exposing the lies and prevarications of the past that have brought us to where we are today. If you believe everything you see in the "responsible" media or think that absolutely everything that appears in most college-level history texts is true, you might be shocked by

what you see in TBR—but if you are shocked by what you see in TBR, then that's all the more reason you need to join the growing ranks of independent-minded free-thinkers from all walks of life and all over the world who are longtime TBR subscribers.

THE BARNES REVIEW $46 for ONE year (six bimonthly issues—64 pages each); Including this special free bonus: A FREE COPY OF Michael Collins Piper's blockbuster book *The New Jerusalem*. That's a $20 gift free for a one-year domestic subscription. Subscribe for two years at $78 and get *The New Jerusalem* PLUS Mark Glenn's *No Beauty in the Beast: Israel Without Her Mascara*. Outside the U.S. email TBRca@aol.com for international rates and for S&H to your nation.

THE RUDOLF REPORT

EXPERT REPORT ON CHEMICAL & TECHNICAL ASPECTS OF THE 'GAS CHAMBERS' OF AUSCHWITZ

New second expanded and revised edition by Germar Rudolf and Dr. Wolfgang Lambrecht. In 1988, Fred Leuchter, American expert for execution technologies, investigated the alleged gas chambers of Auschwitz and Majdanek and concluded that they could not have functioned as claimed. Ever since, Leuchter's claims have been attacked. In 1993, Rudolf, a researcher from the prestigious Max Planck Institute, published a thorough forensic study about the "gas chambers" of Auschwitz. His report irons out the deficiencies and discrepancies of "The Leuchter Report." The Rudolf Report was the first English edition of this sensational scientific work. This new edition analyzes all existing evidence on the Auschwitz gas chambers and offers even more evidence. The conclusions are startling. Appendix describes Rudolf's unique persecution—this brilliant scientist was so feared by the mainstream holocaust establishment that they banned him from writing about or researching the subject as terms of his release from prison!

Here's what just one scholar had to say about this book: "I am extraordinarily impressed. To my knowledge, you are the first expert in Germany who has addressed this particular topic in a scholarly impeccable and well-founded way. It is not for me to attribute an ice-breaker function to your expert report. It is easy to see which political-historical effects will originate from it, though its entire dimension cannot yet be estimated." —Prof. Dr. Hellmut Diwald, 1992

THE RUDOLF REPORT (softcover, 457 pages, indexed, illustrated, #378, **$33** minus 10% for TBR subscribers) can be ordered from TBR Book Club, P.O. Box 15877, Washington, D.C. 20003. Inside U.S. add $5 S&H. Outside U.S. email TBRca@aol.com for best S&H to your nation. To charge a copy to Visa, MasterCard, AmEx or Discover, call TBR toll free at 1-877-773-9077. Set in Times New Roman

ON THE COVER: Various photos show chemist Germar Rudolf during his on-site investigation on existing structures at the Auschwitz labor camp. This book is the result of his extensive scientific analysis of the data he gathered there.

Table of Contents

Page

Part I: Science 9
1. Prelude 11
1.1. Slow Death in U.S. Gas Chambers 11
1.2. Hydrogen Cyanide – a Dangerous Poison 14
1.3. The Acid that Causes Blue Stains 19
2. The Coup 23
2.1. Fred Leuchter on Auschwitz and Majdanek 23
2.2. Damage Control 26
3. The Origins 29
3.1. On the Problem 31
3.2. On Politics 35
4. A Brief History of Forensic Examinations of Auschwitz 39
4.1. Introduction 39
4.2. The Moral Obligation of Forensic Examination 39
4.3. A Definition of Forensic Science 41
4.4. Forensic Science and Auschwitz 42
4.4.1. Forensics in the Courts 42
4.4.1.1. The 1946 Krakow Auschwitz Trial 42
4.4.1.2. The 1964-1966 Frankfurt Auschwitz Trial 44
4.4.1.3. The 1972 Vienna Auschwitz Trial 45
4.4.2. Forensics Outside the Courts 45
4.4.2.1. In Search of Mass Graves 45
4.4.2.2. Faurisson and the Consequences 46
5. Auschwitz 47
5.1. On the History of the Camp 47
5.2. Epidemics and the Defense Against Them 54
5.2.1. Danger of Epidemics 54
5.2.2. Epidemic Control with Zyklon B 55
5.2.3. Epidemic Control in Auschwitz 60
5.2.3.1. Terminology Used and Responsibilities 60
5.2.3.2. Procedures Used 62
5.2.3.3. Results 63
5.2.3.4. Basic Policy Decisions 63
5.2.3.5. The Army Medical Officer 64
5.2.3.6. Short-Wave Delousing Facility 67
5.2.4. Disinfestation Installations BW 5a und 5b 68
5.3. "Gas Chamber" in the Auschwitz I Main Camp 72
5.4. "Gas Chambers" in the Birkenau Camp 82
5.4.1. Crematoria II and III 82
5.4.1.1. Point of Departure 82
5.4.1.2. The Obsessive Search for "*Criminal Traces*" 87
5.4.1.2.1. New Cellars Stairways 88
5.4.1.2.2. Gassing Cellar, Undressing Room, and Showers 90
5.4.1.2.3. "*Gas-tight Doors*" for Crematorium II 93
5.4.1.2.4. Ventilation Installations 97
5.4.1.2.5. Pre-heated Morgues 99

5.4.1.2.6. "*Cremation with Simultaneous Special Treatment*" 99
5.4.1.2.7. "*Gas Testers*" and *"Indicator Devices for HCN Residues"* 101
5.4.1.2.8. Zyklon B Introduction Holes and Columns 104
5.4.1.2.9. Conclusions 122
5.4.2. Crematoria IV and V 123
5.4.3. Farmhouses 1 and 2 127
5.4.4. The Drainage System in Birkenau 129
5.4.4.1. Background: Eyewitness Accounts 129
5.4.4.2. The Ground Water Table in Birkenau 130
5.4.4.3. Open-Air Incineration in Pits 132
5.5. Construction Conclusions 133
6. Formation and Stability of Iron Blue 139
6.1. Introduction 139
6.2. Instances of Damage to Buildings 140
6.3. Properties of Hydrogen Cyanide, HCN 143
6.4. Composition of Iron Blue 145
6.4.1. Overview 145
6.4.2. Excursus 145

Caveat Internet: Most of the revisionist literature quoted in this book can be downloaded free of charge from the Internet. The corresponding addresses have been given in the footnotes in some cases, all accessed in July 2010. Due to the evanescent nature of many Internet sources, however, there is no guarantee that the sources will still be at the same location when the reader tries to access them. In that case please use common sense and search engines to relocate them or to find similar sources about the issues they are meant to undergird. Most revisionist books and papers published in a revisionist periodical do not have an online address listed for space reasons, although many, if not most, are available online. In that case, please check whether the respective online file can be found at one of the two major revisionist online archives storing hundreds of revisionist books and periodicals[1] in html, pdf and ZIP format: www.vho.org and www.vho.org/aaargh (mirrored at www.aaargh.codoh.com). For a list of writings by Prof. R. Faurisson see at www.vho.org/aaargh/fran/archFaur/archFaurc.html.

Part I:
Science

1. Prelude

1.1. Slow Death in U.S. Gas Chambers

On June 15, 1994, dramatic events unfolded during the execution of capital punishment. David Lawson, sentenced to death for a capital felony, was scheduled to be killed by hydrogen cyanide in the gas chamber located in the state prison of Raleigh, North Carolina – but the prisoner refused to assist his executioners.[2] Lawson repeatedly held his breath for as long as possible and took only short breaths in between.[3] Lawson exhibited enormous willpower, calling out to both executioners and witnesses throughout his execution:

"I am human."

At first his cry was clearly audible, but as the minutes went by he became less and less understandable and finally, more than ten minutes into the execution, there was just a mutter. He was declared dead only after eighteen minutes. The witnesses to the execution were horrified.

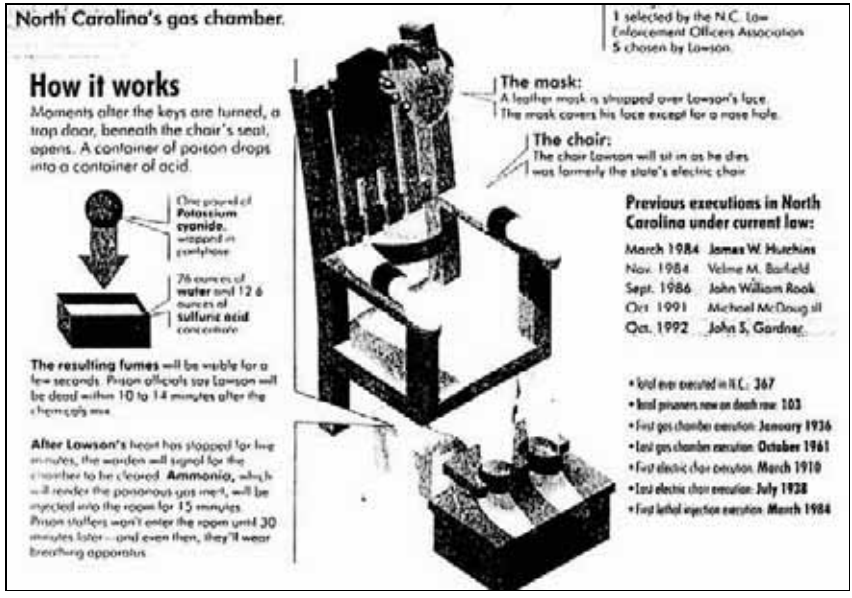

Fig. 1: *Schematic drawing of the U.S. execution gas chamber in North Carolina.*[5]

[2] A detailed description of this execution can be found at: Bill Krueger, "Lawson's Final Moments," *The News & Observer*, Raleigh, North Carolina, June 19, 1994, p. A1.

[3] "Killing Me Cruelly," *Newsweek*, November 8, 1993, p. 73; *The New York Times*, October 6, 1994, p. A20; *ibid.*, June 16, 1994, p. A23.

The warden of the prison who had also supervised the execution was so shaken that he resigned. Because of this execution fiasco, executions with poison gas have been abandoned for a short period of time in the USA and replaced with lethal injections.

In early March 1999, however, this horror had already been forgotten. This time, the victim was a German national. Despite intervention by the German government, Walter LaGrand was executed in the state prison at Florence, Arizona. LaGrand's death struggle against lethal cyanide gas lasted eighteen minutes. Thirty witnesses peered through a bulletproof window as the confessed, convicted murderer died horribly behind an armor-reinforced door.[4]

It is now clear to the experts, and especially to those still waiting on death row, that a quick and painless execution by gas requires the cooperation of the intended victim. Prisoners about to be gassed were usually encouraged to inhale deeply as soon as the cyanide was released in order to make their deaths come easily. However, if an intended victim was uncooperative, the execution could easily become a fiasco. By simply refusing to take the deep breaths needed to quickly inhale a lethal dose of cyanide, the agony could last for more than eighteen minutes, even under ideal conditions. Publications in the United States reveal that executions lasting from 10 to 14 minutes are the rule, rather than the exception. Amnesty International calls them "botched executions."[5-8]

The method used in American execution gas chambers was introduced in 1924, and has since been improved to technical perfection. The expense to kill just one single person is tremendously high, since neither the witnesses, nor the prison personnel or the environment may be endangered by the poison gas released for such an execution. Re-

See also more recently: Scott Christianson, *The Last Gasp. The Rise and Fall of the American Gas Chamber*, University of California Press, Berkeley, CA, 2010.

8 These paragraphs are based on an article by Conrad Grieb, "The Self-assisted Holocaust Hoax" (www.vho.org/GB/c/FPB/SelfAssisted.html); Ger.: "Der selbstassistierte Holocaust-Schwindel," *Vierteljahreshefte für freie Geschichtsforschung*, 1(1) (1997), pp. 6ff. (subsequently abbreviated as *VffG*).

inforced-glass windows, massive, heavy, hermetically-sealed steel doors, powerful ventilation systems with a device to burn the evacuated poisonous gases, and a chemical treatment of the chamber interior to neutralize all remaining traces of the poison make this execution method the most cumbersome of all.[9]

During the last two decades of the 20th century, the only technical expert in the United States able to build and maintain this equipment was Frederick A. Leuchter Jr., sometimes referred to in the media as "Mr. Death,"[10] since his profession was the design, construction and maintenance of various kinds of execution devices.[11]

A feature article in *The Atlantic Monthly* (Feb. 1990), for example, factually described Leuchter as

> *"the nation's only commercial supplier of execution equipment.* […] *A trained and accomplished engineer, he is versed in all types of execution equipment. He makes lethal-injection machines, gas chambers, and gallows, as well as electrocution systems* […]*"*

Similarly, a lengthy *New York Times* article (October 13, 1990), complete with a front-page photo of Leuchter, called him

> *"The nation's leading adviser on capital punishment."*

In his book about "America's Capital Punishment Industry," Stephen Trombley confirms that Leuchter is, in fact,[12]

> *"America's first and foremost supplier of execution hardware. His products include electric chairs, gas chambers, gallows, and lethal injection machines. He offers design, construction, installation, staff training and maintenance."*

Killing someone in a gas chamber is very dangerous for those who carry out the execution, above all because the body of the dead prisoner is saturated with lethal gas. After the execution, explains Leuchter:[13]

> *"You go in. The inmate has to be completely washed down with chlorine bleach or with ammonia. The poison exudes right out through his skin.*

---

[9] Re. the technical proceedings cf.: F.A. Leuchter, "The Third Leuchter Report," in: F.A. Leuchter, R. Faurisson, G. Rudolf, *The Leuchter Reports. Critical Edition*, 2nd ed., The Barnes Review, Washington, DC, 2010, pp. 183-212.

[10] Such is the title of a documentary movie directed by Errol Morris about Fred Leuchter, shown at the Sundance Film Festival in Park City (Utah, USA) on January 27, 1999: Errol Morris, *Mr. Death: The Rise and Fall of Fred A. Leuchter, Jr.*, Fourth Floor Productions, May 12, 1999; VHS: Universal Studios 2001; DVD: Lions Gate Home Entertainment, 2003(www.video.google.com/videoplay?docid=654178281151939378). The original version first shown on Jan. 27, 1999, during the Sundance Film Festivals in Park City (Utah) has been reworked after protests.

[11] The following paragraphs were adapted from taken the paper "Probing Look at 'Capital Punishment Industry' Affirms Expertise of Auschwitz Investigator Leuchter," *The Journal of Historical Review* 17(2) (1998), pp. 34ff. (subsequently abbreviated as *JHR*)

[12] Stephen Trombley, *op. cit.* (note 7), p. 8.

[13] *Ibid.*, p. 98.

> *And if you gave the body to an undertaker, you'd* kill *the undertaker. You've got to go in, you've got to completely wash the body."*

Bill Armontrout, warden of the Missouri State Penitentiary in Jefferson City, confirms the danger:[14]

> *"One of the things that cyanide gas does, it goes in the pores of your skin. You hose the body down, see. You have to use rubber gloves, and you hose the body down to decontaminate it before you do anything* [else]*"*

In Leuchter's opinion, gas chamber use should be discontinued, not just because of the cruelty of this method of execution, but because of his beliefs relating to gas chambers as such:[15]

> *"They're dangerous. They're dangerous to the people who have to use them, and they're dangerous for the witnesses. They ought to take all of them and cut them in half with a chain saw and get rid of them."*

With a career built on the motto "Capital punishment, not capital torture," Leuchter takes pride in his work. He is glad to be able to ensure that condemned prisoners die painlessly, that the personnel who carry out executions are not endangered, and that taxpayer dollars are saved.

1.2. Hydrogen Cyanide – a Dangerous Poison

Hydrogen cyanide, is not, of course, utilized solely for the purpose of executions in American gas chambers, but for much more constructive purposes as well. Since approximately the end of WWI, hydrogen cyanide, or HCN, has been used to exterminate vermin such as bedbugs, lice, corn weevils, termites, cockroaches, and other pests. It is, of course, important to be extremely cautious while applying hydrogen cyanide in order to avoid disaster, because it is in many ways a highly dangerous poison.

The residents of a house in Los Angeles, California, had to learn this in a quite painful way shortly before Christmas 1947. They had hired the Guarantee Fumigation Company to destroy the termites which threatened to eat up the wooden structure. The pest controllers, however, were apparently not very competent, because when using a container of pressurized HCN to fill the house, which had been wrapped up like a Christmas present, they exceeded safe limits and pumped in too much gas. (Fig. 2, p. 16).[16] Due to unknown reasons, the mixture of air and HCN, which can be highly explosive under certain circumstances, ig-

---

[14] *Ibid.*, p. 102

[15] *Ibid.*, p. 13.

[16] A gassing requires 1-2% by volume, while an explosion requires 6% by volume or more; see, in this regard, chapter 6.3.

nited during the fumigation. The resulting explosion destroyed the entire dwelling.[17]

However, hydrogen cyanide has yet another insidious characteristic: it is highly mobile. This mobility is highly welcome when it comes to killing vermin: Wherever fleas and bugs try to hide, the gas will still reach them! Unfortunately, hydrogen cyanide does not restrict itself to attack vermin. Rather, it indiscriminately seeps into the smallest cracks and even penetrates porous substances such as felt sealing materials and thin walls, thereby leaking into areas where it is not welcome. The failure on the part of disinfestors to ensure that all places to be fumigated are adequately sealed off have been described in toxicological literature:[18]

> "Example*: J.M., a 21 year old female home decorator, was working in the cellar of the house, the second floor of which was being treated for vermin with cyanide gas. Due to insufficient sealing during fumigation, the gas penetrated the corridors, where it poisoned the disinfestor, and reached the cellar through air shafts. Mrs. M. suddenly experienced an intense itching sensation in her throat followed by headache and dizziness. Her two fellow workers noticed the same symptoms and they all left the cellar. After half an hour, Mrs. M. returned to the cellar whereupon she suddenly collapsed and fell unconscious. Mrs. M. was taken to a hospital together with the unconscious exterminator. Mrs. M. recovered and was released. The exterminator, by contrast, was pronounced dead on arrival."*

But the dangers of this type of poison gas are not merely restricted to persons in the same house in which fumigation is taking place. Large quantities of gas may penetrate the open air and endanger the entire neighborhood, as shown by an accident in the fall of 1995 in a Croatian holiday resort:[19]

> *"That failed profoundly. Three local residents suffering from symptoms of poisoning and a number of surviving woodworms were the results of the botched action against vermin in a church in the Croatian holiday resort Lovran, close to Rijeka. The exterminator's clumsy work necessitated the evacuation of several hundred residents of the locality.*

[17] "How to get rid of termites," *Life*, Dec. 22, 1947, p. 31; see also *Liberty Bell*, 12/1994, pp. 36f.

[18] Sven Moeschlin, *Klinik und Therapie der Vergiftung*, Georg Thieme Verlag, Stuttgart 1986, p. 300.

[19] DPA, "Dilettantische Kammerjäger," *Kreiszeitung – Böblinger Bote*, Nov. 16, 1995, p. 7. Research has failed to determine which toxic gas was involved. Since hydrogen cyanide is one of the most poisonous and most rapidly diffusing of all gases used in disinfestation, the reported damage would have been at least as great if caused by hydrogen cyanide, even if hydrogen cyanide was not in fact involved in this accident. A number of additional examples are described by K. Naumann: "Die Blausäurevergiftung bei der Schädlingsbekämpfung," *Zeitschrift für hygienische Zoologie und Schädlingsbekämpfung*, 1941, pp. 36-45.

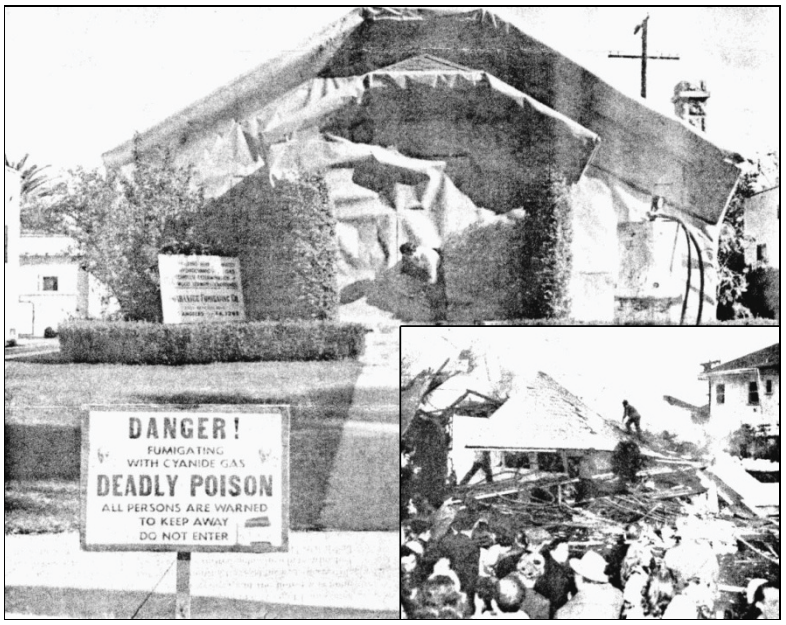

Fig. 2: *How to get rid of termites: Larger photo: Before. Smaller photo: After.*

The exterminators tried to treat the Church of the Holy Juraj for woodworm during the night, using the highly toxic gas. But since they failed to seal off the church appropriately, the gas seeped into surrounding houses in which people were already asleep. 'Fortunately, the people woke up immediately because of sudden attacks of nausea – that's what saved them from certain death,' wrote the newspaper, 'Vecernji List.' Three residents nevertheless suffered severe intoxication. The mayor decided to evacuate the center of the town. The exterminators were arrested. The woodworms survived. DPA"

But that is still not all: on top of this, hydrogen cyanide is also a tenacious poison. It adheres wherever it is utilized, especially in a moist environment. Deadly cyanide gas continues to evaporate slowly from moist objects for hours and days, involving a permanent environmental hazard where sufficient ventilation cannot be assured. This is emphasized by an especially dramatic and simultaneously macabre accident in the United States in the fall of 1998:

Los Angeles Times

Oct. 13, 1998 | STEVE BALL, TIMES STAFF WRITER

9 Hurt After Student's Apparent Suicide by Cyanide

Toxic fumes produced when a college student from Orange County died of an apparent suicide Monday forced the evacuation of an Iowa dormitory and the hospitalization of nine people, authorities said.

Carl T. Grimm, 20, a sophomore from Placentia, ingested potassium cyanide about 7:30 a.m. in his dormitory room at Grinnell College, a private liberal arts school about 50 miles east of Des Moines, Iowa, Grinnell Fire Chief Jerry Barns said.

Four paramedics who responded to the call at Younkers Hall came in contact with fumes from the poison, as did two college staff members and three other students.

Grimm was taken to Grinnell Regional Medical Center, where he was pronounced dead. […]

The others who became ill on the Iowa campus were treated and released from the hospital. […]

Firefighters sent to the dormitory evacuated the three-story structure until the Des Moines Hazardous Materials Unit arrived to ventilate the building.

Authorities could not say immediately where or how Grimm acquired the potassium cyanide. [20]

Another case, which occurred somewhat differently, nevertheless led to an accident which was no less tragic. Salts of cyanide, which release cyanide gas in the presence of moisture, are used for the separation of gold and silver during the processing of precious metals. In the case in question, a company was engaged in the processing of the cyanide-rich residues of such chemical reactions contained in large tanks, which is not without risk. The employer directed the workers, who were not equipped with gas masks or protective clothing, to go into the tanks which were still releasing cyanide gas. The consequences were tragic:

Department of Justice

Department of Justice National News Release

MONDAY, MAY 10, 1999

On May 7, the jury in Pocatello, ID, found that Allan Elias ordered employees of Evergreen Resources, a fertilizer manufacturing company he owned, to enter and clean out a 25,000-gallon storage tank containing cyanide without taking required precautions to protect his employees. Occupational Safety and Health Administration inspectors repeatedly had warned Elias about the dangers of cyanide and explained the precautions he must take before sending his employees into the tank, such as testing for hazardous materials and giving workers protective gear.

Scott Dominguez, an Evergreen Resources employee, was overcome by hydrogen cyanide gas while cleaning the tank and sustained permanent brain damage as a result of cyanide poisoning.[…]

Over a period of two days in August 1996, Elias directed his employees – wearing only jeans and T-shirts – to enter an 11-foot-high, 36-foot-long storage tank and clean out cyanide waste from a mining operation he owned. Elias did not first test the material inside the tank for its toxicity, nor did he determine the amount of toxic gases present. After the first day of working inside the tank, several employees met with Elias and told him that working in the tank was giving them sore throats, which is an early symptom of exposure to hydrogen cyanide gas.

The employees asked Elias to test the air in the tank for toxic gases and bring them protective gear – which is required by OSHA and which was available to the defendant free of charge in this case. Elias did not provide the protective gear, and he ordered the employees to go back into the tank, falsely assuring them that he would get them the equipment they sought. Later that morning, Dominguez collapsed inside the tank. And he could not be rescued for nearly an hour because Elias also had not given employees the required rescue equipment.[21]

[21] Occupational Safety & Health Administration, news release, May 10, 1999; Allan Elias was sentenced to 17 years imprisonment on April 28, 2000, www.justice.gov/opa/pr/2000/April/239enrd.htm; an entire book has been written about the case: Joseph Hilldorfer, Robert Dugoni, *The Cyanide Canary*, Simon & Schuster, New York 2004. The cyanide-contaminated sludge in the tank also contained phosphoric acid, resulting in the release of cyanide gas.

Even this example fails to convey the full scope of the insidious nature of cyanide gas, since it does not just kill by means of inhalation; even a gas mask may prove insufficient, especially if a person is sweating heavily. Hydrogen cyanide is dissolved most readily on moist surfaces, and it easily penetrates the skin. This was proven by a dramatic accident in 1995 in a cave in the French city of Montérolier:[22]

> *"The death of nine persons on June 21, 1995, in the cave of Montérolier (Seine-Maritime) was said to have been caused by the release of cyanide gas originating from the poison gas used during First World War, the so-called Vincennite. This was announced Wednesday by former Professor of Physical Chemistry, Louis Soulié.* […] *At a press conference in Buchy, he said that 'neither the children nor the firemen rushing to the rescue – one of whom wore a gas mask – died of carbon monoxide poisoning.'*
>
> […] *'Even six days after their deaths, a cyanide concentration twice as high as the fatal dose was still observed in the victims' blood.'*
>
> *According to the professor's remarks, the three children lit a fire in the cave and threw a Vincennite bomb found in the cave into the fire. The bomb exploded. The gas caused the deaths of three children, four firemen, the father of one of the children and an amateur spelunker.*
>
> *According to Prof. Soulié, the deaths of the firemen looking for the children in the cave, including the fireman wearing a gas mask, were due to the fact that hydrogen cyanide dissolves in the sweat and penetrates the body through the skin, where it causes poisoning."*

1.3. The Acid that Causes Blue Stains

Great excitement was caused by a strange occurrence in a Protestant church at Wiesenfeld, Lower Bavaria, Germany, in the spring and summer of 1977. The congregation had renovated the deteriorating church at great expense during the previous year, but now they faced a disaster. Huge blue stains were found to have formed in all parts of the plastered interior of the church. The experts having renovated the church were now called in for consultation, and found themselves confronted by a riddle which was only solved by a chemical analysis of the stained portions of the walls. The entire interior surface of the church was impregnated by Iron Blue.[23] No explanation could be found for this

---

[22] "Un expert évoque la présence de gaz mortel dans la grotte," *Le Quotidien de la Réunion*, June 25, 1998.

[23] Iron Blue is the ISO designation (ISO 2495) for iron cyanide blue pigments of various composition, which are also known as Berlin Blue, Turnbull's Blue, Prussian Blue, Vossen Blue®, Milori Blue, Paris Blue, French Blue, China Blue, Bronze Blue, Steel Blue, Ink Blue, among others, and as ferric ferrocyanide.

in the literature. It nevertheless proved possible to reconstruct the sequence of events.

A few weeks after the replastering of the church with a water-resistant cement mortar, the entire church had been fumigated with Zyklon B (hydrogen cyanide) to exterminate woodworm in the choir stalls. The hydrogen cyanide, released by the Zyklon B, did not just kill woodworm: it also reacted chemically with the plaster. The hydrogen cyanide contained in the Zyklon reacted with the iron oxides contained in quantities of 1-2% in all plasters, thus forming Iron Blue, a highly stable compound well know for centuries.[24]

Fig. 3: *In August 1976, the Protestant church at D-96484 Meeder-Wiesenfeld was fumigated with Zyklon B. Subsequently, blue-colored stains appeared all over the plaster (see Fig. 4).*

Another case had occurred five years earlier in 1972 in the Catholic church of St. Michael in Untergriesbach, also in Bavaria. Here, too, the church had been recently refurbished with fresh plaster, which turned blue after the church had been gassed with Zyklon B to combat woodworms, just as it would happen in Wiesenfeld five years later.[25]

Reports of blue pigmentation of walls resulting from fumigation with hydrogen cyanide for the destruction of vermin in areas with moist, ferrous plaster are not unknown in technical literature, as shown by a recent survey.[26] The necessary prerequisite for this reaction ap-

[24] G. Zimmermann (ed.), *Bauschäden Sammlung*, vol. 4, Forum-Verlag, Stuttgart 1981, pp. 120f., relating to the case of building damage occurring in August 1976 in the Protestant church at D-96484 Meeder-Wiesenfeld. We wish to thank Mr. W. Lüftl, Vienna, for discovering this information, as well as Mr. K. Fischer, Hochstadt am Main, who was held liable for damages as responsible architect, and who supplied me with further details. Reproduced from: G. Rudolf, "Wood Preservation through Fumigation with Hydrogen Cyanide: Blue Discoloration of Lime- and Cement-Based Interior Plaster," in: G. Rudolf (ed.), *Dissecting the Holocaust*, 2nd ed., Theses & Dissertations Press, Chicago 2003, pp. 557-561.

[25] www.pfarrei-untergriesbach.de/pfarrbrief11.htm.

[26] E. Emmerling, in: M. Petzet (ed.), *Holzschädlingsbekämpfung durch Begasung*, Arbeitshefte des Bayerischen Landesamtes für Denkmalpflege (Working Notebooks of the Bavarian State

pears to be that the fumigated plaster must be new and must exhibit high humidity. In other cases, there was also damage to the structure and interior installations, but no blue stains, perhaps because the plaster was old and had already set.[27]

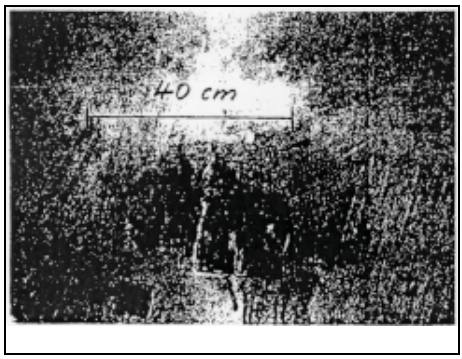

Fig. 4: *Inky blue stains on the plaster of a church fumigated with hydrogen cyanide.*

Office for Monument Maintenance), vol. 75, Lipp-Verlag, Munich 1995, pp. 43-56. Whether the examples cited in the paper may perhaps refer to the above mentioned case only in a roundabout way, must remain open for the time being. Carl Hermann Christmann reports the case of a farm building belonging to an 18th century monastery; the farm building was sold to a farmer following secularization, and the farmer then used it as a barn. Approximately 20 years ago, an investor converted the beautiful Baroque building into a luxury holiday restaurant. The existing interior plaster was repaired and painted white. After some time, blue stains appeared in the white paint; the stains were identified by a consulting expert as Iron Blue. The expert assumed that the former owner must have fumigated the building with hydrogen cyanide between 1920 and 1940, which then caused the stains 40-50 years later. Personal communication from C.H. Christmann according to his recollection on July 13, 1999; Mr. Christmann was unfortunately unable to find the source of the information. I would be extremely grateful for any references to passages in the literature in relation to this case.

[27] In one case, the fumigation of a church freshly painted with iron-free lime paint led to dark stains caused by the polymerization of hydrogen cyanide: D. Grosser, E. Roßmann, "Blausäuregas als bekämpfendes Holzschutzmittel für Kunstobjekte," *Holz als Roh- und Werkstoff*, 32 (1974), pp. 108-114.

2. The Coup

2.1. Fred Leuchter on Auschwitz and Majdanek

On February 3, 1988, Fred Leuchter received an unexpected visitor at his home in Boston, Massachusetts. A professor of French, Greek and Latin, as well as critic of testimonies, texts and documents, from the University of Lyon II – Dr. Robert Faurisson – had an unusual assignment in mind: He wanted to persuade Leuchter, in his capacity as an expert in execution technology, to prepare a professional opinion to be used in a criminal trial then taking place in Toronto, Canada.[28] More precisely, Dr. Faurisson wanted to convince Leuchter to determine whether or not the generally alleged mass exterminations with hydrogen cyanide gas in the concentration camps of the Third Reich were technically possible. Until that time, Leuchter had never questioned the existence of German homicidal gas chambers. When Prof. Faurisson showed him some mostly technical documents, however, Leuchter began to have doubts about the technical feasibility of the alleged homicidal gassings and agreed to come to Toronto to view additional documentation.

After this meeting and on the assignment of defense counsel, he then traveled to Poland with his wife (who was also his secretary), his draftsman, a video cameraman and a translator, to make a technical examination of the concentration camps at Auschwitz, Auschwitz-Birkenau and Majdanek for the above trial. He returned to the United States and wrote a 192-page report (including appendices). He also brought 32 test samples taken from the masonry in the crematoria at Auschwitz and Birkenau, the locations where the alleged gassings are said to have taken place, as well as from a delousing gas chamber. The background of these samples is as follows:

Almost all the concentration camps of the Third Reich contained facilities for the disinfestation of lice carried by inmate clothing. Various methods were used to accomplish this objective: hot air, hot steam, several different poison gases, and towards the end of the war even microwaves. Delousing was urgently needed in particular because lice

[28] Re. background and course of the criminal proceedings cf.: R. Lenski, *The Holocaust on Trial*, Reporter Press, Decatur, Alabama 1990, abridged transcript of the trial against Ernst Zündel in Toronto 1988; a lengthy compilation of the entire trial: Barbara Kulaszka (ed.), *Did Six Million Really Die? Report on the Evidence in the Canadian "False News" Trial of Ernst Zündel – 1988*, Samisdat Publishers Ltd., Toronto 1992.

carry epidemic typhus, a disease with a history of repeated outbreaks in eastern and central Europe. Epidemic typhus appeared again during WWII where it claimed hundreds of thousands of victims, not only in the concentration camps and prisoner-of-war camps, but among soldiers at the front. Since WWI, the most effective and the most widely used means for the extermination of lice and other pests, was hydrogen cyanide, marketed under the trade-name *Zyklon B*.

It has been known for decades that the walls within the buildings in which Zyklon B is proved to have been used to delouse inmate clothing exhibit massive, blotchy, bluish discoloration. This blue discoloration is due to a chemical substance known as *Iron Blue* which, under the right conditions, is formed in a chemical reaction by hydrogen cyanide with

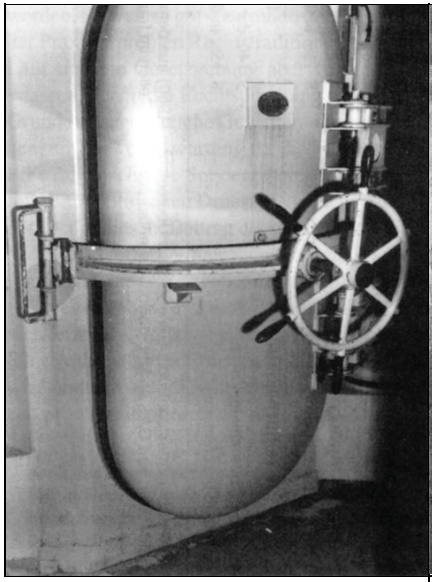

Fig. 5: *Single door to an execution gas chamber for one single person per gassing procedure (Baltimore, USA, 1954, technology from the 1930s). The execution of a single person with hydrogen cyanide is inevitably far more complicated and dangerous to the environment than the fumigation of clothing (even in a Degesch[29] circulation chamber).*

Fig. 6: *One of three doors from an alleged National Socialist gas chamber for the execution of hundreds of persons simultaneously, using Zyklon B (hydrogen cyanide) (Crematorium I, Auschwitz, Poland, early 1940s). This door is neither of sturdy construction, nor is it air-tight (note the keyhole). It is partly glazed and opens inwards i.e., into the room, where corpses were allegedly piling up.*

[29] Deutsche Gesellschaft für Schädlingsbekämpung (German Society for Pest Control), a subsidiary of the I.G. Farbenindustrie AG.

certain components of masonry. This substance can still be observed in surviving delousing facilities today. It is obviously a very stable compound. Professor Faurisson was the first person to point out that this blue discoloration is absent from the supposed homicidal gas chambers at Auschwitz. Faurisson's idea was to analyze samples from the masonry in the alleged homicidal gas chambers for traces of poison gas or its compounds (cyanides) and compare them with samples taken from the delousing chambers. Fred Leuchter followed this suggestion when doing his on-site investigations in Auschwitz in 1988.

Fig. 7: *Frederick A. Leuchter, the world's first, and possibly only, cyanide gas chamber expert, during a talk at the conference of the Institute for Historical Review in 1992*

On April 20 and 21, 1988, Leuchter took the stand as an expert witness in the courtroom in Toronto. He reported about his research and developed his conclusions. The atmosphere in the courtroom was tense. Leuchter's testimony was straightforward and at the same time sensational: According to Leuchter, there had never been any possibility of mass extermination of human beings by gassing either in Auschwitz, or in Birkenau, or in Majdanek:[30]

> *"It is the best engineering opinion of this author that the alleged gas chambers at the inspected sites could not have then been, or now, be utilized or seriously considered to function as execution gas chambers."*

Shortly before Leuchter, another witness was questioned: Bill Armontrout, warden of the Maximum Security Prison in Jefferson City, Missouri. It was Armontrout who, on request of defense attorney Barbara Kulaszka, pointed out that no one in the United States understood the operation of gas chambers better than Fred A. Leuchter. Armontrout himself confirmed in court the great difficulties involved in killing people with poison gas, as Robert Faurisson had done before him.

---

[30] F. A. Leuchter, *An Engineering Report on the Alleged Execution Gas Chambers at Auschwitz, Birkenau and Majdanek, Poland*, Samisdat Publishers Ltd., Toronto 1988; new: F.A. Leuchter, "The First Leuchter Report," in: F.A. Leuchter et al., op. cit. (note 9), pp. 13-119, here p. 57.

Following Leuchter, Prof. James Roth, director of a chemical laboratory in Massachusetts, also took the witness stand to describe the results of his analysis of the 32 masonry samples, the origins of which had been unknown to him: All samples taken from the gas chambers supposedly used for mass human extermination exhibited either no or only negligible traces of cyanide, while the sample from the delousing chambers taken as a control exhibited enormously high cyanide concentrations.[31]

Leuchter's report and subsequent testimony shook the foundations of Holocaust history, the story of the "Nazi gas chambers." Considering the tens of thousands of copies of this Leuchter Report that have been distributed in all major languages all over the world and the many speeches Leuchter held, the impact of the work of this one man was enormous.

2.2. Damage Control

Alarmed by this development, the "Never Forgive, Never Forget" brigade wasted no time in taking counter-measures. Self-styled "Nazi hunter" Beate Klarsfeld announced that Fred Leuchter "has to understand that in denying the Holocaust, he cannot remain unpunished."[32]

Jewish organizations launched a vicious smear campaign to destroy not only his reputation, but his ability to make a living. Leading the charge was Shelly Shapiro and her group, "Holocaust Survivors and Friends in Pursuit of Justice." Calling Leuchter a fraud and impostor, this group claimed, despite better knowledge, that he lacked qualifications as an execution equipment specialist and had asserted the possession of professional qualifications which he had never earned.[33]

Although these accusations were entirely unfounded and failed to survive any legal verification, the "get Leuchter" campaign, with the co-operation of mainstream journalists and editors, was successful. Leuchter's contracts with state authorities for the manufacture, installation, and servicing of execution hardware were cancelled. He was financially forced out of his home in Massachusetts and had to find pri-

vate work elsewhere. No American has suffered more for his defiance of the Holocaust lobby.

3. The Origins

Before the publication of the *Leuchter Report*, discussion relating to the reliability of eyewitness testimony of National Socialist mass murder was confined to groups describing themselves as "revisionists," usually termed "Neo-Nazis" or "right-wing extremists" by the media. But in fact, the labels used by the media were wide of the mark, as can be seen in the case of four of the most well-known revisionists: Paul Rassinier, French Socialist and former member of the French Resistance, who was an inmate of the concentration camps Buchenwald and Dora-Mittelbau;[34] German Jew Josef Ginsburg, who suffered from anti-Jewish measures taken during WWII by other countries as well as Germany.[35] The two most notable revisionists, Professors Arthur R. Butz, USA,[36] and retired Prof. Robert Faurisson, of France, can certainly not be accused of being political extremists, and nobody ever seriously tried to do this.[37]

Fig. 8: *Prof. Dr. Robert Faurisson*

The discussion on the technical problems of the National Socialist mass-murder of the Jews was begun in the late 1970s by Robert Faurisson, then professor of French, Greek and Latin, and an analyst of documents, texts, and witness statements at the University of Lyon II. He began to question the standard historical version of the Holocaust after he had made numerous critical studies concerning witness testimony and on documents that supposedly supported the claims of mass-murder. In 1978 for the first time, he advanced the argument that "there had not been one single

[34] Some of his most important works were also published in English, see *The Real Eichmann Trial or the Incorrigible Victors*, Torrance, CA, 1976; *Debunking the Genocide Myth*, The Noontide Press, Los Angeles, 1978; *The Holocaust Story and the Lies of Ulysses*, 2nd ed., Institute for Historical Review, New Port Beach 1990.

[35] Some of his most import works (all in German) are available online at www.vho.org/dl/DEU.html#jdd.

[36] Cf. *The Hoax of the Twentieth Century*, 3rd ed., Theses & Dissertations Press, Chicago 2003; "Context and perspective in the 'Holocaust' controversy," *JHR*, 3(4) (1982), pp. 371-405.

[37] Cf. *Mémoire en défense*, La Vieille Taupe, Paris 1980; Serge Thion (ed.), *Vérité historique ou vérité politique?*; La Vielle Taupe, Paris 1980; R. Faurisson, *Écrits révisionnistes*, 4 vols., published by author, Vichy 1999.

gas chamber under Adolf Hitler."[38] Later he supported this claim with physical, chemical, topographic, architectural, documentary, and historical arguments. He described the existence of the homicidal gas chambers as "radically impossible."[39] At the end of 1979, the largest French daily newspaper, *Le Monde,* decided to publish Professor Faurisson's provocative thesis, so he was given the opportunity to summarize it in an article.[40] The establishment historians' reaction was characteristic[41] and is best illustrated by a passage from a declaration signed by Pierre Vidal Naquet and 33 other researchers:[42]

> *"One may not ask how such a mass-murder* [of Jews] *was possible. It was technically possible, because it happened. This is the obligatory starting-point of every historical investigation of this subject. We simply want to call into memory this truth: There is no debate over the existence of the gas chambers, and there must not be one."*

Such a dogmatic explanation is equivalent to a capitulation, which was well understood. Hence they reconsidered their standpoint and went back to the drawing board.

Over the years that followed, establishment historians took up the questions raised by Robert Faurisson and others, at least to some extent, although they doggedly refused to permit him, or any one else who even remotely voiced similar thoughts, to participate in any academic activities. In the early 1980s, two large Holocaust conferences were held in the cities of Paris[43] and Stuttgart.[44] Some of the more important reasons for these conferences certainly were the works of Faurisson, Butz and others.[45]

In 1983, as a counter-measure against the ongoing successes of revisionists, a compilation was published, principally the work of French and German establishment historians.[46] While this book ridiculed and insulted revisionists and cast political aspersions against them, and at the same time was intended to refute their claims, it does neither address any particular revisionist argument, nor are any revisionist publications quoted or authors named, so that it is impossible for the reader of this book to verify the polemic accusations made against the revisionists. This book also repeats the mistake often emphasized by revisionists: quotations from "eyewitness" testimony and passages from documents were taken out of context and pasted uncritically into a predetermined historical pattern.

The publication of the *Leuchter Report* at the end of the 1980s gave a significant boost to revisionism. From that time onward, there has been an unending stream of publications.[47] The number of persons involved in "revisionism" increases steadily; although in many European countries this development has been curtailed by the enactment of laws threatening heavy penalties.[48]

3.1. On the Problem

A fact-oriented discussion of the technical arguments brought into the public by the *Leuchter Report* was started in France by an attempt at refutation by the pharmacist Jean-Claude Pressac in the periodical *Jour*

Sanning's papers and book on Jewish population statistics: "Die europäischen Juden. Eine technische Studie zur zahlenmäßigen Entwicklung im Zweiten Weltkrieg," 4 parts, *Deutschland in Geschichte und Gegenwart* 28(1-4) (1980), pp. 12-15; 17-21; 17-21; 25-31; Sanning, *Die Auflösung des osteuropäischen Judentums*, Grabert, Tübingen 1983; English: *The Dissolution of Eastern European Jewry*, Institute for Historical Review, Torrance, CA, 1983.

Fischer Verlag, Frankfurt 1983; Engl.: *Nazi Mass Murder*, Yale University Press, New Haven 1993; French: Henry Rollet (ed.), *Les chambres à gaz: secret d'Etat*, Les Editions de Minuit, Paris 1984.

[47] Since a complete listing of them all is impossible here, the reader's attention may be directed to the expanding series *Holocaust Handbooks* and the literature quoted in them; see the ads at the end of this book (www.HolocaustHandbooks.com).

[48] The Fabius-Gayssot Law was passed in France in 1990, rendering punishable the "denial of the facts" of the National Socialist war crimes "ascertained" at the Nuremburg Trials of 1946 convened by the Allied powers. In 1993, Austria followed suit (sec. 3h Criminal Law); in 1994, Germany (sec. 130 Criminal Code, new version), in 1995, Switzerland (sec. 216bis Criminal Code) and in 1996, Spain enacted similar laws that year, but abrogated it in 2007. A similar law passed in Belgium in 1997. Poland adopted a similar law in 1999, Czechia in 2001, and Hungary in 2010. Canada and Australia have created "Human Rights Commissions" which persecute revisionists and other offenders against political correctness. For more details see http://en.wikipedia.org/wiki/Laws_against_Holocaust_denial.

Juif.[49] His work could hardly qualify as an expert discussion in view of the absence of any references to his sources and any exact scientific argumentation. Though he did point out several deficiencies in the *Leuchter Report*, he made several errors himself in chemical and engineering questions due to his lack of expertise.[50]

The first response from Germany came from the official *Institut für Zeitgeschichte* (IfZ, Institute for Contemporary History).[51] It was based on Pressac's work and was hardly useful due to the lack of technical expertise in the same.[52]

A little later, a contribution on the *Leuchter Report* appeared in an anthology on the Third Reich, authored by retired social worker Werner Wegner, who had no qualifications in chemistry or civil engineering either.[53] Instead of seeking the advice of qualified people on these matters, he drew his own conclusions – to his own massive embarrassment.[54] One may question why Dr. Rainer Zitelmann, the responsible editor of this anthology, included this ridiculous piece in his otherwise well-researched compilation.[55]

At the end of 1991, chemist Dr. J. Bailer critiqued the *Leuchter Report* in a little booklet published in Austria.[56] This work is notable for largely ignoring the witness testimony on the procedures supposedly

used during the gassings at Auschwitz and for the author's lack of understanding of the process by which hydrogen cyanide reacts with masonry. Despite criticism directed at his study,[57] Bailer repeated his unsustainable objections in a later publication without responding to his critics.[58]

At approximately the same time as Bailer's first publication, G. Wellers also published a study of the *Leuchter Report*.[59] Wellers' position was superficial, and is characterized by lack of technical and scientific knowledge.[60]

Finally, the Auschwitz State Museum itself ordered an expert report to be compiled. The Institute for Forensic Research, Toxicology Division, of Krakow, Poland, named after Prof. Dr. Jan Sehn, prepared this report under Prof. Dr. J. Markiewicz on September 24, 1990, which confined itself to the analysis of masonry samples.[61] The report concluded that the reason why Leuchter's samples from the homicidal gas chambers were mostly negative with respect to traces of cyanide was because the cyanide compounds had been exposed for more than 40 years to weathering, which these compounds allegedly could not have withstood. Three of these authors from the Jan Sehn Institute later published additional findings,[62] which were, however, based on a verifiably incorrect analytical method – as was the first series of analyses – so that their results were flawed.[63] Correspondence with the authors failed to elucidate the reasons for the deliberate use of an incorrect method.[64]

In 1997 in France, distribution of the French edition of an earlier version of this present report produced two notable reactions, only one

of which addressed factual arguments,[65] but which nevertheless failed to discuss the technical problems in a scientific manner.[66] The Chemical Department of the French Academy of Sciences chose not to make a comment publicly on factual arguments, but rather to resort to polemic phraseology and personal attacks.[67]

In 1998, in the United States, in answer to the present report, a paper appeared on the Internet, which partly discusses technical issues and partly consists of political name-calling.[68] In related correspondence,[69] however, the author of the paper avoided any discussion of the central issues.[70]

In 1999, cultural historian Prof. Robert Jan van Pelt produced an expert report on Auschwitz for the defense in the libel case of British Historian David Irving against American writer Deborah Lipstadt.[71] This report represents a retreat to the argumentative situation *before* Jean-Claude Pressac's first book, published in 1989,[72] ignoring almost all arguments brought forward by revisionists since that year.[73] In 2002 van Pelt's expert report appeared in a revised and extened version as a book.[74] It is the first book in English to intensively discuss various revi-

sionist arguments, although it fails to mention even one of the many books and papers written by the most industrious and productive revisionist researchers, Carlo Mattogno. Van Pelt mainly relied on the works of J.-C. Pressac for his own book, even though he hardly ever mentions him.[75] It is a pity that the cultural historian van Pelt tries to address many chemical, toxicological, engineering and architectural questions for which he simply lacks both expertise and experience. But even when it comes to analyzing the historical record, van Pelt falls far short of the requirements for a serious study, as Mattogno has concluded in his 750 pp. analysis of van Pelt's tome:[76]

> *"*[van Pelt's] *study of Auschwitz has no scientific and historiographic value,*
>
> - *because it ignores works of crucial importance;*
> - *because it does not even mention essential opposing views and arguments;*
> - *because it fails to approach pivotal technical issues with technical means;*
> - *because it is highly inconsistent;*
> - *because it uses deceptive methods;*
> - *because it presents conflicting sources without due source criticism;*
> - *because it reveals a decidedly threadbare knowledge of the camp's history;*
> - *because it deforms all sources to serve the alleged 'extermination' aspects of Auschwitz;*
> - *and because even regarding the claimed 'extermination' aspects it exhibits an incomplete and superficial grasp."*

Most of the above-mentioned attempted refutations of the *Leuchter Report*, and subsequent discussion with other revisionists, are marred by personal insinuations about the motivations of persons making use of revisionist arguments, or by polemical excursions, neither of which contribute to the scientific discussion.

3.2. On Politics

The question of whether or not systematic mass-killings of Jews in homicidal gas chambers specifically constructed for the purpose of ac-

Pelt's Plea against Sound Reasoning," *The Revisionist* 1(1) (2003), pp. 99-104; Paul Grubach, "World War I Atrocity Propaganda and the Holocaust," *ibid.*, pp. 104-109.

[75] When he addresses chemical questions, he also refers to some degree to the work of R. Green, *op. cit.* (notes 68, 70).

[76] Carlo Mattogno, *Auschwitz: The Case for Sanity*, The Barnes Review, Washington, DC, 2010, p. 670.

complishing their extermination took place under the National Socialist regime is apparently viewed as a political issue. Whether or not a moral appraisal of the National Socialist regime depends on the existence or non-existence of gas chambers is disputable. A political evaluation of the Third Reich is not significantly dependent upon this moral evaluation. Since the present discussion contains neither a moral, nor political, evaluation of a long-dead regime, I shall make no moral or political statements. Personally, I am inclined to judge a politician, or political system, on the basis of what s/he, or it, was able to leave behind for their respective nation – everything else follows. That must suffice at this point.

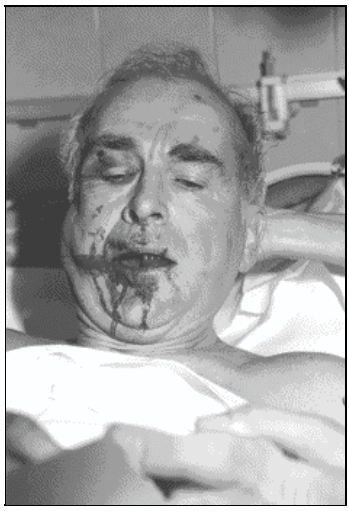

Fig. 9: *People who run out of arguments turn to violence. Prof. Faurisson after an attack by Jewish thugs, Sept. 16, 1989.*[77]

To everyone who has ever suspected that revisionists are motivated by a desire to whitewash National Socialism, or restore the acceptability of right-wing political systems, or assist in a breakthrough of Nationalism, I would like to say the following:

While researching, our highest goal must at all times be to discover how historical events actually occurred – as the 19th century German historian Leopold Ranke maintained. Historians should not place research in the service of making criminal accusations against, for example, Genghis Khan and the Mongol hordes, nor to whitewash any of their wrong-doings. Anybody insisting that research be barred from exonerating Genghis Khan of criminal accusations would be the object of ridicule and would be subject to the suspicion that he was, in fact, acting out of political motives. If this were not so, why would anyone insist that our historical view of Genghis Khan forever be defined solely by Khan's victims and enemies?

The same reasoning applies to Hitler and the Third Reich. Both revisionists and their adversaries are entitled to their political views. The accusation that revisionists are only interested in exonerating National

[77] *The Globe and Mail*, Sept. 18, 1989, *Le Monde*, Sept. 19, 1989, *Sunday Telegraph*, Sept. 24, 1989; see also "Revisionist Historian Suffers Savage Beating" (www.codoh.com/thoughtcrimes/8909FAUR.HTML).

Socialism and that such an effort is reprehensible or even criminal, is a boomerang: This accusation implies that it is deemed unacceptable to partially exonerate National Socialism historically, and by so doing, always also morally. But by declaring any hypothetical exoneration based on possible facts as unacceptable, one admits openly not to be interested in the quest for the truth, but in incriminating National Socialism historically and morally under any circumstances and at all costs. And the motivation behind this can *only* be political. Hence, those accusing revisionists of misusing their research for political ends have themselves been proven guilty of exactly this offense. It is therefore not necessarily the revisionists who are guided by political motives – though quite a few of them certainly are – but with absolute certainty all those who accuse others of attempting to somehow historically exonerate a political system which has long since disappeared.

As a consequence, our research must never be concerned with the possible "moral" spin-off effects of our findings in relation to politicians or regimes of the past or present, but solely with the facts. Anyone who argues the opposite does not understand scientific research and should not presume to condemn others on the basis of authentic research.

4. A Brief History of Forensic Examinations of Auschwitz

4.1. Introduction

In late spring 1993, the Max Planck Institute for Solid State Research in Stuttgart issued an internal memorandum informing its employees that a doctoral candidate there – the author of this book – had been dismissed because of private research he had done on Auschwitz. The institute explained that in view of the horror of the National Socialists' crimes against the Jews, it was morally repugnant to discuss the specific manner in which the victims had been killed, or to try to determine the precise number of the dead. Hence one of the world's leading scientific research institutes stated to its personnel that it is not only unethical, but reprehensible and a cause for dismissal, should they dare to determine accurate quantities and causes. This is not without its own irony. However, many people are deeply moved by the question whether or not the monstrous crime alleged should be subject to careful scrutiny by means of thorough forensic analysis. The following is an attempt to answer this question by offering a brief overview on forensic examinations of the purported crime scenes at Auschwitz which have been conducted thus far.

4.2. The Moral Obligation of Forensic Examination

Does it really matter how many Jews lost their lives in the German sphere of influence during the Second World War? Is it so important, after so many years, to attempt painstakingly to investigate just how they died? After all, it is surely morally correct that even one victim is one too many; and nobody seriously denies that many Jews died.

To affirm these things, however, is not to raise a valid objection – moral or otherwise – to the scientific investigation of a crime held to be unique and unparalleled in the history of mankind. Even a crime that is alleged to be uniquely reprehensible must be open to a procedure that is standard for any other crime: namely, that it can be – must be – subject to a detailed material investigation. Further: whoever postulates that a crime, alleged or actual, is unique must be prepared for a uniquely thorough investigation of the alleged crime before its uniqueness is accepted as fact.

If, on the other hand, someone sought to shield so allegedly unparalleled a crime from investigation by erecting a taboo of moral outrage, the creators of that taboo would, at least morally, themselves commit a singular offense: imputing unparalleled guilt, beyond any critique and defense, in this case to an entire people, the Germans.

To demonstrate just what kind of double standard is being applied to "the Holocaust" (generally defined as the purposeful annihilation, chiefly by gassing, of millions of Jews by the National Socialists), let us note the international reaction to several recent examples of mass murder or "crimes against humanity."

In 1949, a trial started in southwest France which caused as much attention in France as did the Nuremberg War Crimes Trial: Mdm. Marie Besnard was accused of having murdered twelve people with arsenic. During this extraordinary court battle, 15 experts on medical, chemical, geological and analytical forensic experts made exhaustive analyses and long-lasting, extensive experiments with the aim to verify whether the arsenic traces found in the buried victims stemmed from poison or are the result of yet unknown concentration processes in buried corpses. Finally, after twelve years of research and arguing of the fifteen experts, of which eight were professors and one even a Nobel Price laureate, Mdm. Besnard was acquitted due to lack of evidence.[78]

After the collapse of the Soviet Union in 1991, numerous mass graves, containing altogether hundreds of thousands of bodies of victims of the Soviets, were discovered, excavated, and investigated. Not only was the number of victims determined, but in many cases the specific cause of death as well. In the same regions where many of these mass graves were found, one million Jews are said to have been shot by the *Einsatzgruppen*. Yet no such grave has ever been reported found, let alone dug and investigated, in the more than half a century during which these areas have been controlled by the USSR and its successor states.

During the conflict in Kosovo in 1999, rumors about mass killings by Serbs spread around the world. After the fighting was over, an international forensic commission arrived in Kosovo, searching, excavating and forensically investigating mass graves. These graves proved to be not only fewer than the Serbs' Albanian opponents had alleged, but to contain small fractions of the number of victims claimed.

---

[78] Michael D. Kelleher, C. L. Kelleher, *Murder Most Rare: The Female Serial Killer*, Praeger, Westport, Conn., 1998.

Did the Allies attempt, during the Second World War and in the years immediately following, to find and to investigate mass graves of persons said to have been victims of the Germans? So far as is known, only once: at Katyn. But the findings of the Soviet forensic commission, which blamed the mass murder of several thousand Polish officers buried there on the Germans, are today generally considered a fabrication. The report of the international forensic commission invited by the Germans in 1943, on the other hand, which found that the Soviets had carried out this mass murder, is today considered accurate even by the Russian government.[79]

4.3. A Definition of Forensic Science

Forensic science is generally regarded as a supporting science of criminology. Its aim is to collect and to identify physical remnants of a crime, and from these to draw conclusions about the victim(s), the perpetrator(s), the weapon(s), time and location of the crime as well as how it was committed, if at all. This science is relatively new and entered the courtrooms only in 1902, when fingerprint evidence was accepted, in an English court, for the first time. The 1998 CD-ROM *Encyclopedia Britannica* writes about forensic science:

> *"A broad range of scientific techniques is available to law enforcement agencies attempting to identify suspects or to establish beyond doubt the connection between a suspect and the crime in question. Examples include the analysis of bloodstains and traces of other body fluids (such as semen or spittle) that may indicate some of the characteristics of the offender. Fibres can be analyzed by microscopy or chemical analysis to show, for instance, that fibres found on the victim or at the scene of the crime are similar to those in the clothing of the suspect. Hair samples, and particularly skin cells attached to hair roots, can be compared chemically and genetically to those of the suspect. Many inorganic substances, such as glass, paper, and paint, can yield considerable information under microscopic or chemical analysis. Examination of a document in question may reveal it to be a forgery, on the evidence that the paper on which it is written was manufactured by a technique not available at the time to which it allegedly dates. The refractive index of even small particles of glass may be measured to show that a given item or fragment of glass was part of a particular batch manufactured at a particular time and place."*

Hence, forensic research is exactly what revisionists, starting with Robert Faurisson, have called the search for material evidence. The

[79] Cf. George Sanford, *Katyn and the Soviet Massacre of 1940*, Routledge, Oxford 2005.

revisionists' demand for such material evidence is entirely consistent with the normal practice of modern law enforcement. Also, as is generally acknowledged, forensic evidence is more conclusive than eyewitness testimony or documentary evidence.

Even though forensic methods have hardly been applied with regards to Auschwitz, there are a few examples which I shall discuss briefly in the following chapter.

4.4. Forensic Science and Auschwitz

4.4.1. Forensics in the Courts

4.4.1.1. The 1946 Krakow Auschwitz Trial

In 1945, the Jan Sehn Institute for Forensic Research (Instytut Ekspertyz Sadowych) prepared a report on a forensic investigation of Auschwitz that was submitted in evidence in the 1946 Auschwitz trial in Krakow, Poland.[80] This expert report should be treated with caution, because forensic examinations and judicial procedures under the Communists have been anything but trustworthy, and in 1945, Poland was a Stalinist satellite. One need only point to the example of Katyn, the Soviet account of which was fully endorsed by Poland's Communist regime.[79]

The Krakow forensic investigators took hair, presumably cut from inmates, and hair clasps from bags found by the Soviets in Auschwitz. Tested for cyanide residues, both hair and clasps showed positive results. Additionally, a zinc-plated metal cover was tested for cyanide and found to have a positive result as well. The Krakow Institute claims that this metal cover once shielded the exhaust duct of a supposed homicidal gas chamber at Birkenau.

The tests conducted by the institute were qualitative, not quantitative, analyses. In other words, they could only determine whether or not cyanide was present, not how much of it was there. As to whether or not homicidal gassing with hydrogen cyanide took place in Auschwitz, these analyses are worthless, for three reasons:

1. There is no way of determining the origin and history of the hair and hair clasps obtained from bags in Auschwitz. Assuming that the analytic results are correct, from a chemical point of view the following can be noted: A positive test for cyanide in human hair

[80] Published in German, *op. cit.* (note 56), pp. 36-40; the original is in the Auschwitz State Museum.

proves only that the hair has been exposed to HCN (hydrogen cyanide). But that result does not suffice to establish that the persons from whom the hair came were killed by cyanide. It is a good deal more likely that the hair had already been cut when it was exposed to the gas: in German as well as in Allied camps, it was standard to cut off prisoners' hair for hygienic reasons. When hair over a certain length was later reused,[81] it had to be deloused beforehand (often with Zyklon B, the active ingredient of which is hydrogen cyanide). Hence, positive cyanide results from loose hair do not prove human gassings.

2. We face a similar problem with the zinc-plated covers allegedly used to cover the ventilation ducts of the supposed gas chambers: their exact origin and history is unknown. It would have been much preferable for the Krakow Institute to have analyzed samples from the walls of the alleged gas chambers instead of obtaining samples from pieces of metal:
   a. Whereas the origin and history of these metal covers are uncertain, the origin and (at least partly) the history of the walls of the morgues allegedly used as gas chambers are known.
   b. In contrast to cement and concrete, zinc-plated metal covers prevent the formation of stable iron cyanide compounds.[82] The developing zinc cyanide compounds are relatively unstable and must be expected to vanish in a short period of time.[83]
   c. The tendency of porous wall material in moist underground rooms to accumulate and to bind hydrogen cyanide, physically as well as chemically, is hundreds of times higher than that of sheet metal (see chapter 6.7.).
   d. As a matter of fact, the letter accompanying the samples sent to the Krakow Institute actually mentions that a mortar sample allegedly taken from a so-called gas chamber is enclosed as well and should also be tested for cyanide. However, for unknown reasons, the Krakow Institute did not mention this mortar sample in its report, perhaps because it did not show any positive result.

---

[81] Letter from the SS-Wirtschafts- und Verwaltungshauptamt, Oranienburg, to concentration camp commanders, August 6, 1942, IMT document USSR-511, cited in: International Military Tribunal, *Trial of the Major War Criminals* (hereafter *IMT*), Nuremberg 1947 (www.avalon.law.yale.edu/subject_menus/imt.asp), Aug. 5, 1946, vol. 20. The letter ordered the recycling of prisoners' hair twenty centimeters or more in length; but see also the critical remarks by Carlos W. Porter, www.cwporter.com/gussr511.htm.

[82] Zinc prevents the formation of rust, which is required to form long-term stable iron cyanides.

[83] Like earth alkaline cyanides, zinc cyanides are slowly decomposed by humidity.

3. It is unknown where those zinc-plated metal covers are today. It is furthermore impossible to identify them, since the Krakow report does not include a description or photo of them. Therefore, this analysis cannot be reproduced.

4.4.1.2. The 1964-1966 Frankfurt Auschwitz Trial

Several expert reports were prepared during the Frankfurt Auschwitz trial, the best known being those of the Munich *Institut für Zeitgeschichte* (Institute for Contemporary History).[84] However, none of these reports was forensic in nature. They addressed legal, historical, or psychological topics. Throughout this mammoth trial, the court, the prosecution[85] and the defense[86] never suggested that material traces of the alleged crime be secured and investigated. The prosecution had at its disposal numerous statements by eyewitnesses and confessions by perpetrators, and it considered this material entirely sufficient to establish beyond reasonable doubt the existence of a program to exterminate Jews at Auschwitz and elsewhere during the Third Reich.[87] The abundance of such evidence has since been used to argue that the lack of documentary and material evidence is irrelevant.[88] That no material evidence was presented during the Frankfurt Auschwitz Trial was freely conceded by the court in its ruling:[88]

> *"The court lacked almost all possibilities of discovery available in a normal murder trial to create a true picture of the actual event at the time of the murder. It lacked the bodies of the victims, autopsy records, expert reports on the cause of death and the time of death; it lacked any trace of*

---

[84] H. Buchheim, M. Broszat, H.-A. Jacobsen, H. Krausnick, *Anatomie des SS-Staates*, 2 vols., Walter Verlag, Freiburg 1964.

[85] Throughout his writings, Adalbert Rückerl, one of the most prominent German prosecutors in "Holocaust cases," dispenses with any mention of material evidence. Instead, he declares documentary evidence the best and most important form of evidence, even in the absence of material evidence for the authenticity and correctness of the documents themselves (in Jürgen Weber, P. Steinbach (eds.), *Vergangenheitsbewältigung durch Strafverfahren?*, Olzog, Munich 1984, p. 77). Rückerl reports that it is practically impossible to find a suspect guilty solely on documentary evidence, so that, especially given the increasing time span separating alleged crimes from trial, it is almost always necessary to fall back on eyewitness testimony, even though its unreliability is clear, particularly in trials of so-called "National Socialist violent crimes" (A. Rückerl, *NS-Verbrechen vor Gericht*, C. F. Müller, Heidelberg 1984, p. 249; Rückerl, *Nationalsozialistische Vernichtungslager im Spiegel deutscher Strafprozesse*, dtv, Munich 1978, p. 34; Rückerl, *NS-Prozesse*, C. F. Müller, Karlsruhe 1972, pp. 27, 29, 31).

[86] Such total naiveté, combined with legal incompetence, on behalf of the defense is best exemplified in Hans Laternser, *Die andere Seite im Auschwitzprozeß 1963/65*, Seewald, Stuttgart 1966.

[87] One of the most prominent German advocates of this thesis is Professor Ernst Nolte in his book *Streitpunkte*, Propyläen, Berlin 1993, pp. 290, 293, 297.

[88] Ref. 50/4 Ks 2/63; cf. I. Sagel-Grande, H. H. Fuchs, C. F. Rüter (eds.), *Justiz und NS-Verbrechen*, vol. 21, University Press, Amsterdam 1979, p. 434.

the murderers, murder weapons, etc. An examination of the eyewitness testimony was only possible in rare cases. Where the slightest doubt existed or the possibility of a confusion could not be excluded with certainty, the court did not evaluate the testimony of witnesses […]*"*

4.4.1.3. The 1972 Vienna Auschwitz Trial

Between January 18 and March 10, 1972, two architects responsible for the design and construction of the crematoria in Auschwitz-Birkenau, Walter Dejaco and Fritz Ertl, were put on trial in Vienna, Austria.[89] During the trial, an expert report on the possible interpretation of the blueprints of the alleged gas chambers of the Auschwitz and Birkenau crematoria was presented to the court. The report concluded that the rooms in question could not have been gas chambers, nor could they have been converted into gas chambers.[90] Thanks to this first methodologically sound expert report on Auschwitz, the defendants were acquitted.

4.4.2. Forensics Outside the Courts

4.4.2.1. In Search of Mass Graves

In 1966 the Auschwitz State Museum commissioned the Polish company Hydrokop to drill into the soil of the Auschwitz-Birkenau camp and to analyze the samples. It is not known whether this research was done in the context of the Frankfurt Auschwitz trial. The results, however, vanished into the museum's archives: they have never been released, which by itself is revealing enough. Years later, however, several pages from this report were photocopied and sent to the German revisionist publisher Udo Walendy, who published them with commentary in an issue of his periodical.[91] Traces of bones and hair allegedly found at several places might indicate mass graves. The few pages published by Walendy, however, do not reveal whether these findings led to an excavation or a subsequent forensic study of the traces. It is not even evident whether the bone and hair samples collected are human or animal remains. (Since Birkenau had a butchery to provide the camp with

[89] Ref. 20 Vr 6575/72 (Hv56/72), Jan. 18-March 10, 1972; this reference number is different from the one Robert van Pelt quotes in his report: *The Pelt Report*, *op. cit.* (note 71), p. 135 n. 59: 20 Vr 3806/64 and 27 C Vr 3806/64).

[90] Personal communications by Walter Lüftl who interviewed the expert, who must, for the time being, remain anonymous for fear of persecution and prosecution. See Michael Gärtner (=W. Lüftl), "Vor 25 Jahren: Ein anderer Auschwitzprozeß," *VffG*, 1(1) (1997), pp. 24f.

[91] Udo Walendy, *Historische Tatsachen*, no. 60, Verlag für Volkstum und Zeitgeschichtsforschung, Vlotho 1993, pp. 7-10.

meat, animal offal might have been disposed in garbage trenches in the camp's vicinity.[92])

4.4.2.2. Faurisson and the Consequences

As a result of Prof. Faurisson's activities as described in chapter 3, forensic research on Auschwitz boomed since 1988. Each time a researcher came to a conclusion contradicting the widely held views, he was socially ostracized and persecuted, like Prof. Faurisson, Fred Leuchter and Germar Rudolf, but when the results confirmed the reigning paradigms, the researchers were darlings of the media and politicians, like Jean-Claude Pressac, the researchers from the Jan Sehn Institute in Krakow, and more recently Prof. Robert van Pelt.[74]

It must therefore be stated that forensic research on Auschwitz is not at all reprehensible, as stated by the Max Planck Institute in Stuttgart. Such research was always done, more or less intensively. What is often considered to be reprehensible, however, is a research *result* that is unwanted by the public. This is an unfortunate bias, because science can prosper only where any result is openly and freely published and discussed without researchers fearing punitive measures.

The present book is an attempt to give the reader an update about the results of the ongoing forensic research on the two major camps of Auschwitz, the *Stammlager* or main camp close to the town of Auschwitz itself, and the *Birkenau* camp some 3 km to the northwest of the town. May it *not* lead to more persecution and ostracism of its author than he already has experienced.[93]

[93] For this, see the appendix at the end of this book.

5. Auschwitz

5.1. On the History of the Camp

Although the name of Auschwitz, a town in Polish Upper Silesia, is utilized as a synonym for the alleged National Socialist crime of an assembly-line extermination of Jews – frequently described as "unique" – thus far, worldwide, there has never been any balanced description of this concentration camp. Generally, only three books, from the thousands on the subject, are worth selecting for discussion here.

Danuta Czech's *Kalendarium*, a work of post-war Polish-Communist propaganda, resembles a sort of catalogue of chronological listing of actual and invented individual events, without any attempt to draw up a critical view of the existing material on the history of the camp.[94]

Jean-Claude Pressac's works concentrate almost exclusively on only five buildings in the camp, the crematoria,[72,95] but due to his lack of technical and architectural expertise, he nevertheless fails miserably in his self-appointed task of explaining the technique and manner of functioning of these buildings.[96]

Robert van Pelt and Deborah Dwork, in their history of the city of Auschwitz, deal only superficially with the subject of the concentration camp,[97] and van Pelt's more recent book[74] is narrowly focused on homicidal gassings, does not really go beyond what Pressac already presented, and exhibits a crass inaptitude to deal with the historical documentation.[76]

Books available on bookstore shelves are – for the most part – a compendium of eyewitness reports, scattered amongst serious attempts at documentation and literary pretensions.[98]

Only in the very early 1990s, *i.e.*, since the collapse of the Communist regime in Eastern Europe, did the files of those agencies of the Third Reich become available to us which allow a reliable history of the Auschwitz camp to be written. The files of the *Zentralbauleitung der Waffen SS und Polizei Auschwitz* (Central Construction Office of the Waffen SS and Police at Auschwitz), which are located in Moscow,[99] the files of the *Kriegsarchiv der Waffen SS* (War Archive of the Waffen SS) in the Military-Historical Archives in Prague, and the files of Auschwitz concentration camp, which are located at the Auschwitz Museum, are especially important in this regard. Since there are more than one hundred thousand documents in these archives, it will be necessary to wait for several years for the appearance of a seriously documented work on the topic. It must be considered certain that such research, which is only just beginning, will lead to a further massive revision of our image of the Auschwitz concentration camp.[100]

In the absence of better documentation, in the following – as far as the brief survey of the history of Auschwitz is concerned – I will rely upon the statements of Jean-Claude Pressac,[72,95] where his statements are undisputed. Where corrections are necessary, I resort to the extensive research results by Carlo Mattogno.[100]

The installations of the Auschwitz I camp, also known as the *Stammlager* (main camp) and located on the outskirts of the city of Auschwitz, originally formed part of the barracks of the Austrian-Hungarian Monarchy (later Poland), and were transformed into a concentration camp

[100] Carlo Mattogno has started am ambitious series about various aspects of the Auschwitz camp, currently comprising the titles: *Special Treatment in Auschwitz. Origin and Meaning of a Term* (2004); *The Bunkers of Auschwitz. Black Propaganda versus History* (2004); *Auschwitz: Open Air Incinerations* (2005); *Auschwitz: Crematorium I and the Alleged Homicidal Gassings* (2005); *The Central Construction Office of the Waffen-SS and Police Auschwitz* (2005) *Auschwitz: The First Gassing. Rumor and Reality* (2005) (all Theses & Dissertations Press, Chicago); and in the making: *The Crematory Ovens of Auschwitz* and *Healthcare in Auschwitz* (both planned for 2011, The Barnes Review, Washington DC).

after the German invasion of Poland in September 1939. Camp II, located in the vicinity of the villiage of Birkenau (known as Auschwitz-Birkenau) was erected after the start of the Russian campaign, officially as a Waffen SS prisoner of war camp for the reception of Russian POWs. Both camps belonged to the same complex, with over 30 additional smaller camps in Upper Silesia, intended to supply manpower in the form of forced labor for the industries in the area, among them the chemical works recently built by the Germans on a large scale at Auschwitz, in particular the BUNA works of the German industrial giant *I.G. Farbenindustrie AG* for coal refining (liquefaction and gasification plants for artificial rubber and fuel production), located close to the settlement Monowitz east of Auschwitz, see Fig. 10. Birkenau camp was used, among other things, for the reception of unfit prisoners. The intended camp capacity of 200,000, according to the final planning situation, was unique among the concentration camps of the Third Reich. This capacity was, however, never even approximately achieved.

Cramming together large numbers of people in the most restricted areas of camps whose sanitary infrastructure were just being developed caused serious health problems in all camps of the Third Reich. Both inmates and hundreds of civilians working in the camps could introduce all sorts of parasitic insects into the camp, in particular lice and fleas. Lice are the chief carriers of epidemic typhus, which was a widespread disease in Eastern Europe. Therefore, the camps were equipped with hygienic installations, including extensive disinfestation installations, in which the clothing and personal effects of newly arriving inmates were disinfested, for instance with the insecticide Zyklon B (a porous carrier material soaked with liquid hydrogen cyanide), a product frequently used for this purpose. The inmates themselves were given a haircut[101] and were made to shower thoroughly. Since the camp was at times insufficiently equipped with disinfestation installations and materials, also aided by carelessness during disinfestation on the part of civilians working in the camp, typhus epidemics broke out, repeatedly killing large numbers of inmates as well as guards.

Due to the high mortality rate, these camps were equipped with cremation facilities. After a devastating typhus epidemic had broken out in summer 1942, during which more than 300 people died per day at peak times, plans were made to build four cremation facilities at Birkenau in the hope of being able to cope with the amount of corpses. Of these four

[101] In the Third Reich, hair cut to a certain length is alleged to have been collected for industrial purposes, after previous delousing, see note 81.

crematoria, however, two were severely damaged shortly after they were put into operation. Since it turned out that the capacity of the four Birkenau crematoria was much higher than needed, the two damaged crematoria were not repaired but were allowed to remain idle. The main camp in Auschwitz possessed only one crematorium installation which was put out of operation with the opening of the installations at Birkenau.

Historians today usually assume that the above mentioned cremation installations were not only used for the purpose initially planned, *i.e.*, the incineration of inmates having died of natural causes, but were later misused for the mass extermination of the Jews, among others. According to these historians, the term "*arbeitsunfähig*" (unfit for labor), used in relation to prisoners, was equivalent in meaning to "undeserving of life." This implies that any arriving inmates who were unable to work were killed immediately. For this purpose, human beings are said to have been killed ("gassed") in certain rooms of the crematoria after a few structural modifications. This was allegedly done using Zyklon B, which was originally intended exclusively for vermin control. After their alleged murder, the victims are said to have been burnt, some of them in the cremation ovens and some in open ditches.

According to eyewitness accounts, a homicidal gas chamber is supposed to have existed in the crematorium of Auschwitz I (main camp); this location still exists today, intact, but has been the object of serious manipulation, as we shall see. Additional homicidal gas chambers are said to have existed in the Birkenau camp, Auschwitz II, located approximately three kilometers away. These gas chambers were allegedly located in the four crematoria of that camp, as well as in two farmhouses outside the actual camp itself, which had been modified for homicidal gassing purposes.

Of the installations used for disinfestation in the Birkenau camp *using Zyklon B*, only buildings 5a and b (BW 5a/b) in construction sections 1a/b (*Bauabschnitt* 1a/b) remain intact. In these buildings, one wing each is said to have been temporarily used for the disinfestation of personal effects with hydrogen cyanide. The following chapters 5.2.-5.5. will describe architectural and structural features of the individual structures of the Auschwitz main camp and Birkenau. Maps of these camps are reproduced in Figs. 11 and 12.

5.2. Epidemics and the Defense Against Them

5.2.1. Danger of Epidemics[102]

Before the era of modern warfare, it has always been taken for granted that during a war epidemic disease caused more deaths among the soldiers and civilians than the use of weapons. It took the atomic bomb, deployed in a ruthless and criminal manner by the United States against unarmed people (whose government had already agreed to surrender) and in contravention to international law, to change this assumption.

The epidemic most feared in World War I at the eastern front was typhus.[103] Typhus epidemics claimed uncounted thousands of lives among German soldiers at the Russian front and could be prevented from spreading into German territory after the end of the war only by the most rigorous of measures. Since that time, the danger of epidemics has been taken seriously by medical and military offices and personnel.[104]

For example, the German encyclopedia *Der große Brockhaus*, vol. VI of the 1930 Leipzig edition, contains a comprehensive article on epidemic typhus. This acute infectious disease is spread only by the body louse:[105]

> *"The disease is caused by* Rickettsia prowazeki *(discovered in 1910 by Ricketts and in 1913 by Prowazek), a micro-organism found in the intestines and salivary glands of infected lice.* […]
>
> *Epidemic typhus occurs chiefly where unfavorable social and sanitary conditions prevail: in dank overcrowded living quarters, hospitals, prisons, emigration ships, caused by crop failures and price increases, thus also known as starvation, hospital, prison, ship or war typhus. Typhus is endemic in Russia, the Balkans, northern Africa, Asia Minor, and Mexico. According to Tarrassevich, 25-30 million people suffered from epidemic ty-*

[102] The following remarks are largely based on H.J. Nowak's study, "Shortwave Delousing Facilities in Auschwitz," in: G. Rudolf (ed.), *op. cit.* (note 24), pp. 312-324.

[103] Epidemic Typhus, which is also called European, Classic, or Louse-Borne Typhus, or Jail Fever, is a louse-borne disease caused by bacteria belonging to the Rickettsia group (R. *prowazekii*). Whereas Typhus is the term commonly used in English to refer to all diseases caused by various Rickettsia bacteria, the German term for Epidemic Typhus is "Fleckfieber." This German term's literal translation into English – "Spotted Fever" – is used only for one type of typhus, the so-called Rocky Mountain Spotted Fever (R. *rickettsii*) which is transferred by ticks (although there are other tick-transmitted bacteria of the same family); see www.merck.com/mmpe/sec14/ch177/ch177a.html.

[104] O. von Schjerning, *Handbuch der Ärztlichen Erfahrungen im Weltkrieg 1914/1918*, volume VII Hygiene, J. A. Barth Verlag, Leipzig 1922, in particular, pp. 266ff: "Sanierungsanstalten an der Reichsgrenze."

phus in Russia in 1918-1921, which amounts to 20-23% of the population. […]

Successful control and prevention of epidemic typhus consists of enforcing all measures available to destroy the body louse."

The experiences of German physicians during WWII were no different.[106,107] The topic of epidemics can be found in countless publications. Practical experiments were also conducted, which increased knowledge about fighting the causes of this disease.

Professor Dr. F. Konrich was completely justified in stating, in his publication "About sanitation facilities of German POW camps,"[108] that epidemics such as those in question "[…] had long been extinct here [in Germany]." However, it also becomes quite understandable why all of the offices and institutions involved over-reacted when epidemic typhus broke out in the Auschwitz concentration camp in early July 1942.[109] The outbreak was traced to the civilian laborers brought in to work in the camp, rather than to inmates deported to Auschwitz. Also, due to drastic measures taken to isolate and eradicate this epidemic, its spreading to the camp's nearby civilian population could be prevented. Tragically, however, the epidemic inside the camp itself was brought under control only in the second half of 1943, hence it raged there for an entire year.

5.2.2. Epidemic Control with Zyklon B

One of the most efficient methods to fight lice and thereby to contain and eliminate typhus – but also to kill other vermin like grain beetles, bugs, cockroaches, termites, mice, rats and many more – is their poisoning with highly volatile hydrogen cyanide.

Liquid hydrogen cyanide has a short shelf life and is extremely dangerous when handled incorrectly. At the end of the First World War, hydrogen cyanide was introduced onto the market in an easier to handle and safer form: porous materials soaked with hydrogen cyanide with the addition of a stabilizer and an irritant warning material, intended to warn people of low concentrations of hydrogen cyanide, which in lower

[108] Friedrich Konrich, "Über die Sanierungsanstalten der deutschen Kriegsgefangenenlager," *Gesundheits-Ingenieur*, July 19, 1941, pp. 399-404.

[109] Cf. Wilhelm Stromberger, "Was war die 'Sonderbehandlung' in Auschwitz?," *Deutschland in Geschichte und Gegenwart*, 44(2) (1996), pp. 24f.

concentrations has only a slight odor that many people cannot even smell at all.

This product, called Zyklon B, was then packed in tin cans, which can only be opened with a special tool. The number of patents filed for the additives to Zyklon B shows that there was no simple, clear solution to the problems relating to the stabilizers and irritant warning materials.

Fig. 13: *"We are blocking the entry of destructive insects." Ad by the Degesch depicting its railway disinfestation tunnels in Germany.*[110]

Legally, there was a great difference between the stabilizer for Zyklon B and the irritant warning material. A stabilizer for Zyklon B was required by German law,[111] while an irritant warning material, by contrast, was not legally required.[112]

Zyklon B was licensed and produced by the Degesch corporation residing in Frankfurt.[113] Until the end of the Second World War, it played

[111] Deutsche Reichsbahn Eisenbahnverkehrsordnung (EVO, German Reich railway regulations), annex C to §54 EVO, *Vorschriften über die nur bedingt zur Beförderung zugelassenen Gegenstände vom 1. Okt. 1938* (Regulations on Objects Permissible for Restricted Transport Only, dated 1 October 1938), p. 50:

> *"Die Blausäure muß durch einen von der Chemisch-Technischen Reichsanstalt nach Art und Menge anerkannten Zusatz, der zugleich ein Warnstoff sein kann, beständig gemacht sein."* (The hydrogen cyanide must be stablized by an additive, which may also be an irritant, in the manner and quantity recognized by the Chemical-Technical Reichs Foundation.)

[112] L. Gaßner, "Die gesetzlichen Bestimmungen der Anwendung hochgiftiger gasförmiger Stoffe zur Schädlingsbekämpfung in Deutschland" (The legal provisions relating to the use of highly poisonous gaseous materials for pest control in Germany), in: Karl Greimer, *Handbuch des praktischen Desinfektors*, Th. Steinkopf, Dresden 1937, pp. 185f. The fact that Auschwitz concentration camp received Zyklon B without an irritant is therefore not so unusual as sometimes represented in the literature, *i.e.*, as a "criminal trace." The well-known "exceptional" regulations for the Waffen SS are no exception; they merely referred to the applicable Reichs regulations and implementation provisions regulating the use of Zyklon B; see Deutsches Reich, "Anwendung von hochgiftigen Stoffen zur Schädlingsbekämpfung durch die Waffen-SS," Rund-Erlaß des Reichsministers für Ernährung und Landwirtschaft vom April 3, 1941, quoted acc. to *Zeitschrift für hygienische Zoologie und Schädlingsbekämpfung*, 33 (1941), p. 126.

[113] On the history of the firm, mixed with uncritical Holocaust story telling, see Jürgen Kalthoff, Martin Werber, *Die Händler des Zyklon B*, VSA-Verlag, Hamburg 1998.

an extraordinarily important role in the struggle against insect pests and rodents[114,115] in food warehouses, large-scale means of transport like trains and ships, both in Europe and in America.[116] For example, Dr. G. Peters reports in his work *Blausäure zur Schädlingsbekämpfung* (Hydrogen Cyanide for Pest Control)[117] about the fumigation of ships with hydrogen cyanide, which happened in the United States as early as 1910, and about tunnel facilities, into which entire railway trains could be driven in order to be disinfested (see Fig. 13 & 14). The use of Zyklon B in public buildings, barracks, PoW and concentration camps was also featured in the literature of that time.[118-121] Of course, there were several other gaseous pest control agents in addition to Zyklon B.[122,123] Zyklon B continued to play an important role even after the war, until it was largely replaced by DDT and its successors.[124,125]

A large number of publications are available from both the wartime and pre-war periods, to which reference is made.[117,118,121,126-130] There

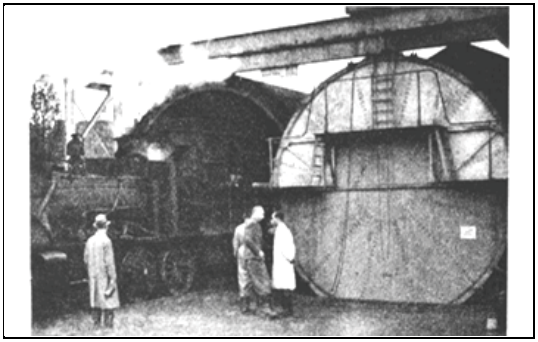

Fig. 14: *A lice-ridden train enters a railway gassing tunnel in Budapest.*[116]

are also guidelines on the fumigation of property and rooms, describing the procedures in detail, both before and afterwards.[131,132] These do not considerably differ from the regulations in application today.[133] Based upon this, the following is a brief discussion of the technology and method of procedure employed.

Initially, for the disinfestation of personal effects, ordinary rooms (10 to 30 m^2 surface area) were temporarily modified, by making the windows and doors as gas-tight as possible by means of felt sealant material and paper strips, while providing for proper heating and ventilation of the rooms. Workers wearing gas masks spread Zyklon B evenly on the floor of the room containing the property to be disinfested. This procedure was similar to what was then the regular fumigation of ordinary rooms for the destruction of vermin. Such converted rooms may be seen even today in the main camp of Auschwitz I. The use of temporarily sealed rooms for fumigation purposes is not without risk since the sealing is never perfect.

Later, special gas-tight installations without windows were built, equipped with efficient heating and ventilation systems, and later also with circulating air systems for a more rapid circulation of the gas inside the room (so-called "*Degesch-Kreislaufverfahren*," Degesch circulation procedure, see Fig. 15, p. 59). Cans of Zyklon B were opened by means of an exterior mechanism, so that the workers were no longer exposed to danger. The bottom of the can was automatically punctured and the preparation fell into a basket, into which a fan blew hot air, thus quickly evaporating the hydrogen cyanide and carrying the fumes away. These Degesch circulation devices were relatively small in size, a few m^3, to economize on the expensive disinfestant.

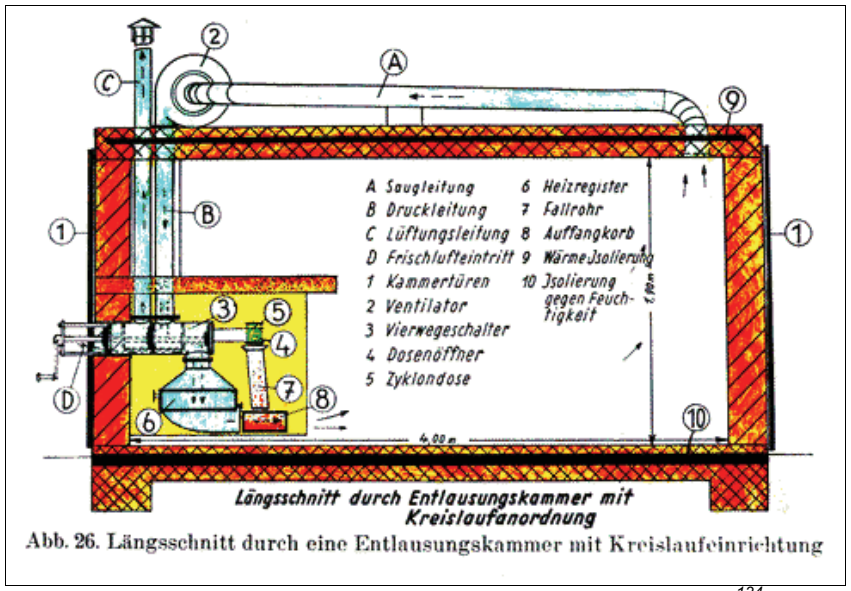

Fig. 15: *Degesch delousing chamber with circulation feature.*[134]

These professional installations were often part of an entire hygienic complex. As a rule, such a building complex was organized approximately as follows in terms of purpose (see Fig. 16, p. 60):[108]

- Undressing room, "dirty side." People to be deloused removed their soiled clothing and handed them over for laundry/disinfestation/disinfection.
- Shower. Prisoners washed themselves after undressing, plus sometimes other procedures, such as haircuts, medical examinations, or at times even including a sauna.
- Dressing room, "clean side." Their own cleaned and sanitized clothing was given back to the prisoners or substitute clothing was issued to them, since the cleaning may have lasted many hours.
- Disinfestation/Disinfection room. An area to clean and process the clothing combined with a laundry.

It was not uncommon for a crematorium to be installed in the same building complex, as may still be seen at Dachau concentration camp today (near Munich), in which the new hygienic installation possesses a series of Degesch circulating air installations for the disinfestation of clothing, with an undressing and redressing room to the right and left of the inmate showers, as well as a crematorium. (The room described as a

[134] Ludwig Gaßner, "Verkehrshygiene und Schädlingsbekämpfung," *Gesundheits-Ingenieur*, 66(15) (1943), pp. 174ff.; cf. F.P. Berg, *op. cit.* (note. 116).

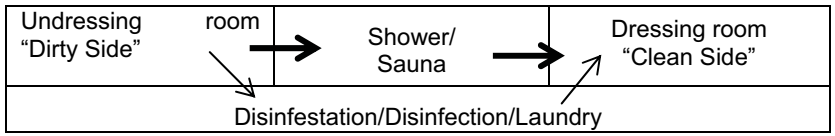

Fig. 16: Schematic organization of a hygiene complex
→ Clothing pathway; ➔ Inmate pathway

"gas chamber" at Dachau today is actually the inmate shower, which is indispensable in the above schema, and which has been intentionally mislabeled by the museum.)

The applicable concentrations during the disinfestation of clothing might be very different according to the type of vermin and exterior conditions, and usually ranged from 5 to 30 g of hydrogen cyanide per m^3 of air. The application time varied just as greatly, from under two hours up to ten hours and more. In the more modern installations with heating (higher than 25°C) and circulating air/ventilation installations, good results could be attained with concentrations of 20 g per m^3 already after 1 to 2 hours. Disinfestation in ordinary rooms, on the other hand, could last up to 24 hours or more.

5.2.3. Epidemic Control in Auschwitz

5.2.3.1. Terminology Used and Responsibilities

We shall use the technical terms established in the 1939 German Army Regulations (*Heeresdienstvorschrift* 194),[131] since these determined how the personnel, *i.e.*, the physicians and those who disinfected the camps, were to proceed:

> *"**Disinfection***
>
> *Disinfection means* […]*: destroying the disease-(epidemic-)causing agents on objects, in rooms, in excretions and on the bodies of infectious persons.*
>
> ***Disinfestation***
>
> *Disinfestation means: ridding rooms, objects and people of vermin (small life forms) that can transmit pathogens, cause economic damage or annoy man."*

The regulation quoted lists all known physical and chemical means of disinfection and disinfestation. Similarly, a "work guideline" was released in 1943 by the Sanitation Institute of the Waffen-SS: "*Entkeimung, Entseuchung und Entwesung*"[118] (Sterilization, Disinfection and Disinfestation).

Fig. 17: *Typical advertisement of the firm Degesch about the broad variety of applications of gassing methods offered: Flour mills, ships, stores, grain storages, houses, railroad cars, trucks.*[135]

The authority in charge of sanitation in the Waffen-SS as well as in the concentration camps was the "*Hygieneinstitut der Waffen-SS*"[136] (Sanitation Institute of the Waffen-SS), established in 1942 in Berlin, which set up a branch office in 1943 in Rajsko near Auschwitz with its "*Hygienisch–bakteriologischen Untersuchungsstelle Südost d. W-SS*" (Sanitary and Bacteriological Testing Station Southeast of Waffen-SS). The files from this testing station have survived (151 volumes dating from 1943 to 1945).[137]

The garrison physician (army medical officer) and the medical personnel were in charge of implementing all sanitary measures. This physician – and this was the case at Auschwitz as well – was to be consulted as subject expert in all relevant matters of construction planning and other things. Where hydrogen cyanide was to be used, requirements called for specially trained expert personnel. In Auschwitz, this role was filled by the "disinfectors."

[137] Heinz Bobrach *et al.*, *Inventar archivalischer Quellen des NS-Staates*, K. G. Saur, Munich 1995, volumes 3/1, 1991. So far, we are aware of approximately 110,000 laboratory examinations. Many probative and highly informative facsimiles are to be found in *Hefte von Auschwitz*, nos. 1 through 19, special editions, Auschwitz State Museum Publishers, Auschwitz Museum, since 1959.

5.2.3.2. Procedures Used

Generally, four procedures were used at Auschwitz for disinfestation and disinfection:

– hot air
– hot steam
– hydrogen cyanide
– microwaves

Data on the disinfestation and disinfection installations in operation in Auschwitz camp may be taken from a listing dated January 9, 1943: "*Hygienische Einrichtungen im KL und KGL Auschwitz*"[138] (Sanitary Facilities in the POW and Concentration Camp Auschwitz) directed to the *Amtsgruppenchef* C (Berlin), and an "*Aufstellung über die im KL. und KGL. Auschwitz eingebauten Entwesungsanlagen Bäder und Desinfektionsapparate*"[139] (List of Disinfestation Facilities, Baths and Disinfection Systems Installed in the POW and Concentration Camp Auschwitz), dated July 30, 1943.

The following capacities, taken from the last-mentioned document, relate to a 24-hours-a-day operation period.

a) In the concentration camp (protective custody camp):
   Block 1: One hot air disinfestation installation, manufactured by the Klein corporation for 1,800 people and approximately 3,600 blankets since the fall of 1940.
   Block 3: One hydrogen cyanide gas disinfestation installation (*i.e.*, Zyklon B), for 1,400 people and approximately 20,000 pieces of laundry.[140]
   Block 26: One hot air installation for 2,000 people.
   Disinfestation building at *Deutsche Ausrüstungs-Werke* (German Equipment Works, *i.e.*, Canada I): 1 hydrogen cyanide gas disinfestation installation (BW 28) for approximately 30,000 pieces of laundry, blankets, etc. (in operation since the summer of 1942).
   Civilian worker disinfestation barracks: One hot air disinfestation installation, manufactured by the *Hochheim* corporation, with a daily capacity for 2,000 people, with large shower bath installation and disinfection apparatus, permanently installed.
b) In the POW camp (K.G.L., Birkenau):

[138] *RGVA* 502-1-332-46/46a.
[139] *RGVA* 502-1-332-9/10.
[140] According to Pressac, in operation since 1941/42, *op. cit.* (note 72), p. 25.

BW 5a in B Ia: One disinfestation apparatus (manufactured by *Werner*) and one hot air apparatus (manufactured by *Hochheim*) in operation since November 1942 for 2, 000 people.
One chamber for hydrogen cyanide fumigation has been built for 8,000 blankets and has been in operation since the fall of 1942.

BW 5b in B Ib: Installation as in BW 5a.

All the facilities listed therein were subject to modifications. The number of sanitary facilities increased with the number of inmates, as the two aforementioned documents already show. Pressac mentions 25 chambers operated with Zyklon B, without providing a verifiable source.[141]

5.2.3.3. Results

The results could only be compiled if one knew the number of persons disinfested by means of the installation. These numbers have thus far remained unclear. Although Danuta Czech claims in her book[94] that such documents on large time periods are available in the Auschwitz archive, we have so far been unable to examine them. As of the present writing, it is still impossible to make a reliable statement as to whether or not the existing disinfestation installations were consistently reliable for the indicated number of persons. Pressac, in the conclusions to his second book,[142] indicates the peak of the first epidemic between "September 7-11" 1942 with "375 deaths per day," which clearly indicates that the capacity of the facilities available did not suffice.

5.2.3.4. Basic Policy Decisions

Two policy decisions made by the *SS-Hauptamt Haushalt und Bauten* (SS Main Office Budget and Construction) in the Reich Administration of the SS and its successor no doubt also influenced the measures taken in the camp. The first decision of June 5, 1940,[143] stated that HCN would no longer be used, and replaced instead with a hot-air method. The reason for this was probably that the use of HCN in makeshift delousing chambers was not reliable and had caused many accidents and was thus deemed too dangerous. The second decision, issued on March

[141] *Ibid.*, p. 550.
[142] J.-C. Pressac, *op. cit.* (note 95), p. 157
[143] *RGVA* 502-1-333-145

11, 1942,[144] 21 months later, seems to have reversed that first decision by calling for the "[…] conversion of all delousing facilities to operation with HCN," in which regard it was noted:

> *"Deviations therefrom – delousing by means of hot air or hot steam – are only permissible insofar as they involve temporary installations, in which the necessary safety for the handling of HCN is not ensured."*

A further letter from the Office C VI of February 11, 1943,[145] to the Commandant again expressly states, probably with reference to the letter of June 5, 1940: "[…] as per the prohibition against the use of HCN for disinfestation […]." This means that all efforts were to be made to convert all facilities to be operated with the only really reliable method available – HCN – but that the use of HCN was allowed only where and if the necessary safety and reliability of the method was ensured, *i.e.*, makeshift delousing chambers were not allowed to be operated with HCN.

Men in positions of authority, accustomed to decision-making, and faced with a dangerous epidemic capable of spreading to the civilian population with incalculable consequences, will always take suitable measures and act accordingly. Hydrogen cyanide (= Zyklon B) was the most reliable disinfestation agent of its time[146,147] The only problem was in finding a safe location for such facilities, perhaps outside the actual camp (see chapter 5.4.3.).

5.2.3.5. The Army Medical Officer

On September 9, 1942, Dr. E. Wirths was stationed in Auschwitz as garrison physician. From the records we may say that he performed his duties correctly; in this context, reference is made in particular to his massive criticism of the highest echelons.

As time went by, the number of inmates increased steadily, and unfortunately there were more than just one epidemic. We shall therefore briefly summarize, by means of examples, the conclusions reached by this physician and the steps he took in consequence.

On December 4, 1942, Dr. Wirths reported to headquarters about a discussion held in the administrative council of Bielitz District. The

145 *RGVA* 502-1-332-37

146 Gerhard Peters and W. Rasch, "Die Blausäure als Entlausungsmittel in Begasungskammern," *Der praktische Desinfektor*, September 1941, pp. 93-96.

147 Gerhard Peters, Emit Wüstinger, "Entlausung mit Zyklon-Blausäure in Kreislauf-Begasungskammern. Sach-Entlausung in Blausäure-Kammern," *Zeitschrift für hygienische Zoologie und Schädlingsbekämpfung*, issue 10/11 (1940), special printing. *RGVA* 502-1-332-86/90; it arrived at the Auschwitz construction office on July 3, 1941.

subject was epidemic typhus. A considerable number and range of persons had participated in the discussion, including the medical officer, the Wehrmacht, and representatives of the government. This illustrates how seriously the epidemic was taken:[148]

> *"He reports that at present three large disinfestation, shower, and sauna facilities could be put into operation, specifically two facilities for the inmates and one for the members of the SS troops. The capacity of these facilities is some 3,000 to 4,000 persons per 24 hours. Zyklon B disinfestation has been discontinued entirely, since it has been found that success is not 100% certain with this procedure."*

Buildings BW5a and 5b were intended for the inmates. The capacity of these disinfestation facilities was probably adequate for the number of inmates at this time. One must consider, however, that at this same time the structural shell for another 19 Degesch circulation fumigation chambers was being completed in Building BW160 of the Main Camp (admissions building). Another paragraph of the above letter states that the garrison physician of Kattowitz had provided the loan of two mobile boiler installations.

On April 18, 1943, Wirths reports to the Commandant, with warning reference to the sewer system in Birkenau, and concludes that "[…] great danger of epidemics is inevitable."[149]

On May 7, 1943, in a discussion with the chief of Amtsgruppe C, SS Brigadier General and Major General of the Waffen-SS engineer Dr. Kammler and others, the garrison physician set out in chapter "*II. Bauten in Zuständigkeit des Standortarztes*" (II. Buildings Under the Charge of the Garrison Physician):[150]

> *"*[…] *that the continued health of the inmates for the major tasks is not guaranteed, due to the poor toilet conditions, an inadequate sewer system, the lack of hospital barracks and separate latrines for the sick, and the lack of washing, bathing, and disinfestation facilities."*

Dr. Wirths clearly pointed out the inadequacies and also how to rectify them.

At this point we must warn the reader, who may perhaps not be sufficiently aware of the historical context, not to jump to false conclusions. The reader may well lack an understanding of all the problems that were involved in obtaining materials as well as all the other necessities required to build these facilities in wartime. Figuratively speaking, a written permission was required to purchase every brick.

---

[148] *RGVA* 502-1-332-117/119
[149] *RGVA* 502-1-332-219
[150] *RGVA* 502-1-233-33/38

We must also point out that, in those days in eastern Europe, a sewer system of any kind at all was exceptional to start with, and that this is all the more true for sewage treatment facilities, which were built for both camps at great expenditure in resources and according to high technical standards.

The above quoted document continues:

> *"The Brigadier General acknowledges the foremost urgency of these matters and promises to do everything possible to ensure rectification of the shortcomings.* ***He is somewhat surprised, however, that the medical side presents him with reports giving a very favorable account of the sanitary and hygienic conditions on the one hand; while he is then immediately confronted with reports to the exact opposite effect on the other hand.*** *The Chief of the Central Construction Office is hereby instructed to present suggestions for rectification by May 15, 1943."* (Emphasis added.)

It began with the toilet facilities, with regards to which he enforced changes that he considered necessary. For example: lids on the toilets, because otherwise "[…] a great danger of epidemics is inevitable."[151] These lids were ordered by the Head of Department C of the WVHA (*Wirtschafts-Verwaltungshauptamt*, Economic Administrative Main Office) on May 10, 1943.[152] It ended with roofing matters related to the gypsy kindergarten:[153]

> *"For the damaged roofs of kindergarten blocks 29 and 31 in the Gypsy Camp I request 100 rolls of roofing felt (very urgent.)"*

In between, on May 28, 1943,[154] he selected six circulating air delousing facilities which – as was noted down in handwriting – were ordered on May 29, 1943, by the Building Administration's expert on heating matters, Jährling. Then there is an account of a water quality test on June 1, 1943,[155] etc. This extensive correspondence resulted in separate subject files in the filing system of the Central Construction Office, such as "Sanitary Conditions."[156]

The physician's field of work was great and varied and deserved its own monograph. He was even responsible for ensuring that the inmates' kitchen personnel were frequently examined – including laboratory tests of their stool, etc. That Dr. Wirths truly saw to absolutely everything, is obvious from the documents.

[154] *RGVA* 502-1-332-28
[155] *RGVA* 502-1-332-212
[156] *RGVA* 502-1-149-135

The garrison physician's reminders and admonitions increased over time. On balance, one must conclude that, just as today, while there were opportunists and careerists in those days, there were also – as our example shows – SS-men with backbone and a sense of duty, professional ethics and the courage to stand up for their beliefs.

At the end of the comments section of the Memorandum of May 9, 1943, we find:

> *"**As stop-gap measure until that time, the Brigadier General provides the loan of a new short-wave delousing platoon.**"* (Emph. added.)

5.2.3.6. Short-Wave Delousing Facility

Perhaps one of the most fascinating aspects of Auschwitz concentration camp is the installation of a stationary short-wave installation, the world's first technological predecessor to the microwave ovens in common use today. This technology was invented by Siemens in the late 1930s and developed to mass-production readiness during the war. This was a by-product of the powerful radio tubes built for the television transmission of the Berlin Olympics in 1936, the energy-rich radio waves of which killed the insects in the vicinity of the antenna. The development took place with financial assistance from the Wehrmacht, which hoped to achieve a perceptible improvement in the struggle against the epidemics raging in the east. Since the inmates assigned to the armaments industries in the concentration camps were particularly valuable towards the end of the war, the Reich leadership decided not to put the first installation into operation at the eastern front for the disinfestation of soldiers' clothing, but rather, in the largest labor complex in the Reich, in Auschwitz. Due to Allied bombing attacks, however, there was a one-year delay in the completion of this installation, which probably cost the lives of tens of thousands of inmates. The Auschwitz camp administration had anticipated its installation as early as 1943 and had therefore postponed other delousing projects. This facility, put into operation during the summer of 1944, proved in fact to be of revolutionary effectiveness, both quick and cheap: personal effects were moistened and placed on one end of a conveyor belt and emerged at the other end a few minutes later, completely free of vermin and sterile.[157]

[157] See also, in this regard, H.J. Nowak, *op. cit.* (note 102); H. Lamker, "Die Kurzwellen-Entlausungsanlagen in Auschwitz, Teil 2," *VffG* 2(4) (1998), pp. 261-272 (…/1998/4/Lamker4.html); for an English summary see "High Frequency Delousing Facilities at Auschwitz," *JHR*, 18(3) (1999), p. 4.

5.2.4. Disinfestation Installations BW 5a und 5b

The only structures remaining intact in Auschwitz-Birkenau today, possessing a wing for the disinfestation of personal effects with Zyklon B, are buildings (*Bauwerk*, BW) 5a and 5b in construction sections B1a and B1b, respectively. Both buildings were planned as mirror images of each other. The west (respectively east) wing of these buildings were used, at least temporarily, for disinfestation with Zyklon B. These rooms were expressly labeled "*Gaskammer*" (gas chamber) in the building plans, see Fig. 18.

This is no triviality: rather, it is important proof that the term "gas chamber," at that time, referred exclusively to installations for the disinfestation of personal effects, both by architects during the planning of such buildings, and by disinfestation experts. The title of one of the most important contemporary publications on the subject of cyanide disinfestation by F. Puntigam, H. Breymesser, E. Bernfus was, for example, *Blausäure**gaskammern*** [sic] *zur Fleckfieberabwehr* [hydrogen cyanide **gas chambers** for the prevention of epidemic typhus], and the term used in an advertisement of the firm Degesch was likewise "**gas chambers**," see Fig. 17, p. 61. This was simply the ordinary designa-

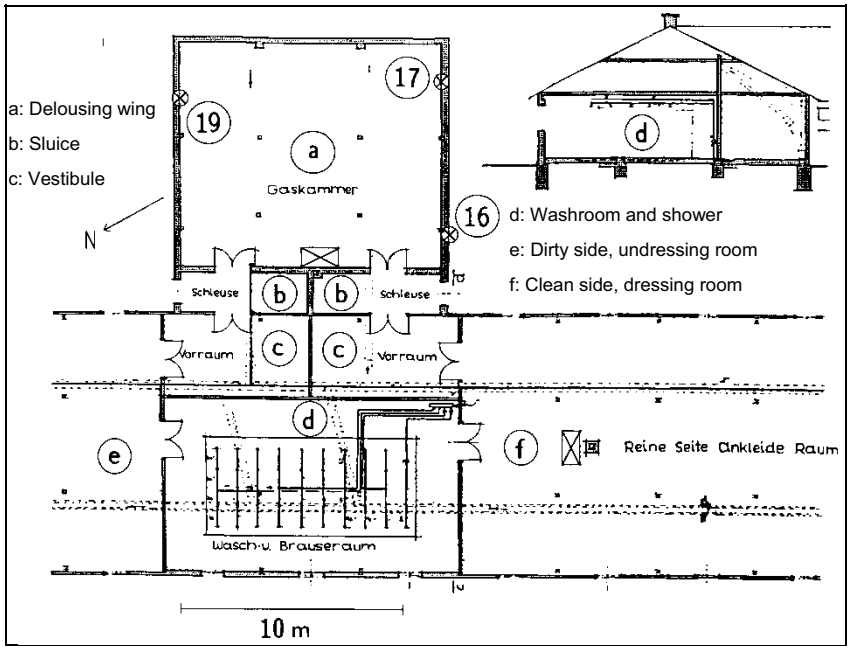

Fig. 18: *Ground plan of the HCN disinfestation wing of building 5a before building alterations (mirror image) and BW 5b today. BW 5b sample taking locations drawn in.*[158]

tion for rooms used for the disinfestation of personal effects.

Therefore, we must always assume, in the absence of proof to the contrary, that the use of the term "gas chamber" in a German document from this period refers to a room for the disinfestation of personal effects!

For this reason, *in the following,* the term gas chamber will be placed in quotation marks at all times ("gas chamber"), whenever the word refers to chambers for the execution of human beings. There are two reasons for this:

1. The German technical term *Gaskammer* originally pointed exclusively to disinfestation chambers operated with toxic gas. To apply the same term to chambers intended for the execution of human beings is an incorrect use of the term at that time.
2. Simply for the purpose of avoiding confusion as to the meaning of the word "gas chamber" in each case, a distinction must be made in writing.

Fig. 18 shows the ground plan of the two disinfestation gas chambers of building 5a and 5b approximately in their original condition. The chamber in building 5a was transformed in the summer of 1943 and

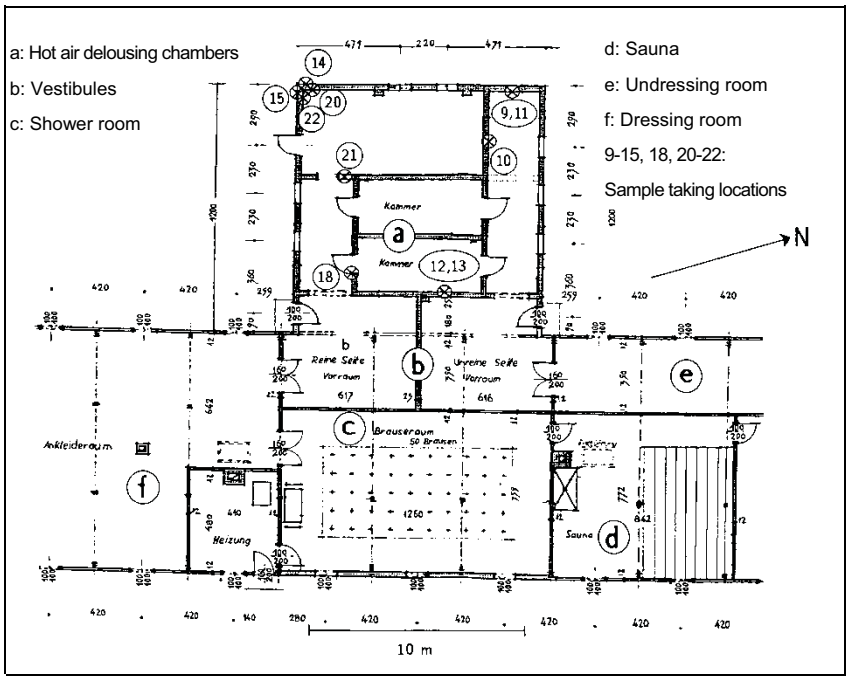

Fig. 19: *Ground plan of the hot air disinfestation wing of building 5a after building alterations in 1943. BW 5a sample taking locations drawn in.*[158]

received two small hot air chambers, visible in Fig. 19.[158] The buildings have ordinary brick walls and a concrete foundation built level with the ground, plastered and whitewashed on the interior with chalk-based mortar. The room in building 5b has no separate ceiling, the roof's framework is covered from underneath with boards of an unknown material (perhaps Heraclite). Originally without windows, like building BW 5b today, the disinfestation wing of BW 5a was equipped, during the building alterations, with windows firmly walled in which cannot be opened.

In the gable wall of the disinfestation room in BW 5b are two circular openings, approximately 50 cm in diameter, corresponding to the former ventilation exhaust and air intake channels, Fig. 20. The roof has three ventilation chimneys; there must have been three ovens in this room during the time of operation.[159] The double doors, opening inwards and drawn onto the plans, have been replaced with single doors, also opening inwards. For the time being, one can only speculate on any equipment of the disinfestation chambers.

The room has a surface area of approximately 130 m^2, is open to the framework of the roof, and therefore has a volume of at least 400 m^3.

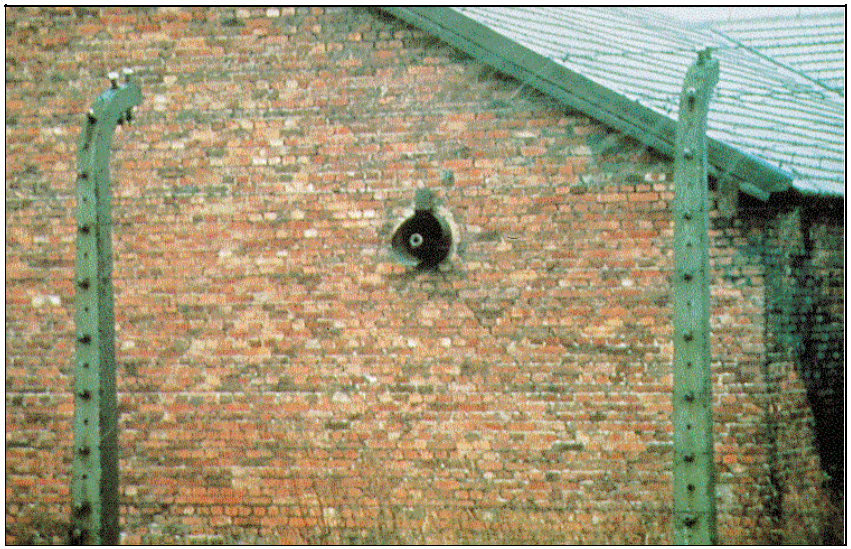

Fig. 20: *Ventilation outlets from the disinfestation wing of building BW 5b, without equipment today. The ends of the water pipes are visible inside; see also Fig. 21.*

[158] J.-C. Pressac, *op. cit.* (note 72), pp. 55-58, Plans of buildings 5a/b, pp. 59f. exterior photos. Building alteration plan no. 2540 for conversion to hot air delousing installation, dated July 5, 1943.

[159] *Ibid.*, p. 53.

However, the space above 2 m in height must probably be considered to have been unusable dead space, resulting in the waste of huge amounts of HCN/Zyklon B, since a quantity of Zyklon B of at least 4 to 5 kg (10 g per m^3) cyanide content was necessary for just one gassing,[160] regardless of whether the room contained only a few personal effects or whether the available area was filled. For example, with 100 fumigation cycles per year (one every 3 or 4 days) approximately 0.8 tons of Zyklon B would have been consumed by this installation alone and by building 5a, corresponding to 10% of the entire Zyklon B deliveries to Auschwitz in 1942, with a total delivery of 7.5 tons.[161]

When one considers that there were other HCN disinfestation installations in Birkenau in addition to this one; that the deliveries to Birkenau camp also supplied the related labor camps (more than 30 in number); and the fact that inmate barracks were also occasionally fumigated with this insecticide,[162] it becomes clear that the quantities of Zyklon B delivered to Auschwitz camp can actually be explained by normal delousing activities.

The annual delivery quantities were evidently too low to ensure successful disinfestation of all personal effects and buildings in all camps in the Auschwitz complex, since typhus epidemics were never entirely eliminated.

How frequently the delousing chambers of BW 5a and 5b were actually used for HCN disinfestation has to remain open for the time being, since no documentation about this has been found yet, and also because the document cited above states that the use of Zyklon B had to be abandoned as early as December 1942 (at least in unsafe installations), *i.e.*, just a few weeks after this installation was put into operation (see p. 65).

---

[160] The gross mass given on the label of a Zyklon B can always refered to the net HCN content of the can, *i.e.,* ex<u>c</u>luding the mass of the carrier material. That means for instance that a 1 kg Zyklon B can consisted of 1 kg HCN *plus* some 2 kg of carrier material, *i.e.*, a 1 kg can had a total mass of some 3 kg.

[161] Office of Chief of Counsel for War Crimes, British Military Tribunal, Case against B. Tesch *et al.*, here, the sworn statement of A. Zaun, Hamburg Oct. 24, 1945, Document No. NI-11 396; quoted according to U. Walendy, *Auschwitz im IG-Farben-Prozeß*, Verlag für Volkstum und Zeitgeschichtsforschung, Vlotho 1981, p. 62.

[162] See also the Höß order relating to the avoidance of accidental poisoning during the disinfestation of barracks, reproduced by J.-C. Pressac, *op. cit.* (note 72), p. 201. For each barracks with a volume of approximately 40m×12m×3.5m > 1,500 m^3, this means a requirement of 15 kg Zyklon B; the 100 barracks in Birkenau camp alone would require 1.5 tons!

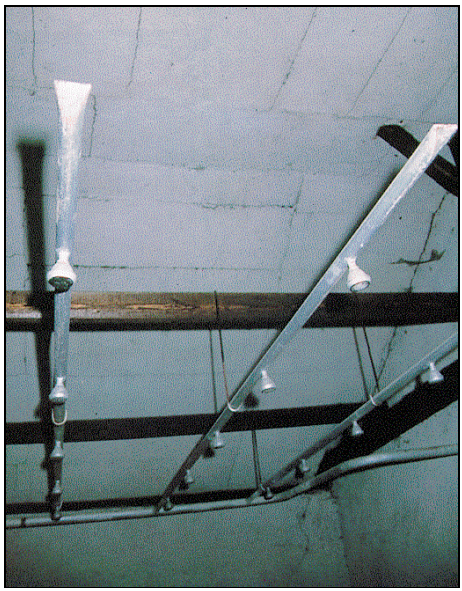

Fig. 21: *Water pipe system with shower heads in the disinfestation wing of building BW 5b. These water pipes have no connection; they terminate in the ventilation outlets. See Fig. 20.*

A remarkable feature of the disinfestation room of building BW 5b is a network of the water pipes, laid in hooks fastened to the diagonal roof girders, visible in Fig. 21. A few of the pipe endings are equipped with shower heads. The water pipes have no connection. Paradoxically, they end in the above mentioned ventilation outlets, and can only have been installed after the removal of the ventilators installed there. There are, of course, shower rooms in these buildings, but in a very different location (see Fig. 18). The shower installations once in existence there, however, have been entirely dismantled. Since the doors to these rooms were open in the early 1990s, any visitor could examine this peculiar construction. The original German drawings and documents of this building do not indicate that these pipes were installed during the German occupation, which means that they were probably installed after the war for an unknown reason.

5.3. "Gas Chamber" in the Auschwitz I Main Camp

According to Pressac, no material or documentary evidence of the "gas chamber" in the crematorium in the main camp exists, but there are many eyewitness accounts:[163]

> *"As evidence to establish the reality of homicidal gassings there remain only the testimonies of participants,*[…]*"*

These accounts, according to Pressac, are characterized by many contradictions, technical impossibilities, and general incredibility. He observes a "general tendency to exaggerate," and explains the gross

[163] J.-C. Pressac, *op. cit.* (note 72), p. 123.

errors and technical impossibilities in the eyewitness accounts and writings of camp commandant Höß by stating:

"He was present, without seeing."

That is, Pressac alleges that Höß had no idea of the methods, risks and dangers involved in the handling of Zyklon B. But this is in contradiction to an order issued by commandant Höß calling for caution during the fumigation of barracks with Zyklon B[162] – caution which had become necessary in view of several cases of poisoning. This special order of the commandant warning of accidents involving Zyklon B gas, an order which was distributed throughout the camp, indicates a duty of care with regards to those inmates who were, allegedly and nevertheless, doomed to die from the effects of that same gas sooner or later. We will have occasion to speak of Höß's testimony at a later time.

Pressac, moreover, explains the form and basic tone of the testimony of SS man Pery Broad as incorrect because this testimony is soaked in Polish patriotism, to say nothing of the transparent Polish hatred against SS men, although Broad was an SS man himself and had no links to Poland, and because Pressac found out that this "testimony" has been slightly reworked by the Poles, the original of which is missing. In other words, this "document," obviously patched together by the Poles, is quite worthless insofar as a critical examination of its source is concerned. Nevertheless, Pressac considers the basic testimonies with regards to homicidal gassings to be correct.[164]

The "gas chamber" in the main camp is a room in a ground level building, which replaced a former kitchen building of the former Austro-Hungarian barracks located at the same spot.[165] The floor and ceiling of Crematorium I are of reinforced concrete, while the exterior walls are of brick masonry, insulated on the exterior by a coating of tar. Except for the access ways, the building is practically underground due to the fact that dirt has been piled up against the walls. The interior walls are plastered and whitewashed.

Fig. 22 shows the floor plan of the building at the beginning of the war, planned and constructed as a normal crematorium with a morgue.[166] This also explains the piles of dirt, which were intended to ensure an even, cool temperature. For the same reason, the partition between the morgue and the oven room is double-walled with a heat-insulating air-barrier in between.

[165] *Ibid.*, p. 129.
[166] *Ibid.*, pp. 151/153.

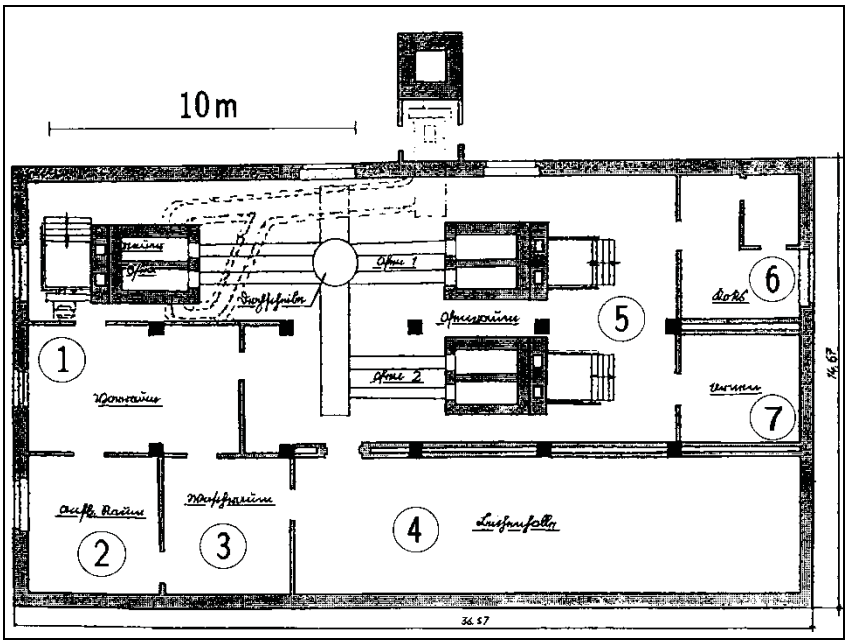

Fig. 22: *Ground plan of Crematorium I in Auschwitz I/main camp in its original condition. The morgue was later alleged to have been used as a "gas chamber."*[166]
1: Vestibule; 2: Laying-out room; 3: Wash room; 4: Morgue; 5: Oven room; 6: Coke; 7: Urns

Mattogno has found documentary evidence that this morgue had a ventilation system, which worked rather poorly, though. This prompted SS-*Untersturmführer* Maximilian Grabner, head of the Auschwitz Political Department, in June 1941 to urge the installation of a better system.[167]

Sometime between late 1941 and early 1942 the morgue is said to have been "converted" into a "gas chamber." On this occasion, three to four holes are claimed to have been pierced through the roof for the introduction of the Zyklon B for homicidal gassings, as well as two holes for the incorporation of heavy ventilators.[168] The head of the Auschwitz Museum, Franciszek Piper, however, opines that:[169]

> *"In the case of Crema I there were no ventilators. The doors were opened and the gas was allowed to ventilate by convection."*

[167] C. Mattogno, *Auschwitz: Crematorium I and the Alleged Homicidal Gassings*, Theses & Dissertations Press, Chicago 2005p. 17-22, here p. 19.
[168] *Ibid.*, pp. 131f.
[169] D.D. Desjardin, "My Visit to Auschwitz-Birkenau, May 30-31, 1996," interview mit F. Piper, www.codoh.com/newrevoices/nddd/ndddausch.html.

Pressac reproduces a photo of the roof of the crematorium, taken by the Soviets shortly after the liberation, in which three dark spots on the roofing felt are alleged to be troughs of former Zyklon B introduction holes, allegedly now covered up.[168,170] The photograph reproduced in his book is, however, too poor in quality to permit anything to be seen with clarity, much less permitting any conclusion as to the construction or engineering. Pressac's speculation must therefore be viewed as groundless.

In the autumn of 1944, the crematorium was converted into an air raid shelter. The alterations made, especially the replacement of the thin partitions by thick walls, can be seen in Fig. 23.[171] The alleged Zyklon B introduction holes as well as the ventilation holes are alleged to have been sealed at that time – assuming that they ever existed.

The building work undertaken for this conversion is described in a

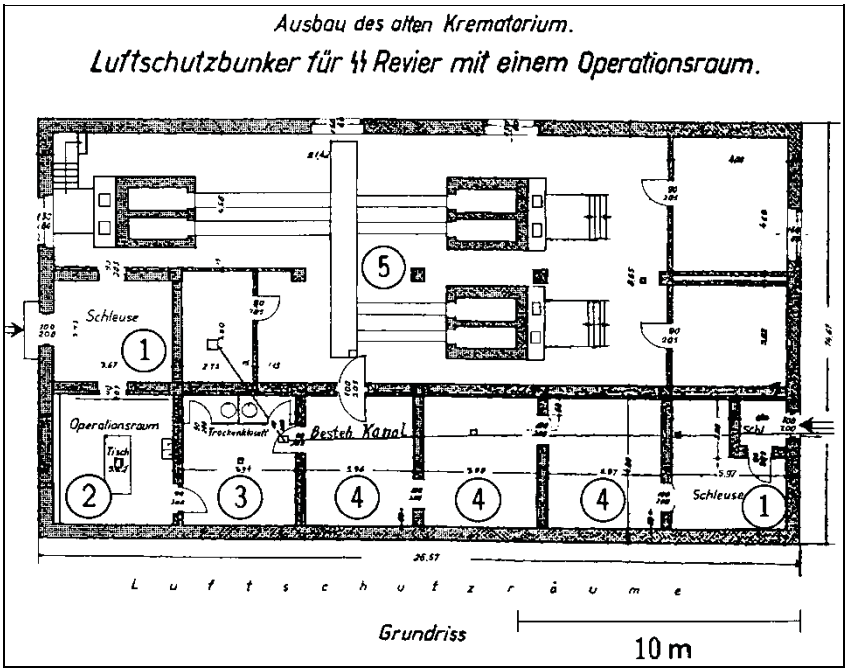

Fig. 23: *Ground plan of Crematorium I Auschwitz I Main Camp after conversion to air raid shelter, 1944.*[171]
1: Sluice; 2: Operating room; 3: Former washroom, now air raid shelter with toilet; 4: Air raid shelter; 5: Former oven room.

[170] J.-C. Pressac, *op. cit.* (note 72), p. 149; photograph of the roof of Crematorium I immediately after the liberation.
[171] *Ibid.*, p. 156.

document in the smallest detail.[172] There is no mention of any filling in of any old existing holes pierced through the roof, but rather of the incorporation of gas-tight windows and doors as well as the piercing of new holes:

> *"Installation of gas-tight doors, window shutters, and windows,*
> *Manufacture of openings in the masonry necessary for the heating ovens, as well as for the ventilation outlets and intakes and pipes."*

This is a strong indication that before this time there were neither gas-tight doors and windows nor any large openings which would have required to be closed (Zyklon introduction holes).

Direct access to the air raid shelters, which evolved from the multiple division of the morgue/"gas chamber," was possible through a newly added entrance with sluice/air lock, which today is represented as the entryway taken by the victims, although the "gas chamber" had no entrance in that location – as a matter of fact, it had no direct entrance from the outside at all.[168] Toilets were likewise built into the former

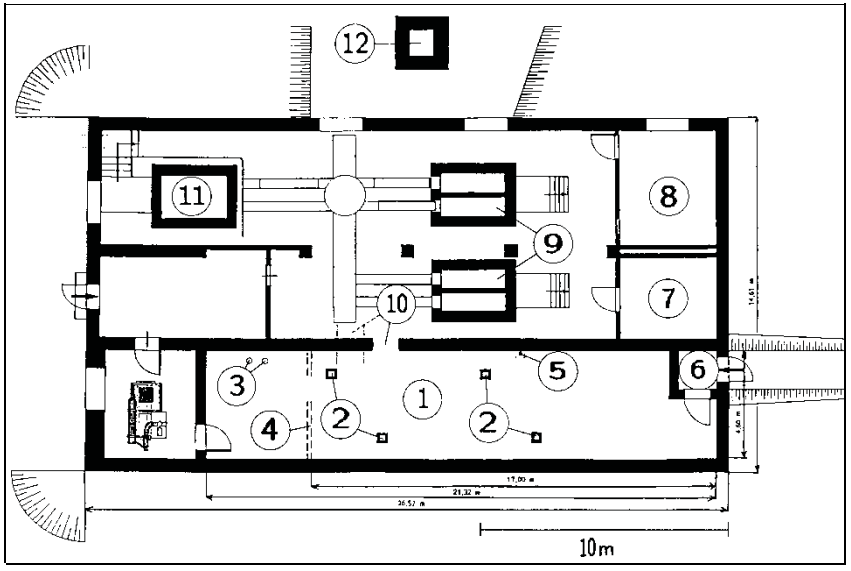

Fig. 24: *Ground plan of Crematorium I in Auschwitz I/Main Camp today, after subsequent fakery.*[173]

1: "Gas chamber"; 2: Fake Zyklon B introduction holes; 3: Toilet drains; 4: former partition morgue-washroom; 5: Ventilation chimney from air raid shelter; 6: Air lock, today referred to as victim entryway; 7: Urns, 8: Coke; 9: Reconstructed ovens; 10: Newly pierced entry to oven room; painted: old entryway; 11: Remains of the old oven; 12: Fake chimney.

[172] "Herstellung der für die Beheizungsöfen, sowie für die Ent- und Belüftung erforderlichen Mauerdurchbrüche und Schläuche," letter from the Auschwitz Air Raid Warden, Aug. 26, 1944, *RGVA* 502-1-401.

washroom at this time.

Fig. 24 shows the floor plan of the crematorium in its present condition.[173] According to Pressac, the access from the morgue/"gas chamber" to the present cremation room was newly placed after the war – not quite at the original location. The partitions in the air-raid shelter, including the wall to the washroom, which was, however, never part of the morgue (the later "gas chamber"), were torn down. Accordingly, the perplexed visitor sees two discharge pipes from two toilets inside the alleged "gas chamber." According to Pressac, who gives no source for this statement, the roof was newly covered with tarred roof felt. As a result, the traces of the Zyklon B holes and ventilation holes of the "gas chamber" were allegedly covered over. The renewed incorporation of four staggered Zyklon B introduction stacks by the Polish museum after the war is therefore not alleged to have taken place in the same location. Pressac's argument must cause astonishment, though, since the roof/ceiling is of unplastered bare concrete on the inside. It should have been quite easy to determine the location of the original openings – now allegedly sealed – from the interior, and it would also have been quite easy to reopen them.

As confirmed to visitors by the museum administration upon inquiry, the two chimney openings in the cremation room, as well as the chimney itself, which is without any functional connection outside the building, were built after the war as a "reconstruction for museum purposes" on the location of the alleged original installations.[174]

The French journalist and well-known anti-revisionist, Eric Conan, writes:[175]

> *"Another delicate subject: What to do with the* ***falsifications*** *left behind by the communist administration? In the 50s and 60s, several buildings*

[173] J.-C. Pressac, *op. cit.* (note 72), p. 159.

[174] *Ibid.*, p. 133; see also the confirmation of changes in the partial recreation of the installation in the letter from the Auschwitz State Museum to Joel P. Hayward, ref. I-8523/26/2120/ 91, dated May 7, 1991; B. Bailer-Galanda, *Informationen der Gesellschaft für politische Aufklärung*, Innsbruck, June 1991, no. 29, p. 1, relating to Leuchter's statement relating to Crematorium I: "Er verwechselt museale Rekonstruktionen der Gaskammern, die dem Betrachter einen Eindruck der damaligen Geschehnisse vermitteln sollen, mit real funktionierenden Gaskammern." (He confuses a museum reconstruction of the gas chambers, intended to provide the observer with the impression of the events at that time, with authentically functioning gas chambers.); Letter from Dr. Scheel, Bonn, German Foreign Office, Jan. 8, 1979, ref. 214-E-Stuparek: "Auch mir ist bekannt, daß es im Lager Auschwitz keine Gaskammern gegeben hat. Die Gaskammern befanden sich im ca. 3 km davon entfernten KZ Auschwitz-Birkenau." (I know as well that there were no gas chambers in Auschwitz camp. The gas chambers were located in the Auschwitz-Birkenau camp, located approximately 3 km away.)

[175] "Auschwitz: la mémoire du mal," *L'Express*, 19-25 January 1995; see also, in this regard, Robert Faurisson's remarks: "Sur Auschwitz, lentement, la vérité reprend ses droits" (The truth about Auschwitz is slowing reclaiming its rights), Feb. 4, 1995.

which had disappeared or had been misappropriated were rebuilt with gross errors and displayed as authentic. Some, which were 'too new,' have been closed to the public. Not to mention the delousing gas chambers, which were sometimes presented as homicidal gas chambers. Those aberrations have helped the deniers a lot, which took the essence for their legends out of them. The example of the Crematory I is typical. In its morgue, the first gas chamber was installed. It operated for a short period of time in early 1942. The blocking of this area, which was essential for the gassings, disturbed the operation of the camp. End of April 1942, it was therefore decided to move the deadly gassings to Birkenau, were it was conducted on an industrial scale mainly with Jewish victims. The Crematory I was subsequently converted into an air raid shelter with a surgery room. In 1948, when the museum was created, Crematory I was reconstructed in a supposed original state. ***Everything in it is false****:*[176] *the dimensions of the gas chamber, the locations of the doors, the openings for pouring in Zyklon B, the ovens, rebuilt according to the recollections of some survivors, the height of the chimney. At the end of the 70s, Robert Faurisson exploited those* ***falsifications*** *all the better because at that time the museum officials balked at admitting them.*[177] *An American revisionist*[179] *has shot a video in the gas chamber, still presented as authentic: one may see him questioning the visitors with his 'revelations.'* […] *For the moment, things remain as they are, and* ***the visitors are not told anything****. This is too complicated. One shall see later what to do."* (Emphases added.)

According to the inflection: they were lying, they are lying, they will be lying…

In view of this unrealistic "reconstructions" carried out after the war, the Jewish-American "professor of architecture" Robert van Pelt, who actually is only a professor of cultural history, in co-operation with the Jewish-Canadian Holocaust historian Deborah Dwork, arrives at the following, no less unequivocal conclusions:[178]

> *"The architecture designed to enact the metamorphosis from* Mensch *to* Untermensch *was intact when the Soviets liberated the camp in 1945. All traces of it were removed subsequently. The guidebook for sale in the bookstore does not mention the building* [Crematorium I] *at all. Perhaps the men and women who created the museum could not reconcile its implications with their ideology of a resistance: an ideology that denied total victimization. Perhaps it was simply a question of resources and the need for tourist services. Whether for doctrinal or practical reasons, the destruc-*

[176] In the original: "Tout y est faux: […]"

[177] See Serge Thion (ed.), *op. cit.* (note 37), pp. 316f.; R. Faurisson, "The Gas Chambers…," *op. cit.* (note 39), p. 335.

[178] *Op. cit.* (note 97), pp. 363f.

tion of the original arrangement within the present visitor reception center is a postwar obfuscation and a loss.

There have been additions to the camp the Russians found in 1945 as well as deletions, and the suppression of the prisoner reception site is matched by the reconstruction of Crematorium I just outside the northeast perimeter of the present museum camp. With its chimney and its gas chamber, the crematorium functions as the solemn conclusion for tours through the camp. Visitors are not told that the crematorium they see is largely a postwar reconstruction.

When Auschwitz was transformed into a museum after the war, the decision was taken to concentrate the history of the whole complex into one of its component parts. The infamous crematoria where the mass murders had taken place lay in ruins in Birkenau, two miles away. The committee felt that a crematorium was required at the end of the memorial journey, and Crematorium I was reconstructed to speak for the history of the incinerators at Birkenau. This program usurpation was rather detailed. A chimney, the ultimate symbol of Birkenau, was re-created; four hatched openings in the roof, as if for pouring Zyklon B into the gas chamber below, were installed, and two of the three furnaces were rebuilt using original parts. There are no signs to explain these restitutions, they were not marked at the time, and the guides remain silent about it when they take visitors through this building that is presumed by the tourist to be the place where it happened*."*

This argument of the "usurpation" is packed with dynamite, because it suggests that the events alleged to have taken place in Crematorium I, events described by eyewitnesses Rudolf Höß, Pery Broad and a few others, actually never took place at this location. But this undermines the credibility of all other eyewitnesses from the very outset, including those from Birkenau. We wonder if the authors are aware of this?

It may at least be stated without fear of contradiction that the ceiling, exterior walls and pillars as well as the foundation of crematorium are in their original condition. If Zyklon B introduction stacks and ventilation openings had existed in the reinforced concrete roof, breaks in the reinforced concrete structure would be visible from the interior in the corresponding places, since these cannot have been made to disappear without leaving visible traces.

In addition to today's Zyklon B introduction stacks there are indeed three locations in what is presented today as the "gas chamber," where the concrete has been breeched in a circular pattern, which indicates that these may have been round holes. (Another one is located in the air lock, see Fig. 27, 1-4)

Figs. 25 and 26: *Two of the four former openings through the roof of the morgue of Crematorium I in Auschwitz Main Camp, visible at the ceiling. They probably served as ventilation openings for the air raid shelter in 1944. They have been closed after the war "for museum purposes," because their location makes it obvious that they couldn't have served as Zyklon B introduction holes.*

The four openings in the concrete in existence today and presented as "Zyklon B introduction shafts" (marked A to D in Fig. 27) are neither plastered, nor have the remains of the cut steel reinforcement rods been removed in a professional manner. The holes have been planked with wood and sealed with tar. Such poor workmanship reflects neither the care required in handling a poisonous gas, nor standard German craftsmanship.

If the SS had put these holes in the concrete during the war, one must assume that they would have taken care to evenly distribute these holes in the ceiling of the original(!) morgue in order to ensure an even distribution of the Zyklon B inside the room. The stacks today, however, are only evenly distributed in the ceiling of this room if one considers the washing room, which was only incorporated after the war(!), as an integral part of the morgue ("gas chamber"; see Figs. 22 and 24). Thus, the arrangement of today's introduction holes only make sense, if they were created especially for its present status as a falsely dimensioned "reconstruction for museum purposes" (B. Bailer-Galanda)[174] *after* the war. This by itself is strong circumstantial evidence that those holes were chiseled in after the interior walls of the former air raid shelter – one too many of them – had been torn down by the Soviets or the Poles. This is also supported by the fact that it has been generally assumed until the present day – without contradiction by any side – that the introduction holes visible today were indeed created *after* the war *without* recourse to the alleged remains of old, walled-up holes.[179]

[179] See, in this regard, the interview with David Cole, "David Cole in Auschwitz," 1993; www.youtube.com/watch?v=iXKHw0EZrqM; partially printed as "David Cole Interviews Dr.

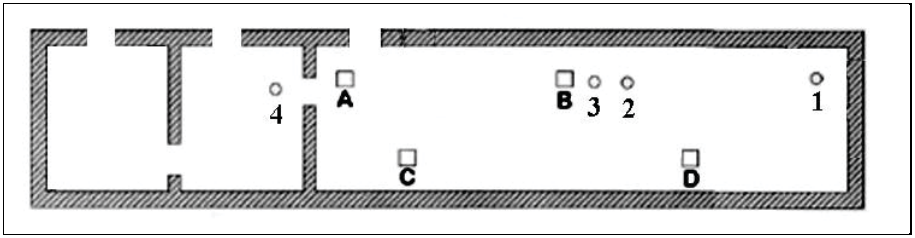

***Fig. 27**: Schematic floor plan of the morgue of Crematorium I (original situation) with surgery room (left) and washing room (with opening no. 4). A,B,C,D: location of current openings in the roof made after the war. 1, 2, 3, and 4: location of original openings of the air raid shelter for ventilation and heating ducts, today closed.*[180]

As mentioned earlier, there are four circular spots of some 35 cm in diameter visible in the ceiling of Crematorium I, which at some point might have been holes going all the way through the roof. They have been crudely filled with plaster, but since the reinforcement iron bars have not been removed from these holes, these iron bars are rusting.[181] Due to this the plaster comes crumbling down, which the museum's janitors diligently sweep away. Fig. 27 shows their location (1-4), together with the four openings included after the war "for museum purposes" (A-D). The walls shown are as they have been when the building was allegedly used as a "gas chamber." It is obvious that these old opening cannot have anything to do with alleged Zyklon B introduction holes:

1. Hole 4 is located in the wash room, not in the morgue, which was allegedly misused as a "gas chamber."
2. Hole 1 is in a corner of the morgue where the air lock of the air raid shelter was located (see. Fig. 23), which is falsely labeled "victims' entry" today. It is therefore reasonable to assume that this hole as well as the others served as ventilation openings for the shelter.

Franciszek Piper, Director, Auschwitz State Museum," *Journal of Historical Review*, 13(2) (1993), pp. 11-13.

[180] Taken from C. Mattogno, "The Openings for the Introduction of Zyklon B," *The Revisionist*, 2 parts, 2(4) (2004i), pp. 411-436, here p. 413, slightly adapted (an earlier version of this paper is available online: www.vho.org/GB/c/CM/noholes.html).

[181] Steel reinforcement rods in concrete are only practicable when the iron is deeply embedded in the concrete and therefore protected for decades against corrosion by the very durable alkaline environment of the concrete, since concrete is only slowly carbonated by the carbon dioxide (CO_2) in the environment, resulting in a neutralization of its pH value. The reinforcement rods in the ceiling of the morgue in question have been exposed to the surface, and the thin patches of mortar of dubitable quality cannot protect it efficiently, so the pH value drops quickly (*i.e.*, becomes less alkaline), particularly when rain water containing CO_2 penetrates the concrete; see the crack in Fig. 25, which would quickly allow the entry of rain water.

3. The steel reinforcement rods have not been removed from these holes. That would not have prevented them from being used as ventilation holes for a shelter, but it would have made it difficult to render the hole gas-proof.
4. The distribution of the holes over the morgue's roof/ceiling is so irregular that it can be excluded with technical certainty that they served to distribute anything throughout the former morgue.
5. Mainstream historiography, basing itself on witness statements, claims that the openings were square or rectangular. These holes are circular.

Based on all these arguments, it can be concluded with certainty that at the time of the alleged use of this room as a "gas chamber," there were no openings for the introduction of Zyklon B. Furthermore, there was no direct access to the "gas chamber" from the outside. The victims would have had to enter through the corpse room (laying out room), or through the oven room. They would, therefore, have had to file past the corpses of their already-murdered companions in misery – truly a macabre spectacle. There could be no successful deception of the victims and camouflage, nor could there be any hope of willing co-operation or acquiescence on the part of the inmates under such circumstances. Or, to put the lack of direct access doors to the "gas chamber" in Robert Faurisson's words:

"*No doors, no destruction.*"

5.4. "Gas Chambers" in the Birkenau Camp

5.4.1. Crematoria II and III

5.4.1.1. Point of Departure

These crematoria are entirely comparable in size, equipment, and manner of construction to other similar installations built in the Third Reich at that time, as well as with those built today.[182] In this connection, reference is made to the trial of the builder of the cremation installations in Birkenau camp. In 1972, the court acquitted the two defen-

[182] The present writer has before him a sketch of the ground plan of the crematorium, built in 1939, of the Sachsenhausen concentration camp, which is similar in design and dimensions with Crematoria II and III at Auschwitz, yet no mass murders are alleged to have occurred at Sachsenhausen. Compare with this the construction design of modern crematoria: H.-K. Boehlke, *Friedhofsbauten*, Callwey Verlag, Munich 1974, in particular, the crematorium diagram on p. 117, including a doctor's office; cf. E. Neufert, *Bauentwurfslehre*, Ullstein Fachverlag, Frankfurt 1962, pp. 423f.

dants, master builder W. Dejaco and master builder F. Ertl, since suspicion of aiding and abetting in mass murder could not be corroborated.[183] An expert report drawn up during this trial on the surviving plans and documents on the construction of the crematoria led to the conclusion that these buildings could not have been used or modified so as to serve as instruments of mass murder.[90] In interview with Walter Lüftl, one of the master builders at Auschwitz, Walter Schreiber, stated as follows on the planning of these crematoria:[184]

"Lüftl: In which areas were you active?

Schreiber: As senior engineer I inspected the civil project of the Huta Corporation and negotiated with the Central Construction office of the SS. I also audited the invoices of our firm.

L.: Did you enter the camp? How did that happen?

S.: Yes. One could walk everywhere without hindrance on the streets of the camp and was only stopped by the guards upon entering and leaving the camp.

L.: Did you see or hear anything about killings or mistreatment of inmates?

S.: No. But lines of inmates in a relatively poor general condition could occasionally be seen on the streets of the camp.

L.: What did the Huta Corporation build?

S.: Among other things, Crematoria II and III with the large morgues.

L.: The prevalent opinion (considered to be self evident) is that these large morgues were allegedly gas chambers for mass killings.

S.: Nothing of that sort could be deduced from the plans made available to us. The detailed plans and provisional invoices drawn up by us refer to these rooms as ordinary cellars.

L.: Do you know anything about introduction hatches in the reinforced concrete ceilings?

S.: No, not from memory. But since these cellars were also intended to serve as air raid shelters as a secondary purpose, introduction holes would have been counter-productive. I would certainly have objected to such an arrangement.

L.: Why were such large cellars built, when the water table in Birkenau was so extremely high?

S.: I don't know. Originally, however, above-ground morgues were to be built. The construction of the cellars caused great problems in water retention during the construction time and sealing the walls.

---

[183] Proceedings against master builders W. Dejaco and F. Ertl (note 89).

[184] Schreiber was the Supervising Engineer at the Kattowitz agency of the Huta corporation, which built the crematoria at Birkenau. See also Werner Rademacher (=Walter Lüftl), "Engineer's Deathbed Confession: We Built Morgues, not Gas Chambers," *The Revisionist* 2(3) (2004), pp. 296-297. He died in 1999.

L.: Would it be conceivable that you were deceived and that the SS nevertheless had gas chambers built by your firm without your knowledge?

S.: Anyone who is familiar with a construction site knows that is impossible.

L.: Do you know any gas chambers?

S.: Naturally. Everyone in the east knew about disinfestation chambers. We also built disinfestation chambers, but they looked quite different. We built such installations and knew what they looked like after the installation of the machinery. As a construction firm, we often had to make changes according to the devices to be installed.

L.: When did you learn that your firm was supposed to have built gas chambers for industrial mass killing?

S.: Only after the end of the war.

L.: Weren't you quite surprised about this?

S.: Yes! After the war I contacted my former supervisor in Germany and asked him about it.

L.: What did you learn?

S.: He also only learned about this after the war, but he assured me that the Huta Corporation certainly did not build the cellars in question as gas chambers.

L.: Would a building alteration be conceivable after the withdrawal of the Huta Corporation?

S.: Conceivable, sure, but I would rule that out on the basis of time factors. After all, they would have needed construction firms again, the SS couldn't do that on their own, even with inmates. Based on the technical requirements for the operation of a gas chamber, which only became known to me later, the building erected by us would have been entirely unsuitable for this purpose with regard to the necessary machinery and the practical operation.

L.: Why didn't you publish that?

S.: After the war, first, I had other problems. And now it is no longer permitted.

L.: Were you ever interrogated as a witness in this matter?

S.: No Allied, German, or Austrian agency has ever shown an interest in my knowledge of the construction of Crematoria II and III, or my other activities in the former Generalgouvernement [German occupied Poland]. *I was never interrogated about this matter, although my services for the Huta Corporation in Kattowitz were known. I mentioned them in all my later CVs and recruitment applications. Since knowledge about these facts is dangerous, however, I never felt any urge to propagate it. But now, as the lies are getting increasingly bolder and contemporary witnesses from that time like myself are slowly but surely dying off, I am glad that someone is willing to listen and to write down the way it really*

was. I have serious heart trouble and can die at any moment, it's time now."

Prof. van Pelt has stated as follows on Crematorium II:[185]

"Auschwitz is like the holy of holies. I prepared years to go there and to have a fool [Leuchter] *come in, come in completely unprepared, it's sacrilege. Somebody who walks into the holy of holies and doesn't give a damn."* [00:40:59-00:41:20]

"Crematorium II is the most lethal building of Auschwitz. In the 2,500 square feet of this one room, more people lost their lives than any other place on this planet. 500,000 people were killed. If you would draw a map of human suffering, if you created a geography of atrocity, this would be the absolute center." [00:55:44-00:56:15]

Van Pelt's testimony emphasizes the importance of Crematorium II (and Crematorium III, built as a mirror image of Crematorium II, although allegedly not used quite as intensively), which will be discussed in the following.

A special, separate morgue with better ventilation was then used, as is usual today, as a laying out room for the victims of possible epidemics. This cellar is designated as an "*Infektionsleichenkeller*" (infection corpse morgue) in the technical literature. Fig. 28 is the floor plan of Morgue 1 (alleged "gas chamber") of Crematorium II, which was designed mirror-symmetrically to Crematorium III. Fig. 29 shows the cross section through Morgue 1.[186] As may be seen from the cross-section, these morgues, for the most part, are located below ground. The long and slender type of construction, the underground location, as well as the lack of contact with the cremation rooms result in an even, cool temperature in these areas. This corresponds to their having been planned as morgues, which is how they are designated in the building plans.

The planning of such large cellars is not astonishing, furthermore, when one considers that several hundred corpses a day had arrived during the worst periods of the epidemics raging in Auschwitz, and that these corpses had to be stored somewhere. The compelling interpretation of the non-criminal planning of these rooms as harmless morgues is shared even by Pressac.

The documentation reproduced by Pressac shows that this installation was derived from an earlier 1941 plan for a new crematorium in the main camp.[187] The access road to the crematoria in Birkenau was located on the side of the chimney wing (see Fig. 31). The original plan for the main camp, however, provided for an access road on the other side of the building. Moreover, the high water table of the terrain in

[187] *Ibid.*, p. 183, on the non-criminal planning of Crematoria II and III, see, in particular, p. 264.

Birkenau did not permit location of the morgue quite under ground.[188] The cellars were therefore raised so as not to swim on top of the ground water. Together with the layer of earth on top of the cellars, these were insurmountable for vehicles and carts. Direct access to the cellars from the outside was therefore blocked. For this reason, an additional flight of stairs was incorporated to the offices of Morgue 3 as well as a flight of stairs at the end of Morgue 2 (see Fig. 31).

Possibly as a result of the dramatically altered military situation after the German defeat of Stalingrad in the winter of 1942-43, all construction plans were reduced in costs and required manpower wherever possible. Hence, the new stairways did not have corpse chutes as the old stairway. Several other cost-reducing changes were made on Crematorium III.[189] Defects in the quality of the cheap material used for Crematoria IV and V must have led to their early breakdown (see chapter 5.4.2.).

The original basement stairways with corpse chutes of Crematoria II and III had already been finished by then, although they could only be accessed with difficulty. That these stairs were built at all, indicates a hasty transmission of the old plans for the main camp to the new situation in Birkenau.

The walls of the morgue consist of double brick masonry with a layer of waterproofing in between for insulation.[189] The interior walls are plastered with a hard, cement-rich material, the ceiling and support pillars of reinforced concrete show the marks of wooden planking and are therefore not plastered. The roof, made of reinforced concrete, is isolated by a layer of tar, which is protected from environmental and mechanical damage by a rather thin layer of cement covering it. The layers of tar both on top of the roof as well as between the two brick walls were indispensable as a water barrier due to the high ground water in the swampy region of Birkenau. Both morgues had several drains.

5.4.1.2. The Obsessive Search for "*Criminal Traces*"

Jean-Claude Pressac was the first researcher to dig through the mountains of documentation at the Auschwitz Museum and later through the documentation of the Central Construction Office stored in Moscow. He was also the first one to create the now-widely used term

[188] See also Michael Gärtner, Werner Rademacher, "Ground Water in the Area of the POW camp Birkenau," *The Revisionist*, 1(1) (2003), pp. 3-12; C. Mattogno, "Cremation Pits" and Ground Water Levels at Birkenau," *The Revisionist*, 1(1) (2003), pp. 13-16.

[189] J.-C. Pressac, *op. cit.* (note 72), p. 187, costs and survey of construction design of Crematoria II and III.

"criminal trace." Based on the total absence of documents proving the erection of homicidal "gas chambers," Pressac resorted to a semantic trick by attributing a criminal significance to harmless documents, which were said to constitute a clue that something was not quite right about the crematoria at Auschwitz. Based on the progress in research, however, all these "criminal traces" compiled by Pressac and others and accompanied by sometimes fantastic cerebral acrobatics have collapsed.[190] The most notable of them are listed and briefly refuted in the following.

5.4.1.2.1. New Cellars Stairways

Fact 1: Additional access ways via stairways from the outside were later incorporated into the cellars of Crematoria II and III.

Incorrect additional allegation: The corpse chute at the old, original stairway entrance was demolished.[191]

Incorrect conclusion: The construction of new stairways *without* corpse chutes with the simultaneous demolition in the original stairway access way could mean only one thing: no more corpses were to go sliding into the cellars but rather people who were still able to walk down a few steps. Hence they had to be alive while entering, and were killed *after* they had entered the building.[192]

Correct conclusion: The new stairways were necessary based on the alteration in the plans, see the chapter above. This is supported by the heading of the plan for the new stairways: "Change of cellar access to street side."[193] The corpse chute, furthermore, wasn't even demolished. In fact, it appears in all following plans as shown by Carlo Mattogno:[194]

- *"– Plan 2136 of the Central Construction Office of 22 February 1943 for Crematorium III;*[195]
- *– Plan 2197 of the Central Construction Office of 18 March 1943 for Crematorium II;*[196]
- *– Plan 109/15 of the firm Huta of 24 September 1943 for Crematoria II and III;*[197]

– *Plan 109/16A of the firm Huta of 9 October 1943 for Crematoria II and III.*[198]

Moreover, the 'chute' is mentioned as existing in ordinances 200 and 204 of the Central Construction Office to the inmate locksmith shop of 18 March 1943 respecting Crematorium II.[199]"

Moreover, Crematoria II and III were undoubtedly used during their entire period of operation for the temporary storage of the bodies of persons having died of "natural" causes (epidemics, exhaustion, age, etc.), awaiting cremation, which amounted to at least thousands of bodies. If it were true that stairways without chutes could only be used by living persons still capable of climbing stairs on their own, then one might be permitted to ask: how did the corpses of persons having died of "natural" causes get into the morgue (or wherever they were stored)? Did they walk by themselves? Of course not. They were carried, and sometimes certainly even a few steps up and down – and not only inside the crematorium. Was it therefore impossible to get corpses into a building not having a chute? Certainly not. Would missing chutes therefore prove that only living people could enter? Of course not. So why did the SS not build a new corpse chute by the new stairway? Perhaps simply because the costs of the crematorium were running out of control due to the constant changes in plans, and because it was desired or necessary to keep the costs down? Would that not be a much simpler and more logical explanation?

[198] *Ibid.*, p. 328.
[199] *The Trial of Höß*, volume 11a, p. 88.

5.4.1.2.2. Gassing Cellar, Undressing Room, and Showers

Fact 1: There are documents of the SS Central Construction Office which mention an "*Auskleidekeller*" (undressing room) in Crematorium II.[200]

Fact 2: There is a document which mentions a "*Vergasungskeller*" (gassing cellar,) in Crematorium II.[201]

Fact 3: There is a document which lists "*14 Brausen*" (14 showers) for Crematorium III.[202]

Fact 4: Pieces of wooden planking left in the underside of the ceiling of Morgue 1 in Crematorium II are visible even today.[203]

Incorrect conclusion: Morgue 1 of Crematoria II & III was built as homicidal "gas chamber," equipped with "false" shower heads, which were fastened to the pieces of wood left in the concrete and used to deceive the victims; Morgue 2 was used as the undressing room for the victims.[204]

Correct conclusions: The term "*Vergasungskeller*" does not clarify, in which way "gas" and "cellar" are linked here: for homicidal, for disinfestation, or for other purposes? This can be deduced from a different document, though: a memo of the Topf firm written on February 17, 1943, which states, among other things:[205]

> *"Herr Schultze called and informed us as follows: The aeration blower no. 450 for the gas cellar* [Gaskeller] *cannot be found there* [i.e. at Auschwitz]*, although it is said to have been shipped by us."*

The term "*Gaskeller*" was obviously used for the same room, and from the ventilation system described in this document it derives that it was Morgue 1. As A.R. Butz rightly pointed out, this technical term refers to a gas shelter, i.e., to a room providing safety from air raids with poison gas.[206] Samuel Crowell has thoroughly documented the German wartime regulations for the construction of air raid shelters,[207] which made their inclusion in new structures obligatory. Since Crema-

[205] First mentioned by Jean-Claude Pressac, "Une critique sur le fond," *L'Autre Histoire*, no. 6, Oct. 16, 1996, pp. 9-14. The document was made available in a brochure in 2005 prepared for an exhibition on Topf & Sons in Germany, within the context of a Holocaust memorial exhibition at the Berlin Holocaust Museum, which took place from January to April in 2006. It is reproduced online at www.codoh.com/incon/incontopf.html.
[206] A.R. Butz, *op. cit.* (note 36), p. 446, with reference to two Russian-German dictionaries.
[207] S. Crowell, "Defending Against the Allied Bombing Campaign: Air Raid Shelters and Gas Protection in Germany, 1939-1945," www.codoh.com/incon/inconabr.html.

toria II & III were the only solid structures with basements in the Birkenau camp, it is logical to assume that at least one room in the basements of these buildings was designed to serve as a gas-tight air raid shelter in case of need. As we have seen before, this was also confirmed by the senior engineer involved in the construction of these building (see p. 83). Hence, the use of the term "*Vergasungskeller*" in the document mentioned above may simply have been a misnomer for "*Gaskeller*."

Regarding the alleged fake showers, it should be kept in mind that by the 1940s no proper means for drilling holes into concrete had been invented and that no neat plastic dowels existed yet. There was therefore only one way to fasten installations to bare concrete walls and ceilings: conical pieces of wood were cast into the concrete, onto which electrical lines, lamps, water pipes, and other installations were screwed tightly. The existence of such pieces of wood in the ceiling of Morgue 1 does not prove that shower heads were fastened there. It is more probable that lamps or electrical lines were fastened there. Nor is there any proof that the "showers" mentioned in the document were "false," as stated by Pressac. In actual fact, the Central Construction Office temporarily considered expanding the Birkenau crematoria into hygiene centers equipped with disinfestation installations, inmate showers and undressing rooms, but nevertheless later abandoned these plans. Carlo Mattogno has produced extensive documentation in support of this argument:[208]

> *"Now in an 'Aufstellung' (itemization) by the Topf company dated 13 April, 1943, concerning requested metals to be used in the construction of certain machinery for Crematorium II at Auschwitz, the following piece of information appears:*[209]
>
> '2 Topf disinfestation heaters for Crematorium II in the prisoner of war camp Auschwitz.'
>
> *On 14 May, Bischoff sent Topf the following 'urgent telegram':*[210]
>
> 'On Monday bring the overdue warm water project for approximately 100 showers. Installation of water heater or boiler in the still under construction trash incinerator Crematorium III or flue for the purpose of utilizing the high emission temperature. Contingently higher walling of the oven for the purpose of accommodating a large reserve container is possible. It is being requested to send along the appropriate designs with Herrn Prüfer on Monday, May 17.'

[209] *Archiwum Panstwowego Muzeum w Oswiecimiu* (hereafter *APMO*), BW 30/34, p. 47.

[210] *APMO*, BW 30/34, p. 40.

On June 5, 1942, Topf sent Drawing D60446 to the Central Construction Office 'regarding the installation of the boilers in the rubbish incinerator.' This project involved the installations intended for Crematorium II.[211]

In an undated 'questionnaire' apparently written in June 1943 regarding the Birkenau crematoria, in answer to the question, 'Are the exhaust gases utilized?,' the head of the Central Construction Office, Bischoff, responded: 'planned but not carried out,' and in response to the following question: 'If yes, to what purpose?,' Bischoff answered: 'for bath facilities in Crematorium II and III.'[212]

Finally, there is an invoice from the firm VEDAG Vereinigte Dachpappen-Fabriken Aktiengesellschaft (United Roofing-Felt Factories, Incorporated) dated July 28, 1943, with the subject 'Auschwitz-crematorium' referring to 'completed sealing work for the ***disinfestation*** *facility' (emphasis added) which was carried out between May 21 and July 16, 1943* […].[213]

Before drawing any conclusions, a few explanations are required. While both Topf disinfestation heaters were then installed in the Zentralsauna, the document cited above refers them to Crematorium II. The project for the installation of 100 showers in Crematorium III (and in Crematorium II) could not have been for the prisoners of the 'sonderkommando' of the crematoria, since only 50 showers were installed in the shower room of the Zentralsauna, which had been designed for the inmates of the entire camp;[214] *therefore it is clear that the 'bath facilities in Crematorium II and III' in the 'questionnaire' quoted above, were intended for the prisoners of the entire camp as well. This means that it was planned to convert the Crematoria II and III into hygienic centers.*

The purpose of such centers was to cleanse the inmates and their clothing, i.e., to free them from dirt and disease-carrying parasites. But this necessarily included a disinfection or disinfestation installation. The expansion of the crematoria was not however completed because work had already begun in the meantime on the central sauna which was better suited for this purpose. The documents cited here nevertheless prove a temporary intent on the part of the Central Construction Office to perform cremation, inmate cleaning and the disinfestation of clothing in the same building.

Now I think that it is not irrelevant to note here that in this project the water heating system for the showers was connected to the garbage incinerator and not to the crematorium oven, as for example in the five-muffle oven of the Lublin KL. In my opinion, the reason for that decision was the fact that the crematorium ovens did not ensure a continuity of use to be able to provide sufficient hot water throughout the entire day; in other

---

words, the crematorium ovens were not used enough to ensure efficient operation of the water heating system.

That the VEDAG-Invoice[213] *indeed refers to the hot-air disinfesting chambers installed in the Zentralsauna, is definitely proven by a VEDAG single invoice which has the same date and the same contents as the first invoice noted above, but it refers to the 'BW 32 = disinfestation facility,' that is to say, precisely in the Zentralsauna.*[215] *But for what reason does the invoice have as its subject: 'Auschwitz-crematorium'? This heading has an obvious relationship to the aforesaid Topf 'itemization' of April 13, 1943, concerning '2 Topf disinfestation heaters for Crema II' which were then installed in the Zentralsauna. In any case, the two documents establish the correlation crematorium–disinfestation and portray the expression of a plan or at least of a intention by the Central Construction Office to combine cremation and disinfestation within the same edifice."*

Since, as shown in chapter 5.2.2., the installation of hygiene centers with showers, disinfestation, undressing and dressing rooms and adjacent crematoria is not at all unusual, the "traces" adduced by Pressac and van Pelt may be seen to have been incorrectly interpreted.

5.4.1.2.3. "*Gas-tight Doors*" for Crematorium II

Fact 1: Morgue 1 in Crematorium II was equipped with gas-tight doors with a peephole.[216]

Fact 2: An initially planned double door opening to the inside of Morgue 1 was replaced by a double door opening to the outside.[217]

Incorrect conclusion 1: Morgue 1 in Crematorium II was converted into a homicidal "gas chamber," equipped with gas-tight doors sporting peepholes to observe the victims' demise.[218]

Incorrect conclusion 2: Doors opening to the inside of Morgue 1 would have been blocked by gassing victims piling up in front of it so that the doors could not have been opened. Realizing this, the SS changed the doors to open to the outside.

Correct conclusions 1: Even if a peephole was not entirely necessary for a disinfestation chamber, it has nevertheless been proved that the disinfestation chamber doors installed in Auschwitz were also equipped with exactly such peepholes, as shown in the photograph reproduced

Lipstadt, ref. 1996 I. No. 1113, 2001, p. 6; www.holocaust-history.org/irving-david/rudolf/affweb.pdf.

here (Fig. 32).[219] Peepholes were in fact required for all disinfestation doors, because anyone entering a disinfestation chamber had to be observed from the outside in order that, in case of an accident, help could be provided immediately.[220]

One document indicates that gas-tight doors measuring 100 cm × 192 cm were ordered for Morgue 1 (the "gas chamber") of Crematoria II and III.[221] But since the same kind of door was also ordered for the inmate sauna in building BW5a (for hygenic and health reasons the inmates had a sauna, see Fig. 19), this merely shows that gas-tight doors do not prove any homicidal intent *per se*.[222]

Fig. 32: *Wooden disinfestation chamber door at Auschwitz, rendered provisionally gas-tight with peephole and metal protection grid. This is what the gas-tight doors for the homicidal "gas chambers" are supposed to have looked like. Note the extremely flimsy lock.*

On the delivery plan, *i.e.*, the final plan for Crematorium II, the size of the doors is drawn in as 190 cm × 170 cm, 30 cm less wide than on older plans. Hence this gas-tight door would not have fit.[223] Based on the ruins, it must be possible even today, to establish whether the door was possibly walled in to make it even narrower and whether there are any traces of door frames. Excavations would be necessary to determine this.

The engineers Nowak and Rademacher

[220] C. Mattogno "Auschwitz: 'Gas Testers' and Gas Residue Test Kits," *The Revisionist*, 2(2) (2004), pp. 150-155, here p. 152.
[221] *Ibid.*, p. 436. In the inventory list on p. 430, a handwritten entry mentioning a gas-tight door only appears in Crematorium II.
[222] RGVA, 502-1-328, p. 70: "*Herstellung von 2 Stck. Gasdichte Türen 100/200 für die Sauna*".
[223] *Ibid.*, p. 311, blueprint of March 20, 1943; older plans: pp. 227, 308, 312, 322.

have shown that the "gas-tight" doors manufactured at Auschwitz by inmates from wooden planks could not have been gas-tight in a technical sense. The planks did not close hermetically, the fittings were simply fastened through the wood by means of bolts, and the seals consisted of felt strips.[224]

One has to consider that a hypothetical homicidal "gas chamber" door would have to open outwards – a door opening inwards would be blocked by inmate bodies lying in front of the door. Such doors would require an especially stable arrangement, because the locks and hinges would have to be capable of resisting the pressure of hundreds of panicking people. The pressure exerted by such masses of people becomes

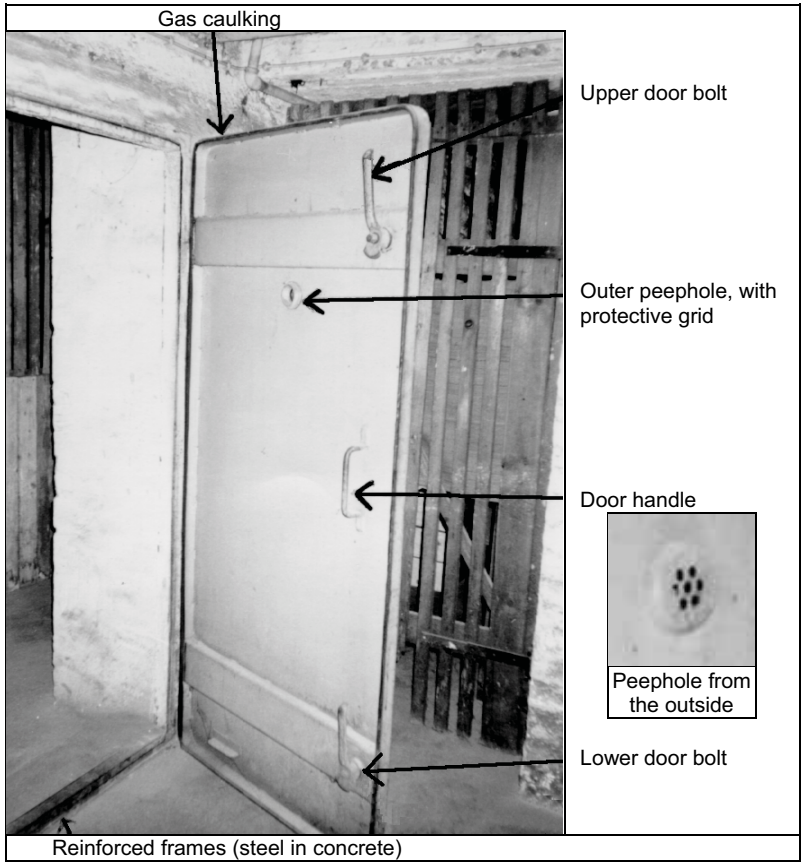

Fig. 33: *German air-raid shelter door from 1939 in the cellar of a private house in Karlsruhe © Photo: R. Faurisson, 1991*

[224] H.J. Nowak, W. Rademacher, "'Gasdichte' Türen in Auschwitz," *VffG* 2(4) (1998), pp. 248-261; Engl.: "'Gas-Tight' Doors in Auschwitz," in: G. Rudolf (ed.), *op. cit.* (note 24), pp. 324-336.

apparent when one recalls the photographs of panicky spectators at football/soccer matches. Separating fences and partitions between individual spectator blocks are commonly trampled down like mere blades of grass in such situations. In any case, a simple wooden door, rendered provisionally gas-tight, as has been found in Auschwitz, a photograph of which is reproduced by Pressac in his book (see Fig. 32),[225] could never have resisted such pressure.

The camp administration could actually have ordered solid, technically gas-tight steel doors (air-raid shelter doors, Fig. 33) since they were offered such doors, but it can be proven that they did not order them. One must assume that they had no serious need for them.[224]

In this context, a comparison of the flimsy wooden doors as found in Auschwitz (used for delousing purposes only) with technically gastight, massive iron doors as used for executions in U.S. homicidal gas chambers is revealing, compare Fig. 32 with Fig. 5 (page 24).

The installation of a door with felt seals in Crematorium II may have been temporarily considered either in connection with the temporarily considered expansion into a hygiene center or because it was desired to use the only solid reinforced concrete cellar in Birkenau camp as an air-raid shelter, as remarked by senior engineer Schreiber. Several eyewitness testimonies suggest indeed that this cellar was actually used as an air-raid shelter for inmates.[226] This would also explain other more minor "traces" which cannot be discussed here. Samuel Crowell has shown in several articles the extent to which the SS actually built air-raid shelter installations not only for themselves but also for the camp inmates.[227]

[225] J.-C. Pressac, *op. cit.* (note 72), pp. 46-49, 425-428, 486, 500.

[226] Miklos Nyiszli's book *Auschwitz: A Doctor's Eyewitness Account*, Arcade Publishing, New York 1993, alleges, on p. 128, that the inmates took refuge in the gas chamber during air raids. Martin Gilbert's *Auschwitz and the Allies* (Henry Holt & Co., New York 1981), p. 309, contains the testimony of a female survivor, according to which she, together with many other female arriving inmates, was led to a darkened room to remain there during an air raid. What is most interesting about this testimony is the description of the manner in which some of the women became hysterical during the air raid and believed that they were inhaling poison gas. Another conclusion which could be drawn from this testimony is that the SS were concerned with protecting their inmates from air raids, and that there must have existed several such air raid shelters at Birkenau, which must have been gas-tight, that however remained entirely unnoticed and unstudied (from: S. Crowell, "Technik und Arbeitsweise deutscher Gasschutzbunker im Zweiten Weltkrieg," *VffG* 1(4) (1997), p. 242, fn. 4; Engl.: "Technique and Operation of German Anti-Gas Shelters in WWII: A Refutation of J.C. Pressac's Criminal Traces," www.codoh.com/incon/inconpressac.html. Another survivor reports that the inmates were regularly led into an air raid shelter during Allied air raids in 1944: Colin Rushton, *Spectator in Hell. A British Soldier's Extraordinary Story*, Pharaoh Press, Springhill (Berkshire) 1998.

[227] Samuel Crowell, *ibid.*; see also "The Gas Chamber of Sherlock Holmes: An Attempt at a Literary Analysis of the Holocaust Gassing Claim," www.codoh.com/incon/inconshr123.html; "Comments on Mattogno's critique of the bomb shelter thesis," www.codoh.com/incon/inconscrmtgno.html; "Bombenschutzeinrichtungen in Birkenau: Eine

Correct conclusions 2: The change in orientation of the doors was probably caused by the design of this morgue's ventilation system. Since the air inlet of this system had a higher resistance than the outlet (see next chapter), a considerable subpressure was caused in Morgue 1, constantly sucking air in from the rest of the building. This is a desired effect for a morgue where many corpses had to be stored, so that unpleasant smells would not reach other parts of the building. A double door opening to the side with a lower pressure (inside Morgue 1) would open automatically, whereas a door opening to the side of higher pressure closes automatically.

5.4.1.2.4. Ventilation Installations

Fact: All rooms in Crematoria II and III were equipped with efficient ventilation installations.[228]

Incorrect conclusion: Morgues 1 of Crematoria II and III were converted into homicidal "gas chambers" equipped with installations for the intended purpose of extracting poison gases.[229]

Correct conclusion: It is in fact inconceivable that a large morgue without windows and with only one door filled with innumerable bodies of the victims of epidemic disease would *not* be equipped with a ventilation system. The capacity of the ventilation system, however, proves that these installations were designed for typical morgues.[230] The capacity of the blowers can be gleaned from invoices sent to the Central Construction Office by the Topf corporation after installation of the systems.[231] According to this, both morgues #1, *i.e.*, the alleged "gas chambers" (in the invoice designated as the "B-room"), were each equipped with a 4,800 m^3/h intake and outlet blower,[232] while for the

Neubewertung," *VffG* 4(3&4) (2000), pp. 284-330; Engl. "Bomb Shelters in Birkenau: A Reappraisal," www.codoh.com/incon/inconbsinbirk.html; upcoming: Samuel Crowell, *The Gas Chamber of Sherlock Holmes*, Nine-Banded Book, Charleston, WV, in press (2011).

[228] The ventilation ducts of Morgue 1 are visible in the plans published by J.-C. Pressac, *op. cit.* (note 72), pp. 224, 289; chapter on the ventilation installations of Crematoria II and III: *ibid.*, pp. 355ff.; engine power of the ventilation installations for all rooms in Crematoria II and III: *ibid.*, p. 374 and 377; size of the ventilation outlets: *ibid.*, p. 234; Fig. of an outlet cover in the ventilation outlets.

[229] For Pressac see footnote above; a similar opinion has been expressed by van Pelt, *Pelt Report*, *op. cit.* (note 71), p. 208, as well as by Judge Gray in the Irving vs. Lipstadt trial, *op. cit.* (note 71), §7.62.

[230] See also, in this regard, C. Mattogno, in: G. Rudolf (ed.), op. cit. (note 96), pp. 153-155. The following remarks are closely patterned after Mattogno; for further details see there.

[231] Invoice no. 729 dated May 27, 1943. *APMO*, D-Z/Bau, nr. inw. 1967, pp. 246f.; *ibid.*, 231f.: invoice no. 171 dated 22. February 1943 for Crematorium II.

[232] The engines had a nominal output of 2 HP (approximately 1.5 KW). The output data relate to a back-pressure of 40 mm water column. The increment calculations for estimating the ventilation shaft resistances in Crematoria II & III according to engineering handbooks have shown

"L-room" (the so-called "undressing room") only one outlet blower was installed with a capacity of 10,000 m^3/h.[233]

When considering the volume of the two morgues (Morgue 1: 504 m^3; Morgue 2: 900 m^3), this results in (4,800÷504 =) approximately 9.5 air exchanges per hour for the alleged, planned "gas chambers," and in (10,000÷900 =) approximately 11 air exchanges per hour for the undressing rooms. How come the SS assumed that the "gas chambers" would need less ventilation than the undressing rooms, or even less than the dissecting rooms, laying out rooms and wash rooms, which had an even greater capacity of approximately $13^1/_3$ air exchanges per hour?

Wilhem Heepke's classic work on the construction of crematoria states that a morgue requires a minimum of 5 air exchanges per hour and 10 during intensive use.[234] Thus it is clear that the ventilation installations provided for the morgues were designed, in terms of orders of magnitude, for morgues in intensive use or for morgues containing the bodies of epidemic disease victims. For comparison: professionally designed Zyklon B disinfestation chambers with circulating air systems were equipped with 72 air exchanges per hour.[235] Furthermore, it should be mentioned that the *original* plans for a new crematorium in the main camp from 1941 – a time when even Pressac admits that the SS had no criminal intentions – provided for 17(!) air exchanges per hour for the dissecting room(!) and the morgues.[236] This exchange rate is considerably higher than what was later realized for all rooms of Crematoria II and III, including the alleged "gas chambers." Thus, on the way from beneficial planning to (allegedly sinister) construction, the air exchange rates had been drastically *reduced* (probably in order to reduce costs). Does anybody seriously believe that the SS would have lowered the ventilation capacity when changing the designation of a morgue from a beneficial use to a homicidal "gas chamber," instead of increasing it?

---

that the back pressure to be expected would probably have been higher (in the region of 50-60 mm water columns), due, particularly, to the primitive lids with many small holes covering the ventilation slit. Two blowers were probably used for this reason. Personal communication from Hans Lamker, a certified engineer.

233 J.-C. Pressac gives the output of these blowers at 8,000 m³/h, but without proving it (together with Robert van Pelt in: Yisrael Gutman, Michael Berenbaum (ed.), *Anatomy of the Auschwitz Death Camp*, Indiana University Press, Bloomington 1994, pp. 210, 232). Perhaps he simply crudely added the output of the two blowers together, which is impermissible, since the blowers did not work in parallel, but in series (behind each other).

234 W. Heepke, *Die Leichenverbrennungs-Anstalten*, C. Marhold, Halle 1905, p. 104.

235 Gerhard Peters, Emil Wüstiger, "Sach-Entlausung in Blausäure-Kammern," *Zeitschrift für hygienische Zoologie und Schädlingsbekämpfung*, 10/11 (1940), pp. 191-196, here p. 195.

236 J.-C. Pressac, *Les crématoires d'Auschwitz*, *op. cit.* (note 95) p. 18.

This is thus the final refutation of any argument on the alleged criminal characteristics of the ventilation installations in these crematoria.

5.4.1.2.5. Pre-heated Morgues

Fact: The morgues of Crematoria II and III were never heated, although a heating system was temporarily considered; water pipes in Morgue 1 were removed.[237]

Incorrect conclusion: Morgues need no heating for normal operational functioning. Crematoria II and III were converted into homicidal "gas chambers," (intended to be) equipped with a heating system so that "the gas would work more rapidly." It was necessary to eliminate the plumbing system in the morgue because panic-stricken inmates would have damaged the pipes.[238]

Correct conclusion: According to expert literature, morgues do indeed need some kind of heating equipment, because corpses must be protected from the effects of frost and freezing temperatures in winter.[239] Hence, under normal operation, morgues would have been equipped with heating devices, but the initial plans to equip the morgues in Auschwitz with heaters were cancelled,[240] rendering the argument obsolete. Regarding the removal of the water pipes, a "non-criminal" explanation follows logically: Since no heating was ever installed in these morgues, there was a danger that the water pipes would have burst in freezing temperatures due to the lack of any heating (if the pipes could not be completely drained). In order to prevent burst pipes and a subsequent flooding of the morgues, the pipes were removed.

5.4.1.2.6. "*Cremation with Simultaneous Special Treatment*"

Fact: With regards to the "Electrical supply and installation of the concentration camp and prisoner of war camp" the documentary note ("*Aktenvermerk*") of the Auschwitz Central Construction Office of January 29, 1943, states:[241]

---

[237] Pre-heating: J.-C. Pressac, *op. cit.* (note 72), pp. 221, 223. Demolition of the water pipes: *ibid.*, p. 286; for further details in this discussion, which is just as fruitless, since they are based on the "criminal traces" dreamed up by Pressac; see in general C. Mattogno, op. cit. (note 76).

[238] See also the above footnotes referring to Pressac, in particular, relating to the water pipes; a similar opinion expressed by van Pelt, *Pelt Report*, *op. cit.* (note 71), p. 296, as well as by Judge Gray in the Irving vs. Lipstadt trial, *op. cit.* (note 71), §7.68.

[239] E. Neufert, *op. cit.* (note 182).

[240] J.-C. Pressac, *op. cit.* (note 72), p. 230. The waste heat of the forced draught blowers was to be used, but since these burned out and were removed, the entire pre-heating project for Morgue 1 was cancelled.

[241] *RGVA* 502-1-26-21, Jan. 29, 1943.

> *"This putting into operation* [of Crematorium II] *can however only extend to restricted use of the available machines (in which case cremation with simultaneous special treatment* [original: "*Sonderbehandlung*"] *will be made possible) since the* [electrical] *supply leading to the crematorium is too weak for its output consumption."*

Incorrect conclusion: Since the "special treatment" mentioned apparently required electricity and because the homicidal "gas chamber" possessed an electrical ventilation, R.J. van Pelt concludes that "*Sonderbehandlung*" referred to homicidal gassings, which was made possible by operating the ventilation despite a reduced power supply.[242]

Correct conclusion: First, it is not apparent from this document whether or not electricity is required for "special treatment." Furthermore, on January 29, 1943, the ventilation installation for the morgue had not yet even been delivered, let alone installed and put into operation. Commencement of construction was not anticipated before February 10.[243] Installation was only charged to the account on February 22, 1943.[244] Therefore, the "available machines" on January 29, 1943, did not include the ventilation system. Actually, the concept "special treatment" in this connection has no "criminal" significance at all, as W. Stromberger[109] and recently C. Mattogno have pointed out:[245]

> *"By considering the historical context – a typhus epidemic increase so dangerous in 1942 as to induce* […] *Major General of the Waffen SS Glücks to command on February 8, 1943, the complete quarantine of the camp*[246] *– the meaning of the term 's*pecial treatment*' in the memorandum of January 29, 1943, could only be an extension of its hygienic-sanitary meaning which emerges from other documents.*[247] *That is, from the hygienic-sanitary point of view, the '*existing machines*' would have guaranteed proper cremation with limited capacity.*
>
> *This is confirmed by a document going back a few weeks. On January 13, 1943, Bischoff wrote a letter to the firm Deutsche Ausrüstungswerke in Auschwitz with the subject* 'Fulfillment of carpentry jobs for the building planning room.' *In this document, Bischoff complained about the delay in receiving doors* 'for Crematorium I in the KGL,' *explaining in detail:*[248]

> 'Above all, the ordered doors of Bftgb. No. 17010/42/Ky/Pa of order letter dated 26.10.42 for Crematorium I of the concentration camp are urgently needed for carrying out special measures.'
>
> *The expression '*carrying out special measures*' had no criminal significance at all. On the contrary, it denoted the construction of hygienic-sanitary installations, including the hospital for the prisoners (*Häftlingslazarett*) projected for the BIII sector of Birkenau. Therefore, if the crematorium was made for '*carrying out special measures*,' it means that it was a part of these installations and its hygienic-sanitary function was exclusively the cremation of dead bodies of deceased camp prisoners."*

5.4.1.2.7. "*Gas Testers*" and *"Indicator Devices for HCN Residues"*

Fact 1: There is a telegram of February 26, 1943, by means of which heating technician Jährling of the Topf & Söhne oven construction firm orders "10 gas testers" for Crematorium II.

Fact 2: There is a letter from the Topf corporation of March 2, 1943, which, referring to the above telegram, mentions "*Anzeigegeräte für Blausäure-Reste*" (indicator devices for HCN residues).

Incorrect conclusion: The SS ordered the indicator devices in order to verify whether the ventilation of the "gas chamber" was successful after completion of mass murder with hydrogen cyanide in Crematorium II.[249]

Correct conclusion: According to the technical literature, "gas testers" are flue gas analyzers intended to determine the exhaust gas composition of oven gases.[250] Such devices were standard equipment in crematoria. That the above-mentioned order referred to such devices is clear from the fact that they were ordered by a heating technician from an oven construction firm. The letter in reply from the Topf corporation dated March 2, 1943, stating that one must first find out who marketed these devices, has been revealed on several occasions to be an absurdity:[251]

– According to contemporary literature, devices for the detection of HCN residues were called "*Blausäurerestnachweisgeräte*" (HCN residue detection devices) or "*Gasrestnachweisgeräte für Zyklon*" (Gas residue detection devices for Zyklon).[132] Since the Topf &

[249] See the two footnotes above, with relation to Pressac; van Pelt, *Pelt Report*, *op. cit.* (note 71), pp. 200, 254.

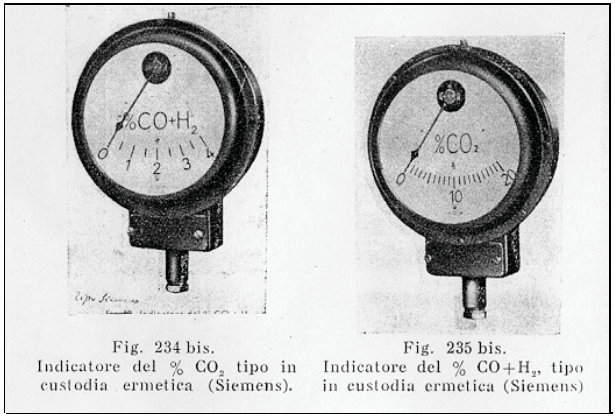

Fig. 234 bis. Indicatore del % CO_2 tipo in custodia ermetica (Siemens).

Fig. 235 bis. Indicatore del % $CO+H_2$, tipo in custodia ermetica (Siemens)

Fig. 34: *Photograph of two indicator devices from the Siemens corporation for the $CO+H_2$ and CO_2 content, respectively, in %. Component of a gas tester.*[252]

Söhne corporation, according to the letter, had already received information on the possibility of procurement of such devices from three firms, the correct name of these devices must in the meantime have penetrated even to Topf & Söhne.

– Furthermore, these detection devices are based on a wet chemical method which possessed no "indicator" and could not, therefore, be designated as indicator devices. On the other hand, the gas testers mentioned in the telegram had a physico-chemical sensor connected to a dial (see Fig. 34).
– According to contemporary prescriptions, testing with HCN residue testing devices was obligatory in every disinfestation action using hydrogen cyanide in order to test whether the ventilation of a fumigated room had been successful before it could be entered without a gas mask. Since disinfestation had been performed on a large scale in Birkenau since 1941, it is categorically impossible that no one should have concerned himself with the possibility of ordering such devices before early 1943!
– Since the creation of Birkenau camp in 1941, the SS garrison doctor for Auschwitz camp was responsible, among other things, for the ordering, administration, and use of Zyklon B and all materials for its handling (disinfestation installations, gas masks, HCN residue detection devices, etc.). He therefore had three years experience in this business. Why then should the Central Construction

[252] Alberto Cantagalli, *Nozioni teorico-pratiche per i conduttori di caldaie e generatori di vapore*, G. Lavagnolo Editore, Turin 1940, p. 308; taken from C. Mattogno, *op. cit.* (note 251), p. 19.

Fig. 35: *Photograph of Crematorium II of Birkenau taken in February 1943.*[256]

Office, which was not competent in this matter, in addition to being unauthorized, have issued the order for the procurement of HCN residue detection devices in 1943?

– In addition to crematorium ovens, the Topf corporation also produced hot air disinfestation ovens as well as silo fumigation installations which were, however, not operated with HCN.[253] Why then should the heating technician Jährling, a civilian engineer, order devices, of which he had no knowledge, from a firm, which obviously did not even know the supplier of the devices, when the health service of Auschwitz camp had already been regularly supplied with these devices by the Tesch und Stabenow corporations for two years and therefore knew the supplier? There was very probably a supply of them in storage at the camp.

It is therefore the conviction of W. Rademacher, C. Mattogno and myself that this reply from the Topf corporation is a forgery, in which a term such as "*Anzeigegeräte für Rauchgasanalyse*" was perhaps replaced by the term "*Anzeigegeräte für Blausäure-Reste*" (Indicator Device for Smoke Analysis by Indicator Device for HCN Residues).

[253] Hydrogen cyanide would form poisonous residues with moist food. The gases Areginal and Cartox were used; see also G. Kunike, *Das ABC der Vorrats- und Hausschädlinge und ihre Bekämpfung*, Theodor Weicher, Berlin 1941, pp. 53f.

5.4.1.2.8. Zyklon B Introduction Holes and Columns

Fact 1: There are eyewitness testimonies claiming that there were three or four square holes measuring 70 cm in the roofs of both morgues 1 of Crematoria II and III. According to some witnesses, columns fabricated of mesh metal ran from the floor of the morgues through the holes in the ceiling and protruded over the roof. Zyklon B is alleged to have been thrown into these columns for the purpose of mass killings.[254]

Fact 2: There are two photographs showing objects on the roof (see further below).

Fact 3: There is a document mentioning "*Drahtnetzeinschiebevorrichtungen*" (wire mesh push-in devices).

Incorrect conclusion: The eyewitnesses are right.

Correct conclusion: Pressac reproduced a photo of Crematorium II showing square objects located on the roof of Morgue 1 (the fourth object obviously lies behind the cellar).[255] The same photograph also appears in Danuta Czech's book.[256] It was taken in early February 1943, see Fig. 35, the decisive detail of which being magnified in Fig. 36. If these objects are really Zyklon B introduction holes, as Pressac believes, then one must assume that the objects are:

a) of equal size

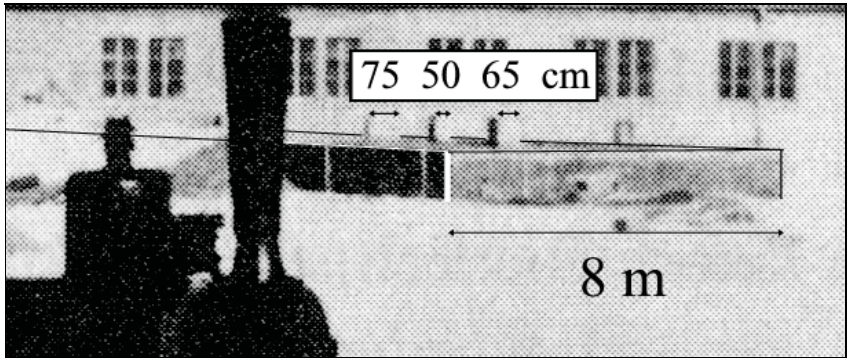

Fig. 36: *Magnification of detail from Fig. 35 with outlines of the morgue and scale of measurements drawn in. The width of the three objects in Fig. 35 shows strong variation between ca. 50 and 75 cm. Furthermore, it is notable that the shady side of the first object, seen from the left, is considerably weaker than those of the others.*

[254] Henryk Tauber: J.-C. Pressac, *op. cit.* (note 72) p. 484; Filip Müller, *Sonderbehandlung*, Steinhausen, Munich 1979, p. 95; Charles Sigismund Bendel: E. Kogon *et al.*, *op. cit.* (note 46), p. 227; Michal Kula: E. Kogon *et al.*, *op. cit.* (note 46), p. 231; for a summary and critique of these and other witness accounts on these alleged openings and introduction devices, see G. Rudolf, *op. cit.* (note 73), pp. 34-37.

[255] *Op. cit.* (note 72), Crematorium II, p. 340, taken ca. between Feb. 9 and 11, 1943.

[256] D. Czech, *op. cit.* (note 94), p. 454.

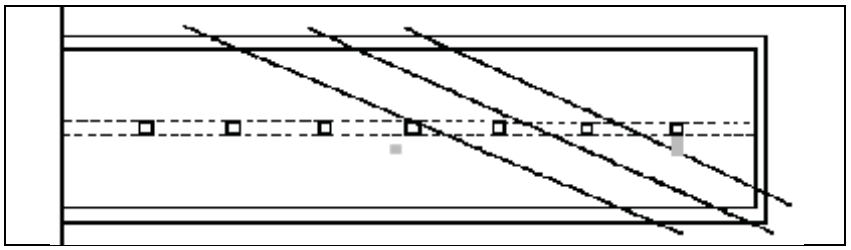

Fig. 37: *Schematic drawing of a view onto Morgue 1 of Crematorium II. Longitudinally painted: the concrete longitudinal beam with the 7 supporting pillars. Drawn in as intersecting lines: base-lines, upon which the middle of the three objects located on the roof must have been located.*[257] *Obviously, they were not evenly distributed along the roof. Gray rectangle: actual location of the two openings in existence today.*

b) regularly aligned
c) regularly distributed along the roof
d) nearly the same color and
e) casting approximately the same shadows.

Fig. 36 points out the outlines of the cellar, indicating its width as well as the approximate width of the three objects. Despite the mediocre resolution of the photograph, it may be concluded that these objects are of unequal width, not evenly distributed over the roof, but stand, on the contrary, close together. It also seems peculiar that the shady side of the first object seen from the left, compared with those of the other two objects, is remarkably light in color. Fig. 37 shows the alignment of perspective, viewed from above, on which these objects can possibly be located.[257] As none of the requirements set forth above is met, the argument that these objects are above-roof parts of Zyklon B introduction stacks must be abandoned.

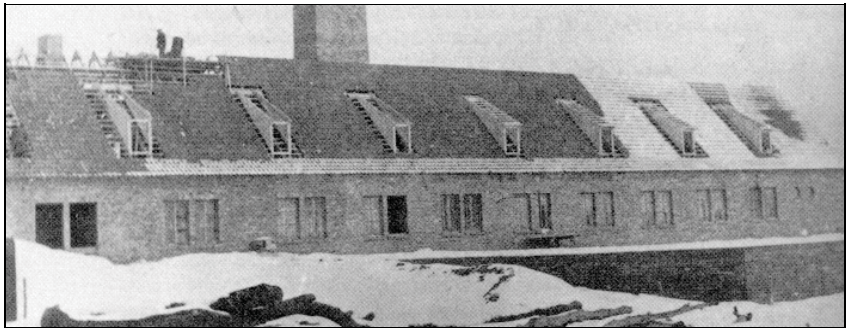

Fig. 38: *Photograph of Crematorium II from Jan. 20, 1943, similar in perspective as Fig. 35, but without objects on the roof of Morgue 1.*

[257] Taken from Jean-Marie Boisdefeu, *La controvers sur l'extermination des Juifs par les Allemands*, volume 1, Vrij Historisch Onderzoek, Berchem 1994, p. 168.

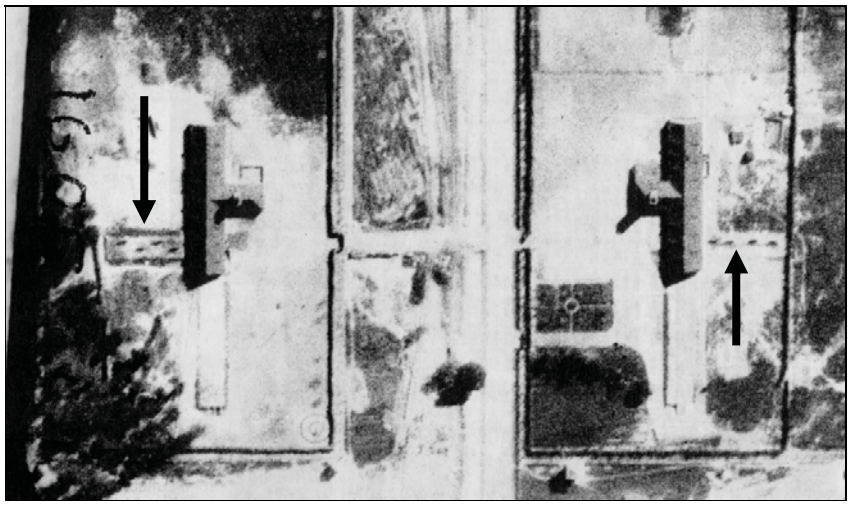

Fig. 39: *Enlargement of Allied air photo RG 373 Can F 5367, exp. 3185 of Birkenau camp, taken on August 25, 1944. An interesting feature is the dark spots on Morgue 1 ("gas chambers") of both crematoria (arrow), of which it is known today that there are no introduction stacks for Zyklon B.*

It should be mentioned in passing that these objects are not to be seen in other photographs of the morgue, see Fig. 38 taken on January 20, 1943,[258] as well as another photograph reproduced by Pressac and taken in the summer of 1943.[259] It will therefore be necessary to find another explanation for the objects in the photograph taken in February 1943, such as, for example, that some sort of objects had been placed on the roof – perhaps in the course of constructing the building, undertakings which were obviously still underway – or *horribile dictu*, but less likely, that the picture has been retouched at a later date.

Fig. 39 shows an enlargement of an Allied air photo of Birkenau camp taken on August 25, 1944.[260] Darkened areas (arrow) are clearly visible on the lateral wing, the roof of Morgue 1 ("the gas chamber") of Crematorium II. A stereoscopic evaluation of this air photo shows that these darkened areas on Fig. 39 cannot have possessed any height.[261]

---

[258] From D. Czech, *op. cit.* (note 94), p. 398, and J.-C. Pressac, *op. cit.* (note 72), p. 335.

[259] J.-C. Pressac, *op. cit.* (note 72), p. 341. Pressac, of course, alleges the existence of Zyklon B introduction apertures; in actual fact, however, nothing of the sort is to be seen.

[260] Alliied aerial photographs, National Archives Air Photo Library, Washington, D.C., RG 373 Can F 5367, exp. 3185, published by CIA employees D.A. Brugioni and R.G. Poirier, "*The Holocaust Revisited: A Retrospective analysis of the Auschwitz-Birkenau Extermination Complex*,", CIA, ST-79-10001, Washington, D.C., 1979; allegedly on their own, private, responsibility.

[261] R. Lenski, *op. cit.* (note 28), pp. 356ff., testimony of aerial photographical appraiser Kenneth R. Wilson, pp. 8 927-8 941e of the trial transcript; see also B. Kulaszka (ed.), *op. cit.* (note 28), pp. 353f. According to Wilson, the spots on the photos dated Sept. 13, 1944, cannot be seen.

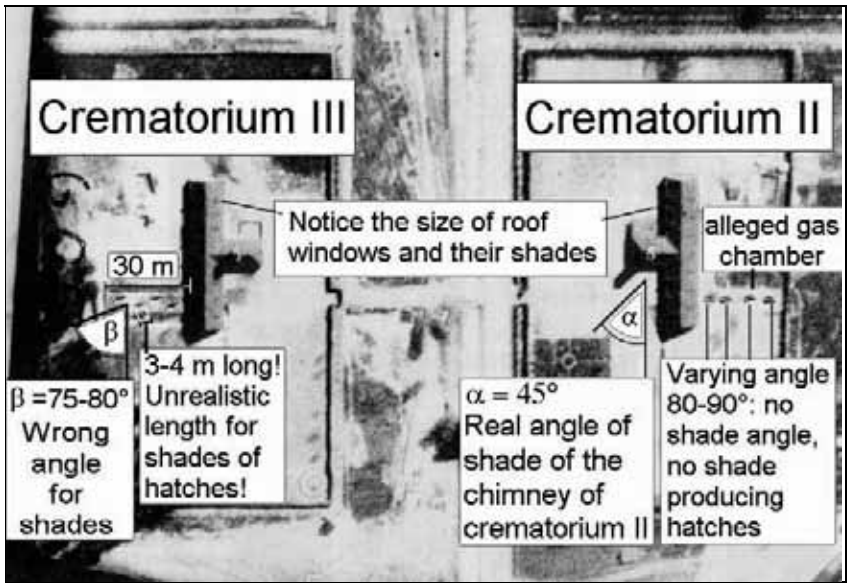

Fig. 40: *Schematic drawing of the air photo in Fig. 39. It is immediately apparent that the spots on the roofs of morgues 1 cannot be introduction stacks: too large, too irregular, wrong direction for "shadows."*

If the Zyklon B introduction stacks really possessed the dimensions of 70 cm ($2^1/_3$ ft) on each side as described by the eyewitnesses, this cannot be reconciled with the spots on the air photo, which are approximately 2 to 3 m^2 in area (20-23 ft^2). It must be noted that the chimneys of the inmate barracks as well as the large crematorium chimneys are rich in contrast, symmetrical, and straight. The spots on Morgue 1 of both crematoria, by contrast, form an angle of approximately 75-80° (Crematorium III) or 80-90° (Crematorium II, irregular) to the arrangement of the main wing of Crematorium II (see schematic drawing Fig. 40). If these spots were objects of any kind, they would have to exhibit the same alignment as the shadows of the crematorium chimney of Crematorium II, the chimney of an inmate barracks, and other sharply conspicuous parts of the picture. The actual shadows, in contrast to the spots above, form a 45° angle to the main direction of Crematoria II and III (see Fig. 40).

We know that the chimney of Crematorium II was 15 m high.[186] It throws a shadow on the picture which is five times as long as the spots on the roof of Morgue 1 ("gas chamber") of Crematorium III (length of shadow of chimney: 20 m, that is, the angle of the sun was approximately 37°, length of the spots on Morgue 1 ("gas chamber") of Crematorium III: approximately 4 m). This means simply that the alleged

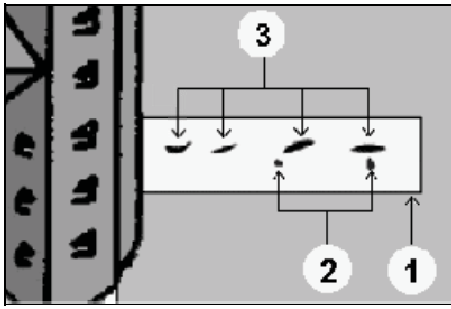

Fig. 41: *Schematic drawing of the location and size of the spots (3) on the roof of Morgue 1 (the "gas chamber") of Crematorium II (1) visible on the air photos, as well as the location (2) of the only holes to be found today.*[262]

Zyklon B introduction stack must have projected 3 m above the roof of Morgue 1 ("gas chambers") of Crematorium III in order to cast such long shadows, which may be ruled out as impossible.

Absence of spatial height, irregular shape, incorrect size (length and width), and wrong, irregular direction of the spots therefore prove definitively that these spots are neither the shadows of any objects, nor can they be the legendary Zyklon B introduction stacks. The irregular, vague nature of these spots, as well as the fact that they are missing on at least one air photo,[263] gives rise to the conclusion that they are the retouching of a forger, added at a later time. An expert study prepared in late 1992 by John Clive Ball, a professional air photo interpreter in Canada, has since proven that the air photos were faked while they were in the possession of the CIA – surprise, surprise![264]

As a result of the long-lasting wrong interpretation of these spots on this air photo, the otherwise unfounded allegation was made that the alleged Zyklon B introduction stacks were aligned linearly on the middle of the roof in case of Morgue 1 ("gas chamber") of Crematorium II, and aligned alternating to the left and to the right of the middle of the roof in case of Morgue 1 of Crematorium III, according to the location of the spots on this air photo. The alternating alignment, however, would contradict the argument that the Zyklon B introduction columns were aligned behind the concrete support pillars in order to conceal them so that the entering victims would not become suspicious. As a

[262] Figure 41 was taken from the Air Photo Evidence website (air photo.com/altered/altered.html) with John C. Ball's kind permission.

[263] J. Ball, *Air Photo Evidence*, Ball Resource Service Ltd., Delta, B.C., Canada 1992, p. 48, Morgue 1 of Crematorium II, photograph dated 13 September 1944, RG 373 Can B 8413, exp. 6V2.

[264] The manipulations on this picture are overly plentiful, such as, for example, a drawing of a group of inmates accidentally marching over the roof of a barracks! See also J.C. Ball, *ibid.*, p. 42; idem, "Air Photo Evidence" in: G. Rudolf (ed.), *op. cit.* (note 24), pp. 269-282. On the alleged original photographs, it may furthermore be seen that the spots on morgues 1 of both crematoria (II + III) are pointing in different directions; private communication by J.C. Ball.

matter of fact, no introduction column could have been hidden behind a concrete pillar, because this would have necessitated the opening of a hole not only through the reinforced concrete roof, but also through the massive longitudinal support beam, see Fig. 28, which would have compromised the stability of the entire morgue. Hence, an alignment to the left and/or right of the support pillars would have been unavoidable.

After the building was destroyed towards the end of the war – by whom does not matter – one occasionally encounters the attitude that the remaining ruins are fakes, and that the original installations have disappeared without a trace. This would mean that the Poles rebuilt the crematoria true to the original for many millions of zlotys after the war, only in order to blow them up. A grotesque idea. Thus the author of the present book was rejected as an expert witness by a court on December 6, 1991, and May 5, 1992, on the grounds that his research on the "gas chambers" was fully irrelevant since, as it was allegedly well known, the structures in Auschwitz were only fakes, the authentic "gas chambers" having disappeared without a trace.[265]

Such allegations are, of course, absurd, and only testify to the technical incompetence of the judges entrusted with these matters. It is a shame that such individuals are given the power to decide the fate of

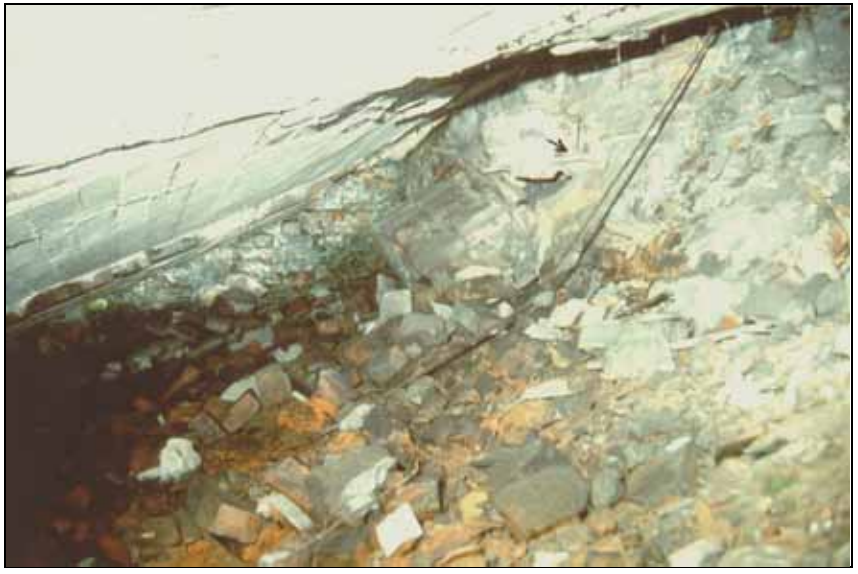

Fig. 42: *Interior photograph taken from the ruins of Morgue 1 ("gas chamber") of Crematorium II. The arrow points to the sample taking location (see chapter 8.3.3.).*

[265] County Court Munich, ref. 451 Cs 112 Js 3326/90 and ref. 432 Cs 113 Js 3619/90.

others in these disputes.[266]

The roofs of Morgue 1 ("gas chambers") of both crematoria today are broken in pieces and have collapsed, but the ceiling of Morgue 1 ("gas chamber") of Crematorium II is still relatively intact. The next to the last of the seven pillars of Morgue 1 ("gas chamber") of Crematorium II, seen from the south, still bears a piece of the ceiling. There, one can still climb down into the interior of the cellar through a hole in the ceiling (Fig. 43, p. 110) (see also Figs. 42 and 44), in which the ground water stands on the floor even in summer during a fairly lengthy dry season. Large parts of the masonry work and concrete ceiling accessible there are in original condition, protected from wind and weather. There are no visible signs of erosion or corrosion. In his book, Pressac shows illustrations of the circular, intact ventilation pipe openings through the ceiling of Morgue 2 of Crematorium II as well as through the concrete ceiling of the oven room of Crematorium III.[267]

Figs. 48-53 (p. 116) show the five openings in the ceiling of the

Fig. 43: *Alleged Zyklon B introduction hole in the ceiling of Morgue 1 ("gas chamber") of Crematorium II, entry to the still passable part of the cellar.*

[266] See, in this regard, the letter from the semi-official German Institut für Zeitgeschichte, in which, with relation to the Auschwitz State Museum, the reconstruction of the installations in Crematorium I is described and the condition of the original ruins of the crematoria in Birkenau are briefly mentioned: H. Auerbach, Institut für Zeitgeschichte, Munich, letter dated March 20, 1992.

[267] J.-C. Pressac, *op. cit.* (note 72), pp. 365f.

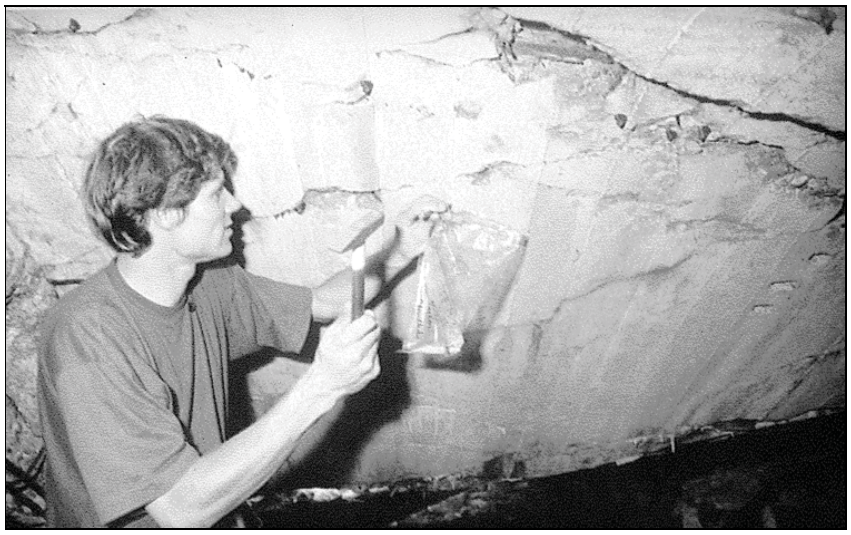

Fig. 44: *Ceiling of Morgue 1 ("gas chamber") of Crematorium II. Sample taking location of samples 1 and 2.*

oven room of Crematorium III as of December 1991. They were used to withdraw radiant heat from the crematorium ovens. The ceiling collapsed during the demolition of the oven room, and most of the five holes were damaged to some degree during the process.

If the Zyklon B introduction holes described by eyewitnesses really existed, with the wire mesh columns installed inside them, then what else is to be expected?

According to eyewitness Henryk Tauber, the victims would have demolished all the equipment in this room:[268]

> *"The people going to be gassed and those in the gas chamber damaged the electrical installations, tearing the cables out and damaging the ventilation equipment."*

1. Several hundred people, locked into a cellar with a very small surface area, anticipating death, would panic and attempt to escape, damaging everything that stood in their way. So what would the victims locked into the cellar have done to the wire mesh columns described by the eyewitnesses? If these columns actually existed, their outer framework would have to have been of solid steel, but certainly not of fragile wire mesh construction.

2. These columns would, in addition, have had to have been solidly anchored in the concrete ceiling, the floor, and the concrete pillars. But since solid anchoring dowels did not yet exist at that time, hoop irons

[268] *Ibid.*, pp. 483f.; *Pelt Report*, *op. cit.* (note 71), p. 106.

would have been cast into the concrete during the construction of the cellar, spread out to a "dovetail" inside the concrete.[269] If carried out after completion of the building, holes would have been chiseled into the concrete, and the hoop irons would have been cast in cement filling these holes, see Fig. 46 (p. 113). In both cases, a removal of such cast-in hoop irons would have been impossible. All one could do is cut them off with a saw or a welding torch.[270] Hence, if any introduction device was ever installed in these morgues, traces of such hoop irons must still be present.

3. Furthermore, the steel reinforcement rods in the reinforced concrete would have to run wreath-like around the hole, and would be capable of verification by means of induction devices, even today.

4. Since, in addition, the morgues' roofs were covered with a layer of soil approximately one half meter thick, the entire construction would have to be protected against the intrusion of soil and rain water, and in so doing it would have been indispensable to raise the edges of the holes above the surface of the roof like miniature chimneys.

Nothing of the kind can be found on the roof of Morgue 1 of Crema-

Fig. 45: *Alleged Zyklon B introduction hole in the roof of Morgue 1 ("gas chamber") of Crematorium II in December 1991. It is clearly visible that it was not cleared from the steel reinforcement rods. These were simply bent backwards.*

[269] I am grateful to Carl Hermann Christmann, a certified building engineer, for this information.
[270] I am grateful to R. Faßbender, a certified building engineer, for this information, who also provided the drawings.

torium II which has remained largely intact. The only two holes which can be found today of anything approaching the diameter involved and somewhat regular and rectangular in shape were obviously crudely pierced at a later time, as may been seen in Figs. 45 and 43 (p. 110). Even Pressac admits that these are the only holes visible today.[271] Nevertheless his richly illustrated book includes not one clear photograph of these two existing holes.

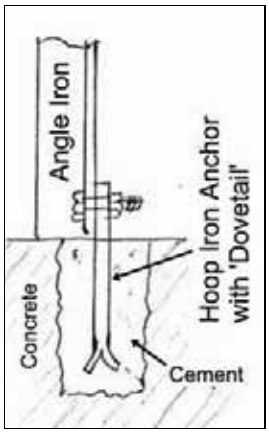

Fig. 46: *Hoop iron with dovetail, cast in cement in a hole in concrete.*

All other smaller breakthroughs, cracks, and openings in the roofs of morgues 1 ("gas chamber") of Crematoria II and III visible today are breaks in the reinforced concrete effected at a later time with the iron reinforcing rods sticking out. Nowhere does one find cleanly poured concrete edges or rough, chiseled out edges with some remaining plaster work; there are no remains of ascending concrete or brick/mortar stacks; no steel reinforcement rods running other than would be expected for an ordinary flat roof without holes; and there are no traces of any hoop irons, dovetails, or any other means of anchoring any device to the morgue's floor, ceiling, or concrete pillars.

If any of these holes were used as Zyklon B introduction holes, they would have to have been broken through following completion of the roof, *i.e.*, shortly before the commencement of the alleged mass murders.[272] Such holes with no plasterwork to polish off their rough edges, however, could neither have been sealed against escaping poison gas, nor against intruding soil and water, nor would it have been possible to safely install any panic-proof introduction devices in them. Using such crude holes would truly be an incredibly stupid piece of bungling.

But there is more. In the opening shown in Fig. 45 the reinforcement rods were only separated and bent back. They possess their full length even today. One could bend them back again and weld them back together with their stumps, which are also visible to the left of the photograph (covered with snow).[273] Nor is there any trace of reinforcement

[271] J.-C. Pressac, *op. cit.* (note 72), p. 354.

[272] The ceiling was finished towards the winter of 1942/43, while the mass exterminations allegedly began in March 1943; see also J.-C. Pressac, *op. cit.* (note 72), pp. 338f.

[273] Please do not attempt to bend them back again! More recent photographs show that individuals have obviously broken off two of the three reinforcement rods during similar such attempts. One of these persons who unintentionally broke off one rod was Dr. Fredrick Töben in Febru-

rods running in a wreath-like pattern around the hole. This hole, therefore, can never have been used as an introduction hole; it was never finished. And what makes matters worse: this is still the "best" of all holes and cracks in this roof in existence today. All others are even more irregular and filled with reinforcement rods.

No apparatus, using the technology available at that time, could be anchored in such crudely pierced, unplastered holes, from which the reinforcement rods were not even removed; therefore, no gas introduction device could ever have been firmly installed, let alone sealed from the exterior. This means that the entire environment including the supposed perpetrators would have been endangered by the gas streaming out of the opening. The supposed victims could furthermore only have been prevented by force from escaping through these holes, or even throwing the Zyklon B back out through the hole, since these holes could obviously not be closed.

We might even go much further in this direction: we can tell from the concrete when at least one of the two large holes was pierced. An opening pierced through the concrete in the roof of either Morgue 1

Wenn Felsen zu-fallen

ZUFALL

Es gibt *Zufälle*, die haben etwas mit *Fallen* zu tun. Fallen im Sinne von Stürzen. Im Fall von Josef Prana-Kvasny wurde daraus auch eine *Falle*, in der ein glückseliger *Zufall* ihn vor dem Tod bewahrte. Unsere heutigen wahren *Zufalls*-Geschichten handeln von Felsstürzen, bei denen Menschen durch glückliche Fügungen gerettet wurden.

Josef Prana, speziell in Wien durch seine Leibwächterschule bekannt geworden, aber auch als Komponist (dem Papst schickte er eine Hymne, auch beim Songcontest-Bewerb machte er oft mit), hielt sich im September 1982 im lateinamerikanischen Costa Rica auf. Er besitzt dort eine rund 350.000 Quadratmeter große Insel namens Bejuco. Und weil er sich schon gut im Lande auskannte, wollte er zwei Männern bei der Suche nach einem geeigneten Grundstück behilflich sein. Einer war der Österreicher Friedrich Zimmermann. Ein Wiener, Kurt Kyba, Jahrgang 1958, lieh Prana und den anderen einen kleinen Suzuki-Jeep. Kyba selbst nahm an der Immobilien-Tour nicht teil.

„Wir fuhren von Cartago Richtung Golfito", schildert Prana. „Unterwegs machten wir in einer

ary 1997, as he advised me personally after his visit to Auschwitz. Another rod was broken off later by unknown person(s), see Carlo Mattogno, op. cit. (note 180).

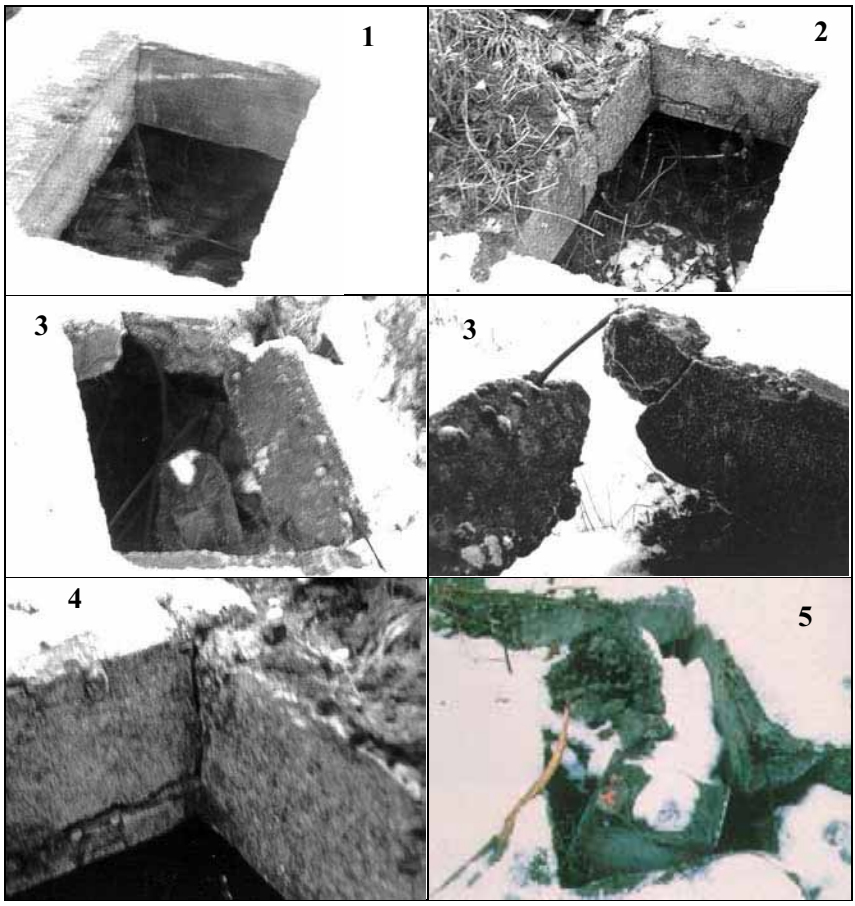
[274] *Kurier*, Aug. 30, 1992, p. 20: "Wenn Felsen zu-fallen" (when rocks fall close).

("gas chamber") in consideration at a later time would inevitably have had the consequence, when the building was blown up, that the breaks and fissures caused to the roof by the explosion would have run preferentially through these holes.

The reason for this is that explosions exert extraordinarily great forces, and that the formation of cracks is favored by any weakness in the structure, since the tension peaks attain very high values in the vicinity of acute angles (notch effect, see Fig. 47).[275] Such holes, in particular, which would already have damaged the structure of the concrete due to their incorporation following completion of the structure, represent not only points of likely fracture, but points of inevitable fracture. This is made more obvious by Figs. 48-53 (p. 116). Although the explosion pressure in the oven room, on an even level with the ground, could turn aside in all directions, and the roof remains relatively intact to the attic, three of the five oven room ventilation holes, cleanly cast and reinforced in the concrete roof, were completely destroyed. In the case of two of the other holes, clearly visible cracks formed at the corners, visible in the photos reproduced by Pressac.[267]

In the morgues of Crematoria II and III, the explosion pressure could only turn upwards, causing their roofs to be much more seriously damaged than the roof of the oven room. The alleged Zyklon B introduction holes in the roof of Morgue 1 ("gas chamber") of Crematorium II, however, are conspicuous for having remained relatively intact; in the case of the hole in Fig. 45 all the cracks and fissures run around this hole! On the spot, one furthermore recognizes the arbitrary arrangement of this hole in a location at which the roof of the morgue is undamaged. This alone proves with technical certainty that this hole was broken through after the destruction of the roof!

The chisel marks on the edge of the hole in Fig. 43 are so similar to those in Fig. 45 that it must be assumed that both holes have the same history.[276]



There were therefore no holes in the ceilings of these rooms through which the poison gas preparation could have been introduced by means of wire mesh pillars or otherwise, as described by eyewitnesses.

Prof. van Pelt remarked accurately in this regard:[277]

---

[275] Heinz Neuber, *Kerbspannungslehre: Theorie der Spannungskonzentration*, 4th ed., Springer, Berlin 2001.

[276] Carlo Mattogno, *op. cit.* (note 180), has shown that the size of this hole actually increased over the years, probably because the Auschwitz Museum wants to give it a more regular, rectangular shape.

Figs. 48-53: *The five properly constructed ventilation holes in the ceiling of the oven room to the upper story, Crematorium III (no. of holes indicated; #3 twice); condition: December 1991. Note the cracks caused by the explosion.*

"Today, these four small holes that connected the wire-mesh columns and the chimneys [on the roof of Morgue 1, Crematorium II] *cannot be observed in the ruined remains of the concrete slab. Yet does this mean they were never there?"*

An interesting question, which the professor of architectural history answers as follows:

"While there is no certainty in this particular matter, it would have been logical to attach at the location where the columns had been some framework at the bottom of the gas chamber ceiling, and pour some concrete in the holes, and thus restore the slab."

[277] *Pelt Report*, *op. cit.* (note 71), p. 295; see also Brian Renk, "Convergence or Divergence?: On Recent Evidence for Zyklon Induction Holes at Auschwitz-Birkenau Crematory II," *JHR* 20(5&6) (2001), pp. 33-51.

Van Pelt's claim that the camp administration could have filled the holes in the ceiling with concrete in the fall of 1944 in order to restore the ceiling, is without proof. But at least Prof. van Pelt believes that the SS administration acted logically, in that they allegedly attempted to wipe away all trace of their alleged crime. But does van Pelt really believe that it would have made more sense to fill up the holes with concrete instead of removing the entire roof of the "gas chamber," as was done with the roofs of morgues 2, the "undressing room"? An Allied air photo taken on December 21, 1944, shows that the roof of the other morgue, which is not alleged to have been used to commit any murders, was completely removed.[278] Obviously the whole matter makes no sense. To believe van Pelt, we must believe, that the SS arbitrarily created architectural relics to confuse later tourists and Holocaust researchers instead of destroying the roof entirely, as in the case of the undressing room. This seems too absurd to be taken seriously.

But if van Pelt had the most rudimentary knowledge of architecture, he would know that it is impossible to remove holes measuring 70 × 70 cm (that is almost half a square meter!) from a concrete roof *without leaving clearly visible traces*. Actually, however, there are no traces of openings in the roof later closed with concrete.

In addition, concrete patches filled in later would have flown out of these holes like a cork out of a shaken champagne bottle during an explosion, thus making the holes just as visible as they were before. On closer inspection, Prof. van Pelt's allegation turns out to be not only demonstrably wrong, but utterly absurd.

But at least Prof. van Pelt agrees with the revisionists that there are no remains of these alleged holes. In remarking that there are no such traces, van Pelt has in fact proven that there were never any holes in the ceiling of this room, and, consequently, no Zyklon B introduction holes of any nature whatever, and, consequently, no introduction of any poisonous substances whatever in the manner described by the "eyewitnesses." He has proven that his "eyewitnesses" were lying. He has proven that there is no proof for the mass murders in Auschwitz. Actually, he has proven that there is no proof for the Holocaust. "No holes, no 'Holocaust'" (Robert Faurisson). It is beautiful to see the great Professor of Architecture Robert Jan van Pelt in the year 2000 come to the same conclusion as myself in the year 1991, when I investigated the

[278] Dino A. Brugioni, Robert G. Poirier, *op. cit.* (note 260), p. 15; see also G. Rudolf, *op. cit.* (note 73), p. 39. I am grateful to Fritz P. Berg for this argument.

ceiling of the alleged "gas chamber" of Crematorium II of Birkenau. Only our conclusions are somewhat divergent.

At this point, I would like to introduce a witness who contacted David Irving by e-mail after conclusion of Mr. Irving's legal proceedings against Deborah Lipstadt in May 2000. He is an engineer named Barford; his colleagues are assisting in the conservation and restoration of the camp for the Auschwitz Museum administration. He informed David Irving that, during his trial, investigations were made in complete secrecy at Auschwitz with regards to the mystery of the holes, and then remarked:

> *"*[W]*hat happened to their* [the Auschwitz Museum's] *tests on the roof of Crema II mentioned in the attachment? Did they find the Zyklon B holes or not? Did they report those results to Lipstadt's lawyers, and when?* […]
>
> *As you can guess, despite my belief that you and the Revisionists are wrong, and despite spending half an hour examining the collapsed roof of the underground gas chamber of Crematorium II from different angles, I found no evidence of the four holes that the eyewitnesses say were there* […].
>
> *Secondly several areas of the slabs are covered in small rubble from an outer layer of concrete which was fractured by the blast. Now I would have expected these fragments to have fallen through the holes, if they were there, into the void beneath.* […]
>
> *I remain puzzled by the lack of physical evidence for these holes."*

In early 2000, the late Charles D. Provan distributed a paper claiming he had located the missing holes in the roof of Morgue 1 of Crematorium II.[279] What Provan did, however, was simply to declare those cracks as "holes," which were caused by the concrete support pillars piercing through the collapsing roof and cracks caused by the roof bending over the longitudinal beam. All holes described by Provan are full of reinforcement bars, they lack regular shape, have no straight edges and corners (as is to be expected for regular, planned-in holes), no traces of plaster (as is to be expected if holes were chiseled in later), no traces of chimney extensions to lead these stacks through the soil, no traces of anchoring devices (dowels, hoop irons, dovetails…). In his schematic drawing of the roof, Provan even possesses the boldness to display these cracks as holes with regular shapes.[280] C. Mattogno has pointed out in detail how unfounded and distorted Provan's claims really are.[281]

[279] "No Holes? No Holocaust? A Study of the Holes in the Roof of Leichenkeller 1 of Krematorium II at Birkenau" published by author in early 2000; online.

[280] *Ibid.*, p. 36.

[281] Carlo Mattogno, *op. cit.* (note 180).

Finally, I want to focus on those legendary "Zyklon B introduction columns," for which Michal Kula is the most frequently quoted "eyewitness." He gives a detailed description of these columns which he claimed he had built.[282] J.-C. Pressac[283] (see Fig. 54) and Prof. van Pelt[284] have prepared drawings of these columns based on Kula's description.[285] First, the fact that there are no holes in the roof of the morgue in question measuring 70×70 cm – nor of any other size – categorically proves that Kula's columns cannot have been installed. Next, there is neither material nor documentary evidence that these columns existed.[286] All we actually have in this regard is a handwritten entry in an inventory list for Crematorium II[202] saying "*4 Drahtnetzeinschiebevorrichtungen*," which, literally translated means something like "wire mesh push-in device." I have reproduced this handwritten entry in Fig. 55. The following points deserve to be pointed out:

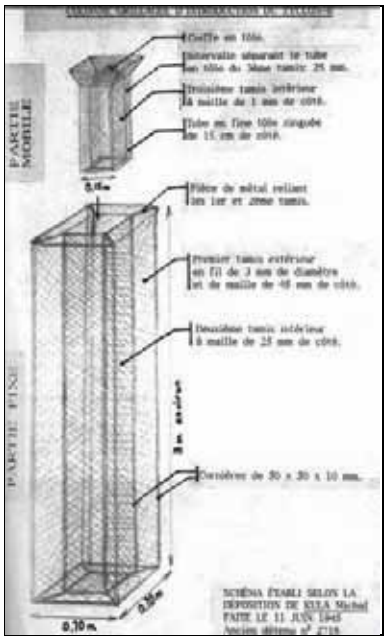

Fig. 54: *J.-C. Pressac's drawing of the legendary "Zyklon B introduction columns" as described by Michal Kula.*[283]

- It is unknown, by whom and when this handwritten entry was made.
- This entry is made for morgue no. 2, the alleged undressing cellar, not(!) for Morgue 1, the alleged "gas chamber."
- If Kula's introduction columns would be included in this inventory list, they would appear with an appropriate name describing the whole thing, not just a "push-in device," which could only be the inner part of Kula's device.

---

[282] Höß trial, vol. 2, pp. 99-100.

[283] J.-C. Pressac, *op. cit.* (note 72), p. 487; on p. 287, Pressac shows a rather primitive drawing with French inscriptions, probably prepared by a former French inmate on request of the Soviet investigation commission right after the war.

[284] R. van Pelt, *op. cit.* (note 74), pp. 194, 208; *caveat emptor*: Though van Pelt's translation of Kula's testimony is erroneous, and though the data supplied in Kula's testimony is rather meager, van Pelt uses it to make five different, very detailed drawings – some of it necessarily based on van Pelt's fantasy, and the rest based on Kula's fantasy.

[285] See also Jamie McCarthy, Mark van Alstine, "Zyklon Introduction Columns," www.holocaust-history.org/auschwitz/intro-columns.

[286] C. Mattogno, op. cit. (note 76), pp. 83-93.

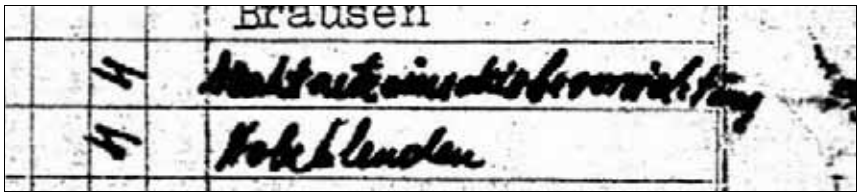

Fig. 55: *Handwritten entries in an inventory list of Crematorium II for Morgue 2. The lower one reads "Holzblenden" (wooden blinds). The upper one may read "Drahtnetzeinschiebevorrichtung" (wire mesh push-in device)*[202]

– In German, *schieben* describes horizontal (pushing) movements,[287] whereas for vertically lowering an object, the word *laß* is used, *i.e.*, *Einlaßvorrichtung* instead of *Einschiebevorrichtung*.

Whatever this handwritten entry really refers to, one thing is clear: it does not support Kula's claim of the existence of complex Zyklon B introduction devices(!) in Morgue 1(!) of the Crematoria II and III.

Furthermore, M. Kula's credibility as a witness must be considered very low, since he claims, for example, that he saw how corpses of gassing victims were carried away:

> *"I saw then that they* [the corpses] *were greenish. The nurses told me that the corpses were cracked, and the skin came off."*

As will be shown in chapter 7., victims of Zyklon B gassings aren't greenish (they are pinkish-reddish), and there is no reason for the corpses to crack and for their skin to come off. This is nothing but atrocity propaganda.

But let us assume for a moment, the SS would have faced the problem of introducing HCN into the morgues 1 of Crematoria II and III after their roofs had been finished. I offer two options to solve the problem, and every reader might pick the solution that seems more likely:

a) Pierce (2×4=) eight holes through the reinforced concrete roofs – a laborious and expensive task, leading to massive, irreparable damage to the roofs' layer of tar and upper cement layer; add (2×4=) eight brick or concrete chimneys of at least 1 m height to lead the holes through the layer of soil on top of the roofs, and attempting to repair the damage done to the roof by the violent hole piercing process – another laborious, material consuming, and expensive task; design and construct (2×4) eight wire mesh columns 3 m high, consisting of three parts: a panic-proof, outer column made of massive steel (which does not correspond to Kula's claims, though), a middle wire mesh column (with no purpose at all but to hinder the HCN from

[287] *E.g.*, a cabinet's drawer is a *Schublade* (the German verb *schieben* (to push) is irregular: *schieben*, *schob*, *geschoben*; noun: *Schub*=thrust).

spreading out), and a removable inner wire mesh column, another laborious, material- as well as time-consuming, and expensive task; find a way to anchor these eight devices panic-proof in the concrete floor, ceiling and pillars, another laborious and expensive task; all these works had to be planned, approved, tested, and material had to be allocated, leaving a thick and long "paper trail" of documents (which, by the way, doesn't exist); but finally, all one would possess at the end would be a primitive device allowing for the simple introduction of Zyklon B by pouring it into the inner column; one had to sit and wait for a long time until a lethal amount of HCN had evaporated from the Zyklon B carrier and had spread into the morgue, or alternatively, one had to apply an excessive amount of Zyklon B to ensure high evaporation rates for quick execution success, and remove and destroy the Zyklon B after the gassing, though only a fraction of the HCN had been released by then.[288]

But there was a second, much simpler option:

b) Installing a simple basket – to hold Zyklon B – in the air intake ventilation shaft of Morgue 1 right after the easily accessible intake ventilator, which then would blow the HCN vapors right into the "gas chamber," similar to the Degesch circulation procedure. This would have reduced the gassing time and the amount of Zyklon B required to a fraction compared to any scenario where Zyklon B is simply kept closely together on heaps without any moving air.[289]

Also, one could have drastically increased the evaporation rate of the Zyklon B in this basket even further, hence accelerating the execution procedure. All that would have been required was to alter an idea the Topf engineers had in early March 1943. When facing cooling problems of the cremation chimney's forced draught blowers, the Topf engineers suggested to use the excess heat produced by these engines to pre-heat the morgue. The only constructional change needed for this was to redirect this excess heat into the morgue's air intake duct (see chapter 5.4.1.2.5., p. 99). Though the forced draught blowers overheated and were damaged shortly the-

[288] For evaporation rates of Zyklon B, see chapter 7.2. and 7.3.1.3.

[289] The brick-built air intake duct was easily accessible from the attic, where the fans were installed, and from the ground floor; see J.-C. Pressac, *op. cit.* (note 72), pp. 276, 291, 329, 369. The use of the air intake fan to introduce HCN would have lead to some HCN losses through the air exhaust chimney already during the gassing, thus endangering anybody close to those crematoria, but certainly not more than would have been the case when all the HCN had to be removed after the end of a hypothetical gassing, so this would not be an argument against this technique. Also, such a loss of HCN is minimal compared to the loss following Kula's scenario. For more on this, see chapter 7.3.1.3.

reafter,[240] it would have been easy to construct a short air duct from the furnace chimney to the air intake duct of Morgue 1 instead. In this way, warm air coming from the crematory ovens (suffocatingly low in oxygen) would have been redirected over the Zyklon B basket into Morgue 1, supplying this room with warm, oxygen-depleted air enriched with HCN.

I assume the point I am making is clear: there were all sorts of cheaper and less complicated solutions available than suggested by Michal Kula. His solution is simply impracticable and is an insult to every engineer's and architect's intelligence – naturally bearing in mind the fact that the ruins of Crematorium II clearly prove that no such columns were ever installed anyway.

5.4.1.2.9. Conclusions

Pressac's "criminal traces" have been refuted on structural engineering grounds. So, too, have all the "eyewitnesses," who have been discredited without exception. The alleged homicidal "gas chambers" are therefore refuted upon the grounds of building engineering alone. Or, in Robert Faurisson's words:

"No Holes, No 'Holocaust'"

In summary, the arguments relating to the introduction columns may be listed as follows:

Table 1: Arguments relating to the Zyklon B introduction columns

ALLEGATION	FACT
Zyklon B introduction stacks are visible on Morgue 1 ("gas chamber") Crematoria II and III on an air photo.	An analysis of this air photo proves that the spots visible have no spatial height, have an irregular shape, an incorrect size (much too long and wide), and irregular directions different from real shadows; these spots can therefore neither be shadows of any objects, nor can they be the legendary Zyklon B introduction stacks.
The filling stacks are visible on a ground photo of Crematorium II.	These three objects are only visible on one photograph; on others they are missing. They stand closely together, have different dimensions and irregular alignment. Introduction stacks would have the same size, a regular alignment and be evenly distributed over the roof. The objects do not accord with the holes actually found, either in location or in number.

ALLEGATION	FACT
For planned introduction holes, cleanly cast and reinforced holes with concrete/brick stacks protruding over the layer of soil laying on this roof would have to be expected.	The only two holes deserving this name clearly show chisel marks; the concrete structure was destroyed at a later time; there are no smooth, cast concrete edges and surfaces, no stack-like elevation to prevent the entry of rain water and soil into the hole. All other cracks and openings are highly irregular, filled with reinforcement rods, and obviously caused by the collapsing roof being pierced by pillars and bent over the longitudinal beam.
For holes chiseled in, the reinforcement rods would have to be removed, the edges polished off, and a protruding stack built. Such holes would be severely damaged by an explosion.	In all cases the reinforcement rods still project into the holes; in one case, these were only cut through and bent back. The edges of all holes and cracks were not plastered; the tar insulation is openly visible; there is no trace of any stacks added. The "best" of these holes is in an area unaffected by the explosion that blew up this morgue, proving that this hole was chiseled in after the war.
The installation of introduction devices running from the ceiling to the floor requires panic-proof fixtures, like massive dowels and hoop irons with dovetails	No trace of such fixtures can be found anywhere, hence no such devices were ever installed. There is also no documentary or physical evidence that such devices ever existed.

5.4.2. Crematoria IV and V

Figure 56 (p. 125) shows the ground plan of Crematorium IV and mirror-symmetrically that of Crematorium V.[290] Based on cost considerations, these buildings, planned and begun later, were constructed in a simpler manner than Crematoria II and III. Due to low quality materials, the ovens of both crematoria broke down shortly after the putting into operation of the installation. They were not repaired due to crematorium over-capacity. There are few documents as well as contradictory and, to some extent, incredible eyewitness testimonies relating to these installations, which, according to Pressac, must be considered the least well-known.[291]

These crematoria were planned starting in the summer of 1942 and built until early 1943. According to Pressac, in addition to the two

[290] Plan received from R. Faurisson. The same plan is found in J.-C. Pressac, *op. cit.* (note 72), p. 401, but of very poor quality.

[291] J.-C. Pressac, *op. cit.* (note 72), pp. 379ff., chapter on Crematoria IV and V: "[…] the least known of the instruments of extermination […] a comparison of such testimonies reveals inconsistencies."

western rooms, which bear no designation in the plans, the vestibules are also supposed to have been used as homicidal "gas chambers." All these rooms allegedly possessed gas-tight hatches with wooden shutters approximately 1.50 m from the floor and measuring 30×40 cm, in the exterior walls, for the introduction of Zyklon B,[292] which are later supposed to have been widened to 40×50 cm.[293]

Both rooms had heating furnaces that needed to be fired from the vestibule, which, according to Pressac, was allegedly also used as a "gas chamber." No ventilation installation is known to have existed. Pressac assumes ventilation by natural convection.[293] Franciszek Piper, Director of the Auschwitz Museum, agrees:[169]

> *"There were plans for mechanical ventilation of the Zyklon B, but these were not put into effect. Evacuation of the gas was instead achieved by convection, that is, by merely opening the doors."*

Pressac alleges the later incorporation of a door in the corridor for natural ventilation support, but without proving it.[294] Since it would hardly have been any more expensive for the SS to provide for mechanical ventilation in these rooms, and since this solution would have been considerably more effective, Pressac's argument of the installation of a door for ventilation can be rejected as unrealistic. It is also obvious that the morgue and oven room possessed ventilation chimneys. The rooms which purportedly served as "gas chambers," however, are the only rooms which, apart from the coke room and doctor's office,[295] possessed *no* ventilation chimney!

According to an older Pressac publication,[296] these "gas chambers" were not planned and built as such either, which he bases, among other things, on the fact that the absence of a ventilation installation would have led to a need to evacuate the entire building for many hours during a gassing.[297] It is, in fact, inconceivable for a gas chamber *not* to possess a ventilation system, regardless of the purpose for which it was designed.

---

[292] *Ibid.*, p. 384. For an illustration of the gas-tight door and hatches, see pp. 46-49, 425-428, 486, 500.

[293] *Ibid.*, p. 386.

[294] Pressac points to a photo of Crematorium IV, *ibid.*, p. 417, as proof of his hypothesis. But since the photograph was taken from the south side while the corridor lies on the north side of the building, the door shown in the plan is the access, drawn on the plan, to one of the undesignated rooms. If he means to refer to Crematorium V, hidden in the forest in the background, then it is impossible to claim seriously that anything can be recognized on this photo.

[295] A doctor's office in crematoria, by the way, is quite normal, even today; see also E. Neufert, *op. cit.* (note 182).

[296] J.-C. Pressac, *Le Monde Juif*, no. 107, Juli-September 1982, pp. 91-131.

[297] Pressacs argues this way in his new book as well, *op. cit.* (note 95), pp. 67, 89.

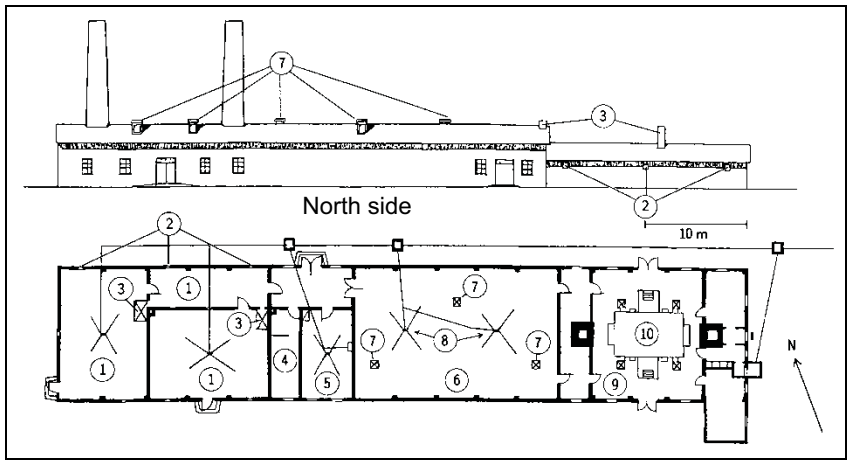

Fig. 56: *North lateral view (above) and ground plan (below) of Crematorium IV and/or V (mirror image) in Auschwitz II/Birkenau camp.*[290]
1: Alleged "gas chambers"; 2: Alleged Zyklon B introduction hatches; 3: Heating ovens; 4: Coke room; 5: Doctor's office; 6: Morgue; 7: Ventilation chimneys; 8: Gullies; 9: Oven room; 10: Crematorium ovens

In his new book, Pressac leaves these arguments unchanged.[298] Since the mass extermination of the Jews was supposed to have been already fully underway – particularly, in farmhouses I and II – when Crematoria IV and V were being planned, it is, of course, absurd to believe that these installations could have been incorrectly designed and built. Today, therefore, Pressac assumes a "criminal planning" of the crematoria.[299] The claim of such criminality is allegedly supported by various documents mentioning the "installation of gas-tight [sic] windows," "pouring concrete floor in gas chamber," and repeated mentions of gas-tight doors in various connections.[300]

As already shown in the chapter on the disinfestation of personal effects, the German word "*Gaskammer"* (gas chamber) was the designation commonly used at that time for the disinfestation of personal effects. The combination of crematoria and disinfestation installations in one and the same building was very common practice at that time.[301] Indications have since been found leading to the inference that it was initially planned to use the rooms referred to in some documents as "gas chambers" for disinfestation purposes.

[298] J.-C. Pressac, *op. cit.* (note 72), p. 386.
[299] *Ibid.*, p. 447.
[300] *Ibid.*, pp. 406, 442-455.
[301] For a prominent example, one need only consider Dachau concentration camp, the crematorium building of which contained a series of Degesch circulation delousing chambers, see p. 59.

In the case of Crematoria IV and V, one must assume that the rooms in question here were intended for disinfestation purposes, but perhaps never completed for this purpose, let alone used. In any case, there is no evidence that ventilation systems absolutely necessary for the use of HCN were ever installed.[302] The reason for this may lie in the fact that starting in early 1943, the Germans were working on the completion of a large hygienic complex with a large hot air disinfestation installation (the so-called "*Zentralsauna*") in the immediate vicinity of these crematoria, and were also anticipating the early use of microwave disinfestation installations as promised by Berlin (see chapter 5.2.3.6.).

Mattogno has shown that documentary evidence points at the installation of showers in the two rooms in question within these crematoria, which sport waste water gullies. These works, which are referred to as "water installations" or "sanitary installations" in the documents, lasted from March 15 to April 23, 1943, and comprised for a total of 816 man-hours. Mattogno posits that the large stoves installed in these rooms served to both heat the rooms and provide hot water for the showers. The moisture in those shower rooms would also explain why the lamps were placed in recesses.[303] This supports the thesis that these rooms served as hygienic centers. Mattogno also concludes from the extant documents that the vestibule may have been considered to serve as a disinfestation gas chamber.[304]

W. Rademacher has remarked that Pressac personally quotes a document by means of which "210 gas door anchorings" were ordered in Auschwitz. This document indicates that the term gas-tight ("*gasdicht*") does not necessarily constitute a reference to execution of disinfestation chambers, since it has never been claimed that there was a need for roughly one hundred doors for homicidal "gas chambers" at Auschwitz.[305] It is entirely possible that all doors and windows were designated as "gastight," if they were equipped with felt insulation and were therefore sealed off against air currents, a characteristic not at all common in windows for inmate barracks in a concentration camp.[306]

---

[302] J.-C. Pressac, *op. cit.* (note 95), pp. 89f., alleges, in this regard, that a ventilation installation was built into Crematorium IV only in late May 1944, but his remarks are untenable in this regard; see also G. Rudolf, "Some Technical and Chemical Considerations about the 'Gas Chambers' of Auschwitz and Birkenau," in: G. Rudolf (ed.), *op. cit.* (note 24), pp. 347f.

[303] J.-C. Pressac, *op. cit.* (note 72), pp. 399f.: "Kavernischen" / "Wand-Lampen versenckt [sic]."

[304] C. Mattogno, op. cit. (note 76), pp. 177-179.

[305] W. Rademacher, *op. cit.* (note 251), p. 80; J.-C. Pressac, *op. cit.* (note 72), p. 451.

[306] At least the windows of those inmate barracks still accessible today in Birkenau have been installed in a very sloppy way, so that the wind blows intensely through the gaps. It is, however, questionable whether these barracks are authentic or were rebuilt after the war.

Pressac himself provides yet another item of proof that the term "gas chamber" has no criminal significance in Auschwitz documents. One document states: "1 key for gas chamber." Since all "gastight" doors found at Auschwitz, as well as all surviving photographs of such doors, show that these doors had no locks, this document must refer to a door for another type of room, such as a room for the storage of Zyklon B, which truly required storage under lock and key.[307]

The walls of Crematoria IV and V, which were built entirely above ground, were of simple brick masonry. After they were blown up, both buildings were demolished to their foundation walls and concrete foundations. The foundation wall of Crematorium V, which today is approximately 1 m high, is supposed to have been rebuilt.[308] The foundation wall of Crematorium IV, which is approximately 50 cm high, is also supposed to have been rebuilt out of other rubble at a later time.[61]

Even these ruins can still speak to us, even if, in this case, only the concrete foundations are authentic. Another technical precondition for the use of the rooms alleged to have been homicidal "gas chambers" would be that it would have to have been rendered impossible for the victims on the inside to get anywhere near the introduction hatches, since otherwise they could have simply pushed the SS man off the ladder while he was throwing the Zyklon B into the chamber; they could then have attempted to escape. A U-shaped, solid steel grid construction anchored in the floor and in the masonry of the walls with steel hoop anchors spread out into dovetails would have been necessary to keep the victims on the inside at arm's length from the hatches. The concrete floors of these rooms surviving today, however, make it clear that nothing of the sort was ever anchored in the floor.

Mattogno has recently discovered that the small openings in those rooms, which came in two sizes of only 15×25 cm or 20×30 cm when deducting the frames, had iron bars in front of them. This would have made it impossible to stick a can of Zyklon B through them, hence the introduction of the posion as attested to by witnesses was not possible.[309]

5.4.3. Farmhouses 1 and 2

According to eyewitness accounts, there are supposed to have been two farmhouses (sometimes referred to as bunkers 1 and 2), located

[307] J.-C. Pressac, *op. cit.* (note 72), p. 456.
[308] *Ibid.*, p. 390.
[309] C. Mattogno, op. cit. (note 76), pp. 168ff.

westnorthwest of the Birkenau camp, which were converted into homicidal "gas chambers." Their location and construction are not, however, exactly described. Pressac mentions contradictory eyewitness reports in this regard.[310] Relating to the testimony of P. Broad, for example, he writes: "[…] not exploitable […], since it has been rewritten by and for the Poles […]," and: "It is impossible to make a synthesis of all these accounts." Höß's report relating to the characteristics and location of these buildings is only superficial.[311] According to remarks in the judgment to the Frankfurt Auschwitz trial,[312] the homicidal mass gassings are supposed to have taken place in a manner similar to those in the chambers of Crematoria IV and V, as described above. This procedure is clarified by the testimony of Richard Böck,[313] and, to a certain extent, by Milton Buki,[314] Rudolf Höß, Szlama Dragon, Maurice Benroubi, Moshe Maurice Garbarz, Johann Paul Kremer (at the Frankfurt Auschwitz trial), and André Lettich.[315]

Pressac has published a photograph of what are alleged to be the remains of the foundation walls of farmhouse 2.[316] According to analyses of Allied air photographs, there was only temporarily a building in the vicinity of the location ascribed to farmhouse 2; there is no trace of farmhouse 1.[264,317] The extermination of the Hungarian Jews is supposed to have been underway when the air photos were taken, with many thousands of victims per day and strongly smoking cremations in large open ditches precisely in the area analyzed.[318] There is no trace of large cremation ditches, large fires giving off copious smoke, or large stockpiles of fuel. Only on air photos made during the winter of 1944/1945, a few mass graves can be seen west of Crematorium III – probably for the victims of the chaotic circumstances in the camp after

the Germans started to shut down and dismantle the equipment in fall of 1944 during their withdrawal.[319]

Documents discovered by Werner Rademacher in a Moscow archive prove that one of these farmhouses which really did exist was used – for disinfestation. The SS, in particular, was (at least in theory) prohibited from carrying on the disinfestation of personal effects with Zyklon B inside the camp whenever there was a safety risk. The conversion of a farmhouse, which was located outside the camp and whose utilization as provisional HCN disinfestation installations would not have involved any safety risk for the camp itself, could have resulted from this difficult situation. Several documents are now available which refer to an "existing building" outside of construction section B III, in which a bath and sauna were to be installed.[320]

In late 2001, several European newspapers reported that an Italian scholar had discovered the "bunker 1" in Birkenau.[321] As C. Mattogno has shown, however, this is nothing but a hoax. The farmhouse allegedly identified as the old bunker is at a totally different location than the alleged bunker 1 supposedly was, and it was never anything else but a farmhouse.[322]

5.4.4. The Drainage System in Birkenau

5.4.4.1. Background: Eyewitness Accounts

J.-C. Pressac quotes various eyewitnesses claiming that due to the restricted capacity of the Auschwitz crematoria, a large portion of the bodies of the victims of homicidal mass gassing were cremated in open-air pits. These pits were allegedly located north of Crematorium V as well as close to the farmhouses (bunkers) 1 and 2. The size of these pits is described as roughly 20-60 m long, 3-7 m wide, and 1.5 to 3 m deep.[323]

5.4.4.2. The Ground Water Table in Birkenau

In his expert report, Fred Leuchter pointed out that due to the high ground water table he found in Birkenau in 1988, it would have been impossible to dig deep pits and to light and maintain a fire in them.[30] The reason for the high ground water table is that the Birkenau camp lies in the immediate vicinity of the confluence of the Sola river into the Vistula river. A few hundred meters away from the camp one finds swampy meadows even today.

Leuchter, however, did not investigate the important question of whether the ground water table was similarly high in 1942-1944, when the events attested to by the witnesses took place. It has been pointed out that the Birkenau camp had a sophisticated grid work of drainage canals which lowered the ground water table.[324] This drainage system is still functioning fairly well to this day. Whereas the ground water table around the camp is basically right at the surface, it is today lowered to 60 to 70 cm under the surface within the camp, obvious, for example, from Figure 57. The photo was taken on August 15, 1991, during a long period of drought. It shows a construction trench in front of the *Zentralsauna* located in the western part of the camp.

Fig. 57: *Then and today – the unchanged ground water state in the Birkenau camp, here in midsummer 1991, in a construction trench in front of the* Zentralsauna*, approximately 70 cm. Incinerations of corpses in pits many meters deep, in accordance with witness testimony, were not possible.*

But how effective was this drainage system in 1942-1944, and most importantly, how effec-

[324] J.-C. Pressac, *op. cit.* (note 72), p. 209, drainage plan POW camp Birkenau.

tive was it in the area north of Crematorium V and in the vicinity of the alleged farmhouses, which were located *outside* of the camp's drainage system?

There are two pieces of circumstantial evidence indicating that the water table was not much different then than it is today. The first evidence is the well known small pond in the vicinity of Crematorium IV, which is supposed to have existed the same way during the war. If the drainage system had lowered the water table by several meters, the pond next to Crematorium IV, contrary to many witness statements, would have dried up. This proves the unchanged water table from then until now. The second evidence is the subterranean location of the morgues of crematoriums II and III, as well as some of the building sections of the *Zentralsauna*. They all were constructed by insulating the buildings' basements from intruding water with a waterproof layer of tar, which indicates that there was a need to protect against such water in the first place. Also, since the drainage ditches in the camp are only 1 to 1.5 meters deep, they could not have lowered the water table to less than one meter. This maximum value, though, can only be achieved in the immediate vicinity of the ditches.

In complementary studies, Michael Gärtner and Werner Rademacher on the one hand[188] and Carlo Mattogno on the other hand[325] have shown, with a vast amount of contemporary German documents dealing with the camp authorities' problems caused by the high water table, that between the end of 1941 and middle of 1944, the water table in Birkenau in general and outside the camp perimeter in particular was very high, coming close or even reaching the surface and turning the entire area into a swampy region. All three authors showed that construction on buildings with basements was possible only by permanently pumping off ground water, and Mattogno even found documents expressively *forbidding* the digging of pits for outhouse latrines, because this would contaminate the drinking water of the entire Auschwitz region. Mass incinerations of corpses in deep pits, of course, would have contaminated the drinking water as well, hence would never have been permitted.

[325] "'Verbrennungsgruben' und Grundwasserstand in Birkenau," *VffG* 6(4) (2002), pp. 421-424; Engl.: "'Incineration Pits' and Ground Water Level in Birkenau," *The Revisionist*, 1(1) (2003), pp. 13-16.

5.4.4.3. Open-Air Incineration in Pits

In general, it is of course possible to burn corpses in open-air pits, though it certainly takes more time and fuel than any cremation in a crematorium, and it also leaves many more traces due to incomplete combustion. In 1999, Dr. Myroslaw Dragan conducted an experimental incineration of an 80 lbs. deer in a pit roughly 1 m deep, 70 cm wide, and 1.2 m long. This incineration with a relatively small amount of wood lasted some 4-5 hours and was almost completely successful.[326] Dr. Dragan found out that for open-air incinerations, small, narrow holes are advantageous over large, wide holes or, even worse, cremations on ground level, since the soil walls of a pit act like the walls of a crematorium oven, storing and reflecting a great deal of the heat produced by the fire – provided that the soil has a considerable amount of clay stabilizing the wall of the pit, and, of course, that no ground water flows into the pit and extinguishes the fire.

The situation in Birkenau, however, was drastically different from that. Not only did the witnesses claim that those pits were very wide, but as Gärtner, Rademacher, and Carlo Mattogno have shown, the

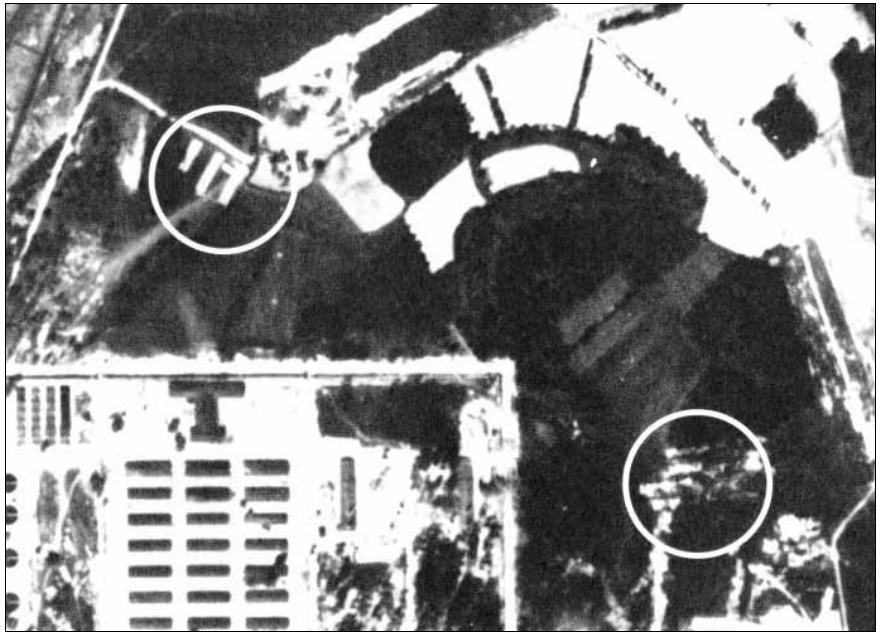

Fig. 58: *White circles: possible sites of old mass graves of typhus victims in Auschwitz.*

[326] Only small pieces of the skull were left over which were located in a corner of the pit. Communications of Dr. M. Dragan, whom I helped to investigate the carcass' remains in June 1999.

ground water table in the areas around the alleged location of those cremation pits was so high that it would have been impossible to dig such deep pits, arrange hundreds of corpses and fuel in them, and maintain a fire for many hours without these pits quickly filling with water. These findings show clearly that the attested burning of corpses in pits many meters deep was impossible under such conditions, since these pits would have filled up with ground water rather quickly.

It is known that in Birkenau the corpses which had accumulated during the typhus epidemic of the summer of 1942 were first buried in mass graves. Due to the danger of the contamination of the ground water, however, they had to be exhumed shortly afterwards. Since the new cremation facilities were still under construction then, it is possible that at least a portion of the corpses were burned on funeral pyres. For this purpose, as a rule, one removes the turf and the upper layer of topsoil in order to preserve them from damage and to absorb the ashes of the wood and the corpses. But holes many meters deep are not dug.

Indeed, one can unearth in excavations west of the Birkenau camp ashes and bone splinters (whether from humans or cattle remains open) to the depth of several decimeters, intensively mixed with all kinds of refuse (glass and porcelain shards, slag, bits of iron, etc.). Apparently this place served as a rubbish heap for the camp under German administration and/or after the war under Polish administration.

In his detailed study of aerial photos of the Birkenau camp made by the allied surveillance planes, J.C. Ball has revealed that at no point in time in the summer and autumn of 1944 in the camp or in its environs were large incineration pits – and fuel stockpiles necessary for that – to be seen, let alone flames and smoke, as are repeatedly attested to.[327] He did, however, locate the places where mass graves had existed (see Fig. 58).[319]

5.5. Construction Conclusions

Even the most primitive temporary disinfestation installations – whether in the initial period of the life of Auschwitz camp or elsewhere – were always equipped with ventilation and a heating system, the last being, of course, useful but not absolutely necessary. But no room not possessing a ventilation system need be considered as a room for repeated fumigation with poisonous gases, whether for lice or human beings. Homicidal "gas chambers" must furthermore be panic proof and

[327] J.C. Ball, *op. cit.* (note 263).

Table 2: Equipment and suitability of actual or alleged "gas chambers"

Building \ Equipment	Poison gas introduction	Heating	Ventilation	panic proof	Suitable for disinfestation	Suitable for mass homicide
Disinfestation room	○	●	●	○	yes	if panic-proof
Crematorium I	×	×	●	×	perhaps	no
Crematoria II and III	×	×	●	×	perhaps	no
Crematoria IV and V	×	●	× / ?	×	hardly	no
Farmhouses I and II	○	?	?	×	hardly/perhaps	no

● = present or possible; ○ = possibly present; × = not present; ? = unknown

have to be equipped, apart from the entry doors, with an opening for the introduction of the poison gas material from the outside; the latter is not absolutely necessary for disinfestation installations, but is nevertheless useful. It must be concluded, therefore, that no installation possessing neither a poison gas introduction device from the outside, nor any possibility of ventilation, nor panic proof equipment can seriously be considered to serve as a homicidal "gas chamber." If one considers the rooms discussed above in a summary manner, the results are shown in Table 2.

Not taken into consideration in the above, among other things, is the fact that the ventilation system of hypothetical homicidal "gas chambers" would have to be efficient enough for homicidal purposes, which, in view of the above, was not the case, and that the evacuation of the poison gas into the environment after the gassing/execution required special measures in order to avoid that people close to the "gas chambers" – both inside the building as well as in its vicinity – get hurt or even killed.

Although the literature is generally unanimous as to the equipment of the rooms in Crematoria IV and V, the information is, to a certain extent, speculative due to the lack of documents and material evidence. This applies even more so to the farmhouses, on which practically no documents exist.

Fortunately, it is precisely the one "gas chamber" in which the largest number of people was allegedly killed by poison gas during the Third Reich which has remained almost entirely intact: Morgue 1 of Crematorium II. Contrary to all eyewitness testimony, this cellar, during the period of its operation, possessed no Zyklon B introduction holes in the roof, and none of its equipment (door, alleged introduction columns) was panic-proof. It is only logical and consequent to transfer these conclusions also to the mirror-symmetrically built, but otherwise identical Crematorium III, even though we do not possess any physical evidence for this due to the almost complete destruction of the roof of its Morgue

1. If this is so, then those rooms cannot have been used as locations for mass homicide using poison gas, as alleged by witnesses.

When one considers the technical circumstances prevailing in and around Auschwitz in the broadest sense, one becomes aware of the absurdity of the entire claim of homicidal mass gassings. The camp management was fully aware of the methods and technical preconditions for Zyklon B disinfestation, and was even informed as to the latest developments in the related technology.[147] But instead of using these methods, it allegedly took recourse, for mass gassing purposes, to extremely crude methods, particularly where the farmhouses I and II, and, later, Crematoria IV and V were concerned:

Allegedly, hundreds or thousands of people were killed with highly poisonous gas in rooms,

- which had walls and ceilings made of a material absorbing huge amounts of the poison gas and letting it penetrate;
- which did not have escape-proof doors and windows;
- which did not have panic-proof equipment;
- which did not have technically gastight doors and shutters;
- which had no provision to quickly release and distribute the poison gas;[328]
- which had no effective device to ventilate or otherwise render ineffective the poison gas after the end of the execution.

At the same time, the most modern disinfestation installations were being built all over German-occupied Europe,

- which had walls and ceilings covered with gastight coatings;
- which were equipped with escape-proof doors and had *no* windows;
- which had technically gastight doors;
- which had devices to quickly release and distribute the poison gas;
- which had effective devices to ventilate or otherwise render ineffective the poison gas after the end of the gassing procedure.

There were never any perceptible delivery problems for these installations. In the Auschwitz main camp, the latest technology for disinfestation using HCN was incorporated (cf. chapter 5.2.3.5.), while the *Zentralsauna* at Birkenau was equipped with the most modern hot air disinfestation technology! And to top it all off: the Germans even invented

[328] Richard J. Green's claim (*op. cit.*, note 218, p. 31) that "there were in fact devices to distribute the gas over the room" is wrong. He refers to a paper dealing with M. Kula's columns (J. McCarthy, M. van Alstine, *op. cit*, note 285), but those would have *prevented* rather than facilitated the distribution of the gas (see page 119 and 184 of this present book).

the microwave technology, which is so well-known today, *to kill lice*! They erected these installations, which were still very expensive at that time, in Auschwitz camp, *to save inmate lives*! And we are supposed to believe that the Germans were incapable of installing adequate technical equipment for Zyklon B gassings in at least one of their alleged homicidal "gas chambers"! Can anything be more insulting to the human mind?

So much for the claim that homicidal "gas chambers" existed at Auschwitz. We have also proven that the largest room, the one allegedly most-often used as a homicidal "gas chamber," could not have been used for that purpose as stated by alleged eyewitnesses. Together with the untruthful witnesses to a homicidal "gas chamber" in the Main Camp (see chapter 5.3.), and in view of the fact that there is no documentary indication of a criminal use of these rooms, we must conclude that there is no credible proof, and no "criminal trace," in support of the claimed existence of homicidal "gas chambers" in Auschwitz.

Considering these facts, it cannot really be surprising that finally even mainstream historians and media are taking notice of them: In May 2002, Fritjof Meyer, a senior editor at Germany's largest, left-wing weekly magazine *Der Spiegel*, stated in an article that documents and witness statements regarding the alleged gas chambers in the Crematoria II and III of Birkenau

> *"rather indicate that attempts were made in March and April of 1943 to use the mortuary cellars for mass murder in the early summer of 1943. Apparently, the tests were not successful* […] *The actually committed genocide probably took place mainly in the two converted farmhouses outside of the camp."*[329]

In other words: there is a tendency to abandon those locations, which Prof. Dr. R. van Pelt called "the absolute center" in the "geography of atrocities" (see page 85), or even the Birkenau crematoria altogether, since, according to Meyer, the genocide is now supposed to have taken place mainly in those ominous farmhouses or bunkers, of which we possess hardly any documentary evidence.

Following Meyer, the final destruction of the corpses of the alleged victims of mass murder is now supposed to have happened almost ex-

[329] F. Meyer, "Die Zahl der Opfer von Auschwitz," *Osteuropa*, 52(5) (2002), pp. 631-641, here p. 632; for critical reviews of these articles, see Germar Rudolf, "Cautious Mainstream Revisionism," *The Revisionist*, 1(1) (2003), pp. 23-30; C. Mattogno, "Auschwitz. The new Revisions by Fritjof Meyer," *The Revisionist*, 1(1) (2003), pp. 30-37; idem, "On the Piper-Meyer-Controversy: Soviet Propaganda vs. Pseudo-Revisionism," in: *The Revisionist*, 2(2) (2004), pp. 131-139; J. Graf, "'Just Call Me Meyer' – A Farewell to 'Obviousness,'" *ibid.*, pp. 127-130; G. Rudolf, "The International Auschwitz Controversy," *ibid.*, 2(4) (2004d), pp. 449-452.

clusively by means of open-air incinerations in deep pits. However, all claims made regarding the alleged open-air incineration of corpses in deep pits are obviously untrue, because no traces of such incinerations can be found on contemporary air photos, and because the high water table in Birkenau would have prevented the maintenance of fires in deep pits.

Those readers who take no interest in the chemical problems relating to the alleged "gas chambers" in Auschwitz may skip the following chapters 6-8. Prior to a solution to the problem of how the poisonous preparation was introduced into the presumed "gas chambers," further speculation as to the manner and method of the murders, and their possible chemical traces, remains a mere academic exercise, with no basis in reality. Our study of Auschwitz could, therefore, conclude here.

However, because the chemical questions involved attracted so much attention, caused the hottest controversies, and stirred the most intensive debates, detailed remarks are nevertheless in order about the chemical questions raised, first by Faurisson and Leuchter, relating to the formation of residues (Iron Blue) caused by chemical reactions of hydrogen cyanide.

6. Formation and Stability of Iron Blue

6.1. Introduction

Hundreds of thousands of people are claimed to have been killed in the alleged Auschwitz "gas chambers" by hydrogen cyanide in the form of the product *Zyklon B*®. The question which now arises is the following: could this poisonous gas leave chemical traces which could perhaps be detected in these alleged chemical slaughterhouses?

If hydrogen cyanide (HCN), the reactive compound in Zyklon B, were only bound to the walls by adsorption (adhesion),[330] there would be no detectable residues left today, because hydrogen cyanide is highly volatile (boiling point: 25.7°C); all the hydrogen cyanide involved would long since have evaporated.

But if one assumes that the hydrogen cyanide, during fumigation, would combine with certain materials in the masonry to create other, considerably more stable compounds, then one might anticipate the possible existence of chemical residues even today.

The reaction products of interest to us in this respect are the salts of hydrogen cyanide, called cyanides;[331] of particular interest here are iron cyanides formed by the reaction of iron compounds with HCN. Iron occurs universally in nature. It is iron which gives brick its red color, sand its ochre color, and clay its color ranging from yellowish to reddish-brown. More precisely, we are speaking of iron oxide, popularly known as "rust." Basically, all walls consist of at least 1% rust, as a result of sand, gravel, clay and cement, of which the wall is constructed.

Iron cyanides have long been known for their extraordinary stability. One of them has achieved particular fame as one of the most commonly used blue pigments during the last three centuries: Iron Blue, also often referred to as Prussian Blue.

---

[330] *A**b**sorption* and *a**d**sorption* are not the same! *A**b**sorption* is the incorporation (sometimes even consumption) of a matter into a medium (light is absorbed/consumed by a pigment, gas is absorbed/dissolves into a liquid), whereas *a**d**sorption* is the adhesion of matter onto a – usually solid – surface (dust on furniture, steam on windscreen, vapours on any solid surface...); *Adsorption* is further subdivided into *chemisorption*, in which the matter is bound to a surface by chemical bonds, and *physisorption*, in which the bonding is only a physical effect. The transition between both is fluent.

[331] For simplicity's sake, "cyanide" is frequently understood to mean only the anionic part of the cyanide salts, the cyanide ion, CN^-.

6.2. Instances of Damage to Buildings

Chapter 1.3. contained a discussion of two instances of damage to churches which occurred in the 1970s in Bavaria, Germany. In the many hundreds of thousands of fumigations which have been carried out since 1920, there cannot, as a rule, have been any complications. Otherwise the procedure would have been very rapidly abandoned. The cases in question were, therefore, exceptions. But what exactly was it that made these churches exceptions?

Different scenery. 1939-1945. In the camps of the Third Reich, hundreds of thousands of people – Jews, political prisoners, criminals, "anti-socials," and prisoners of war – were crammed together. To stem the raging epidemics, attempts were made, not always with great success, to kill the carriers of disease, particularly head lice. This was done in particular with hydrogen cyanide, Zyklon B, which was sometimes applied in chambers professionally designed for such purposes. But sometimes only ordinary rooms were equipped for such purposes in an auxiliary manner and temporarily used for disinfestation. Many of the camps in the Third Reich were leveled at the end of the war or afterwards; in other camps, the existing buildings were torn down and the building materials used for the repair of old buildings or for the reconstruction of new ones. A few buildings, however, remain intact to this very day. The interiors of these buildings look as in Fig. 59-66 (see the color pictures at www.vho.org/GB/Books/trr/6.html#6.2. & …/8.html#8.3.3.3.).

From the remarks of a team of Polish researchers who conducted investigations on behalf of the Auschwitz Museum, we also know that the disinfestation chamber in the Auschwitz main camp is colored a spotty blue.[61,62] To my knowledge, only the Zyklon B disinfestation chambers of Dachau camp (Degesch circulation chambers) exhibit no blue pigmentation, probably because the walls were professionally coated with a paint impermeable to gas and water.

It seems therefore that a blue pigmentation of masonry is no exception, but rather a rule, particularly where unprotected masonry is repeatedly exposed to hydrogen cyanide over long periods. The large-scale, long-term use of hydrogen cyanide for vermin control in disinfestation chambers only began, in practice, with the onset of the Second World War. And with the dissolution of the National Socialist camps, the confiscation of the corporation having manufactured and marketed Zyklon B (the *I.G. Farbenindustrie AG*), and the invention of DDT at the end of World War II, this large-scale use of hydrogen cyanide ended just as abruptly. No one cared about any "instances of building damage" having occurred in the former National Socialist disinfestation chambers in this period. The question never arose in the literature… until Frederick A. Leuchter came along.

The following is an attempt to demonstrate the manner in which these blue pigments, referred to as Iron Blue, came to be formed in the

[332] Taken from the book by Jürgen Graf, Carlo Mattogno, *Concentration Camp Majdanek*, Theses & Dissertations Press, Chicago 2003, photos XIII, XIV, XIX; see also the photo in Michael Berenbaum, *The World Must Know*, Little, Brown & Co., Boston 1993, p. 138.

masonry during fumigation with HCN, and the conditions favorable to their formation.

There have been many publications on this chemical compound in the last five decades, which were perused and will be summarized in the following in relation to our topic. In so doing, attention was directed at:

1) the circumstances which lead to the formation of Iron Blue, and
2) the long-term stability of Iron Blue under the existing circumstances.

When writing the initial versions of this expert report intended to be presented at German courts of law, I was extremely anxious not to make any mistakes, because I knew that the topic was extremely controversial. As a consequence, I over-examined several chemical aspects involved, some of which can be understood only by chemical experts. Others aspects are not really necessary for an understanding of the core issue. In order to have a complete English version of my expert report, I nevertheless decided to include all the material I accumulated over the years. Those sections, however, which are considered of marginal interest or of interest to experts only, I have given headlines always starting with "Excursus." For some readers it might be advisable to skip these chapters. They will most likely not miss anything.[335]

But first a short description of the starting substance, hydrogen cyanide.

---

[334] Taken from the book by C. Mattogno, J. Graf, *Concentration Camp Stutthof*, Theses & Dissertations Press, Chicago 2003, photos 13 & 14.

[335] I also want to point out that I did not include all this academic, self-serving ivory tower chatter in order to impress people. I was simply advised by many friends, supporters and adversaries to include all my material, since back-references to my German original is not helpful for most English language speakers, of whom only a tiny fraction can read German.

6.3. Properties of Hydrogen Cyanide, HCN

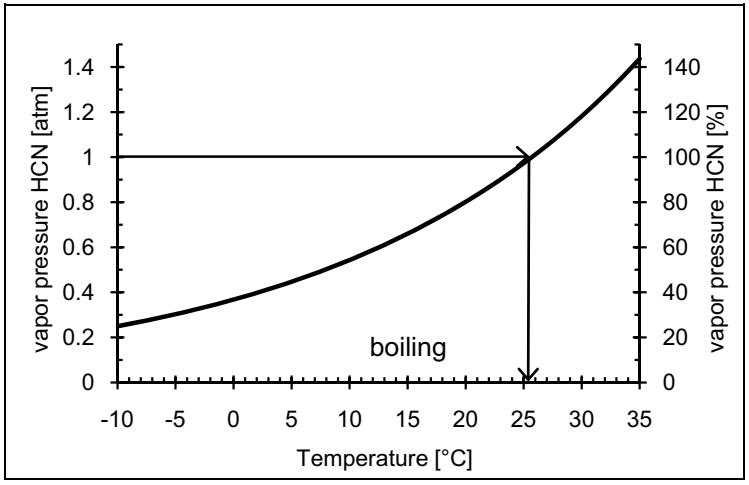
Hydrogen cyanide, a colorless liquid, is similar to water in many of its *physical* properties.[336] This similarity also explains the limitless solubility of HCN in water and its strong tendency towards absorption (dissolution) in water. The equilibrium concentration[337] of hydrogen cyanide in water is investigated in more detail in chapter 6.5.4.

The opinion is often expressed that, because gaseous hydrogen cyanide is approximately 5% lighter than air, it must separate from air and rise. Hydrogen cyanide gas is, however, only slightly lighter than air and does not separate, because of the thermal movement of every gas particle. To clarify this, reference must be made to the principal components of air: The main component of air, nitrogen, 78% by volume, is 8% heavier than hydrogen cyanide gas. If a separation took place between hydrogen cyanide gas and nitrogen, it would all the more occur between the two main components of air, since oxygen (21% of air by volume) is 15% heavier than nitrogen. This would have as a result that all the oxygen of the earth's atmosphere would settle in the lower fifth of the atmosphere, as a consequence of which the entire surface of the earth would get oxidized, *i.e.,* burn. This obviously does not happen. Thus, a spontaneous separation of hydrogen cyanide gas would never take place in air.

Table 3: Physical Properties of HCN[338]	
Molecular weight	27.026 g mol^{-1}
Boiling point (1 atm)	25.7°C
Melting point	-13.24°C
Specific density of the gas at 31°C (air = 1)	0.947
Explosion limits in air	6-41 vol.%[339]

However, the lower density of pure hydrogen cyanide gas compared to air (5% less, which corresponds to a density difference of 35°C warm air as compared to 20°C warm air) can very well lead to a density convection, *if* pure gaseous hydrogen cyanide is released in a location with

[336] High polarity, low molecular mass, possibility of formation of hydrogen bonds.



[337] Concentration is the number of parts per volume.

[338] W. Braker, A.L. Mossman, *Matheson Gas Data Book*, Matheson Gas Products, East Rutherford 1971, p. 301. I have left out some of the less interesting dimensions in this connection: heat capacity (20.9°C): 2.625 J g^{-1} K^{-1} (Water=4.187 J g^{-1} K^{-1}); dielectric constant (20°C): 114 (Water=78.5); evaporation heat: 28 kJ mol^{-1}; evaporation entropy: 190 J mol^{-1} K^{-1}; spontaneous combustion temperature: 538°C; flash point: -17.8°C; regarding dielectric constants, see: R.C. Weast (ed.), *Handbook of Chemistry and Physics*, 66th Ed., CRC Press, Boca Raton, Florida 1986, E 40. However, under normal conditions (1 atm, 25°C), hydrogen cyanide is not a gas.

[339] 1 vol.% is 10,000 ppm (for HCN, roughly 12 g/m³)

the same temperature as the ambient air. The gas would then rise slowly, but gradually mix with the ambient air. But it would be an incorrect to conclude from this that hydrogen cyanide vapors always rise. At 15°C, for example, on physicochemical grounds, no concentrations higher than 65% of hydrogen cyanide can occur in air (see Graph 1); the density of such a mixture lies only approximately 3% below that of air. Furthermore, a great deal of energy is withdrawn from the ambient air by the evaporating hydrogen cyanide. Consequently, the ambient temperature sinks until exactly as much energy is transported to the liquid (adsorbed) HCN as needed for the decelerated evaporation at the corresponding lower temperature. It is therefore theoretically possible for hydrogen cyanide vapors containing little HCN, but which are cold, to be denser, that is heavier, than the ambient air.

Graph 1 shows the equilibrium percentage of hydrogen cyanide in air as a function of temperature. Even at 0°C, the percentage still lies at approximately 36% by volume. Condensation of HCN on surrounding objects would occur only if the percentage rose over the equilibrium percentage (the so-called dew point). Since in all cases here under consideration, a maximum concentration of 10% HCN in air would only be reached for a short period of time close to the source of HCN (the Zyklon B carrier), no condensation of HCN on walls can be expected. An exception is, however, the so-called capillary condensation, which can occur in finely porous materials such as cement mortar.[340]

Graph 1: *Vapor pressure of hydrogen cyanide in percentage of air pressure as a function of temperature.*

[340] The lowered vapor pressure caused by adsorption effects in a narrow hollow space leads to early condensation.

Hydrogen cyanide forms explosive mixtures with air in the range of 6 to 41% by volume. With strong initial ignition, its explosive effects can be compared with nitro-glycerin.[341] In the applications under discussion here, a proportion of 6% by volume and more can be reached in the immediate vicinity of the source, which suffices for local blow ups at the most. Hence, only inappropriately high concentrations can lead to explosive mixtures, as shown by a corresponding accident in 1947.[17] With correct application quantities and concentrations, the technical literature indicates that there is practically no danger of explosion.[342]

6.4. Composition of Iron Blue

6.4.1. Overview

The stoichiometric composition of an ideal Iron Blue crystal is:

$$Fe_4[Fe(CN)_6]_3$$

It is characteristic that the iron in this compound is present in two different oxidation states: Fe^{2+} (here in square brackets) and Fe^{3+} (here on the outer left). The interaction between these two different iron ions gives rise to the blue color of this compound (charge-transfer complex). The actual composition can be quite variable, depending on the stoichiometry on formation and the presence of impurities, in which case the color varies between dark blue and greenish-blue tones.

6.4.2. Excursus

It was with support of the Mösbauer spectroscopy[343] that a long-lasting argument could be settled:[344,345] Turnbull's Blue, $Fe_3[Fe(CN)_6]_2$, is actually the same as Berlin Blue, $Fe_4[Fe(CN)_6]_3$, even if the summation formulas suggest they are different. As a matter of fact, the summa-

[345] H.J. Buser, D. Schwarzenbach, W. Peter, A. Ludi, *Inorg. Chem.* 16 (1977), pp. 2704-2710. Iron Blue single crystals of high purity and homogeneity were obtained by slow oxidation of a solution of $Fe[Fe^{II}(CN)_6]$ in concentrated (!) $HCl_{aq.}$ in air. If in the presence of molar amounts of Kalium only some 2% inclusions were observed.

tion formula of Berlin Blue is closest to the reality: In the ideal Iron Blue crystal, up to 16 molecules of coordination water are included:

$$Fe_4[Fe(CN)_6]_3 \cdot x\ H_2O\ (x=14 \text{ to } 16)$$

It is known today that the "soluble" Iron Blue, a term frequently found in older literature, is mainly a substance with the composition $MeFe^{III}[Fe^{II}(CN_6)] \cdot x\ H_2O$, where Me is the counter ion to the opposite cyanoferrate, $[Fe(CN)_6]^{3-/4-}$, mostly potassium (K^+) or ammonium (NH_4^+).

According to Buser,[345] "soluble" Iron Blue is formed mainly during quick formation and precipitation of the pigment, leading to the inclusion of large amounts of water and potassium or ammonium ions in the extremely voluminous precipitate. The resulting crystal is therefore very faulty and more appropriately called a polymer.[346] By filtration, drying and intensive grinding, however, this very inhomogeneous, polluted Iron Blue can be transformed into a pigment which is colloidal dispersible only with difficulty.[347] This "soluble" Iron Blue is not soluble in the original sense of the word, but can more easily be colloidally dispersed than the "insoluble" Iron Blue, which is very important for its application as a pigment.[348,349]

However, these colloids are very unstable and precipitate easily when salts are added.[350] According to Buser,[345] even in presence of high concentrations of potassium ions, almost pure "insoluble" Iron Blue can be obtained, if the formation process is proceeding slowly enough. In case of deeper interest about the structure one might consult the literature.[345,351]

---

[346] Originally, this term was used only in organic chemistry for chainlike connected, sometimes also branched attachments of equal segments.

[347] *Dispersion* (lat.: dispersere, distribute) are distribution of two different phases within each other. They are called *colloids* (gr.: gluelike) if the particles are between 10^{-8} and 10^{-7} m small. Such a mixture in liquids scatters the light (Tyndall effect), is thus not clear. But due to electrostatic repulsion (equally charged particles), colloids do not tend to coagulate and precipitate. *Suspension*: (lat.: to float) are coarsely dispersed system with particle sizes bigger than 10^{-6} m.

6.5. Formation of Iron Blue

6.5.1. Overview

We are only concerned, in this connection, with how Iron Blue arises from hydrogen cyanide and iron compounds in building materials. In building materials, the iron is generally present in trivalent form (Fe^{3+}), in the form of "rust."

For the formation of Iron Blue, therefore, a part of this iron must be reduced to the bivalent form (Fe^{2+}). The subsequent combination of these different iron ions with CN^- to Iron Blue occurs spontaneously and completely.[352] The most probable mechanism[353] is one in which the cyanide ion itself acts as a reducing agent. The starting point in so doing is an Fe^{3+} ion, largely surrounded (complexed) by CN^- ions: $[Fe(CN)_{4-6}]^{(1-3)-}$. A slightly alkaline environment is favorable to the final reduction of the iron(III)-ion to iron(II).[354]

The pigment formation in the case under consideration proceeds in five steps:

a) Ad-/absorption of hydrogen cyanide (HCN);[330]

[352] F. Krleza, M. Avlijas, G. Dokovic, *Glap. Hem. Tehnol. Bosne Hercegovine*, 23-24 (1977, Vol. Date 1976), pp. 7-13.

[353] Photolytic decomposition of the $[Fe^{III}(CN)_6]^{3-}$ by means of UV radiation is also conceivable as an alternative. Since the interior walls of the rooms in question are not exposed to any UV radition, this mechanism is ignored here. See also G. Stochel, Z. Stasicka, *Polyhedron* 4(11) (1985), pp. 1887-1890; T. Ozeki, K. Matsumoto, S. Hikime, *Anal. Chem.* 56 (14) (1984), pp. 2819-2822; L. Moggi, F. Bolletta, V. Balzani, F. Scandola, *J. Inorg. Nucl. Chem.* 28 (1966), pp. 2589-2598.

[354] pH value of 9-10 according to M.A. Alich, D.T. Haworth, M.F. Johnson, *J. Inorg. Nucl. Chem.* 29 (1967), pp. 1637-1642. Spectroscopic studies of the reaction of hexacyanoferrate(III) in water and ethanol. 3.3×10^{-4} M $Fe(NO_3)_3$ were exposed with a cyanide excess of likewise 3.3×10^{-4} mol l^{-1}. With pH values of approximately 10, all the $Fe_2[Fe(CN)_6]$ was converted into Iron Blue within 48 hours. Cyanate, the anticipated product of the oxidation of the CN^-, could not, however, be proven. Perhaps this is further oxidized directly into CO_2. If this mechanism is assumed, the result, purely stoichiometrically, is that an alkaline environment must be favorable. This finding is supported by the known fact that hexacyanoferrate(III) is a strong oxidation agent in alkaline medium and is even able to oxidize trivalent to hexavalent chrome, hence CN^- ions must have oxidized very quickly: J.C. Bailar, *Comprehensive Inorganic Chemistry*, Vol. 3, Pergamon Press, Oxford 1973, p. 1047. An overly alkaline environment would, however, disturb the complexing of the Fe^{3+}- ion by cyanide, which is then displaced by OH^- ($Fe(OH)_3$ then occurs as a by-product) and/or the latter can hardly be displaced from the iron.
The driving force in the reduction of the Fe^{3+} is the considerably more favorable energetical situation of the hexacyanoferrate(II) as compared to hexacyanoferrate(III); see, in this regard, R.M. Izatt, G.D. Watt, C.H. Bartholomew, J.J. Christensen, *Inorg. Chem.* 9 (1970), pp. 2019ff. Calorimetric measurements relating to the formation enthalpies of Iron Blue from the respective educts (in parentheses) were as follows:
$\Delta H(Fe^{2+} + [Fe(CN)_6]^{3-}) = -66.128$ kJ mol^{-1}; $\Delta H(Fe^{3+} + [Fe(CN)_6]^{4-}) = 2.197$ kJ mol^{-1}.
For this reason, a direct reduction of uncomplexed Fe^{3+}, *i.e.*, not surrounded by cyanide, has an energy disadvantage and is therefore negligible.

b) Ionic splitting (electrolytic dissociation)[355] of hydrogen cyanide in water to the cyanide ion, which alone can form complexes with iron;
c) Complexing of trivalent iron (Fe^{3+}) to the complex iron(III)-cyanide,[356] that is, the displacement of oxygen and/or OH^- ions in rust by cyanide ions;
b) Reduction of iron(III)-cyanide to iron(II)-cyanide;
e) Precipitation of iron(II)-cyanide with trivalent iron as Iron Blue.

The velocity of formation of the pigment can be influenced by various factors, which will be considered:

1. Water content of the reaction medium;
2. Reactivity of the iron;
3. Temperature;
4. Acidity.

6.5.2. Water Content

6.5.2.1. Overview

The formation of cyanide through absorption and subsequent dissociation of hydrogen cyanide in water is the necessary precondition for a reaction with iron compounds, since hydrogen cyanide itself exhibits only a low reactivity. All reactions listed in chapter 6.5.1. under a)-e) occur almost exclusively in water. Water furthermore ensures that the reaction partners – all salts capable of being dissolved in water – come together in the first place. Finally, the moisture contained in building materials also acts as a hydrogen cyanide trap, since hydrogen cyanide dissolves eagerly in water. A relatively high water content in the masonry will therefore considerably increase the speed of reaction.

6.5.2.2. Excursus

The reason for the low reactivity of HCN compared to the free cyanide ion is because HCN is less nulceophilic than the free ion.[357] Aside

[355] *Dissociation*: is the splitting of a compound, in this case into two differently charged ions (heterolytic) in aqueous medium (electrolysis):

$$HCN + H_2O \leftrightharpoons CN^- + H_3O^+$$

[356] Correct: hexacyanoferrate(III).

[357] *nucleophilic* (gr.: core/nucleus loving) is the tendency of a particle to react with positively charged particles. For this, at least a partial negative charge of the nucleophilic particle is required. In this case, cyanide is, due to its negative charge (CN^-), much more nucleophilic towards the positively charge iron (Fe^{3+}) than the formally uncharged (though polar) hydrogen cyanide.

from the dissociation of hydrogen cyanide in water, the process of chemisorption[330] on solid surfaces deserves being mentioned, where the hydrogen cyanide releases its proton (H^+) to an alkaline oxide and is itself attached to a metal ion.

Absorption and dissociation of the superbly soluble hydrogen cyanide (see chapter 6.5.4.) is clearly superior to chemisorption. Furthermore, the aqueous solution (as solvent) is indispensable for the complex formation and redox reactions of the cyanide with Fe^{3+}. Additionally, the aqueous medium makes the reacting agents mobile, which do not always form at the same location. And finally, the moisture contained in the solid material works as a trap for hydrogen cyanide, because it intensely binds the hydrogen cyanide. Or the other way around: the drier a solid material is, the easier hydrogen cyanide, which was ad-/absorbed before, will be released back into the gaseous phase. Therefore, a relatively high water content of the solid material will accelerate the reaction.

Experiments with reactions of hydrogen cyanide (some 4 g per m³ in air, 15°C, 75% rel. humidity) with mixtures of $Fe(OH)_2$-$Fe(OH)_3$ attached to wet paper strips showed that a blue discoloration occurred after 30 min at a pH value[358] of 2 to 3, since at such low values almost no hydrogen cyanide dissociates to the reactive cyanide (see chapter 6.5.5.). At pH values of 7 to 9, a visible blue discoloration occurred after a few minutes of inserting the sample. At higher pH values, this time span grew again, because the initially absorbed hydrogen cyanide had to lower the pH value first, before it could form the pigment (see chapter 6.6.1., pH Sensitivity).

These experiments show clearly that undissociated, gaseous HCN or HCN dissolved as gas shows little reactivity. An addition of small amounts of KCN to an aqueous sulfuric acid solution of Fe^{2+}/Fe^{3+}, however, results in the immediate precipitation of the pigment. The cyanide obviously reacts faster with the iron salts than it is protonated by sulfuric acid, *i.e.*, converted into hydrogen cyanide.

---

[358] *pH* (*pondus hydrogenii* = weight of hydrogen) is a measure for the acid content of aqueous solutions (negative, decadic logarithm of H_3O^+ concentration: $-\lg_{10}(c(H_3O^+))$): pH < 7: acidic
pH = 7: neutral
pH > 7: alkaline

6.5.3. Reactivity of Trivalent Iron

6.5.3.1. Overview

The solubility of trivalent iron diminishes rapidly with increasing alkalinity (rising pH value). Even in a pH neutral environment, almost all iron is bound as rust.[359] The reaction between iron compounds and cyanide resulting in the formation of the intermediate product iron(III)-cyanide, $[Fe(CN)_6]^{3-}$, is therefore largely a reaction on the solid-liquid interface, that is, between the iron adhering to the solid body and the cyanide ion in solution. This reaction occurs considerably more slowly than the same reaction in an aqueous solution. The fastest possible reaction requires a large surface area on the solid-fluid phase boundary, that is, a large interior, microscopically rough surface and a fine, highly porous solid body, since in such cases, a lot of the iron compounds lie on the surface and are therefore less firmly bound and can relatively quickly combine with cyanide.

In an increasingly alkaline environment, only decreasingly small amounts of "rust" can slowly be converted into iron(II)-cyanide, but cannot react with iron(III)-ions to form Iron Blue.

6.5.3.2. Excursus

Even in an alkaline environment, it must be expected that rust, in the presence of perceptible cyanide concentrations, will be quite slowly transformed into iron(III)-cyanide and finally into iron(II)-cyanide.[360] The last step required for the formation of Iron Blue, however, the combination of iron(II)-cyanide with iron(III), will not occur due to the lack of dissolved iron(III)-ions. In a strongly alkaline environment, an increasing concentration of iron(II)-cyanide, which is chemically stable, can slowly accumulate. It remains in a stand-by position, waiting for the pH value to drop.

Iron salts generally tend to incorporate water, and Iron Blue is no exception to this. A higher water content in the solid body results in increased water accumulation in rust, too. The rust expands, so to speak,

---

[359] $Fe_2O_{(3-x)}(OH)_{2x} \cdot x\ H_2O$

[360] Naturally, the equilibrium of the reaction $Fe(OH)_3 + 6\ CN^- \rightleftharpoons [Fe(CN)_6]^{3-} + 3\ OH^-$ under such conditions is strongly on the left hand side. However, this does not mean, as is well known, that a minute quantity of iron(III)-cyanide will not be formed. The latter, however, is withdrawn from the equilibrium in alkaline medium in the presence of excess cyanide, by being reduced by the latter to iron(II)-cyanide, which is considerably more stable in alkaline medium than iron(III)-cyanide; for further details, see also chapter 6.6.1.

and thus becomes more reactive towards competing ligands[361] like cyanide. Freshly precipitated, extremely moist and non-homogenous iron hydroxide is very reactive, and together with hydrogen cyanide, as shown in chapter 6.5.2.2., they form the pigment in visible quantities in minutes.

For the formation of colloidally dispersible Iron Blue, the quick formation in aqueous solution with high concentrations of the agents is required (see chapter 6.4.2.), since this leads to heterogeneous crystallites (tiny crystals) with many inclusions (ions, solvent molecules) and a high degree of disorder. These crystallites have only a small tendency to coagulate.

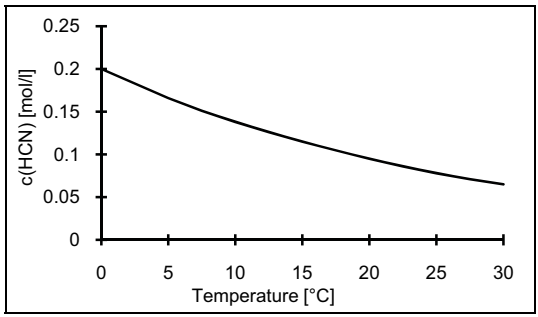
The slow interface reaction at the liquid-solid interface with quite low concentrations of the reacting agents will suppress the formation of colloidally dispersible Iron Blue. The process described here, occurring in walls exposed to hydrogen cyanide, strongly resembles the formation of monocrystals as described by Buser,[345] since in this case also, one reagent (Fe^{2+}) had to be formed through slow reduction by excess cyanide. Thus, except from the inhomogeneous material, the conditions here under consideration are suitable for a slow crystal growth of insoluble Iron Blue without large amounts of inclusions and with formation of few crystal defects.

6.5.4. Temperature

6.5.4.1. Overview

The environmental temperature has an influence on the following processes and features:

A) Accumulation of hydrogen cyanide in the moisture of the masonry;
B) Water content of the solid body;
C) Velocity of reactions.



A: Graph 2 shows the maximum solubility of HCN in water at various temperatures with a hydrogen cyanide content of 1 mol% in air,[362] which corresponds to approximately 13 g hydrogen cyanide per m^3

[361] In complex chemistry, *ligands* refer to in most cases negatively charged particles (anions) surrounding in most cases a positively charged central particle (cation, in general a metal ion). In this case, the central atom iron ($Fe^{2+/3+}$) is surrounded by the ligand cyanide (CN^-).

[362] *mol* is a standard amount of particles: 1 mol = 6.023×10^{23} particles, according to the definition, the number of atoms contained in 12 g Carbon.

air.[363] It increases, as with any gas, with decreasing temperature and lies between 0.065 mol per liter at 30°C and 0.2 mol per liter at 0°C.

These high concentrations prove the extreme solubility of hydrogen cyanide in water.[336] It decreases by approximately half every 20°C. It is therefore approximately 10,000 times more soluble in water than oxygen (O_2) and approximately 250 times more soluble than carbon dioxide (CO_2).[365]

Graph 2: *Saturation concentration of hydrogen cyanide in water as a function of temperature at 1 mol% HCN in the air (partial pressure[364] of p(HCN)=0.01).*

B: The moisture content of masonry is very strongly dependent on the relative humidity of the surrounding air and the temperature. With rising temperature, the tendency of water to evaporate (water vapor pressure) increases, whereas, as a rule, the relative humidity of the air decreases. Both effects lead to a drop in the water content; any increase in the temperature has therefore a cumulative effect. Drops in water content by a power of ten at temperature increases of 10°C have been proven in the temperature ranges of 10-30°C under consideration (see chapter 6.7.).

C: Only an acceleration in the slowest of the five steps described in chapter 6.5.1. can be responsible for a change in the velocity of the entire reaction. In neutral or alkaline medium, this is the displacement of the oxygen or OH^--ion in rust by the cyanide ion (point c). Although the iron(III)-cyanide $[Fe(CN)_6]^{3-}$ itself is stable in a moderately alkaline medium[366] – that is, the iron(III)-cyanide is more stable than the rust – the displacement of OH^- by cyanide ions is inhibited in rust, since the rust is not dissolved in water. An increase in temperature by 20°C usually doubles the velocity of reaction, if the other parameters remain unchanged. But they are not unchanged, because the massively decreased water content at higher temperatures (see above) leads to a dras-

[363] Landolt-Börnstein, *Eigenschaften der Materie in ihren Aggregatzuständen*, part 2, volume b, *Lösungsmittelgleichgewichte I*, Springer, Berlin 1962, pp. 1-158.

[364] The *partial pressure* of a gas is it fraction of the total gas content; e.g., 10 mbar HCN at 1,000 mbar total pressure.

[365] See also www.engineeringtoolbox.com/gases-solubility-water-d_1148.html.

[366] See also J.C. Bailar's remarks on the massive reduction force of $Fe(CN)6]^{3-}$ in the *alkaline* environment, *op. cit.* (note 354).

tic decrease of the reaction partner's mobility, of the reactivity of iron, and higher temperatures also result in a lower concentration of ad-/absorbed hydrogen cyanide (see chapters 6.5.2. and 6.5.3.). A strong reduction in pigment formation must therefore be expected at increased temperatures.

A decisively higher water content of the solid material and the considerably better absorption and solubility properties of hydrogen cyanide in water are the reasons for the tendency of solid materials to accumulate more cyanides with lower temperatures. An increase in the reactivity of iron oxide (rust) in the solid body with relation to hydrogen cyanide with a higher water content of the solid material at lower temperatures must be anticipated, as well as with a general increase in the reactivity of all agents. A cooler, and thus moister, solid material is therefore better suited to the formation of Iron Blue than a warm, dry body.[367]

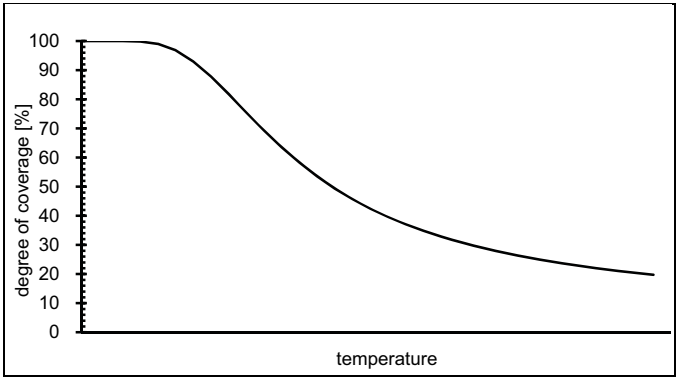
6.5.4.2. Excursus

There are two more steps in the observed reaction which could, theoretically, have an influence on the reaction under consideration:

A) Adsorption on the solid material;
B) Dissociation of hydrogen cyanide.

A: The adsorption of hydrogen cyanide on solid surfaces decreases with rising temperature, according to Langmuir (see Graph 3).[368]

$$\Theta = \frac{\frac{K}{\sqrt{T}} \cdot p \cdot e^{-\Delta H/RT}}{1 - \frac{K}{\sqrt{T}} \cdot p \cdot e^{-\Delta H/RT}} \qquad (1)$$



Θ = Degree of adsorption
K = variable
ΔH = adsorption enthalpy (negative)
R = universal gas constant
e = Euler's number (2.71828...)
T = temperature
p = gas pressure

The intensity of the decrease of the equilibrium degree of adsorption (coverage) with rising temperature as well as the point of approximate saturation, however, are unknown for the problem at hand. But since, as discussed before, all reactions under consideration require aqueous solutions anyway, adsorptions on solid, *i.e.*, dry surfaces are of no importance to our investigation.

---

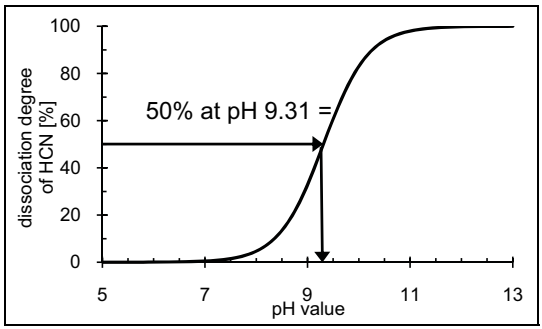
[367] Needless to say, in the immediate vicinity and beyond the freezing point of water, the reactivity drops precipitously.

[368] J. Oudar, *Physics and Chemistry of Surfaces*, Blackie & Son, Glasgow 1975, pp. 26ff.

Graph 3: *Degree of coverage of the surface of a solid material with an adsorbed gas as a function of temperature (schematic)*

B: According to the literature, the dissociation behavior of acids as a function of temperature is not unanimous.[369] Although a tendency of increasing protolysis[370] prevails with rising temperature, this tendency turns upside down at higher temperatures for some acids, others show generally falling values. Since the changes are generally in the range of low percentages only, and because speed of protolysis is generally very high anyway, hence never a restricting factor, this can be neglected here.

6.5.5. Alkalinity



The pH value (acidity or alkalinity) influences the formation in various ways. In chapter 6.5.1., reference was already made to the higher reduction power of cyanide and iron(III)-cyanide in alkaline environment. The pH value also influences the reactivity of iron compounds in the solid body (chapter 6.5.3.).

As remarked above, dissolved hydrogen cyanide hardly exhibits reactivity. The formation of cyanide ions by absorption and dissociation of hydrogen cyanide only starts in sufficient degree at neutral pH values and above, see Graph 4.[371] The data leading to Graph 4, together with the data that enabled us to plot Graph 2 (saturation concentration of HCN as a function of temperature), leads to a graph revealing the relationship between temperature, pH value (acid content), and CN^- satura-

[369] R.C. Weast (ed.), *op. cit.*, (note 338), p. D 163.

[370] *Protolysis* is the splitting of acids (HAc) into their corresponding acid anion (base, Ac^-) and proton (H^+, or with water to H_3O^+): $HAc + H_2O \leftrightharpoons Ac^- + H_3O^+$
here: $HCN + H_2O \leftrightharpoons CN^- + H_3O^+$.

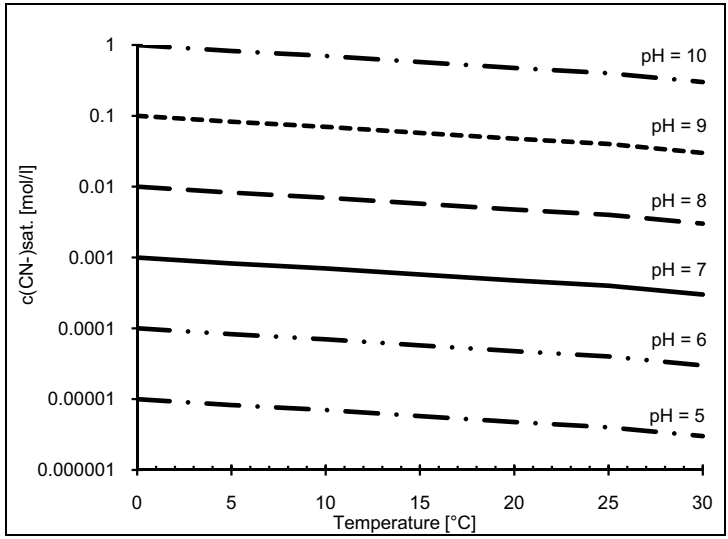
[371] pK_A values of HCN: 9.31; R.C. Weast (ed.), *op. cit.* (note 369).

Graph 4: *Degree of disassociation of hydrogen cyanide as a function of the pH value at room temperature.*

tion concentration, see Graph (p. 156; at a concentration of 1 mol% HCN in air, which is approximately 1% by weight, the usual disinfestation concentration).[372] At neutral pH values, equilibrium concentrations of CN^- are within the range of 3×10^{-4} to 1×10^{-3} mol per liter, depending on the temperature. An increase in the pH value by one point results in a ten-fold increase in the cyanide equilibrium concentration. The actual cyanide concentration in masonry is determined by the velocity of absorption of the gas, adsorption effects within the solid material, and possible reactions of the cyanide.

6.5.6. Carbon Dioxide

Carbon dioxide (CO_2) is a natural trace gas, today making up some 0.04% of earth's atmosphere. Since some four to five percent of our exhaled breath consists of carbon dioxide, enclosed spaces used by humans frequently contain considerably more carbon dioxide than fresh air, depending on how well they are ventilated. In the cases under consideration, no ventilation would have taken place at all for an extended period of time in a room packed full of people. Hence the CO_2 content could have risen to several percent relatively fast.[373]



CO_2 dissolves in water roughly 250 times less than HCN and only reluctantly reacts with water to form carbonic acid (H_2CO_3). As a result, CO_2 has an effective acidity which is roughly 870 times stronger than

[372] Valid for ideal solutions.

[373] Chapter 7.3.1.3.2., p. 196, contains an indirect indication of the CO_2 content, as it is basically the difference between the baseline O_2 concentration in the atmosphere (21%) and the actual O_2 concentration.

HCN.[374] Hence CO_2 is effectively $\left(\frac{870}{250}\right)$ 3.5 times "stronger" than HCN. This means that plain water saturated with both CO_2 and HCN would slow down the dissociation of HCN and hence the formation of cyanide salts.

The situation is different in the capillary water of mortar and concrete, though, as this is not plain water. Since calcium carbonate is a main (lime mortar) or at least a sizeable constituent (cement mortar & concrete) of these materials, the capillary water in them is saturated with calcium and the various dissociation levels of carbonic acid, including CO_2, depending on the prevailing acidity of the respective material (see chapter 6.7. for details). Hence adding any CO_2 to the surrounding atmosphere can shift the existing equilibrium only marginally and slowly by CO_2 slowly diffusing into the wall's capillaries. For saturated calcium carbonate solutions, this diffusion of CO_2 and any other gaseous compound, HCN included, is hampered, however, by the precipitation of calcium carbonate at the air-water interface. This effect is stronger, the more alkaline the capillary water is, as this raises the equilibrium concentration of carbonate. This is the basis for the long-term stability of reinforced concrete, whose capillary water stays alkaline over long periods of time even in the presence of larger amounts of

Graph 5: *Cyanide equilibrium concentration in water as a function of the temperature and pH value at 1mol-% HCN in the air.*

[374] $pK_a(HCN) = 9.31$; $pK_h(CO_2/H_2CO_3) = 2.77$; $pK_{a1}(H_2CO_3/HCO_3^-) = 3.6$; $pK_{a'1}(CO_2/HCO_3^-) = (2.77+3.6) = 6.37$; $pK_{a2}(HCO_3^-/CO_3^{2-}) = 10.25$; see http://en.wikipedia.org/wiki/Carbonic_acid

CO_2. This alkalinity provides an effective corrosion protection via passivation of the reinforcement iron bars, which would otherwise rust, expand, and burst the concrete cast around it (see chapter 6.7.2. for more details).

In contrast to this, there is, thermodynamically speaking, nothing which prevents HCN added to the atmosphere from diffusing into the capillaries. However, the above mentioned thin solid film of calcium carbonate at the air-water interface will slow down the diffusion of any compound through this air-water interface. This barrier works both ways, as it slows down both the accumulation of HCN in the capillary water as well as its later loss, when the surrounding air does no longer contain HCN. Since CO_2 is naturally present to some degree in enclosed spaces frequented by humans under any circumstances, its presence will continue acting as a diffusion barrier even after ventilation of the room. Hence the dominating effect of CO_2 in a room should be that it traps HCN in the capillaries, once it has managed to diffuse into them. This trapping effect should be stronger, the more alkaline the wall is, all the more so as an alkaline environment also supports the dissociation of HCN and thus the formation of cyanides.

High concentration of CO_2 will considerably accelerate the setting of fresh lime mortars and will decrease the pH value of their capillary water, until the equilibrium pH of ca. 7 of saturated calcium carbonate solutions is reached, with the resulting effects of this lower pH value (see chapter 6.5.5.). This effect is much less pronounced and much slower in cement mortars and concrete, which exhibit a different chemistry (see chapter 6.7.2.).

This issue is of importance, because the opinion is sometimes expressed in the literature that the carbon dioxide content of air can have a decisive negative influence on the formation of cyanide salts in wall material.[62,68,70] This is done under the assumption that the capillary system is filled with pure water, which is not the case, though.

The only data available so far are contradictory and due to a flawed method of analysis not really of any value (see chapter 8.4.2.). Appropriate experiments are therefore required to settle this issue by quantifying the influence of CO_2 under realistic conditions.

6.5.7. Conclusion

The result of all factors which can currently be quantified is that slightly alkaline pH values are favorable to the formation of the pigment.

The individual parameters and their influence on the formation of Iron Blue are summarized in the following table:

Table 4: Factors Influencing the Formation of Iron Blue

Parameter	Effect
Water content	Increase in water content results in the following: increased absorption of hydrogen cyanide; long-term retention of ad-/absorbed hydrogen cyanide; increased mobility of reaction partners; increased reactivity of iron oxide; water is the basic precondition for disassociation and redox reactions; generally **positive** influence with **increasing** water content. The water content is dependent above all upon the temperature.
Reactivity of the iron	Factor determining reaction velocity, apart from the type of material and pH value (see below), positively influenced by increasing water content.
Temperature	Increased ad-/absorption of hydrogen cyanide as well as – under otherwise identical conditions – decreased velocity of individual reactions with falling temperature; strong increase on water content, and therefore a strongly **positive** net influence upon all other factors with a **falling** temperature.
pH value	Increased iron reactivity with falling pH, as well as a massive reduction in cyanide accumulation and redox reactivity of iron(III)-cyanide; compromise between iron reactivity and cyanide formation/Fe^{3+} reduction: A **weakly alkaline** pH value is **favorable** to absorption of hydrogen cyanide and accumulation of cyanide as well as for the reduction in iron(III)-cyanide, which determines the velocity of the reaction. Although more strongly alkaline media can accumulate iron(II)-cyanide over longer periods of time, no Iron Blue can form under such circumstances. An extremely high pH value fixates iron(III) as hydroxide and hence impedes the formation of any iron cyanides.
CO_2	CO_2 lowers the pH value and therefore **inhibits** the formation of cyanides. Especially in alkaline walls it leads to the formation of insoluble $CaCO_3$ films at the air-water interface, which **slows** the **diffusion** of HCN both into and out of the capillaries. Once in the capillaries, HCN and cyanides hence get **trapped**, which **supports** the formation of iron cyanides.

6.6. Stability of Iron Blue

6.6.1. pH Sensitivity

Iron Blue is an extremely acid-resistant, but base-decomposing pigment.[375] Hydrogen cyanide is released from this pigment only by warm, diluted sulfuric acid, while cold hydrochloric acid, by contrast, has no effect.[376] In a clearly alkaline environment, *i.e.*, in the presence of high concentrations of OH^- ions, these displace the cyanide ion from the iron(III)-ion. $Fe(OH)_3$ is then precipitated ("rust sludge"), and the Iron Blue is destroyed.[377]

The literature contains authenticated cases of studies with Iron Blue at pH values of 9 and 10, in which it is still stable.[378] The pH range around 10 to 11 can be considered the critical limit for the stability of this pigment. Based on the alkaline behavior of fresh mortar and concrete (in this regard, see also chapter 6.7.2), Iron Blue is only used to paint these surfaces to a limited extent.[379]

---

[375] The hexacyanoferrate acids are very strong acids: J. Jordan, G.J. Ewing, *Inorg. Chem.* 1 (1962), pp. 587-591. The findings of analyses of disassociation constants show, for hexacyanoferrate(III): $K_1^{III}>K_2^{III}>K_3^{III}>0.1$; hexacyanoferrate(II): $K_1^{II}>K_2^{II}>0.1$; $K_3^{II}=6\times10^{-3}$; $K_4^{II}=6.7\times10^{-5}$. Thus, hexacyanoferrate(III) is still almost completely disassociated at pH=1, hexacyanoferrate(II) doubly, from pH=3 triply, from pH=5 complete.

[376] G.-O. Müller, *Lehrbuch der angewandten Chemie*, vol. I, Hirzel, Leipzig 1986, p. 108; the pigment is, however, reversibly soluble in concentrated hydrochloric acid, *i.e.*, the pigment is not decomposed, but merely physically brought into solution; there is therefore no release of hydrogen cyanide; see also H.J. Buser *et al.*, *op. cit.* (note 345); see also chapter 8.2.: analytical method for total cyanide content according to DIN: the pigment is destroyed by boiling $HCl_{aq.}$. Iron Blue suspensions (see note 347) have an acid pH value of approximately 4. At this slightly acid *eigen* pH, as is formed, for example, by acid rain in surface waters, Iron Blue is at its most stable: H. Ferch, H. Schäfer, *op. cit.* (note 349). In technical applications, the alkaline resistance is increased by adding nickel, cf. R.E. Kirk, D.F. Othmer, *op. cit.* (note 348); J.A. Sistino, *op. cit.* (note 348); E. Elsermann, *Deutsche Farben-Z.* 5 (1951), pp. 419ff.; R. Beck, *Deutsche Farben-Z.* 6 (1952), p. 231.

[377] Iron(III)-hydroxide is even less soluble in this range than Iron Blue; on the solubility of $Fe(OH)_3$ see chapter 6.6.3.; to be exact, Iron Blue is not totally destroyed at a high pH; rather, the Fe^{3+} is, initially, merely withdrawn; the base-resistant $[Fe(CN)_6]^{4-}$ remains intact; see note 360.

[378] See the studies by M.A. Alich *et al.*, *op. cit.* (note 354).

[379] J.A. Sistino, *op. cit.* (note 348); H. Beakes, *Paint Ind. Mag.* 69(11) (1954), pp. 33f. Mixtures of Iron Blue and phtalocyanine blue generally find application, since both, alone, lack sufficient long-term stability; Degussa describes the lime fastness of Iron Blue as "*not good*" (H. Ferch, H. Schäfer, *op. cit.* (note 349)); however, Degussa is referring to its fastness on still uncarbonated, alkaline plasters and concretes: H. Winkler, Degussa AG, letter to this author, June 18, 1991. My own experiments with the dissolution of fresh Iron Blue precipitations resulted in a treshold value of pH 10-11 for the stability of Iron Blue.

6.6.2. Solubility

6.6.2.1. Overview

Iron Blue is considered one of the least soluble cyanide compounds, which is the precondition for its widely-varied application as a pigment.[380] The literature flatly refers to Iron Blue as "insoluble."[381]

Concrete, reliable values on the solubility of Iron Blue are not recorded in the scientific literature. However, based on comparative calculations between the known solubility of $Fe(OH)_3$ on the one hand, and the threshold value of the pH stability of Iron Blue on the other hand (pH 10), the approximate solubility of Iron Blue in water can be calculated (see chapter 6.6.2.2.). It amounts to ca. 10^{-24} g Iron Blue per liter of water, this means that 0.000000000000000000000001 g Iron Blue dissolves in 1,000 g of water.

In addition to a compound's solubility in water, its condition (crudely or finely crystalline, superficially adherent or adsorbed by capillary effects) as well as, in particular, the condition and quantity of the water supplied are decisive in determining the actual velocity of dissolution of a substance. Iron Blue formed in masonry will be present in a fine crystalline form and adsorbed by capillary effects, in which case the former favors dissolution, while the latter is extremely detrimental to dissolution. Water almost or entirely saturated with iron(III)-ions is no longer capable of dissolving further iron. Furthermore, water permeation through finely porous solid material like masonry is extremely low even at high water tables; the iron saturation concentration is quickly attained, which, in addition, as remarked above, is generated by the slightly more soluble iron oxides of the solid body rather than by the Iron Blue, once it has formed. It is furthermore very well known that mortar and concrete permeated with paints practically cannot be rendered colorless.[382] It must, therefore, be anticipated that the Iron Blue content formed in walls cannot be perceptibly reduced by dissolution in

---

[380] This property was used in Soviet industry, for example, for the passivation of steel pipes against aggressive waste waters, since CN^- contained in waste waters coats the interior of pipes with an insoluble protective layer of Iron Blue: N.G. Chen, *J. Appl. Chem. USSR*, 74(1)(1974), pp. 139-142. But it should be noted that this borders on criminal negligence, since toxic cyanides simply do not belong in waste waters.

[381] DIN Safety Data Sheet VOSSEN-Blau®, in: *Schriftenreihe Pigmente Nr. 50*, Degussa AG, Frankfurt 1985; see also H. Ferch, H. Schäfer, *op. cit.* (note 349). Last but not least, pigments, by definition, are coloring agents practically insoluble in dissolvents and binding agents (DIN 55,943 and 55,945).

[382] See also, in this regard, the remarks of a company dealing in colored cements and concretes: William H. Kuenning, *Removing Stains from Concrete*, The Aberdeen Group, Addison, IL, 1993; cf. www.allstudies.org/search.php?q=Removing%2BStains%2Bon%2BConcrete

water. Water running down the exterior surfaces is considerably more aggressive, exerting, in particular, an erosive effect, *i.e.*, damaging the masonry as such.

6.6.2.2. Excursus

Tananaev *et al.*[383] examined the solubility of metal hexacyanoferrate(II) and discovered a solubility product[384] of $3 \cdot 10^{-41}$ (pK_S =40.5) for the solubility product of Iron Blue, without mentioning the unit used.

Assuming they used the summation formula of $Fe_4[Fe(CN)_6]_3$ (unit being $mol^7\ l^{-7}$), one attains a solubility of 0.5 mg per liter water. Thus, it would be 14 times less soluble than the nearly insoluble calcium carbonate ($CaCO_3$, 7.1 mg per liter water, $K_S = 4.95 \cdot 10^{-10}\ mol^2l^{-2}$).[385] Later publications support these findings,[352] although attention must be paid to deviations in the stoichiometry (composition) of Iron Blue with impurities, leading to an increased solubility.

Tananaev *et al.* precipitated the complex metal cyanoferrate from an appropriate metal salt solution with $Li_4[Fe(CN)_6]$, probably acquiring a high rate of inclusions (lithium, water) as well. Thus, in spite of the four hour-long accumulation of the precipitation, the filtrate would certainly still have contained colloidally dispersed Iron Blue. Since they finally determined the amount of free Fe^{3+} in the filtrate by precipitating it with ammonia as $Fe(OH)_3$, they will undoubtedly also have precipitated the Fe^{3+} of the colloidally dispersed Iron Blue, as ammonia raises the pH value so much that Iron Blue is no longer stable (see chapter 6.6.1.).

Therefore, they probably did not determine the solubility of Iron Blue, but the measure of stability of the dispersion of fresh precipitations of the pigment.

The solubility product of $Pb_2[Fe(CN)_6]$ given by Krleza *et al.*,[352] which they used as a reference to determine the solubility products, is much lower than the one used by Tananaev *et al.*. If applied to Tananaev's calculations, this produces a solubility of Iron Blue of only 0.05 mg per liter. Krleza *et al.*, however, find similar results for the solubility of most of the metal cyanides analyzed, including Iron Blue. Since conventional methods of analysis, such as gravimetry and titration, tend to

---

[383] I.V. Tananaev, M.A. Glushkova, G.B. Seifer, *J. Inorg. Chem. USSR*, 1 (1956), pp. 72ff.

[384] The *solubility product* of a compound is defined as the product of the entire ionic concentration of the totally dissociated compound: $Fe_4[Fe(CN)_6]_3 \rightleftharpoons 4\ Fe^{3+} + 3\ [Fe(CN)_6]^{4-}$;

$$K_L(Fe_4[Fe(CN)_6]_3) = c(Fe^{3+})\cdot c(Fe^{3+})\cdot c(Fe^{3+})\cdot c(Fe^{3+})\cdot c([Fe(CN)_6]^{4-})\cdot c([Fe(CN)_6]^{4-})\cdot c([Fe(CN)_6]^{4-}) = c^4(Fe^{3+})\cdot c^3([Fe(CN)_6]^{4-}).$$

The pK_S value correlates to the negative decimal logarithm of the product of solubility.

[385] R.C. Weast (ed.), *op. cit.*, (note 338), p. B 222.

Table 5: Dissociation constants and solubility products of iron compounds

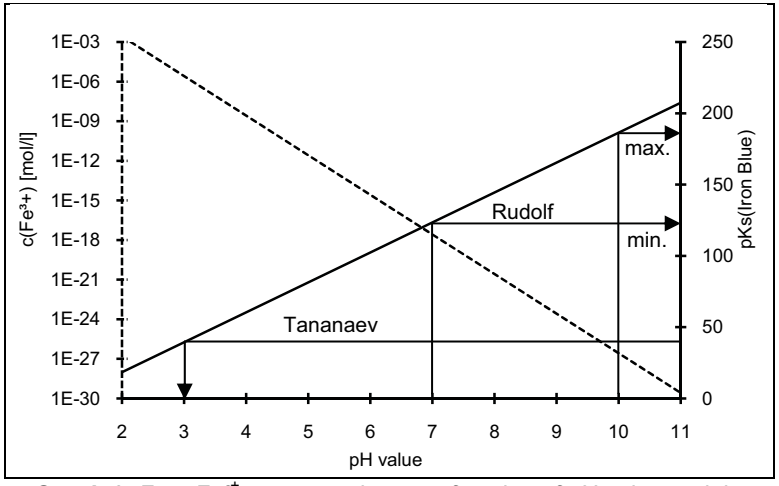
Compound	Constant	Source
$K_S(Fe_4[Fe(CN)_6]_3)$	4.1×10^{-187} mol^7 l^{-7}	calculated
$K_{D(6)}([Fe(CN)_6]^{4-})$	10^{-24} mol l^{-1}	[386]
$K_{D(6)}([Fe(CN)_6]^{3-})$	10^{-31} mol l^{-1}	[386]
$K_S(Fe(OH)_2)$	4.79×10^{-17} mol^3 l^{-3}	[385]
$K_S(Fe(OH)_3)$	2.67×10^{-39} mol^4 l^{-4}	[385]
$K_S(FeCO_3)$	3.13×10^{-11} mol^2 l^{-2}	[385]

be unreliable when facing minute traces, one must but wonder about these similar results.

However, one can escape this dilemma by thoughtful reasoning.

It is safe to say that Iron Blue is stable at a pH value of 7, *i.e.*, in a neutral aqueous medium, so we take this as a minimum value. As mentioned earlier, a pH value of about 10 can be considered the upper limit of stability for Iron Blue, so we take this as maximum value for the following calculations. At pH=7, and even more so at pH=10, the free iron concentration is extremely low, since $Fe(OH)_3$ is nearly insoluble (see Table 5).

At pH 7 and 10, respectively, a saturated $Fe(OH)_3$ solution has the following free Fe^{3+} concentration:



$$c(Fe^{3+}) = \frac{K_L(Fe(OH)_3)}{c^3(OH^-)} \tag{2}$$

$$\text{pH=7:} \quad \frac{2.67\times10^{-39}\ \text{mol}^4\text{l}^{-4}}{10^{-21}\ \text{mol}^3\text{l}^{-3}} = 2.67\times10^{-18}\ \text{mol l}^{-1} \tag{3}$$

$$\text{pH=10:} \quad \frac{2.67\times10^{-39}\ \text{mol}^4\text{l}^{-4}}{10^{-12}\ \text{mol}^3\text{l}^{-3}} = 2.67\times10^{-27}\ \text{mol l}^{-1} \tag{4}$$

Should the free Fe^{3+} concentration surpass this value due to a better solubility of Iron Blue, then Fe^{3+} would precipitate as hydroxide and would be increasingly removed from the pigment, thereby destroying it in the end. Since this does not happen at pH=7 at all, and pH=10 can be considered the point where it just starts to happen, the concentration of the Fe^{3+} ion in a saturated Iron Blue solution must lie well below 10^{-18} mol/liter, *i.e.*, in the area of 10^{-27} mol/liter. Thus, the solubility of Iron Blue must also have a value around 10^{-27} mol per liter (actually: ¼ of the free Fe^{3+} concentration, K_S less than $4.1 \cdot 10^{-187}$ mol^7 l^{-7}, pK_S larger

[386] C. Wilson, *Wilson & Wilson's Comprehensive Inorganic Chemistry*, Vol. 1B, Elsevier, Amsterdam 1960, p. 162.

Graph 6: *Free Fe^{3+} concentration as a function of pH value and the resulting minimal pK_S value of Iron Blue, depending on its stability at the corresponding pH value. pK_S value acc. to Tananaev et al. : 40.5; according to reflections made here: greater than 123, smaller than 186.*

than 186.6) which, at a mol mass of 1,110 g mol^{-1} ($(Fe_4[Fe(CN)_6]_3 \cdot 14 H_2O$) would correlate to 10^{-24} g.

With this, the complex iron pigment does indeed deserve to be called insoluble, as only one part of dissolved Iron Blue can statistically be found in 100,000,000,000,000,000,000,000,000,000 parts of water (10^{29}). The actual solubility would therefore be lower by a factor of 10^{20} than determined by Tananaev *et al.*, which would come pretty close to values calculated for other so-called "insoluble" compounds, like mercury sulfide (HgS). However, one must consider that the chemistry of Fe^{3+} in aqueous solutions doesn't justify the terms "dissolved" or "precipitated," since a multitude of complexes do exist in the broad pH-spectrum, partly as polymer hydroxo-aquo-complexes (compare chapter 6.5.3.).

Graph 6 shows the correlation between the pH value of the free Fe^{3+}-concentration in a hypothetical saturated solution of Iron Blue and the respectively resulting minimal pK_S values possible for Iron Blue, which it must possess, should stability prevail at the given pH-reading. From Tananaev's pK_S value results that the pigment would remain stable only up to pH 3. Accordingly, it would dissociate itself by its *eigen* pH value of 4 (see chapter 6.6.1., note 376), which is formed in its own dispersion. Thus the magnitude of error in the results of Tananaev *et al.* and Krleza *et al.* is apparent.

These reflections show that iron, bound as hydroxides or oxides in solid materials, tends to dissolve in a neutral medium more readily than Iron Blue, since its equilibrium concentration must be higher than that of Iron Blue.

6.6.3. Excursus: Competing Ligands

As shown, OH^- ions may, due to the low solubility of $Fe(OH)_3$, noticeably precipitate the Fe^{3+} of Iron Blue in pH media above 9 to 10. The residual hexacyanoferrate(II), on the other hand, would only decompose in strongly alkaline media, because $Fe(OH)_2$ is simply more soluble (compare Table 5).[387]

Tartrate[388] has, in contrast to oxalate, hardly any effects so that Fe^{3+} can be quantitatively removed from sour wine with $[Fe(CN)_6]^{4-}$, a usual procedure to remove iron ions from wine.[389] Concentrated alkali carbonate solutions will precipitate the Fe^{2+} of Iron Blue as $FeCO_3$, so that they destroy the entire pigment by precipitating Fe^{3+} as $Fe(OH)_3$ (due to alkalinity) and the hexacyanoferrate(II) salt $[Fe(CN)_6]^{4-}$.[390] Calcium carbonate solutions, however, would not be sufficient due to their marginal saturation solubility. Besides that, Kohn examined the supportive effect of most of the organic ligands to disperse Iron Blue.[391]

Thus, apart from OH^- (alkaline medium), there are no other ligands to be considered competing in the formation or dissolution of Iron Blue in the cases here under consideration.

6.6.4. Effects of Light

6.6.4.1. Overview

Iron Blue itself is generally considered a light-resistant pigment, which is only slowly decomposed by the effects of UV radiation.[392]

---

[387] In absence of free cyanide ions, the pH stability limit of hexacyanoferrate(II) (total dissociation) is at 11.8, but already very small amounts of free cyanide (10^{-10} mol l^{-1}) push the limit up to pH=13.

[388] *Tartrate*, corresponding base of tartaric acid. The mixed potassium-sodium-salt is the famous tartrate (potassium bitartrate), which crystallizes on the cork of wine bottles (Seignette salt).

[391] M. Kohn, *Anal. Chim. Acta* 3 (1949), pp. 558ff.; *ibid.*, 5 (1951), pp. 525-528; *ibid.*, 11 (1954), pp. 18-27.

[392] See also Winnacker-Küchler, *Chemische Technologie*, volume 2, Carl Hanser Verlag, Munich 1982, p. 197; H. Ferch, H. Schäfer, *op. cit.* (note 349); Wilhelm Foerst (ed.), *Ullmanns Encyklopädie der technischen Chemie*, volume 13, Urban und Schwarzenberg, Munich ^{3}1962,

There are even patents utilizing Iron Blue as a UV-absorbing pigment, which is only meaningful with sufficient resistance to UV radiation.[393] Since the walls of interest to us here are protected from UV radiation and because UV radiation can only exert a superficial effect on the walls, while the Iron Blue would form and remain within the walls, a possible process of decomposition by UV radiation can have no influence upon our investigation.

6.6.4.2. Excursus

Certain wavelengths of ultraviolet radiation may set free CN^- from hexacyanoferrate(II) and -(III), the preliminary stages of Iron Blue. As far as hexacyanoferrate(III) is concerned, this leads to the formation of Iron Blue.[353] As far as hexacyanoferrate(II) is concerned, quantum efficiencies[394] of 0.1 to 0.4 are reported for wavelengths of 365 nm.[395]

It has been discussed whether complex cyanides can be removed from industrial waste waters by ultraviolet radiation. The unbound cyanide will be oxidized and destroyed by hydroxyl radicals originating from the parallelly occurring photolysis of water.[396] However, results are not unequivocal.[397]

As for Iron Blue, one knows of the bleaching effect under strong, perpetual sun radiation and the ensuing re-darkening during the night.[398] Here also, the liberation of CN^- is responsible, which reduces parts of the Fe^{3+} ions to Fe^{2+} ions. The latter process, however, will reverse during the night under the influence of oxygen and moisture. The Iron Blue concentration will eventually be reduced by the loss of the released cyanide, either by evaporation of hydrogen cyanide, by washing out as CN^-, or by oxidation through Fe^{3+}/atmospheric oxygen or from hydrox-

yl radicals from the natural photolysis of water. The latter process is minute and can therefore be neglected. At any rate, most of the cyanide released by photolysis will again be complex bound to iron.

6.6.5. Long-Term Test

The best long-term test available to us consists of disinfestation buildings BW 5a and 5b in Birkenau, which have defied the wind and weather of the strongly corrosive climate in the industrial region of Upper Silesia for over 50 years, and which are still colored blue, both inside and out, exhibiting a high cyanide content. The same holds for the disinfestation buildings in Majdanek and Stutthof.[332,334] These findings are also supported by two other long-term tests.

The color durability of Iron Blue, in addition to other pigments, was tested during an environmental resistance test lasting 21 years in the industrial district of Slough, west of London.[399] In so doing, pieces of aluminium sheet metal were alternately dipped in an iron(II)-cyanide and then in an iron(III)-salt solution,[400] by which the resulting pigment was adsorbed on the aluminium sheet metal. The test sheets were then exposed to the environment on the roof of a building in a vertical 45° angle facing southwest.

During the 21 years lasting test, in which eight Iron Blue samples were tested among other pigments, the Iron Blue, in particular, followed by iron ochre (Fe_2O_3, rust), exhibited only minimal alterations after this period of time. One sample of Iron Blue and iron ochre was removed only after 10 to 11 years in each case.[401] All other samples still exhibited an intense blue color. Half of the seven remaining Iron Blue samples received the value 4 out of a maximum of 5 points for the best retention of quality, on the gray scale used there in the determination of color changes. Only minor alterations were detected.

The exhibits were therefore exposed to the environmental conditions of a strongly industrialized area, with full effects of precipitation, direct sunshine, and wind erosion for more than 21 years. Under intense summer sunshine and in the absence of wind, the temperature of the dark-blue colored aluminium metal sheets rose steeply (Iron Blue is only

400 $K_3[Fe(CN)_6]$ or $Fe(NO_3)_3$.

401 The literature does not, however, mention this Iron Blue sample as "Prussian Blue," like the others, since it was, at that time, considered to be of another type, i.e., "Turnbull's Blue" or "ferrous ferricyanide."

stable up to approximately 140°C[402]). Snow, frost, hail, storms, and the finest, driving acid drizzle had obviously just as little an effect on the pigment as the UV radiation of direct sunlight. What is remarkable is that in determining the degree of destruction of the pigment no unexposed samples were used since these had been lost over the 21-year period; rather, places on the surface of the exhibits which had been relatively well protected from direct environmental influences by the frames and by rubber rings on the screw joints were used as control samples. These exhibited almost no alterations.

In comparison to the environmental conditions which are of interest here, this long-term test involved considerably more severe conditions, since in this case, the externally formed Iron Blue was only superficially adsorbed upon the aluminium sheets. The pigment nevertheless resisted extremely well.

Another event proves the extraordinary long-term stability of Iron Blue. For many decades at the end of the 19th and the early decades of the 20th century, Iron Blue was a by-product in the generation of city gas, because the hydrogen cyanide contained in coke gas had to be eliminated for security reasons by washing it with iron hydroxide prior to introduction into the city gas network. Iron Blue is the end product of this washing process. City gas works frequently disposed of this product by distributing some of it over their factory terrain with the intend to kill weeds – in vain, though, since Iron Blue has no effect as an herbicide. Today, the grounds of former German city gas works still contain high quantities of Iron Blue, many decades after the works were put out of operation. It was neither decomposed, nor dissolved or washed away by rain water, since it is insoluble. In particular, terrain with a high Iron Blue content is not considered polluted, since it is physiologically unobjectionable due to its stability.[403]

In summary, it may be stated that Iron Blue having formed in the interior of a wall as a component of the wall itself, possesses a longevity comparable to the iron oxide from which it has formed. This means simply that Iron Blue possesses a degree of stability which is comparable to that of the masonry itself: the Iron Blue will remain contained in the wall for as long as the wall itself remains in existence.[404]

---

[402] Compare H. Ferch, H. Schäfer, *op. cit.* (note 349); S. Barbezat, *J. Réch. Cent. Nat. Réch. Sci.* 4 (1952), pp. 184ff.; E. Gratzfeld, *Färg och Lack*, 3 (1957), pp. 85-108; E. Herrmann, *Farbe und Lack*, 64 (1958), pp. 130-135.

[403] D. Maier, K. Czurda, G. Gudehus, *Das Gas- und Wasserfach*, in: *Gas · Erdgas*, 130 (1989), pp. 474-484.

[404] An interesting study has been conducted in this connection about the reduction of soluble components in concrete standing in water, providing support to the statements made here: not

Once perceptible quantities of cyanide have accumulated within a wall, therefore, and once conditions permit the conversion of the cyanide into Iron Blue, no perceptible reduction in the Iron Blue content can be anticipated, even after fifty years or more.

A typical example of the manner in which the media deal with these facts is a press report issued by the German Press Agency (*Deutsche Presseagentur*, DPA) on March 29, 1994, and which was then published in many German newspapers and even broadcast on radio. The report flatly claimed that, according to unnamed experts:[405]

> *"Cyanide compounds decompose very quickly. In the ground, this occurs even after six to eight weeks; in masonry, these compounds could only be preserved under 'absolute conditions of conservation including complete exclusion of air and bacteria.'"*

Inquiries with the DPA press office in Stuttgart, which had published the report, revealed that the writer responsible for the report, Albert Meinecke, had simply invented this expert opinion.[406] This obvious lie continues to be further disseminated, even by German government agencies such as, for example, the Bavarian Ministry of the Interior.[407]

6.7. Influence of Various Building Materials

6.7.1. Brick

6.7.1.1. Overview

Bricks are well-known to acquire their hardness and stability during their baking process. This causes an intensive binding of the components in bricks (sintering). One result of this is that the reactivity of the iron oxide occurring in bricks (2 to 4%) is strongly reduced, so that a

---

even the concentration of alkali ions, which are the most soluble components of concrete, was massively reduced: H.A. El-Sayed, *Cement and Concrete Research*, 11 (1981), pp. 351-362.

[405] Printed by German daily newspapers, for instance: *Süddeutsche Zeitung*, *Stuttgarter Zeitung*, *Südwestpresse-Verbund* (March 29, 1994), *taz*, *Frankfurter Rundschau* (March 30, 1994).

[407] See the Bavarian State Ministry for the Interior, *Verfassungsschutzbericht 1997*, Munich 1998, p. 64. A corresponding reference to the factual incorrectness of the remarks made in this regard by the *Arbeitskreis Zeitgeschichte und Politik* (in a letter by president Hans-Jürgen Witzsch, dated Oct. 8, 1998, Fürth) was countered by the Ministry as follows: "Your efforts to deny and/or relativize the crimes of the National Socialists have been known to the security authorities for years. […] We see no occasion for a discussion of gas chambers." The letter, from Dr. Weber of the Bavarian State Ministry of the Interior dated Oct. 13, 1998, ref. IF1-1335.31-1, probably established a new world record for stupidty.

perceptible inclination to form iron cyanide is hardly to be anticipated. The immediate surface of bricks slightly attacked by atmospheric influences (weathering) nevertheless constitutes an exception to this rule, so that the superficially adherent iron oxide is available for conversion into Iron Blue.

6.7.1.2. Excursus

The chemical composition of bricks varies massively due to the different sorts of marl and loam used as initial material. The content of clay (included in this are 20 to 60% kaolinite, consisting roughly of 47% SiO_2, 40% Al_2O_3, 13% H_2O) may lie between 20 and 70%, the rest being carbonate, finest sand and iron oxides.[408] According to my own analyses, the latter content may vary between 2 and 4%.

The porosity values of bricks lie between 20 and 30 vol.%,[409] according to other sources up to 50%.[410] According to my own mercury penetration tests, the pore size of bricks lies heavily concentrated around 1 µm.[411]

Due to the decreased specific surface (0.5 to 1 m² per g, BET,[412] own tests), the reactivity of the iron oxide is strongly reduced. However, partly dissolved iron at brick surfaces immediately exposed to weathering can be set free for reactions in bigger amounts.

The normal free, *i.e.*, not chemically bound, water content of bricks in dry rooms (20°C) is in the area of one volume percent, but it can rise up to 4% at a relative humidity of over 90%.[413]

6.7.2. Cement Mortar and Concrete

6.7.2.1. Overview

The rust content (Fe_2O_3) of Portland cement, of particular interest to us here, the cement most frequently used for concrete and cement mor-

[413] K. Wesche, *Baustoffe für tragende Bauteile*, volume 1, Bauverlag, Wiesbaden 1977, p. 37.

tars, is usually between 1 and 5%.[414] The sand added to the mortar can also exhibit a high iron content (up to 4%). As mentioned in chapter 6.5.3., a large surface area at the solid-liquid phase limit (iron oxide-cyanide solution) is favorable to the formation of Iron Blue. This is extraordinarily large in cement and concrete mortars (microscopic interior surfaces of approximately 200 m^2 per gram).[415]

Fresh concrete and cement mortars – which are identical from a chemical point of view – are relatively strongly alkaline (pH approximately 12.5). It later falls, however, due to the binding of carbon dioxide from the air. Depending on the special chemistry of the cement mortar, this process proceeds very slowly in the depth of the material. According to the composition of the cement mortar, this may last from a few months to many decades, until the pH value of such a mortar or concrete becomes neutral, even in the deepest layers.[414-416] This chemical behavior explains the stability of reinforced concrete, which prevents the embedded steel from rusting further in the environment within the concrete, which remains alkaline for lengthy periods of time.[417]

The water content of concrete and cement mortars depends on the temperature and relative humidity of the air and fluctuates between 1% and less at 20°C and 60% relative humidity up to 10% in air saturated with humidity.[413] In case of permanently high humidity, penetrating wetness from outside, a major part of the pore system can be filled with water.[418]

Poorly insulated rooms built underground always have cool and humid walls due to their great exchange surface area with the ground. The high water content is due partly to the absorption of humidity from the ground and partly to the condensation of humidity from the air on the cool walls, when the temperature falls below the dew point. The water content of non-insulated cellar walls in unheated rooms therefore lies around 10%, *i.e.*, a factor of approximately 10 or more above that of dry walls of heated rooms above ground.

417 In the strongly alkaline environment, iron is passivated by a passive layer of $Fe(OH)_3$. "Botched work" on building sites, *i.e.*, rusting reinforcement rods and cracking concrete after only a few years or decades, due to overly low pH value in the vicinity of the embedded reinforcement rods, is caused by a) an incorrect composition of the concrete (too little cement – it's cheaper this way – and/or too much or too little water – incompetence), or b) by installing the reinforcement rods too close to the surface of the concrete, where the pH value drops noticeably after a few years or decades; see notes 414f.

418 K. Wesche, *Baustoffe für tragende Bauteile*, volume 2, Bauverlag, Wiesbaden 1981, pp. 51f.

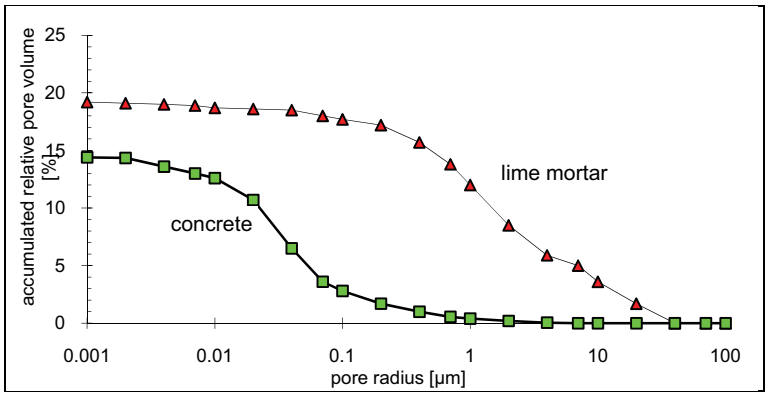
6.7.2.2. Excursus

The chemical composition of Portland cement, the most frequently used cement for concrete and water mortar, can be seen in Table 6.

Table 6: Composition of Portland cement[419]

Al_2O_3 : 5 to 10 %	K_2O: 0.2 to 0.6 %
SiO_2 : 20 %	Na_2O: 0.5 to 3 %
CaO : 60 %	Fe_2O_3: < 5 %

The specific surface of the cement powder is in the order of 3,000 cm^2 per g. Concrete and cement mortar get their stability by hydration of the cement compounds calcium oxide CaO (burnt lime), silicon dioxide SiO_2 (quartz), iron and aluminium oxide Fe_2O_3/Al_2O_3, to mixed, microfibrous calcium alumosilicate-hydrates with a chemically bound water content of some 25 mass %.[420] It then has a specific surface of up to 200 m^2 per g when measured with water adsorption, which is an extremely high value. Other methods (e.g. BET-measuring with nitrogen) yield a value of only $^1/_3$ of this or less.[415] The porosity of mortar and concrete heavily depends on the amount of water added during preparation and lies at a minimum of 27% according to the literature,[418] in which case the volume of the microcapillary pores between the silicate fibers is included as well, which cannot be determined with mercury penetration measurements.



Aside from the absolute porosity, the pore size distribution is decisive for the reactivity towards gases. If the main pore volume is formed by microscopic pores, then the gas diffusion into the material is more inhibited than if the main pore volume is formed by larger pores. Graph 7 shows the accumulated pore volume distribution of concrete and one wall mortar (exact composition unknown, since taken from an old wall, but according to its brittle consistency probably a lime mortar).

Having a similar total pore volume like the wall mortar (here only 14% due to the test method), the concrete's largest portion of pore volume lies between a pore radius of 0.01 and 0.1 µm, whereas the wall mortar's largest portion lies between 0.1 und 10 µm. Hence, if compared with the wall mortar, the gas diffusion into the concrete will be disadvantaged. In general, the average pore size of cement building materials changes to larger values when increasing the content of sand and lime.

Graph 7: *Accumulated pore volume distribution of concrete, according to "Forschungs- und Materialprüfungsanstalt, Abteilung 1: Baustoffe" (Research and Material Testing Agency, Department 1: Building Materials), Stuttgart, and of wall mortar, own analysis. In each case determined by Hg penetration.*

Fresh concrete is relatively strongly alkaline, caused by the high content of calcium hydroxide, which, however, gets bound as calcium alumosilicates rather quickly. However, depending on the type of cement, a certain amount of it is released as time goes by. The pH value of non-carbonated concrete is around 12.5. It later falls, however, due to the binding of carbon dioxide from the air.

The speed of carbonation into the depth of the concrete depends strongly on the consistency and porosity of the material and follows a square root relationship:[421]

$$d = C \cdot \sqrt{t} \qquad (5)$$

d = depth of carbonation
C = constant
t = time

In water tight concretes, it takes many years for the limit of carbonation to advance only a few centimeters due to the inhibition of diffusion in this highly compact material.

In the area of carbonation, the pH value decreases to roughly 7, the equilibrium value of saturated calcium carbonate solutions. But if the wall is wet, this results in a proton exchange and therefore no sharp pH border is formed. If a large portion of the air pores (size in the order of a tenth of a millimeter) is flooded with water poor in carbon dioxide, the carbonation advances more slowly, because compared to the gaseous phase, diffusion in aqueous phases is much slower, by some orders of

[421] W. Czernin, *op. cit.* (note 415); Verein Deutscher Zementwerke, *op. cit.* (note 420); N.V. Waubke, *op. cit.* (note 416).

magnitude. In case of waters rich in carbon dioxide, however, this can accelerate the carbonation.

6.7.3. Lime Mortar

The iron content of lime mortars is based, in particular, on the added sand (up to 4% Fe_2O_3). Lime mortar is manufactured using only burnt lime (CaO), sand and water, and acquires its solidity through the binding of slaked lime ($Ca(OH)_2$) with atmospheric carbon dioxide to lime ($CaCO_3$). This procedure takes only days or weeks (depending on the thickness of the particular layers and the CO_2 content of the atmosphere), due to the cruder porous system, which facilitates the diffusion of gas. For fresh lime mortar, high water contents can be damaging, as the carbon dioxide necessary for the binding process can no longer penetrate into the wall.

The final pH value of this material lies within the neutral range. Since this medium no longer provides sufficient protection for steel reinforcement rods and offers only slight environmental resistance, it is usually used for the plastering of interior walls and for interior brick walls only, in the latter case often mixed with cement.[418] The specific surface of lime mortar lies considerably beneath that of cement mortar (up to one order of magnitude).[422] The water content is similar to cement mortar.

6.7.4. Effects upon the Formation of Iron Blue

The first step in the formation of Iron Blue in masonry is the diffusion of HCN into the masonry and through the gas-liquid interface from the air into the capillary water. The small capillary systems of cement mortars and concretes impede the diffusion of HCN more than the coarser capillaries of lime mortar. In case of an increased CO_2 content, the formation of a solid calcium carbonate layer at the air-water interface impedes the diffusion further. Since the thickness of this layer will increase proportionally with the pH value, alkaline cement mortars and concretes will impede the diffusion of HCN into their capillary water even more.

The second step is the accumulation of gaseous hydrogen cyanide in the capillary water. A cool (10°C) wall in a cellar with atmospheric humidity near the saturation point, due to its higher water content (by a

[422] The reason: no formation of very finely crystalline alumosilicate with higher surface area.

factor of at least 10), has an increased ability (by a factor of 10) to absorb hydrogen cyanide, compared to warm walls in a heated room built above ground with lower atmospheric humidity (20°C, 50% rel.).

The third step in the formation of Iron Blue is the ionic split (disassociation) of the hydrogen cyanide, that is, its conversion into simple cyanide, and its accumulation.[423] This procedure is favored by an alkaline environment, which, in lime mortars, lasts only for a few days or weeks, but which is present for months or years in cement mortar and concrete.

The next step is the formation of iron(III)-cyanide, a process that hardly occurs in a strongly alkaline environment and which occurs slowly in slightly alkaline environments. In the neutral range, this reaction is once again slowed down, because the cyanide also converts into non-reactive, volatile hydrogen cyanide by the humidity in the wall. The environment around the carbonation limit of concrete and mortar (which is slightly alkaline), can therefore be addressed as the area in which iron(III)-cyanide can form easily. In a strongly alkaline area of the masonry, it only arrives at this prior stage of Iron Blue formation through the slow detour of the reduction of slight traces of iron(III)-cyanide to iron(II)-cyanide. A large surface area, as found in cement mortars and concrete, is especially favorable to the solid-liquid interface reaction between solid rust and cyanide in a liquid solution. These generally have the advantage of retaining an alkaline medium for longer periods of time, so that the cyanide accumulated in the masonry is not lost and has enough time to react with rust. Once again, a high water content, which broadens the range of moderately alkaline pH values, is advantageous.[424] The reduction of a part of the iron(III)-ions to iron(II)-ions finally, the next to last step in Iron Blue formation, requires a moderately alkaline pH value, but also occurs in the strongly alkaline range.

A distinction can be made between three areas of different reactivity in masonry:

1. Larger quantities of cyanide ions can accumulate in the non-carbonated portion, due to the alkaline medium, further favored by the increased absorption of hydrogen cyanide by the still-humid material. The cyanide is only bound as iron(III)-cyanide to a slight extent. This is converted quite rapidly into the more stable iron(II)-

[423] In masonry, this largely corresponds to the neutralization of the hydrogen cyanide by calcium hydroxide $Ca(OH)_2$ into calcium cyanide $Ca(CN)_2$.

[424] Very humid mortars and concretes, due to proton diffusion, exhibit no sharp carbonation, *i.e.*, pH limit.

Table 7: Absorption of hydrogen cyanide by various building materials under the effect of 2% HCN by volume over 24 hours.[427]

MATERIAL	HCN [mg m^{-2}]
Terracotta	55.2
Brick	73.0
Lime sandstone, naturally humid	22,740.0
Lime sandstone, briefly dried	4,360.0
Lime sandstone, dried approx. ½ year at 20°C	2,941.0
Concrete block, dried for 3 days	8,148.0
Lime mortar blocks, a few days old*	4,800.0
Cement mortar blocks, a few days old*	540.0
Cement mortar blocks, a month old*	140.0
Cement blocks, pure, a few days old*	1,550.0

* 2.5 to 3.3% HCN by volume.[425] The vol. % data, according to the authors, represent theoretical nominal values, which, in practice, however, are only reached up to 50% or less, through adsorption onto walls and fumigation materials.

cyanide due to its strong oxidation behavior in the alkaline medium. An accumulation of iron(II)-cyanide will therefore take place over a longer time period.

2. In the zone of carbonation, the tendency to accumulate cyanide is reduced, since the disassociation equilibrium lies increasingly on the side of hydrogen cyanide. The oxidation strength of iron(III)-cyanide is also diminished. On the other hand, the pigment itself now becomes stable, so that increased quantities of iron(II)-cyanide will be converted into Iron Blue, intimately mixed with the lime which is now also forming in this area, with the now somewhat more easily soluble iron(III)-ion at the carbonation limit.[426]
3. In the pH-neutral, carbonated part of the masonry, the formation is considerably dependent on the available cyanide concentration, which is strongly reduced there. Already formed iron(II)-cyanide is gradually converted into Iron Blue in the presence of humidity.

Table 7 shows the adsorption values of hydrogen cyanide in various building materials.[427] They confirm the assumption of considerably higher reactivity of cements compared to brick, as well as the greater tendency of fresh cement compared to older, and generally more humid building materials toward accumulating hydrogen cyanide.

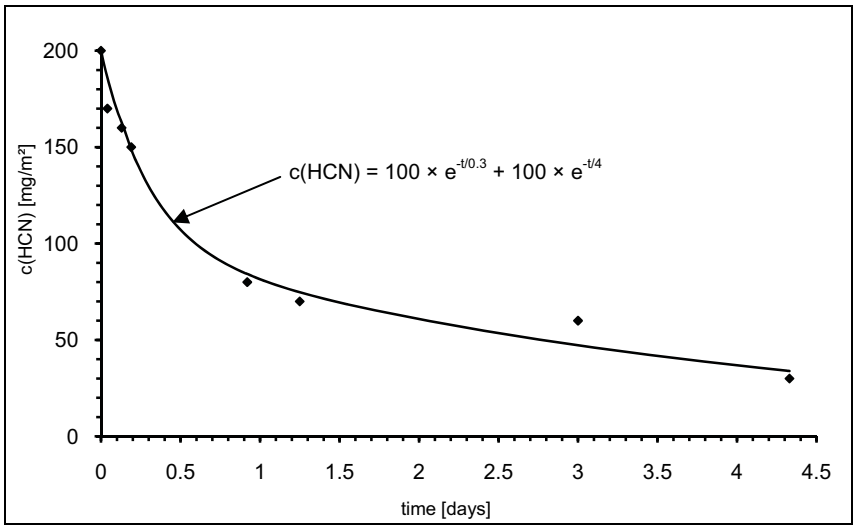
[425] F. Puntigam, *et al.*, *op. cit.* (note 126), pp. 35ff.
[426] From the CO_2 in the air and the $Ca(OH)_2$ in the mortar.
[427] L. Schwarz, W. Deckert, *Z. Hygiene und Infektionskrankheiten*, 107 (1927), pp. 798-813; *ibid.*, 109 (1929), pp. 201-212.

The hydrogen cyanide accumulation in the concrete block, the age of which is unfortunately not indicated, is astonishingly high, if compared with the cement mortar blocks. Because there is no considerable difference between the composition and hence the physical and chemical properties of cement mortar and concrete, it is not clear how the differing analytical results are to be interpreted. It must be kept in mind that the method used by the authors actually measures only the amount of hydrogen cyanide released by the samples after their exposure to HCN. Hence this method cannot establish any possible long-term physical or chemical binding of hydrogen cyanide in the samples. The authors moreover gave no details about the composition of their samples, other than giving them the names as listed. These data are therefore not unassailable.

At least the tendency of humid masonry to absorb higher quantities of hydrogen cyanide is confirmed (compare lime sandstone: factor 8 at equal temperature and relative atmospheric humidity, but different prior history). W.A. Uglow showed in a detailed series of tests that concrete absorbs approximately four to six times as much hydrogen cyanide as lime mortar. He also found a tendency of humid building materials towards increased adsorption of hydrogen cyanide. He also noted a dark blue pigmentation running through the entire concrete sample and did not therefore exclude the possibility of a chemical reaction of the hydrogen cyanide with the material.[428]

The durability of very high concentrations of hydrogen cyanide over longer periods of time even in dry, chemically bound cement may be seen from Graph 8. Concentrations do not fall below ¼ of the initial values even after three days. With daily fumigation lasting several hours, this resulted, in this example, in average HCN concentration in the wall swinging around approximately 100 to 200 mg hydrogen cyanide per m^2 of masonry.

The measurement values in Graph 8 were approximated by a function consisting of two terms:



$$c(t)= 100\cdot e^{-(t/0.3)} + 100\cdot e^{-(t/4)} \qquad (6)$$

c(t) = HCN concentration at time t
t = time in days

The first term in the above can be interpreted as desorption from the surface material with a τ[429] of 0.3 days. The second term describes a slower desorption of hydrogen cyanide with a τ of four days, perhaps

[428] W.A. Uglow, *Z. Hygiene und Infektionskrankheiten*, 108 (1928), pp. 108-123.

[429] τ is the time after which the value has fallen to the 1/e-multiple (0.368…) of the initial value.

Graph 8: *Drop in the hydrogen cyanide concentration in old, dry, cement blocks, after 24-hour fumigation with 2.5% HCN by volume*[427] *(see footnote in Table 7, S. 175).*

caused by the much slower diffusion through the capillary water of the samples. Larger errors relating to the drop in concentration described here will be made over longer periods of time, because the release of hydrogen cyanide is increasingly inhibited by physical and chemical effects (forming of stable compounds).

An analogous function is assumed by the absorption of hydrogen cyanide:

$$c(t)= 100\cdot(2-e^{-(t/0.3)}-e^{-(t/4)}) \quad (7)$$

This is only a correct description of the process when the concentration of hydrogen cyanide in air in the room remains constant. The function then reaches its maximum saturation after approximately 20 days. In order to allow for such an approximation, one must reduce the gassing time involved in such a way as to equal real conditions with variable concentrations. In case of a series of consecutive gassings and airings of masonry, a quasi-constant concentration will be reached after 20 cycles as well.

7. Zyklon B for the Killing of Human Beings

7.1. Toxicological Effect of HCN

The effect of hydrogen cyanide is based on the fact that it paralyzes the respiration of every individual cell in the body. Oxygen can no longer be transported from the blood through the cell walls into the cells.[430] As the vital cell functions are thereby starved of oxygen, the animal or human being suffocates.

Insects and, in particular, insect eggs, are considerably less sensitive to hydrogen cyanide than warm-blooded animals. On the one hand, this is due to their greater resistance (slower metabolism). On the other hand, this is due to the fact that lethal concentrations of the gas must penetrate every crack and fissure, no matter how tiny. Every hem and seam of the garments to be fumigated must be filled with the poison in order to kill, for example, every concealed louse. Warm-blooded animals, by contrast, are rapidly exposed to high concentrations of the gas, not only because of their size, but above all due to their continuous breathing through lungs.[431]

Lethal doses of cyanide can be ingested orally, inhaled, or absorbed through the skin. Oral poisoning (for example, with potassium cyanide KCN) is very painful due to muscular convulsions caused by cell suffocation. Even though victims of poisoning by inhalation of high concentrations of hydrogen cyanide become more rapidly unconscious than with oral ingestion, painful convulsions caused by muscular suffocation appear in these cases as well. For this reason, execution by use of hydrogen cyanide gas, as performed in some U.S. states, has recently been a topic of much controversy; see chapter 1. A dose of 1 mg cyanide per kg body weight is generally considered lethal. Non-lethal doses of cyanide are quickly decomposed and excreted by the body.[432]

---

[430] Reversible attachment of the cyanide onto the Fe^{3+} of the cell-specific enzyme of respiration, cytochrome oxidase, thereby interrupting the supply of oxygen to the cells, rendering impossible the processes of respiration, which are essential for the life of the cell.

[431] Insects can "hold their breaths" for a long time: "The respiratory organs of terrestrial insects consist of tracheal tubes with external spiracular valves that control gas exchange. Despite their relatively high metabolic rate, many insects have highly discontinuous patterns of gas exchange, including long periods when the spiracles are fully closed." Stefan K. Hetz, Timothy J. Bradley, "Insects breathe discontinuously to avoid oxygen toxicity," *Nature*, no. 433 (3 February 2005), pp. 516-519, here p. 516; www.nature.com/nature/journal/v433/n7025/abs/nature03106.html

[432] Binding onto sulfur (to form rhodanide).

The bright red coloration of the blood and bruised spots, caused by over-saturation of the blood with oxygen, since the blood can no longer give off its oxygen to the cells, are generally considered, among other things, symptomatic of hydrogen cyanide poisoning in fatal cases.[18,433-435] Testimonies describing a blue or green coloration of the victims are therefore false.[436]

Absorption through the skin is especially likely when the skin has become moist, for example, as a result of sweating at work. It is generally advised to avoid sweating during the handling of hydrogen cyanide. In this regard, concentrations from 6,000 ppm[437] (0.6 % by volume) constitute a health hazard, while 10,000 ppm (1% by volume) can cause death in just a few minutes.[438]

Table 8 shows the effects of various concentrations of hydrogen cyanide, found in the literature.[439]

Table 8: Effect of various concentrations of hydrogen cyanide in air upon human beings

2 to 5 ppm:	Perceptible odor[440]
10 ppm:	Maximum permissible work site concentration, acc. to German law
20 to 40 ppm:	Slight symptoms after a few hours
45 to 54 ppm:	Tolerable for ½ to 1 hour without significant or delayed effect
100 to 200 ppm:	Lethal within ½ to 1 hour
300 ppm:	Rapidly fatal

F. Flury and F. Zernik indicate that 200 ppm can be fatal within five to ten minutes, while 270 ppm are immediately fatal.[438] These are not, of course, the results of experiments on human beings, but rather extra-

[433] Wolfgang Wirth, Christian Gloxhuber, *Toxikologie*, Georg Thieme Verlag, Stuttgart 1985, pp. 159f.

[435] Hans-Herbert Wellhöner, *Allgemeine und systematische Pharmakologie und Toxikologie*, Springer Verlag, Berlin 1988, pp. 445f.

[436] This is why Michal Kula's statement about the color of gassing victims – "I saw then that they were greenish," proves that he never saw what he claims he did, see p. 120.

[437] ppm stands for "parts per million"; here, 1 ppm HCN corresponds to 1 ml HCN per m^3 (1,000,000 ml) of air.

[438] F. Flury, F. Zernik, *Schädliche Gase, Dämpfe, Nebel, Rauch- und Staubarten*, Berlin 1931, p. 405; see also M. Daunderer, *Klinische Toxikologie*, 30th suppl. delivery 10/87, ecomed, Landsberg 1987, pp. 4ff.; considering the age of the first source as well as the vast amount of literature quoted in chapter 5.2.2., Pressac's claim on page 147 of his first book (note 72) that the lethal dose was not known is completely false. It was also already a known fact in those days that HCN could be absorbed via the skin.

[439] DuPont, *Hydrogen Cyanide*, Wilmington, Delaware 7/83, pp. 5f.

[440] HCN has a very faint smell which is not perceptible by everyone. The literature frequently mentions a smell like "bitter almonds," even though this is misleading, as bitter almonds have a very strong nutty scent, which HCN does not have. The HCN content of bitter almonds is too low to be perceptible next to the strong scent of nuts.

polations, in which lower risk thresholds have been determined on the grounds of safety. This will be demonstrated in the following. To kill an average person with a body weight of 100 kg, the victim must therefore ingest approximately 100 mg hydrogen cyanide (1 mg per kilo body weight). The respiration of a human being at rest amounts to approximately 15 liters of air per minute.[441] With a hydrogen cyanide content of 0.02% (approximately 0.24 mg per liter) the victim must inhale approximately 416 liters of air before ingesting the fatal quantity of hydrogen cyanide. At 15 liters per minute, this will take about half an hour. A very strong person can survive even this period of time. By contrast, a sensitive person weighing 50 kg breathing at an accelerated rate as a result of physical effort or excitement will inhale 40 liters per minute, ingesting a fatal dose of 208 liters of air in five minutes. It is obvious from these calculations that the data in safety instructions are always intended to protect smaller, weaker people from accidents under the most unfavorable circumstances. The data given in the literature as "immediately" or "rapidly fatal" doses are furthermore so indefinite as to be unable to satisfy our purposes. In addition, they only refer to the time when a victim has ingested a fatal dose, but not when death occurs, which can be considerably later.

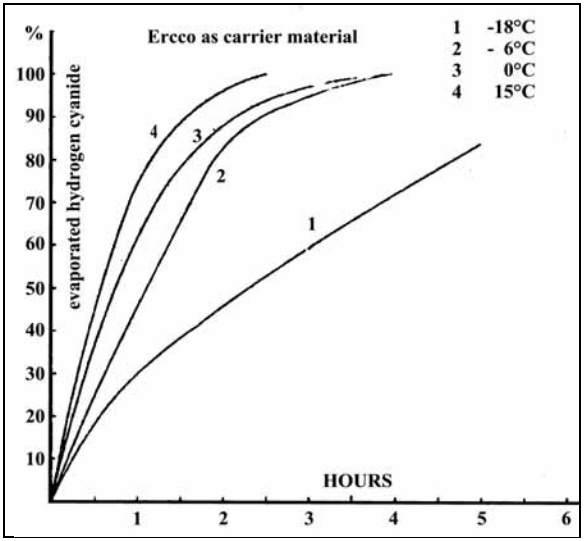
The threshold values will be different if we require even the strongest individual, out of all conceivable individual victims, to die in just a few minutes.[442] The concentrations necessary for this purpose will, by its very nature of the thing, be several times higher than the values indicated above. They could only be determined by a series of experiments, which is naturally impossible with human beings. The only data available to us are those gathered during executions with hydrogen cyanide carried out exclusively in the United States. Leuchter speaks of concentrations of hydrogen cyanide used in executions in the USA in the order of magnitude of 3,200 ppm. In these cases, death occurs after 4 to 10 minutes, depending on the physical constitution of the victim.[443] Press reports from the USA indicate that executions can easily last 10 to 17 minutes (see chapter 1.1.). It must be stressed, though, that this time applies to the point when the executee is actually declared dead, which requires that the heart must have stopped beating. Unconsciousness and immobility will have set in before that. Lethal amounts ingested already before death occurs would lead to the victim's demise, even if the expo-

[441] Robert F. Schmidt, *Biomaschine Mensch*, Piper, Munich 1979, p. 124.
[442] Among toxicologists known as the lethal dose for 100% of all victims, LD_{100}.
[443] F. A. Leuchter, Boston, FAX to H. Herrmann dated April, 20, 1992, as well as private communication from Mr. Leuchter.

sure to HCN were to end before cardiac arrest – unless immediate and drastic medical help is provided. This slow death can drag on for up to an hour.[444,445]

In relation to the quantities used, the U.S. execution gas chamber in Raleigh (North Carolina), for example, is said to use 454 g KCN in half concentrated sulfuric acid, leading to instant formation of hydrogen cyanide vapor, which is even visible for a short period to the witnesses in the witness room and which reaches the victim in seconds.[2] As a matter of pure calculation, this generates approximately 180 g of hydrogen cyanide, corresponding to 150 liters of gas. However, since a considerable part of it remains dissolved in the half concentrated sulfuric acid (approximately 50%, see chapter 8.3.3.4.), we assume in the following that approximately 90 g or 75 liters of hydrogen cyanide are released as gas. In North Carolina, this gas arises immediately beneath the victim, so that the victim must be exposed, immediately after the beginning of the execution process, to a concentration which probably exceeds 10% by volume for a short period, but then falls steadily as a result of diffusion of the hydrogen cyanide throughout the chamber.[446]

At a normal respiration volume of approximately 15 to 20 liters per minute, and assuming an average concentration during the execution of only 0.75% by volume, approximately 1.35 to 1.8 grams of HCN will be ingested in 10 minutes (150-200 liters of inhaled air), which corresponds to ten to twenty times the fatal dose. In the following calculations, we will assume a ten-fold overdose only, in order to render unconscious and motionless all the people in the chamber with certainty within ten minutes (see the case of Lawson, p. 11), leading to their subsequent death within another ten minutes at the latest.



7.2. Evaporation Characteristics of Zyklon B

Zyklon B does not release its poison gas instantaneously, but rather over an extended period of time. Since this period of time can be decisive for the evaluation both of eyewitness accounts as well as of chemical analyses, it will be investigated more thoroughly in this chapter.

R. Irmscher of Degesch reported in a paper written in 1942 that, at that time, the use of cardboard discs and gypsum (Ercco) were the most

[444] M. Daunderer, *op. cit.* (note 438), p. 15.
[445] Satu M. Somani (ed.), *Chemical Warfare Agents*, Academic Press, San Diego 1992, p. 213.
[446] Assuming a volume of 10 m^3 in the chamber, 75 Liter HCN corresponds to 0.75% by volume, *i.e.*, somewhat more than double the end values taken by Leuchter.

commonly used carrier material.[447] The gypsum version was used – even according to eyewitness testimony – in the concentration camps.

Graph 9: *Evaporation rate of hydrogen cyanide from the Ercco carrier material (gypsum with some starch) at various temperatures and fine distribution, according to R. Irmscher/Degesch 1942.*[447]

The evaporation characteristics of this product at various temperatures, *low relative humidity* of the air, and a *fine distribution* of the carrier material are reproduced in Graph 9 as given by Irmscher. The evaporation is "seriously delayed" at high atmospheric humidity, because the evaporating hydrogen cyanide withdraws considerable quantities of energy from the liquid HCN, the carrier material and the ambient air. As a consequence, the temperature of the product and the ambient air drops. If the temperature of the air reaches the dew point, atmospheric humidity condenses out onto the carrier material, which binds the hydrogen cyanide and slows down the evaporation process. Unfortunately the graph does not contain data for higher temperatures, but when considering the difference between the graphs for 0°c and 15°C, we can make a rough extrapolation of a graph for 30°C.

For later references, we want to keep in mind that, at 15°C and in the presence of lower atmospheric humidity, approximately 10% of the hydrogen cyanide used at Auschwitz has left the carrier material during the first five minutes, and approximately 50% after half an hour. At a temperature of 30°C, it can be expected that 15% would have been released within the first five minutes, and up to 60% after half an hour. In

[447] R. Irmscher, "Nochmals: 'Die Einsatzfähigkeit der Blausäure bei tiefen Temperaturen,'" *Zeitschrift für hygienische Zoologie und Schädlingsbekämpfung*, 1942, pp. 35f.; on the history of the development of Zyklon B, see Wolfgang Lambrecht, "Zyklon B – eine Ergänzung," *VffG* 1(1) (1997), pp. 2-5.

areas with a relative humidity of approximately 100%, the evaporation times would have been "seriously delayed," however.

The question of how Zyklon B would have behaved if dumped in a heap on the floor – hence *not* finely spread out – in a room filled with human beings, is somewhat more difficult. The radiant heat of the bodies would have accelerated the evaporation by increasing the temperature in the vicinity of the floor. Further acceleration of evaporation may have occurred due to a possible reduction in size of the carrier granules as a result of being trampled upon or crushed by falling human bodies, as well as direct bodily contact.

On the other hand, the relative atmospheric humidity in the cellars of Crematoria II and III, which certainly would have approached 100% when packed full of people, would have "seriously delayed" evaporation,[448] as well as the possible fluid secretions on the floor caused by panicking victims, which could very well have occurred as soon as the door was closed, that is, prior to release of the Zyklon B. If considering witness claims that the chamber floor was rinsed out with water hoses after each gassing, then the floor would indeed have been wet already before the entry of any victim. Under such conditions, a serious delay in the discharge of the hydrogen cyanide from the seriously wet carrier material would have to be anticipated.

If assuming – against the actual situation as proven by material evidence – that Zyklon B introduction devices were installed in some of the Auschwitz "gas chambers" as attested to by Michal Kula and others,[449] such a device would have had the following effects:

a) The Zyklon B granules would not have been spread out, but rather would have been kept together by the inner wire mesh (or, even worse, within a tin or a can, as claimed by Henryk Tauber and Josef Erber[285]), reducing the evaporation rate considerably.

b) The three layers of wire mesh claimed by Kula would have drastically reduced any air convection within them, reducing both evaporation rate as well as the speed with which the gas spreads out into the chamber

c) Due to high humidity in the air and the lack of air convection, moisture would have condensed intensively on the Zyklon B carrier, reducing the evaporation rate of HCN "seriously."

---

[448] Unheated cellar rooms by their very nature, have very high relative atmospheric humidity. As a result of the large numbers of human beings crammed into the cellar, the atmospheric humidity would certainly approach 100%, resulting in the condensation of water on cold objects.

[449] See chapter 5.4.1.2.8., p. 119, for this.

The present study regarding homicidal mass gassings will be based on the assumption that the Zyklon B would at best have behave in the manner described by Irmscher at 15°C (see above), which is assumed to be similar to a temperature inside the chamber of 30°C, a relative humidity near 100%, and a carrier wetted by a wet floor and/or not finely distributed.

7.3. The Gassing of Human Beings

7.3.1. Eyewitness Testimonies

7.3.1.1. Boundary Conditions

This chapter will examine a few related eyewitness testimonies for a determination of the chemical, physical and technical boundary conditions of the alleged homicidal gassings. A complete and detailed analysis of the many eyewitness testimonies in the individual trials and in the literature would be too voluminous to include here.[450] The following survey is therefore not complete.

In two separate studies I have analyzed the coercive and manipulating conditions under which many eyewitness statements were made, to which I refer the interested reader.[451] It suffices to say that those conditions, many of which prevail to this very day in western societies, undermine the trustworthiness of most witnesses and the credibility of their claims. These statements should therefore never be accepted at face value, but subjected to careful, skeptical scrutiny.

7.3.1.2. Eyewitness Fantasies

The following is a closer examination of three of the more frequently quoted eyewitnesses: Rudolf Höß, former camp commandant at Auschwitz, Richard Böck, a camp SS man of subordinate rank, as well as Henryk Tauber, former inmate and member of the "*Sonderkommando*" in Crematorium II in Birkenau.[452]

The Höß statements may be consulted in the Broszat edition and read as follows:[311]

---

[450] See, in this regard, the excellent analysis of J. Graf, *Auschwitz. Tätergeständnisse und Augenzeugen*, *op. cit.* (note 47) as well as C. Mattogno's various special studies (note 100).

[451] "The Value of Testimony and Confessions Concerning the Holocaust," G. Rudolf (ed.), *op. cit*. (note 24), pp. 85-131; G. Rudolf, *Lectures on the Holocaust*, Theses & Dissertations Press, Chicago 2005, pp. 345-486.

[452] For a more thorough analysis of Höß's and Tauber's statements with further references cf. C. Mattogno, op. cit. (note 76), pp. 375-439.

"Maintaining the fire at the ditches, pouring the collected fat [over the burning bodies …] *They ate and smoked while dragging corpses* […]*"* (p. 126)

"The bodies were doused first with oil residues, and later with methanol […] *He* [Paul Blobel[453]] *also attempted to destroy the bodies with explosives,* […]*"* (p. 157ff.)

"Half an hour after the introduction of the gas, the door was opened and the ventilation installation was turned on. Removal of the bodies began immediately […]*"* (p. 166.)

and elsewhere:[454]

"[…]

Q But was not it [sic] *quite dangerous work for these inmates to go into these chambers and work among the bodies and among the gas fumes?*

A No.

Q Did they carry gas masks?

A They had some, but they did not need them, as nothing ever happened. […]*"*

Anyone who has ever grilled meat knows that fat cannot be scooped up from burning flesh. Fat ignites at approximately 184°C.[455] It is therefore the first thing that burns on a corpse located in a fire. Hence, it is impossible to collect the easily combustible fat during the incineration of a corpse. After all, the bodies were burnt – not grilled.

The incineration of corpses in the open air with combustible fluids is impracticable because fluids have the property of flowing down or away and/or evaporating. When corpses, which consist of more than 60% water, are burnt, this must take place with the expenditure of quite large quantities of fuel and great heat. In particular, open oil or methane combustion would be insufficient.

The alleged attempt to destroy bodies by means of explosives requires no further comment. In reading such testimonies, one must inevitably wonder as to Höß's mental condition in writing them, as well

---

[453] Paul Blobel was the commander of unit 4a of *Einsatzgruppe* C, one of the German military units in Russia charged, among other things, with fighting partisans behind the Russian front. Mainstream historiography has it that in summer 1942 he was charged with the destruction of evidence of German mass murders in Eastern Europe (cf. http://en.wikipedia.org/wiki/Paul_Blobel). In the context of this task he allegedly made the ludicrous attempts at destroying corpses as stated by Höß. I will not dwell on this topic in this book.

[454] Henry Friedländer, *The Holocaust*, Vol. 12: "The 'finale solution' in the extermination camps and the aftermath," Garland, New York 1982, p. 113, Testimony of R. Höß, taken at Nuremberg, April 2, 1946.

[455] J.H. Perry, *Chemical Engineer's Handbook*, Wilmington Delaware 1949, p. 1584.

as that of anyone who takes such claims seriously. Unfortunately, such testimonies are the rule rather than the exception.[456]

Entering the "gas chamber" without a protective filter, eating and smoking in the "gas chamber," as well as the commencement of the corpse dragging operation immediately after the opening of the doors, would only be conceivable, if there were no longer any dangerous quantity of gas in the chamber. The question of whether this was possible will be the subject of chapter 7.3.2.2.

It is interesting to note that M. Broszat deleted the last pages of Rudolf Höß's testimony from his edition, since they contain "completely erroneous data on the numerical strength of these Jews," as Broszat himself stated in a footnote. In these pages, Höß speaks of three million Jews in Hungary, four million in Romania, two million in Bulgaria. The actual figures were lower by a factor of approximately ten.[457] In addition, the same pages contain the following, which is also incredible:[458]

> *"Although well-cared for and plentifully provided with bonus payments, one often saw them* [the Jewish *Sonderkommandos*] *dragging corpses with one hand, and holding and gnawing on something to eat with the other hand.*
>
> *Even during the horrid work of digging up and burning the mass graves, they did not allow themselves to be disturbed while eating. Even the burning of their closest relatives could not shake them.* […]*"*

This is really a bit hard to digest. Höß was repeatedly tortured and abused by his captors.[459] This may explain the absurdities he put down on paper – or was forced to sign. At any rate, it renders his statements inadmissible in any court of law – and should also render them unfit in the scientific community to serve as evidence for anything not independently confirmed by documents or material evidence.

Another commonly quoted witness is Henryk Tauber. Tauber was, according to his own testimony, a member of the inmate *Sonderkommando* of Crematorium II during the war. J.-C. Pressac writes that this

---

[456] For a more detailed study in this regard, see A. Neumaier, "The Treblinka-Holocaust," in G. Rudolf (ed.), *op. cit.* (note 24), pp. 471-500; C. Mattogno, J. Graf, *Treblinka*, Theses & Dissertations Press, Chicago 2004.

[457] Intensive statistical studies in this regard were undertaken by W.N. Sanning, *op. cit.* (note 45); W. Benz, *Dimension des Völkermords*, Oldenbourg, Munich 1991; see also G. Rudolf, "Holocaust Victims: A Statistical Analysis · W. Benz and W. N. Sanning – A Comparison," in: G. Rudolf (ed.), *op. cit.* (note 24), pp. 181-213.

[458] J. Bezwinska, *KL Auschwitz in den Augen der SS*, Verlag des Staatlichen Auschwitz-Museums, Auschwitz 1973, pp. 135f.

[459] Cf. G. Rudolf, *Lectures…*, op. cit. (note 451), pp. 382f.

eyewitness testimony is the best in relation to the crematoria, which he considers to be 95% reliable. This testimony contains the following:[460]

> *"During the incineration of such* [not emaciated] *corpses, we used the coke only to light the fire of the furnace initially, for fatty corpses burned of their own accord thanks to the combustion of the body fat. On occasion, when coke was in short supply, we would put some straw and wood in the ash bins under the muffles, and once the fat of the corpse began to burn the other corpses would catch light themselves.* […]
>
> *Later on, as cremations succeeded one another, the furnaces burned thanks to the embers produced by the combustion of the corpses. So, during the incineration of fat bodies, the fires were generally extinguished.* […]
>
> *Another time, the SS chased a prisoner who was not working fast enough into a pit near the crematorium that was full of boiling human fat. At that time* [summer 1944]*, the corpses were incinerated in open-air pits, from which the fat flowed into a separate reservoir, dug in the ground. This fat was poured over the corpses to accelerate their combustion.* […]*"*

Tauber's claims as to self-igniting, self-combustible corpses are completely absurd and in contradiction to all the laws of physics and engineering. He also confuses grilling with burning with relation to the allegedly boiling fat from the corpses. What is more, fat cannot boil at all. It simply begins to ignite at temperatures of approximately 180-190°C.

Tauber also proves himself a liar in the technical details related by him. He claims, for instance, that the *Sonderkommandos* shoved extraordinarily many corpses into each oven (up to eight) when they heard Allied planes approaching. Tauber claims that, by so doing, huge flames would have come out of the crematorium's chimney, which they hoped would make the Allied bomber pilots aware of them. But as is common knowledge and has been pointed out many times, no flames ever come out of crematorium chimneys. It is also impossible to push eight corpses into a cremation muffle whose door is just two feet wide and high.[461] And apart from that, before Tauber and his co-inmates would have been able to push eight corpses into each oven and get a huge blaze going, any plane they claim to have heard approaching would have long since

---

[460] Interrogation of Henryk Tauber dated May 25, 1945, annex 18, volume 11 of the Höß trial, quoted acc. to J.-C. Pressac, *op. cit.* (note 72), pp. 489f.; this testimony is rather typical; see also A. Neumaier, *op. cit.* (note 456), pp. 489-492.

[461] On a more thorough critique of Tauber's testimony see C. Mattogno, op. cit. (note 76), pp. 375-424; on cremation technology, see C. Mattogno, "The Crematoria Ovens of Auschwitz and Birkenau," in: G. Rudolf (ed.), *op. cit.* (note 24), pp. 373-412; C. Mattogno, *The Crematory Ovens of Auschwitz. A historical and technical study*, The Barnes Review, Washington, DC, in preparation.

flown far, far away. Such testimonies are, to use Pressac's words, nothing but downright lies and pure invention.[462]

Now to the testimony of the witness Richard Böck as quoted during the Frankfurt tribunal:[313]

> *"One day, it was during the winter of 1942/43, H. asked me, whether I wanted to drive with him to a gassing action.* […]
>
> *The transport train, which had already arrived, stood on the free stretch of track.* […]
>
> *They were all loaded, and driven to a former farmhouse.* […]
>
> *After the entire transport – there must have been approximately 1,000 people – was in the building, the door was closed. Finally, an SS man came, I believe it was a Rottenführer, to our ambulance and got out a gas canister. He then went to a ladder with this gas canister.* […] *At the same time, I noticed that he had a gas mask on while climbing the ladder.* […] *he shook* […] *the contents of the canister into the opening.* […] *When he had closed the little door again, an indescribable crying began in the chamber.* […] *That lasted approximately 8-10 minutes, and then all was silent. A short time afterwards, the door was opened by inmates and one could see a bluish cloud floating over a gigantic pile of corpses.* […] *At any rate, I was surprised that the inmate commando which was assigned to remove the bodies, entered the chamber without gas masks, although this blue vapor floated over the corpses, from which I assumed that it was a gas.* […]*"*

In winter of 1942/1943, no crematorium was operable in Birkenau (the first became operable in spring 1943). For this reason, the alleged victims of homicidal mass gassings in a farmhouse as attested to by Böck are supposed to have been cremated in open-air pits close to this farmhouse.

In view of our previous study of the subject, we can establish:

- According to professional air photo analyses of the decisive locations, there were no large cremation ditches, no fuel stockpile, no development of smoke or flames.[463] Accordingly, the scenario of destruction is obviously false in this regard.
- One thousand people occupy a surface area of at least 200 m^2. According to eyewitness testimonies, the farmhouses had only half this much surface area, at the most.[464]

Ball, *Air Photo Evidence*, Ball Resource Service Ltd., Delta, B.C., Canada 1992; idem, "Air Photo Evidence," in: Rudolf (ed.), *op. cit.* (note 24), pp. 269-282, here pp. 275-281: cf. C. Mattogno, *Auschwitz: Open Air Incinerations*, Theses & Dissertations Press, Chicago, IL, 2005.

[464] J.-C. Pressac, *op. cit.* (note 72), pp. 161ff.; cf. C. Mattogno, *The Bunkers of Auschwitz*, Theses & Dissertations Press, Chicago 2004.

- Chapter 7.1.: Hydrogen cyanide is a colorless, invisible gas. Therefore, no "blue vapor floating over the corpses" could be seen. This passage is a sign of pure fantasy, obviously suggested by the German name of HCN, "*Blausäure*" (blue acid), which only relates, however, to the formation of the pigment Iron Blue.
- Chapter 7.2.: Since the events described are alleged to have taken place in winter, the rapidity of the procedure is incredible, since Zyklon B only releases gas slowly at frost temperatures.
- The described entry into chambers with a high concentration of toxic gas without a protective filter is impossible; such a manner of procedure would obviously sooner or later be fatal.

German public prosecutor Willy Dreßen had the following to say about Böck's testimony:[465]

> *"Dear Mr.* […]*,*
>
> *I enclose a copy of the eyewitness testimonies of former members of the SS on the gassing of inmates at Auschwitz* […] *for your information. They are only a selection – there are numerous other such testimonies. In contrast to yourself, I am of the opinion that these eyewitness testimonies relating to the fact of the occurrence of gassings of human beings, are entirely suitable to refute the denial of this fact.*
>
> *Faithfully, (Dreßen), Public Prosecutor"*
>
> *And yet again: "Dear Mr.* […]*,*
>
> […] *Furthermore, the testimony of B ö c k is only one of numerous similar statements* […]
>
> *Faithfully, (Dreßen), Public Prosecutor"*

Böck's testimony was one of the few which the Frankfurt tribunal considered credible after careful examination, that is, the inconsistencies would not be so easily recognized by the layman, in contrast to the many other testimonies. And yet it is entirely incredible.

Pressac himself becomes very critical in quite a few of his passages relating to the reliability and credibility of eyewitness testimonies;[466] yet it is upon these eyewitness testimonies that all the descriptions of the "gas chamber" killings are based. He lists the untruths, impossibilities, and exaggerations of the witnesses and explains how they presumably materialized. Finally, in an interview, he said:[467]

---

[465] Letter from public prosecutor Willy Dreßen, Zentrale Stelle der Landesjustizverwaltung Baden-Württemberg, Ludwigsburg, ref. 110 AR 916/89, July 26, 1989, and Oct. 11, 1989, respectively; see also the book by Ernst Klee, Willy Dreßen, *Schöne Zeiten*, S. Fischer, Frankfurt 1988: Engl.: *The Good Old Days*, Free Press, New York 1991.

[466] J.-C. Pressac, *op. cit.* (note 72), pp. 124-128, 162, 174, 176f., 181, 229, 239, 379f., 459-502. For additional eyewitness testimonies, see also note 458 and E. Kogon *et al.*, *op. cit.* (note 46), pp. 194-239.

[467] *Focus* no. 17/1994, pp. 118, 120.

"No, no. One cannot write serious history based only upon eyewitness testimonies."

At the same time, however, he bases all of his remarks on the alleged existence of homicidal "gas chambers" exclusively on these eyewitness testimonies! And elsewhere, he states, with a naiveté which can hardly be surpassed:[468]

"Witnesses never lie, but they can be mistaken."

Pressac seems to be the only person of the establishment who takes notice of the progress of revisionist research. He knows that traditional historiography of the Holocaust is reduced to absurdity by the facts revealed by this research. Consequently, he keeps changing his attitude when making public statements. The most vehement attack of the (once) media darling Pressac on the dominating historiography occurred during an interview published as an appendix to a PhD thesis analyzing the history of Holocaust revisionism in France. In it, Pressac described the established historiography of the Holocaust as "rotten" and stated:[469]

"Can we alter the course? It is too late. A general correction is factually and humanely impossible [...]. *New documents will unavoidably turn up and will overthrow the official certainties more and more. The current view of the world of the* [National Socialist] *camps, though triumphant, is doomed. What of it can be salvaged? Only little."*

In his first and so far most comprehensive book, Pressac is compelled to correct the statements of witnesses in many cases in order to eliminate errors and, in his opinion, technical impossibilities. But when so doing, he never reveals the basis upon which he undertakes these corrections. In actual fact, he merely replaces the capriciousness of "eyewitnesses" with his own. Thus, the numbers of victims per gassing procedure, as estimated by Pressac, for example, are considerably lower than those estimated in the eyewitness statements, which often speak of several thousand victims per gassing operation per day for Crematoria II and III. One thousand people could only have been made to enter a cellar with a surface area of 210 m^2 under the maintenance of extraordinary discipline accompanied by a readiness to cooperate(!) on the part of the victims (see chapter 7.3.2.1.1.). The numbers of people reported in places by witnesses, on the other hand (2,000 and more[470]), could not have been contained by Morgue 1. To arrive at the number of victims of Auschwitz-Birkenau, as spread by sensationalist media and literature

[470] 2,000 according to R. Höß (H. Friedländer, *op. cit.* (note 454), S. 112), as well as C.S. Bendel, 3,000 according to M. Niyszli, see note 462.

until the late 1980s – four million – one is in fact compelled to resort to technically impossible figures of "gas chamber" occupancy, as the witnesses do – which proves that they were not reporting true events but were aiming at supporting a myth.

At the moment, the official estimates range from approximately 1 to 1½ million victims,[471] though in his second book, Pressac downgraded the "gas chamber" victims to 630,000[472] and later even further down to 470,000-550,000.[473] In an article published in a small German periodical in early 2002, a German mainstream journalist even attempted to reduce the death toll of the Auschwitz "gas chambers" down to as little as 356,000.[474] But as long as this revolutionary development is not accepted by most scholars, we will stick to the number of one million "gas chamber" victims for all further considerations.

The following is a description of the homicidal gassing procedures for the individual installations, if one were to assume that one million human beings were actually gassed:

Crematorium I: Blocking the crematorium environs to third parties; 500-700 victims undressing in open air (what a spectacle for all other inmates!); entry into "gas chamber" (morgue) near oven room; on their way to the "gas chamber," victims march past piles of corpses of earlier victims or "naturally" deceased inmates; introduction of Zyklon B through (non-existing) roof vents with utilization of gas masks after closure of doors; turning on of ventilators and opening of doors after death of victims (approximately five min.); removal of corpses from gas chambers without gas masks; cremation of victims.[475] According to Pressac, only a few gassings occurred, with a total of only 10,000 victims.[476]

Crematoria II/III: Entry of 800 to 1,200 victims into western entrance stairway into Morgue 2; undressing; travel through stairwell into Morgue 1 ("gas chamber"); introduc-

[471] On the origin of the 4 million propaganda figure see C. Mattogno, "The Four Million Figure of Auschwitz," 2 parts, *The Revisionist* 1(4) (2003), pp. 387-392; *ibid.*, pp. 393-399.

[476] *Ibid.*, pp. 131f.

tion of Zyklon B through (non-existing) roof vents either onto the floor or into (non-existing) wire-mesh pillars with utilization of gas masks; turning on ventilators after death of victims (approximately five min.); opening of doors after approximately 20 minutes; hosing down of corpses, soiled with blood, vomit and excrement; removal of bodies with or without utilization of gas masks; no protective garment; cutting of hair and removal of gold teeth while bodies are still in cellar; transport with lift (payload 300 kg[477]) to ground floor; there, transport through water-filled channels to ovens; cremation.[318] Approximately 400,000 victims for Crematorium II, 350,000 for Crematorium III according to Pressac.[478]

Crematorium IV/V: Undressing of a few hundred victims in open air (again: what a spectacle for all other inmates!), otherwise in morgue, some of them next to corpses of last gassing victims (or "naturally" deceased inmates) awaiting cremation; entry into "gas chambers" past coal room and doctor's office; evacuation of the entire building; introduction of Zyklon B through hatches from a ladder after closure of door(s) (despite iron bars in front of those openings); opening of doors after 15 to 20 minutes; removal of corpses to morgue or to cremation ditches behind Crematorium V by the *Sonderkommando*, some of them wearing gas masks, some not. According to Pressac, the number of victims can only be estimated with difficulty, probably approximately 100,000.[479] A similar scenario applies to farmhouses I and II (see chapter 5.4.3.).

7.3.1.3. Quantities of Poison Gas

7.3.1.3.1. Overview

Opinions differ as to the concentration of poison gas alleged to have been used in the presumed executions (see next chapter). The only indi-

[477] Crematory II only received a make-shift elevator, see C. Mattogno, op. cit. (note 76), p. 53.
[478] J.-C. Pressac, *op. cit.* (note 72), p. 187.
[479] *Ibid.*, pp. 384-390.

rect sources available to us are the alleged execution times reported by the eyewitnesses, which in turn permit a crude estimate of the concentrations used. These reported execution times all allege a gassing time of only a few minutes.[480]

Assuming an execution time approximately corresponding to those in U.S. execution gas chambers (ten minutes and more until cardiac

[480] With relation to the killing times, see in, for example: Schwurgericht Hagen, verdict from July 24, 1970, ref. 11 Ks 1/70, p. 97 (5 min.); Final Trial Brief of the Prosecution, quoted acc. to U. Walendy, *Auschwitz im IG-Farben-Prozeß*, *op. cit.* (note 161), pp. 47-50 (3 to 15 minutes in extreme cases); E. (3-4 minute), Franke-Gricksch Report, in: J.-C. Pressac, *op. cit.* (note 72), p. 238 (one minute to kill the victims, another until the doors were opened); Rudolf Vrba alias Walter Rosenberg, Alfred Wetzler, ref. M 20/153, Yad Vashem (acc. to War Refugee Board, "German Extermination Camps – Auschwitz and Birkenau," in: David S. Wyman (ed.), *America and the Holocaust*, volume 12, Garland, New York/London 1990, p. 20 (everyone in the room was dead after three minutes); Jerzy Tabeau, in: *The Extermination Camps of Auschwitz* (*Oswiecim) and Birkenau in Upper Silesia* (10 minutes, quoted according to Enrique Aynat, *Los protocolos de Auschwitz. i Una fuente historica?* Verlag Garcia Hispan, Alicante 1990); André Lettich, *Trente-quatre mois dans les Camps de Concentration,* Imprimerie Union Coopérative, Tours, 1946 (a few moments). Janda Weiss, in: David E. Hackett, (ed.), *The Buchenwald Report*, Beck, Munich 1997, p. 394 (3 min.). If longer killing times appear in the eyewitness testimonies, they refer, not to Crematoria II and III, but, rather, to Crematoria IV/V, bunkers 1-2, or Crematorium I in the Main Camp. The killings in Crematoria II and III are therefore alleged to have been committed very quickly.

arrest at 3,200 ppm HCN, see chapter 7.1.), a concentration of at least 3,000 ppm (3.6g/m^3) would have had to have reached even the remotest corner of the chamber after only half this time (five minutes). With a free volume of 430 m^3 in Morgue 1 of Crematoria II and III,[481] this corresponds to a quantity of hydrogen cyanide of approximately 1.5 kg released and spread out after five minutes. Since the carrier material only releases approximately 10% of its hydrogen cyanide content after five minutes (see chapter 7.2.), at least ten times that amount would have been required in order to kill (or at least turn unconscious) in only a few minutes, *i.e.*, this would mean the utilization of at least 15 kg of Zyklon B.[482] This, of course, only applies on the condition that the hydrogen cyanide released reached the victims immediately, which cannot be expected in large, overcrowded cellars. It must therefore be considered established that quantities of at least 20 kg of Zyklon B per gassing (ten 2 kg cans or twenty 1 kg cans) would probably have had to have been used for the gassing procedures described.

Let us state that the scenarios described by the witnesses would require a quick increase in the concentration of hydrogen cyanide *everywhere* in the chamber. At the same time, logically, there cannot have been a simultaneous drop in the hydrogen cyanide in the chamber – such as through the respiration of the victims. Such a loss in hydrogen cyanide would have had to have been overcompensated for through an even more rapid evaporation of fresh hydrogen cyanide, because the hydrogen cyanide concentration would have *had* to increase for rapid executions. After the end of respiration due to increasing numbers of dead victims, who died in a matter of minutes, this most important cause of a loss in hydrogen cyanide would have ceased to exist as a factor. But since Zyklon B continues to give off large amounts of hydrogen cyanide for many more minutes, it must be assumed that the hydrogen cyanide content in such chambers would continue to increase constantly, and very rapidly, during the first quarter hour at least. Since deadly concentrations (3,200 ppm) would have had to have been reached even in the remotest corner of the chamber already after a few minutes, this means that the hydrogen cyanide concentration inside the chamber after approximately one quarter hour would have exceeded 10,000 ppm and would have continued to rise thereafter – slowly, of course, but nevertheless constantly at all times.

[481] 504 m^3 empty volume of the cellar minus 75 m^3 occupied by 1,000 persons.

[482] At least because the initial evaporation of the hydrogen cyanide would have led to an immediate condensation of the environmental humidity onto the carrier, more or less interrupting the further evaporation of hydrogen cyanide; see also chapter 7.2.

To assume that the respiration of the victims locked in the chambers would have been capable of perceptibly reducing the concentration of hydrogen cyanide in the air is therefore entirely in contradiction to the eyewitness statements.[483] In particular, this would have required that the victims, confined in the chamber, could have acted as quasi-living filters for the greater proportion of the time during which the Zyklon B was releasing hydrogen cyanide (at least one hour). But one thousand people locked in a hermetically sealed cellar would have died in an hour from lack of oxygen alone.

These considerations show that a concentration of hydrogen cyanide in Morgue 1 of Crematoria II and III during the alleged gassings would have had an effect on the masonry which would have been at least as great as that occurring during disinfestation. High rates of hydrogen cyanide absorption would have to be expected during these periods, particularly on the cool and moist masonry of cellars in Crematoria II and III. The duration of the gassing period would have depended above all on the subsequent ventilation, which will be examined below.

7.3.1.3.2. Excursus 1: Poisoning or Suffocation?

Because eyewitness statements about the amount of Zyklon B are rare, and since humans are more sensitive to HCN than insects (see chapter 7.1.), some scholars opine that only small amounts of Zyklon B were used for the alleged mass murders in Auschwitz, for example J. Bailer,[58] W. Wegner,[53] and G. Wellers,[59] who assume an applied concentration of 1 g per m^3 (0.083 vol.%) or less.

R.J. Green argues that an amount was applied which would have corresponded to some 0.45-1.8 vol.% after the *complete* release of all HCN from the carrier. He argues that this would have sufficed to kill everybody inside within a few minutes, as a lethal concentration of 0.045-0.181 vol.% would have been reached by then. At the time the ventilation was switched on (some 30 min later), a concentration of about 0.09-0.72 vol.% would have been reached.[70]

The few witnesses statements we have claim that several kilograms of Zyklon B were used.[484] In his book, Pressac frequently refers to a

[483] Such is, for example, the hypothesis brought forth by G. Wellers, *op. cit.* (note 59), which is similarly incorrect in its findings, due to the incorrect hypothesis that lower quantities of Zyklon B were used: J. Bailer, *op. cit.* (note 56); W. Wegner, *op. cit.* (note 53).

[484] J. Buszko (ed.), *op. cit.* (note 480), p. 118: 6 to 12 kg; Léon Poliakov, *Harvest of Hate*, Greenwood Press, Westport, Conn., 1971, p. 205: 5-7 kg; an analysis of the eyewitness statements has been undertaken by D. D. Desjardin: "Kenneth Stern's Critique of The Leuchter Report: A Critical Analysis," www.codoh.com/newrevoices/nddd/ndddstern.html. The analysis does not, however, take account of the slow release of hydrogen cyanide by the carrier material. See also

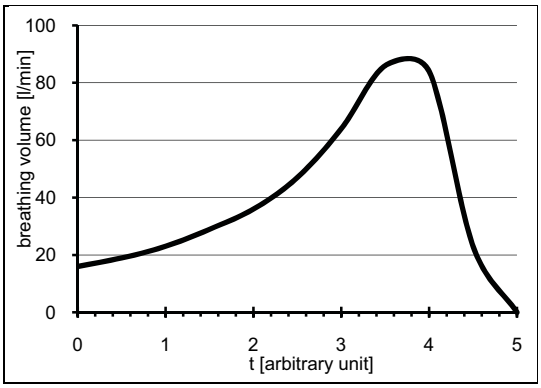
HCN end concentration of 12 g per m^3 or 1 vol.% used for executions.[485] He backs this up with witness accounts, according to which four to six 1-kg cans of Zyklon B were allegedly poured into the "gas chambers" (morgues) of Crematorium II and III, which indeed corresponds to a concentration of 1 vol.%.[318]

Pressac, on the other hand, assumes that 95 to 98% of the entire Zyklon B delivered to the camp was used for the original purpose, *i.e.*, for delousing clothes and rooms,[486] for which he relies on statements from the Nuremberg tribunal.[487] Pressac justifies this with the fact that, in relation to other concentration camps, where doubtlessly no extermination took place, the Auschwitz camp did not receive higher amounts of Zyklon B deliveries, if seen in relation to the number of inmates and in relation to the material delousing facilities that doubtlessly operated there.

The supply figures of the Auschwitz camp can be found in the protocols of the International Military Tribunal Nuremberg. In total, they reached some 19,000 kg during the years 1942 and 1943.[161] The total supplied amount during the entire existence of the camp from late 1940 to early 1945 will hardly have exceeded 40 tons. According to Pressac's statement that not 2-5% of this was used for killings, 800 to 2,000 kg of the total delivery was used for extermination of humans.

But when dividing up this amount of Zyklon B for one million people allegedly killed with it, with 1,000 victims per gassing – the "gas chambers" (morgues I) of Crematorium II and III could hardly hold 1,000 persons per execution – only roughly 0.8 to 2 kg HCN was available for each gassing. With the morgues' free volume of roughly 430 m^3,[481] and after all hydrogen cyanide had evaporated from the carrier (after more than an hour), 800 to 2,000 g of hydrogen cyanide would result in a theoretical end concentration of 1.86 to 4.65 g per m^3, which means that the concentration during the first five or ten minutes was much lower.

If, on the other hand, one million victims were killed according to the eyewitness statements, *i.e.*, with high concentrations in a few mi-



Desjardin's interview with F. Piper, *op. cit.* (note 169), where Piper talks about 6 kg per 1,400 victims.

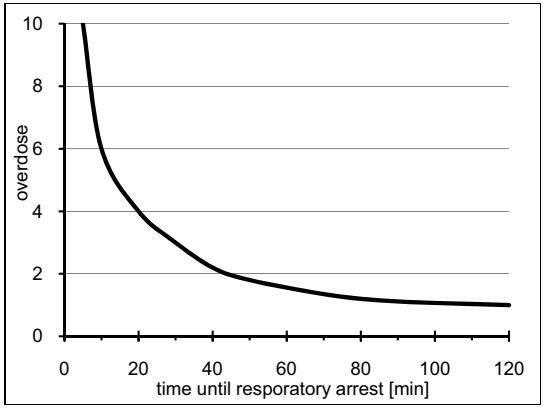
nutes, those 1,000 gassings would have required 1,000×20 kg = 20 tons of Zyklon B, or at least 50% of the entire Zyklon B delivery to the camp.

Graph 10: *Schematic representation of the breathing volume behavior relative to time in case of suffocation/poisoning.*

This shows an obvious inconsistency in Pressac's statements. One cannot have both high concentrations during homicidal gassings and a low percentage of the entire Zyklon B delivery to Auschwitz used for these gassings.



Let us now have a closer look at the theory endorsed by J. Bailer,[58] W. Wegner,[53] and G. Wellers,[59] that only a small amount of HCN was used for the killings. In such a case, the concentration reduction due to the respiration of the victims is no longer a negligible quantity.

Per capita, the respiration of HCN is the higher, the higher the applied concentration is. The reason for this is that, although the victim incorporates lethal amounts of hydrogen cyanide in short periods of time in case of high concentrations, their organism's reaction is delayed. During this delay, the victim incorporates more overdoses of hydrogen cyanide.

Graph 10 shows the behavior of the breathing volume per minute of persons dying of suffocation or poisoning (biochemical suffocations). Respiratory arrest occurs at the end of this period of time (at 5). Death occurs only several minutes after respiratory arrest. If one assumes a time period of 5 minutes until respiratory arrest, the assumed breathing volume during each single minute is: 1st: 20 liters; 2nd: 30 liters; 3rd: 50 liters; 4th: 80 liters; 5th: 30 liters.[441] In total, this yields a breathing volume of ca. 210 liters. Furthermore, we assume that the function is independent of the length of time until respiratory arrest. This means that double the amount of air is inhaled if the time period would be doubled.

Regarding Morgue 1 ("gas chamber") of Crematorium II, we have the following data: Volume: 504 m^3; volume of 1,000 persons: ca. 75 m^3; resulting free air volume: ca. 430 m^3. First, the oxygen content in

the room may be studied. In Table 9, the total inhaled volume of 1,000 victims is given in m^3 and multiples of the free air volume as a function of time. The average oxygen content is reduced by 20-30% per inhalation. This results in the remaining oxygen content in the chamber as given in the last two columns. Oxygen contents below 6% are lethal.[488] So, even without adding any toxic gas, we have to reckon with the victims being suffocated in an airtight chamber already after some 45-60 minutes.

Graph 11: *Incorporated amount of HCN as function of time until respiratory arrest in overdoses of lethal dose (ca. 80 mg).*

Due to the extremely high capability of the lungs to absorb HCN, the human lung acts like a perfect filter which absorbs all hydrogen cyanide out of the air. Taking the experiences of U.S. execution "gas chamber" as a base, death occurs after some 10 minutes at the earliest in case of an application of ca. 4 g HCN per m^3. In assuming a total inhaled volume of ca. 210 liters, this corresponds to an incorporated amount of HCN of ca. 800 mg, which is a tenfold overdose of the lethal dose (80 mg/person). In the following, it is assumed that in an execution lasting several hours, no overdoses of HCN are incorporated. Using these benchmark figures, a relation between incorporated overdose and execution time results as shown in Graph 11.

The HCN content in the air of a room decreases similarly by breathing as by ventilation (exponential behavior, see chapter 7.3.2.2.2.). If the victims have inhaled the entire room volume once, the HCN content will be reduced to ca. 37% of the initial value. As a function of time passed until respiratory arrest occurs, Table 10 shows how much HCN was incorporated by the victims in total (column 3), which portion of the total content of HCN in the air this is (column 4), how much HCN had been released in total (column 5), and how much Zyklon B at a carrier temperature of 15°C had to have been applied to release that

[488] Y. Henderson, H.W. Haggard, *Noxious Gases*, Reinhold Publishing, New York 1943, pp. 144f.; J.S. Haldane, J.G. Priestley, *Respiration*, Yale University Press, New Haven 1935, pp. 223f.

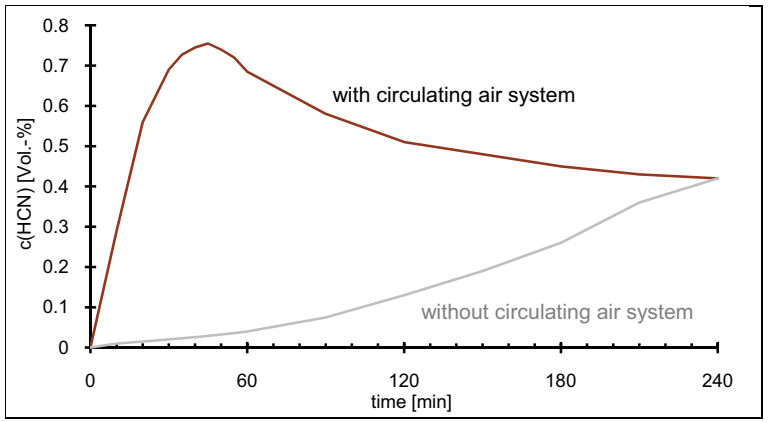
Table 9: Reduction of O_2 content in air-tight Morgue 1 as a function of time

Time until respiratory arrest [min]	Inhaled volume of 1,000 victims [m³]	in free volumes of the room	Reduction of O_2 content (30% per Inhalation)	Reduction of O_2 content (20% per inhalation)
5	210	0.5	17.9	18.9
10	420	1	15	16.8
20	840	2	10.5	13.4
30	1,260	3	7.4	10.8
45	1,890	4.5	4.2 (lethal)	7.8
60	2,520	6		5.5 (lethal)
120	5,040	12		

much HCN as is required in this period of time. The last column shows the ratio of the inhaled amount of HCN and the applied amount. In so doing, it was assumed that the HCN concentration was available to every victim right from the start. In reality, the applied amount of hydrogen cyanide had to be a bit higher than assumed here (delay due to release and distribution of hydrogen cyanide).

According to testimonies, the execution times until all victims seemed dead – which means they were at least unconscious – were shorter than 10 minutes.[480] When considering the delays caused by the release of the gas and its distribution, as well as the fact that death occurs only several minutes after respiratory arrest, the first two lines of Table 10, corresponding to execution times of ca. 10 and 15 minutes, respectively, are at the upper limit of witness accounts. This means that an execution within a few moments or minutes would have required enormous amounts of Zyklon B. Such witness accounts are therefore unrealistic. Furthermore, it must be assumed that, with the execution times attested to, only a fraction of the applied (<10%) and at the execution time released amount of hydrogen cyanide (<60%) actually could have been incorporated by the victims. The rest was available to react with the walls, among other things. Therefore, one has to reckon with high adsorption rates of hydrogen cyanide especially at the cool and wet walls of the cellars of Crematorium II and III, contrary to Weller's hypothesis, according to which this is not supposed to happen.[59] According to his opinion, the little amounts of hydrogen cyanide applied were supposedly inhaled entirely. This contradicts the witness accounts of the quick "gas chamber" death, which required large amounts of hydrogen cyanide.

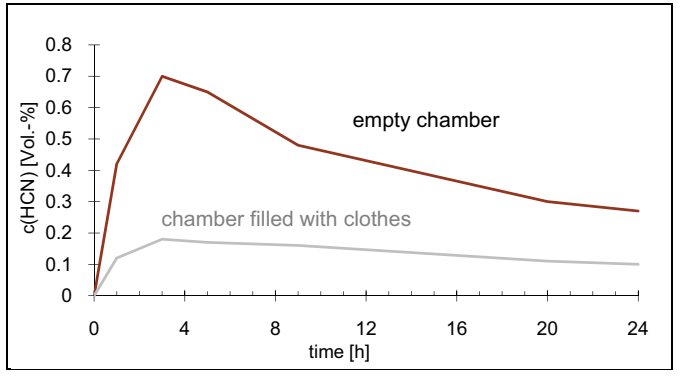
Table 10: Amount of HNC as a function of execution time
(lethal dose = 80 mg/person = 80 g/1,000 persons)



Time until respiratory arrest [min]	Over-dose	Inhaled Amount of HCN [g]	Portion of released HCN [%]	released amount of HCN from carrier [g]	Applied Zyklon B (15°C) [g]	$HCN_{inhaled}$/ $HCN_{applied}$ [%]
5	10	800	40	2,030	28,600	3
10	6	480	63	760	5,000	10
20	4	320	86	370	1,230	26
30	3	240	95	252	625	38
45	2	160	99	161	320	50
60	1.5	120	100	120	200	60
120	1	80	100	80	100	80

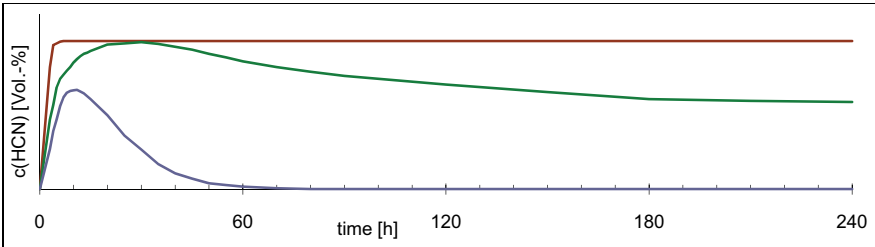
Finally, the application of small amounts of hydrogen cyanide of an end concentration of only 1g/m³, *i.e.*, the use of only some 400 g Zyklon B per gassing, would have been senseless, if the facilities were indeed air-tight, which would have been imperative for their use as a mass "gas chamber." This is, because the victims would have died in a similar period of time due to lack of oxygen anyway (cf. Table 9).

7.3.1.3.3. Excursus 2: HCN Loss due to Adsorption



It is worth taking a look into the HCN losses caused during disinfestations due to adsorption on walls and clothes, as well as due to leaks. Puntigam *et al.*[126] describe the hydrogen cyanide concentration behavior at different locations of a delousing chamber with and without air circulation ("*Kreislaufverfahren*"). Puntigam neither gives measures and loading of the chamber, nor the type of carrier material and its distribution, nor the temperature. Since the different measuring points show different concentrations peaks, this indicates a non-even distribution of the products in the chamber. For the sake of clarity, only the concentration behavior in the center of the room is reproduced in Graph 12.

The loss of hydrogen cyanide as a function of temperature in a disinfestation chamber can be seen in Graph 14. The higher losses at lower temperatures is caused by a higher moisture content in the gassed material and in the walls of the observed room.[127]



Graph 12: *Hydrogen cyanide concentration behavior in delousing chamber with and without circulating air systems, measuring points always in center of room (intern. correspondence of Degesch; values at various points differed greatly).*[126]

According to the already quoted publication by Schwarz *et al.*,[427] their measurements were made in the range of room temperature. Although the interesting part of Graph 13 is only poorly resolved, it is nevertheless clear that under these circumstances the maximum concentration is reached as late as 4 to 5 hours after the start. In these years, circulating air systems did not yet exist, so that only the natural air convection was responsible for distributing the gas. Remarkable is the strong concentration reduction due to adsorption on the load, here lifeless material to be deloused. Due to the slow increase towards the maximum concentration, it must be assumed that Puntigam's values without circulating air system (Graph 12, lower curve) were achieved at similar

Graph 13: *Hydrogen cyanide concentration behavior in disinfestation chamber with and without clothes at room temperature.*[427]

temperatures.

In case of hypothetical homicidal gassings, the sweat produced by the frightened, crowded people and their HCN absorption through skin and lungs will cause similar losses, and in case of the underground morgues of Crematorium II and III, additional losses will occur due to the cold and moist walls.

In order to kill all victims quickly, as attested to by the "eyewitnesses," such losses would have to be compensated by introducing even more HCN than calculated before (chapter 7.3.1.3.1. and 7.3.1.3.3.) in order to quickly reach *and maintain* high HCN concentrations everywhere in the "gas chamber."

7.3.2. Critique of the Eyewitness Descriptions

7.3.2.1. Theatre of the Absurd

First, a few critical remarks on three topics of eyewitness statements relating to homicidal mass gassings should be made at this point.

7.3.2.1.1. Necessity of Cooperation

Just imagine the following scene: 1,000 people of both sexes plus children enter the undressing room with a surface area of 390 m^2 (4,200 ft^2, Morgue 2 of Crematoria II & III). Each one would therefore have an area of only 60 cm × 60 cm (2×2 ft) in which to undress. Experience shows that people do not pack themselves tightly to the very edge of an enclosed area, unless, of course, they are quite willing to do so.[489] In order to get people to do this, the procedure must be rehearsed; they

[489] Just think of street cars or buses, where everyone remains near the door, even though there is plenty of room at the rear.

must be aware of what is happening and what steps they must follow – and they must be willing to cooperate.

Alternatively, few people could be made to undress at a time, but this assumes that the people who have already undressed are in the "gas chamber" and waiting patiently for the next arrival of naked inmates. Once inside the "gas chamber," the same problem occurs again. Here each individual has only an area of 45 cm × 45 cm (1.5×1.5 ft) in which to stand. The people must press themselves tightly together; the first people entering the room must proceed to the end of the room in a disciplined manner and line up against the wall. The next lot will form the line directly in front, and so on, until the entire chamber is full, which must have taken approximately half an hour, even with perfect choreography. Without perfection, we quickly reach an hour or more.

How did they get these 1,000 people to pack themselves tightly together, as one can expect from soldiers who have practiced this for weeks on a parade ground? The only solution is that this must have been practiced just as intensively and disciplined as soldiers do it. And of course, at some point in this alleged scenario, people had to realize that they were *not* gathering for a shower, thus resulting in panic and lack of orderly cooperation with their murderers' procedures.

Finally, let us assume that those "gas chambers" were hermetically sealed. While it was filling up with people over an hour with the door at one end standing open, how would the air quality have developed in that tightly packed room? When the "gas chamber" was not even halfway filled with victims, the people standing at the rear wall must have had the first mild symptoms of suffocation due to oxygen depletion. How do you keep people who run out of air to stay where they are for another half an hour until everybody is ready? Or did the SS have the courtesy and foresight to turn on the ventilation while the room was filling, so that fresh air was being supplied? They better had…

7.3.2.1.2. Failure to Separate the Sexes

All eyewitness accounts known to the author are unanimous in claiming that the victims were not separated by sex before being sent into the "gas chambers." The eyewitness accounts of the failure to separate the sexes are incredible for the following four reasons:

1. This procedure is in contradiction to the procedures followed during disinfestation, where, according to the same witnesses, the sexes were carefully separated.[490]

2. Since there were always two alleged "gas chambers" of each type available in Birkenau (in Crematorium II and III, or IV and V, or bunker I and II), there is no apparent reason why the victims could not have been separated by sex.

3. The claims were repeatedly made that the victims were made to believe that they were going to shower or undergo disinfestation. These procedures would have necessarily separated the populace on the basis of sex, if only because of the need for deception.

4. Particularly in the 1940s of last century, large numbers of people could only have been made to disrobe completely with others of the opposite sex if they had been threatened with force and violence. But this would have nullified all the other measures of concealment.

7.3.2.1.3. Towel and Soap

According to a few eyewitnesses, the victims were handed towels and bars of soap to make them believe that they were going to take a shower.[491] (Who, by the way, would go with a towel under a shower?) This statement becomes incredible given the chaos in the "gas chamber": 1,000 corpses, 1,000 towels, and 1,000 bars of soap, plus vomit, urine, and blood from 1,000 victims! How was it possible to recycle those 1,000 bars of soap? How did they clean 1,000 towels? Did they waste 1,000 towels and 1,000 soap bars for every gassing? It can therefore be concluded that such accounts are untrue, and witnesses testifying about it are not trustworthy.[492]

7.3.2.2. Speed of Ventilation of the "Gas Chambers"

7.3.2.2.1. Introduction

An imaginary experiment may perhaps assist in clarifying a somewhat complicated mathematical relationship: you have a bucket filled to

---

[490] See, for example, the pictures taken by the SS before and after delousing new arriving inmates, neatly separated by sex, as published in the Serge Klarsfeld (ed.), *The Auschwitz Album. Lilly Jacob's Album*, New York 1980.

[491] Cf. the testimony of André Lettich, Thêse Fac. Med., *Trent-quatre mois dans les camp de concentration*, Ed. Tours, impr. de l'Union cooperative, Paris 1946; quoted acc. to E. Kogon *et al. op. cit.* (note 46), p. 210.

[492] See also, in this regard, the detailed analysis of the testimony of SS Man Dr. Hans W. Münch: G. Rudolf, "Auschwitz-Kronzeuge…," *op. cit.* (note 480).

the brim with sea water in front of you. You now take a second bucket filled with fresh water and pour it very carefully into the first bucket, allowing the excess to flow over the edge. Now the question: when you have emptied the second bucket of fresh water into the first, containing sea water, what is the composition of the water in the first bucket? Pure fresh water? Of course not. It will be a mixture of salt and fresh water.

7.3.2.2.2. Excursus

In mathematics, the equation related to this problem is called a linear, homogenous differential equation.

In general, the following time behavior applies for the concentration change of a substance i with time, dc_i/dt, in case of air exchange, provided that the newly added gas (free of i) is ideally mixed with the old gas:

$$\frac{dc_i}{dt} = -a \cdot c_i(t) \tag{8}$$

i.e., that the concentration change of substance i is proportional to the concentration $c_i(t)$ at time t. A modification of the equation yields:

$$\int \frac{1}{c_i(t)}\, dc_i = \int -a \cdot dt \tag{9}$$

After integration over dc and dt, resp., this yields:

$$\ln(c_i(t)) = a' - a \cdot t \tag{10}$$

or

$$c_i(t) = a'' \cdot e^{-at}. \tag{11}$$

For $t = 0$, $e^{-at} = 1$ and thus

$$a'' = c_i(t=0) = c_o \tag{12}$$

with c_o as initial concentration (when the ventilation is started). This leads to:

$$c_i(t) = c_o \cdot e^{-at}. \tag{13}$$

From equation (8) results the initial concentration change $dc_i(t=0)/dt$:

$$\frac{dc_i(t=0)}{dt} = -a \cdot c_o \tag{14}$$

Hence, we get for the constant a:

$$-a = \frac{dc_i(t=0)}{(dt \cdot c_0)} \tag{15}$$

In case of a sufficiently low exchange volume dv per time interval dt, the ratio of total volume V to the exchange volume dv can be introduced as initial concentration change (in case of infinitesimal transition ($dt \rightarrow 0$) this is mathematically correct). For example, if the air exchange per time unit is $^1/_{1,000}$ of the total, the concentration change per time unit is $^1/_{1,000}$, too. This turns (15) into

$$-a = \frac{dv}{(dt \cdot dV)} \tag{16}$$

After the time $t = \frac{V \cdot dt}{dv}$, the complete volume is exchange one time. Therefore, a is the reciprocal of the air exchange time:

$$a = \frac{1}{\text{exchange time}} \tag{17}$$

After a single air exchange, the concentration is:

$$c_i(t) = c_o \cdot e^{-1} \approx 0.37 \cdot c_o \tag{18}$$

For the ^{1}/x-value period (time period in which the concentration drops to ^{1}/x) the following applies accordingly:

$$t^1/_x = \frac{\ln(^1/_x)}{-a} \tag{19}$$

Example: If it is required to lower the value down to 1% of the initial value (12 g per m^3, 1 vol.%, down to 120 mg hydrogen cyanide per m^3, 0.01 vol.%), i.e., down to 1/100 of the initial value, this results to:

$$t^1/_{100} = \frac{\ln(^1/_{100})}{-a} \approx 4.6 \times \text{air exchange time.} \tag{20}$$

The half-value period is:

$$t_{½} \approx \frac{0.693}{-a} \tag{21}$$

Therefore, the concentration has dropped down to half after roughly 2/3 of a complete air exchange. This is true, if the fresh and the old air are mixed perfectly. However, this is not necessarily the case, as there are two other possible scenarios:

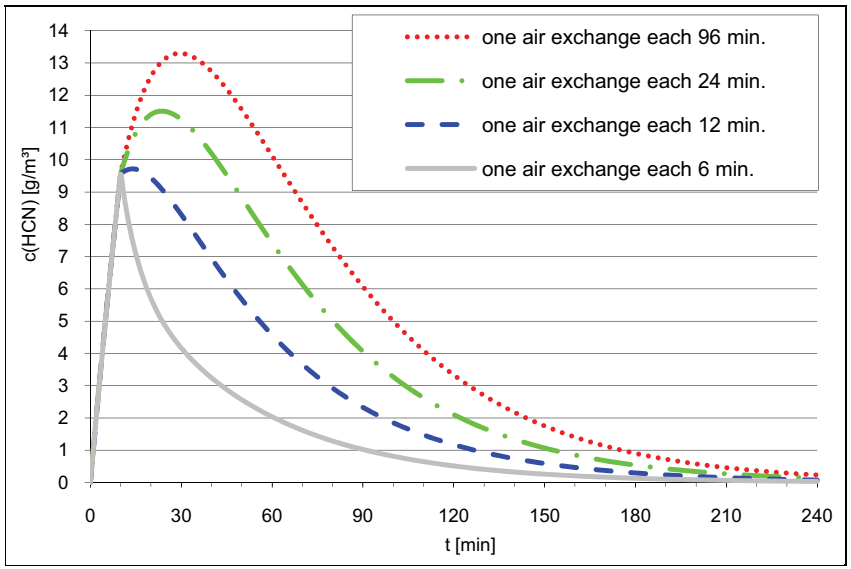
1. Exchange of old gas only (linear, laminar flow along the entire cross-section of the room): air exchange time roughly identical with ventilation time: Technically not given in the facilities under consideration.

2. Exchange of mainly fresh gas (exhaust close to intake), areas of old gas partly not involved: ventilation time is a multiple of what is described above. In our case, this is certainly given for the areas between the corpses, since here almost no mixing of the gases takes place. Additionally, the unfavorable location of the air intakes to the exhausts leads to a partial exchange of fresh gas (air short circuit). This increases the ventilation time by a factor of two to four or more.

The following chapter will determine which scenario was given in the alleged "gas chambers."

7.3.2.2.3. Ventilation of the Morgues of Crematorium II and III

As shown above, when fresh air and stale air mix together, the concentration of the latter falls to only approximately 37% of the initial value after one complete air exchange, and to approximately 14% after a second exchange.



Data are only available on the ventilation installations in Crematoria II and III, so that at this point we have to ignore all other "gas chambers" in this regard.[493] In chapter 5.4.1.2.4., the ventilation capacity of morgues 1 of Crematoria II and III was shown to have been 4,800 m^3 per hour. With a volume of free air in the Morgue 1 of 430 m^3, the volume of the room would be exchanged once in approximately 5-6 minutes.[481]

For morgues 1 of Crematoria II and III under consideration at this point, however, a further problem arises. In particular, the ventilation intake has been installed only approximately 2 m away from the ventilation outlet in the same wall. The distance to the ventilation outlet on the opposite wall, however, is 7.3 m, *i.e.*, 3.5 times as far. The result, in these cellars, is a "ventilation short circuit," especially if we assume that the victims of the alleged mass extermination are all tightly crammed together, especially in the middle of the room, which would further lengthen the fresh air pathway from one side of the cellar to the other. The air blown into the ventilation intake openings would therefore, for the most part, be immediately sucked out through the ventilation outlet openings located nearby.[494] Therefore, it must be expected that the actual ventilation time would be increased in comparison to a perfect mixing of fresh air and stale air as a result of this poor design.

---

[493] Crematorium I is deliberately left out of the discussion, since the mass murders allegedly committed there have, in the meantime, after all, been generally questioned.

[494] A reasonable regulation would have been to install the ventilation inlets on one side of the room, and the ventilation outlets on the other side.

Graph 15: *Simulation of the concentration of hydrogen cyanide in a hypothetical homicidal "gas chamber" of the type of Morgue 1 of Crematorium II in Auschwitz-Birkenau; see text.*

In addition, if we assume that no wire mesh introduction columns existed, as has to be assumed from all extant material evidence, the following problem would also arise: the Zyklon B granules, which in the meantime would certainly have become moist, would lie trapped underneath the bodies in at least some places. To understand how this would effect the ventilation, we have carried out a simulation calculation based on the following assumptions:

1. At 15°C, Zyklon B releases hydrogen cyanide in the dry environment in the manner described by R. Irmscher (see chapter 7.2.). Although the air in the "gas chambers" would have been warmer than 15°C due to the victims' body heat, it also would have had a relative humidity of 100%, plus the Zyklon B would have been lying on a wet floor. Both factors would have "seriously delayed" the release of HCN. Hence I will subsequently use the data for dry, finely dispersed Zyklon B at 15°C.
2. Reaching an *average* concentration of hydrogen cyanide throughout the entire chamber of approximately 5-6 g/m³ after 5 minutes and/or approximately 10-12 g/m³ after 10 minutes (0.5 or 1 vol.%) – necessary for the rapid killing of all victims according to the eyewitnesses – requires the use of approximately 20 kg of Zyklon B (see chapter 7.3.1.3.).

3. The ventilation is turned on after 10 minutes, reducing the concentration of hydrogen cyanide according to the well-known formula (see chapter 7.3.2.2.2.)

The results may be taken from the Graph 15 for four types of air exchanges differing in efficiency: one air exchange every 6, 12, 24 and 96 minutes.[495] A few average values are listed in Table 11, taken from the individual scenarios. The value for 5g/m^3 indicates, when the HCN concentration falls below a value at which it is possible to enter the chamber with a gas mask, but without protective garments and without performing physical work. The value for 2g/m^3 should lie in the vicinity of a value permitting light physical work with a gas mask, but without protective garments. The value for 0.1g/m^3 indicates when the HCN concentration falls below a concentration permitting entry of the chamber without a gas mask and without any health hazard. The column with the heading "$\int c(t)\ dt/10g/m^3$" finally corresponds to a tenth of the surface area under the particular curve. The value corresponds to the duration of a hypothetical gassing of a chamber with a constant 10g/m^3 HCN, when the hydrogen cyanide suddenly rises at the beginning of this period of time and then suddenly disappears at the end of this period. These values can be used for simulation calculations; see next chapter.

The 6 min/air exchange applies in the absence of a short circuit of the air in the chamber. The 12 min/air exchange corresponds to this necessary correction. Both cases assume an empty chamber. In fact, the

---

[495] For those who wish to see it written out:

a. Equation for release of HCN from the carrier material (in fractions):
   $A(t) = e^{-t/a}$
   - in which t = time after the initial release of HCN in minutes
   - in which a = 43.5/minutes (so as to attain the velocity and low atmospheric humidity at 15°C alleged by Irmscher, note 447)

b. Equation for the reduction of the HCN content through ventilation:
   $B(t) = e^{-t/b}$
   - in which b = necessary time for a single air exchange of the room in question.

c. Equation for the actual HCN content:
   i. For the first 10 minutes (no ventilation, only release of HCN):
      $C1(t)=(1-A(t))\times D$
      - in which D = e/f
      - in which e = mass of Zyklon B introduced in grams)
      - in which f = volume of the chambers = 430 m³ (net volume, without the volume taken up by the victims)
      - e has been selected so as to attain a concentration of approximately 10g/m³ after 10 minutes. For the sake of simplicity, I have used 20 kg = 20,000 g .
   ii. Differential equation for the actual HCN content for times after 10 minutes, *i.e.*, with ventilation, iteratively resolved into one minute steps:
      $C2(t+1)=C2(t)\times e^{-1/b}+(A(t))-A(t+1))\times D$
      - in which $(A(t))-A(t+1))\times D$ is the quantity of HCN evaporating from the carrier with each new minute.

Table 11: Some values of the ventilation efficiency of a hypothetical homicidal "gas chamber," with Zyklon B remaining in the chamber, see text. Data in minutes.

Air exchange duration	t (5g/m^3)	t (2g/m^3)	t (0.1g/m^3)	∫c(t) dt/10g/m^3
6	24	61	192	35
12	56	97	228	63
24	81	123	254	90
96	100	144	278	118

ventilation of the intermediate area between the hundreds of bodies allegedly lying around on the floor, and the Zyklon B trapped underneath, will further slow the procedure to a considerable extent, so that, in relation to a hazard-free entry of the chamber, the truth will rather lie somewhere between cases two and four or beyond them.

It may be considered established that under no circumstances could these cellars be entered without a gas mask in less than 3-4 hours after the beginning of the gassing. Hard physical work with gas masks, but without protective clothes, *i.e.*, the alleged removal of the bodies, would not have been possible in less than $1^1/_2$ to 2 hours.

If assuming – against all material evidence – the existence of Zyklon B introduction devices which allowed the removal of Zyklon after the end of the gassing, the resulting data would, of course, look dramatically different, see Table 12. Under such circumstances, it might have been possible to enter the "gas chamber" with a gas mask for hard labor already after 30 to 45 minutes, and without a gas mask within one to two hours. This would then lie at least within the range of some less extravagant eyewitness accounts. That explains also, why Pressac and van Pelt insist on the existence of these introduction columns, contrary to all physical evidence and despite the lack of any documentary proof and reliable witness testimony. Without those introduction columns, however, the scenarios described by eyewitnesses regarding a swift removal of the corpses from the "gas chamber" after the gassing are simply impossible.

These are, of course, only calculated guesses; if one were to ask me whether I would rely upon these values and enter such a "gas chamber" without a gas mask, I would reply that I preferred to insist upon the performance of a traditional chemical test beforehand. The simple reason for this is that all reliable calculation would be rendered impossible by the Zyklon B trapped beneath the bodies, as well as by the wet bodies moistened with hydrogen cyanide.

Table 12: Some values of the ventilation efficiency of a hypothetical homicidal "gas chamber," with Zyklon B removed from chamber, see text. Data in minutes.				
Air exchange duration	t (5g/m^3)	t (2g/m^3)	t (0.1g/m^3)	∫c(t) dt/10g/m^3
6	14	20	37	11
12	18	29	65	16
24	22	38	92	22
96	26	47	119	28

The rooms in Crematoria IV and V which purportedly served as "gas chambers," like farmhouses I and II, allegedly had no ventilation installation and only slight ventilation possibilities by means of a few doors. The use of a room *without* efficient ventilation installations for mass murder at a time and in a place where even dissecting rooms, wash rooms, and laying-out rooms could be and were equipped with ventilation installations, and where many ventilation fans were supplying lots of fresh air in disinfestation rooms right next door, is so absurd that any rational human being ought to refuse to take such stories seriously.

7.3.2.3. Simulation Calculations

The following are the results of a series of simulation calculations for the determination of the relative saturation of the masonry with hydrogen cyanide based on the assumption that similar concentrations of hydrogen cyanide are used in all cases. In so doing, a distinction is made between two sets of circumstances:

1. Disinfestation chamber. The constant concentration assumed for the calculation amounts to 10 g/m³. A constant concentration cannot, however, be assumed, particularly for the existing epidemic disinfestation installations BW 5a und 5b existing in Birkenau, since great quantities of hydrogen cyanide would escape through the non-airtight roof on the one hand, and since both the masonry and the clothing would have absorbed considerable quantities of hydrogen cyanide over time (see chapter 7.3.1.3.3.). We therefore assume two models, as follows: a) one gassing daily with a constant concentration over 6 hours, and b) one gassing daily with 12 hours of constant concentration.[496] This would

[496] In order to keep the HCN concentration in those make-shift delousing chambers of BW 5a and BW 5b constant over 12 hours, this would have required the application of an initial concentration at least twice or thrice as high as 10 g/m², but this would have been impossible due to lack of sufficient Zyklon B. The quantities of Zyklon B necessary for such use would have corresponded to 24 to 30 kg per day, or approximately 9 to 11 tons per year, which is roughly the total quantity delivered to the camp, leaving no HCN for homicidal gassings. Hence, this scenario is unrealistic for our purposes, because our scenario requires homicidal gassings; see also chapter 7.3.1.3.

mean that the chamber was used around the clock, *i.e.*, more or less 24 hours a day, seven days a week, which must be viewed as the extreme upper value.

2. Homicidal "gas chamber." Here as well, our calculation assumes a constant concentration of 10 g/m³. I have selected two different gassing times here: 1/20 day (72 min) and 1/100 of a day (14.4 min). The first value corresponds to the average constant exposure time of "gas chamber" walls to HCN if assuming no Zyklon B introduction columns and a fairly good ventilation after the gassing (see 5th column in Table 11), the second value corresponds to the same scenario, but this time with Zyklon B columns and a close to perfect ventilation after the gassing (see 5th column in Table 12).

In former editions of this expert report, I have used the equations determined in chapter 6.7.4. to calculate the relative saturation of masonry cyclically exposed to hydrogen cyanide. However, after using several approaches on exactly how to do it, which lead to sometimes quite different results,[497] I decided to refer to this equation only in order to establish the time it takes for masonry to reach its maximum saturation or a quasi-constant concentration (20 days and 20 daily cycles, respectively). In this edition, the quasi-stationary concentrations in masonry were calculated iteratively using Fick's law of diffusion.[498]

One wall model used was considered to be insulated at one end that corresponds to the situation as given in morgues 1 of Crematoria II and III, which were built of two layers of brick wall with a insulating layer of tar in between.[499] The other wall model had no such insulation, *i.e.*, it lost HCN on its "outside," leading to an average concentration within the entire wall which is roughly half as high as in the insulated case. This was the situation as it was given in the Zyklon B disinfestation rooms of BW 5a and BW 5b.

Table 13 shows the results of these calculations. Whereas the average concentration profile of the insulated wall model is constant, it is linearly decreasing in the non-insulated walls from the inside out. The maximum average values close to the inner, HCN-exposed surface are

[497] The equations determined in chapter 6.7.4. consist of two terms, which can be handled individually or both together, and it is not at all clear which time value is to be used when switching over from gassing to airing, which all influences the result.

[498] I am not going to explain basic statistical laws of diffusion here. This law is so commonly known that anybody interested in it might look it up in any physics book. Maybe the iterative steps I used were a bit too big, so there is an error margin in my calculations, but if so, it affects all series, so it should not make a difference regarding my comparisons.

[499] See chapter 5.4.1.1. and footnote 189. Though tar is not gas-tight, it still prevents most of the water and HCN to penetrate it.

Table 13: Quasi-stationary concentrations of HCN in masonry in percent of saturation, as a function of daily exposure time to HCN

time	insulated	not insulated, average	not insulated, on surface
14.4 min	1.6%	0.8%	1.6%
72 min	**7.9%**	4.2%	7.8%
6 h	30.9%	**16.2%**	**30.6%**
12 h	56.1%	29.8%	56.2%

quite comparable to the respective constant average concentrations in the insulated cases.

I have emphasized the values of particular interest: In case of homicidal gassings in the morgues 1 of Crematoria II and III (without Zyklon B introduction columns), the walls will reach a quasi-stationary concentration of 8% of their saturation concentration. In case of disinfestation chambers, the value given for 6 hours of exposure to a constant HCN concentration – corresponding to a round-the-clock operation – leads to ca. 16% for the average value of the entire wall, and some 30% for the surface.

The values under consideration here are percent values of the saturation concentration of a wall, *i.e.*, *relative* values. The cases of the disinfestation and homicidal "gas chamber" are only correctly comparable when one considers the *absolute* hydrogen cyanide concentrations in the masonry. If, for example, one considers that, in particular, the interior walls of the disinfestation chambers intended for personal effects were warm, dry walls, while the alleged homicidal "gas chambers" in Crematoria II and III were cool and very moist, then, with equal gassing concentrations, one must multiply the relative concentrations of the homicidal "gas chamber" by the factor of the increased hydrogen cyanide absorption capability of cool, moist walls. If one assumes the value of 8 determined in this regard on page 175, then the absolute average hydrogen cyanide content of the homicidal "gas chamber" would be a value lying around 64% of the saturation concentration of a warm, dry wall in a disinfestation chamber, *i.e.*, four times higher than the average hydrogen cyanide content of the disinfestation chamber wall (ca. 16%), and more than twice as high as its maximum content at the surface (ca. 30%). Even when assuming the existence of Zyklon B introduction columns and a close to perfect success of the subsequent ventilation, the moist and cool homicidal "gas chamber" walls would still have accumulated HCN corresponding to 13% of the average saturation of dry

disinfestation walls, which is close to what would accumulate in those disinfestation walls (16%).

As a result of the high moisture content of those underground morgues, one can see that even with such short gassing times, the walls of a homicidal "gas chamber" accumulate a hydrogen cyanide content which would be quite comparable to that of a disinfestation chamber. Much less hydrogen cyanide in the quasi-stationary condition of the hypothetical homicidal "gas chambers" could only be expected, if one were to assume absurdly short, but technically unfeasible gassing times, the application of very little Zyklon B, or only very few gassings at all.[500]

7.3.2.4. Excursus: Capacity of Protective Filters

Filter devices to protect against hazardous and/or lethal gases and vapors are divided a) into types according to the kind of gas to be filtered and b) into classes according to their capacity. Filters of class 3 with a large capacity are stored externally, usually in a container to be carried at one's side, since they are too heavy to be carried on the mask. They are connected to the mask with a hose. Filters of class 2 are screwed into the mask and form the majority of all used filter types. Filters of class 1 are plug-in filters.

The service life of gas filters depends on:

- Type and concentration of the harmful compound;
- Air demand of the carrier, as a function of the intensity of work performed and the personal constitution;
- Humidity and temperature of the air.
- Needless to say that the Deutsche Institut für Normung (DIN, German Institute for Standardization) has determined the mini-

Table 14: Maximally admissible concentration of harmful compound for protection filters[501]

Gas filter class	Maximally admissible concentration of harmful compound	
1	0.1 vol.%;	1,000 ml m^{-3} (ppm)
2	0.5 vol.%;	5,000 ml m^{-3} (ppm)
3	1.0 vol.%;	10,000 ml m^{-3} (ppm)
Short-term excess up to twice of the table value is permissible		

[500] These calculation were made without considering the effect of an elevated CO_2 content in the alleged "gas chambers," the exact effect of which is not known. Hence, there is plenty of room for future research.

Table 15: Minimum break through times for filters according to DIN 3181 part 1 in minutes[502]

type	test gas	break through criterion (ppm)	class 1 test concentration	class 2 test concentration	class 3 test concentration
A	CCl_4	10	80	40	60
B	Cl_2	1	20	20	30
	H_2S	10	40	40	60
	HCN	10*	25	25	35
E	SO_2	5	20	20	30
K	NH_3	25	50	40	60

* relating to HCN + $(CN)_2$

mum values of break-through times of filters under standard testing conditions. These conditions are:

- 20°C;
- 70 % relative humidity of air;
- 30 liters flow-through of air per minute.

In Table 15 the values of different filter types are given with their respective harmful gas.

Hydrogen cyanide filters used by the Allies during that time belonged to class 3 with filters to be carried externally. The service life of such filters at hard physical labor and 0.05 vol.% of hydrogen cyanide is given as 3 to 5 hours. At a concentration of over 1 vol.%, the gas quickly breaks through even these devices.[503]

R. Queisner wrote a report about his experiences with German filter devices used during the Second World War for delousing procedures with hydrogen cyanide.[504] The filter inserts "*J*" and "*G*" used at that time were especially developed for being applied in air containing hydrogen cyanide and had a service life of 30 min. with a peak load of 1 vol.%. Since the mask carrier is only exposed to small amounts of hydrogen cyanide during delousing activities (during distribution of the product and at the end of the gassing, the hydrogen cyanide concentration is rather low), experience showed that it is possible to use the mask for several hours.

[504] R. Queisner, "Erfahrungen mit Filtereinsätzen und Gasmasken für hochgiftige Gase zur Schädlingsbekämpfung," *Zeitschrift für hygienische Zoologie und Schädlingsbekämpfung*, 1943, pp. 190-194.

According to Schmidt,[441] relaxed humans inhale some 14 liters of air per minute. This can increase up to 50 to 60 liters per minute in case of heavy physical work, in extreme cases even up to 100 to 120 liters.

If, according to Pressac and in agreement with the witness accounts, a concentration of 1 vol.% was used during the gassings, the inmates of the special commands (*Sonderkommandos*), who carried away the corpses out of the "gas chambers" of the Crematorium IV and V as well as out of the farmhouses I/II, which did not have a ventilation system, had to wear gas masks. Equipped with gas filters of class 2 and doing heavy physical work, they would have been exposed to a high concentration of toxic gas. Since hydrogen cyanide is particularly well absorbed through sweat-wet skin, this would certainly have led to signs of poisoning.

The minimum break-through times of corresponding modern gas filters of class 2, type B (for hydrogen cyanide) lies at 25 min. for 0.5 vol.% at an air flow-through of 30 liters per min. In case of sufficiently hard physical labor, this time will be quickly cut to half or a quarter. Therefore, a modern filter of class 2 can offer only several minutes of safety under the circumstances under consideration. Breathing would have been seriously hindered by these filters (max. 5.6 mbar pressure difference at 95 liters per min. according to the current DIN), hence the working speed would have been slow and the demand for resting times and forced pauses due to gas poisonings would have been huge. Since they were especially designed for hydrogen cyanide, the filters of that time had a higher capacity, and consequently their durability might have been correspondingly higher, which, in turn, increased their service time.

Pressac writes[505] that a hydrogen cyanide concentration of 1 vol.% is not tolerable even with filter mask, and that an exposure time of up to one minute is granted only in emergency cases, and this without any heavy physical work!

Finally, a poisoning through the sweat-wet skin would have been avoidable under these circumstances only if the workers would have worked with protective garments in the "gas chamber," which was not reported by any witness and which would have reduced the working performance even more. The accounts of some witnesses regarding the applied concentrations *and* the quick clearing of the chamber after the execution *without* protective garments and masks, on which even Pressac relies, exclude each other and thus can certainly not be correct.

[505] J.-C. Pressac, *op. cit.*, (note 72), p. 16.

It should not be forgotten here that hydrogen cyanide is a contact poison. Transporting corpses, on whose skin huge, possibly lethal amounts of hydrogen cyanide are absorbed, had required that the special commands dealing with these corpses had to wear protective clothes. Finally, when considering the applied concentrations attested to, the guards, like the special commands, would have risked their health. This is true for all "gas chambers."

7.3.3. Evaluation of Eyewitnesses

It is possible to provide a satisfactory answer to the problem of the Zyklon B introduction holes in the roofs of Morgue 1 (the "gas chambers") of Crematoria II and III through the interpretation of air photos and structural considerations. One must therefore conclude that the holes and cracks visible today were only put in during or after the destruction of the building during the winter of 1944-45. This means that the poison gas could not have been introduced into the alleged "gas chambers" in the manner described by the eyewitnesses.

The rapidity of the executions as described by the eyewitnesses, in their extreme values ("a few moments," "a few minutes," "two minutes," etc.) cannot, once again, be attained with Zyklon B under the given technical conditions, and can only be attained through the use of very high quantities of Zyklon B.

Entering the "gas chambers" without protective measures, the performance of heavy physical work in the chambers, sometimes with a naked torso, while eating and smoking, along with testimony relating to large quantities of toxic gas, reveals the perjury of these eyewitnesses.[506]

Equally false are the statements relating to the duration of ventilation of Morgue 1 (the "gas chamber") of Crematoria II and III, since the ventilation would be greatly influenced by various factors (hindrance of circulation by the bodies, the short circuit in the ventilation pathway, the release of hydrogen cyanide by Zyklon B). In fact, safe entry into the "gas chamber" without protective measures can hardly have been possible in less than three to four hours. Finally, heavy physical work could only have been conceivable before the expiration of at least another one and a half hours, even with gas masks.

The eyewitness testimonies relating to the alleged cremation of the bodies, finally, are riddled with fantasy: cremation in deep ditches;

[506] There are, of course, witnesses who allege that gas masks were worn, e.g., C. Vaillant-Couturier, in: *IMT*, vol. VI, p. 216. Protective garments, however, are never mentioned.

cremation with liquid fuels; entirely without – or with ridiculously little – fuel; the destruction of corpses with explosives; the collection of human fat. These have nothing in common with technical reality or possibility, and are largely refuted by the Allied aerial photographic evidence: no huge ditches, no smoke, no fire, no fuel storage areas.

The illogical and ridiculous – in Pressac's words – gassing scenarios in the "gas chambers" of Crematoria IV and V as well as the comparable ones in farmhouses I and II, would have been extremely dangerous for the *Sonderkommandos* (see chapter 5.4.2. and 5.4.3.). Yet these "gas chambers" must have been planned and built as instruments of mass murder,[507] if mass gassings were already underway elsewhere in the camp during their period of construction. All of this must compel people accustomed to thinking in terms of technology and the natural sciences to conclude that the Germans must have decided to choose absolutely the most expensive, laborious, most dangerous and difficult way possible in which to kill people *en masse*.

It would have been logical, for propaganda purposes, to have described the installations such as the disinfestation chambers intended for personal effects located in buildings 5a and 5b as homicidal "gas chambers." But this was never attempted, nor are there any eyewitness testimonies as to such a utilization of these premises. Furthermore, the doors drawn in the plans of the disinfestation chambers of buildings 5b – as well as the doors located there today – open inwards, which would have rendered it impossible to remove bodies lying in front of the doors after the mass gassings. These rooms were, therefore, certainly never used as homicidal "gas chambers." It is nevertheless possible that an attempt was made to represent the disinfestation chamber in building 5b as a (fake) homicidal "gas chamber." The water pipes visible there hang freely in space inside the room, without any connection; only a few of them are equipped with shower heads, while they terminate in the ventilation openings in the exterior wall, *i.e.*, they were installed after the removal of the disinfestation devices (ovens, ventilators, and so on), very probably after the German withdrawal (see Fig. 21). Remarkably, all pipes and fittings have been removed from the real shower room in the same wing (see Fig. 18). In case this is not an attempted falsification, it is still possible that this wing was clumsily converted into a shower room after the end of the war, when Birkenau was used as prisoner camp for Germans. But this is not likely, since this building had

[507] J.-C. Pressac, *op. cit.* (note 72), p. 447

proper showers already, so why dismantle them first, and then construct a makeshift shower in a room unsuitable for it?

Brief mention should be made at this point of the widespread notion that the toxic gas streamed into the alleged homicidal "gas chamber" through shower heads, especially as there are even a few such eyewitness statements. Zyklon B consists of the active ingredient, hydrogen cyanide, adsorbed on a solid carrier material (gypsum) and only released gradually. Since it was neither a liquid nor a gas under pressure, the hydrogen cyanide from this product could never have traveled through narrow water pipes and shower heads. Possible showers, or fake shower heads, could therefore only have been used to deceive the victims; they could never have been used for the introduction of this poison gas. There is general unanimity as to this point, no matter what else might be in dispute.

Table 16: Evaluation of eyewitnesses

EYEWITNESS CLAIM	EVALUATION
Death of all victims after 0 (instantaneously) to 15 minutes.	If high concentrations of hydrogen cyanide are used, as in American execution chambers, death occurs in a period of 10 minutes or even later. During the process, the victim is therefore exposed to a high overdose concentration of hydrogen cyanide. Technically this is not possible with Zyklon B, since the Zyklon B carrier base releases the gas slowly (50% in 30 to 90 minutes, according to the temperature and relative humidity). The distribution of the gas throughout the chamber from a few sources of hydrogen cyanide only, and the absorption of the gas by the moist walls and the nearby victims would further delay the process. Killing all the victims in a few (less than five) minutes would be impossible, even when using very large quantities of Zyklon B (much more than 10g per m^3).
Opening of the doors to the "gas chamber" after the execution (and sometimes a short ventilation time) and immediate commencement of transport of the bodies without gas masks and protective clothing.	The ventilation system, if it existed, did not have the performance to clear the chambers in the time frame attested to. Assuming that the victims died quickly from the high concentrations of toxic gas, then the workers in the *Sonderkommando* would also have been killed by the gas. Working without gas masks equipped with a filter is totally inconceivable; at high concentrations of poison gas, even these are very unsafe. Heavy respiratory devices must be worn at concentrations of over 0.5 vol.%, which would render the removal of the bodies much more difficult. Contamination through the skin must be expected during heavy work, involving perspiration, and due to the high concentrations of hydrogen cyanide on the skin of the victims. At the same time, such concentrations are sufficient to put a stop to the workers' ability to work (dizziness, nausea, etc.). Protective clothing is therefore required.
Blue vapor over the victims.	Hydrogen cyanide is a colorless liquid and/or an invisible gas. The name "*Blausäure*" (blue acid) is due to the reaction of hydrogen cyanide with iron, forming the iron-blue pigment. There cannot, therefore, have been any blue vapor.
Bluish/greenish coloration of the skin of the victims.	Hydrogen cyanide blocks the oxygen supply to the cells. The blood can no longer give off oxygen to the cells. Saturation of the blood with oxygen therefore occurs; the skin of the victim therefore has a reddish, not bluish, appearance, especially on the mucous membranes and during post-mortem lividity. On the other hand, if the victims had slowly suffocated, this could explain bluish coloration of skin.
Attempted destruction of the bodies by means of explosives.	Totally unsuited and dangerous.
Cremation of bodies in crematorium ovens without fuel.	This testimony is quite absurd. Cadavers never burn due to their own fat content alone. Additional fuel is always required.

EYEWITNESS CLAIM	EVALUATION
Commencement of body transport from the chamber of Crematoria II and III 20 minutes after commencement of ventilation, without gas masks.	The unheated morgues 1 of Crematoria II and III, filled with bodies, would have been incompletely ventilated in 20 minutes using the allegedly built-in ventilation installation. Hydrogen cyanide released for hours from the Zyklon B distributed among the bodies, release of hydrogen cyanide absorbed by the skin and walls and the absence of air exchanges between the bodies would have led to ventilation times amounting to several hours, before the cellar could have been entered without gas masks equipped with filters.
Cremation of the corpses in pits 1.5 to 3 meters deep.	Due to the high water table in Birkenau in 1942-1994, deep pits would have quickly filled with water. The maintenance of fires in such pits was not possible.
Cremation of the corpses with methanol and/or old oil.	The complete cremation of corpses requires a high temperature. Liquid fuels always burn only near and on the corpse, so that the heat is lost upwards; in addition, they trickle down into the subsoil in open air. Methanol evaporates very easily and therefore has a very low flame temperature. Experiments with cremations in the open air show that corpses can be carbonized on the outside, but not, however, entirely cremated with these fuels.
Pouring escaping human fat over the bodies.	This is an entirely absurd testimony. If anything burns in the flesh at all, it is the fat. Since the bodies would have been lying in the fire, the fat cannot possibly have been collected outside the fire by means of channels.
Flames shooting out of heavily smoking crematorium chimneys.	Coke fires are very short-flamed and develop only little smoke, and this smoke usually burns within the muffle. Even carbonized, burning corpses do not generate any flame and smoke only slightly if the muffle is working inefficiently. That flames could penetrate through a 10 meter long flue and a 15 ft high chimney to the outside, is technically impossible. Even the fire's reflections disappear in the flue.

7.3.4. An Expert on Cyanide Speaks Out

Gérard Roubeix
51 Av. de la Coquetterie
44000 Nantes

Nantes, the 2nd Nov. 1997
to M. Michel Adam
c/o ANEC
PO Box 21
44530 St. Gildas-des-Bois

Sir,

Having learned about the odious persecution of which you are a victim in the name of "freedom of expression," let me express all of my sympathy and my total solidarity to you.

I have spent 20 years of my career as an engineer in the hydrogen cyanide industry in the service of the groups Pechiney-Ugine-Kuhlmann and Charbonnages de France. In particular, I have been the director of the St. Avold plant, which in 1970, with its production of 40 tons of cyanides per day, was the most important plant worldwide; theoretically, this production would have allowed the lethal poisoning of 500 million human beings on a single day. This shows how I am aware of the problems regarding the handling of HCN. Well, I affirm that all the "testimonies" I have read or heard of concerning these gas chambers, in which 2 to 3,000 people were crammed, are nothing but total fantasy.

I congratulate you for your admirable battle against the hoax. The truth is on its way.

[signed Roubeix]

P.S: You may use this testimony, if necessary."

Michel Adam was a teacher of history and geography in the west of France. At the beginning of July 1997, as a former lady deportee to the concentration camp of Ravensbrück was giving a conference at his school telling about her "memories," he opposed the lady several times by using solid revisionist arguments. Michel Adam was immediately suspended and, after one year of troubles of all sorts, he was dismissed by French Minister for the Arts Claude Allègre on account of the three following official reasons:

– showing his revisionist views in front of his pupils;

– disturbing a meeting of his pupils with a former deportee;
– showing doubts about the credibility of a deportee's testimony.

Already in 1988 Gérard Roubeix wrote a similar letter which has been published elsewhere.[508] He died in 2001.

ANEC stands for *Association normande pour l'éveil du citoyen*, (Norman Association for the Warning of Citizens), which was an association created by the Normandy teacher Vincent Reynouard, who, just as Michel Adams before him, lost his job because of his revisionist views and was sentenced to fines and various prison terms.[509] ANEC published 36 issues of the revisionist periodical *Nouvelle Vision*.

[508] *Annales d'Histoire Révisionniste* 7 (1989), pp. 212f.

Nantes le 2 Nov 97 (87)

à Mr Michel Adam
c/o ANEC
BP 21
44530 St Gildas des Bois

Monsieur,

Ayant appris l'odieuse persécution dont vous êtes la victime au nom de la "liberté d'expression" je tiens à vous témoigner toute ma sympathie et ma totale solidarité.

J'ai passé 40 ans de ma carrière d'ingénieur dans l'industrie de l'azote cyanhydrique au sein des groupes Péchiney-Ugine-Kuhlmann et Charbonnages de France. J'ai été notamment directeur de l'usine de St Auban que j'ai créée et dont la production de 40 T par jour d'ammoniac était en 1970 la plus importante du monde; cette production aurait permis théoriquement d'intoxiquer mortellement 500 millions d'êtres humains en une seule journée. C'est dire que je connais les problèmes concernant la manipulation de l'HCN. Je crois j'affirme que tous les "témoignages" que j'ai lus ou entendus concernant ces chambres à gaz dans lesquelles on enfournait 2 à 3000 personnes relèvent de la plus totale fantaisie.

Je vous félicite pour votre admirable combat contre l'imposture. La Vérité est en marche

7.3.5. Why, Precisely, Zyklon B?

One might naturally wonder why the SS are supposed to have decided to use Zyklon B as an instrument of mass murder. The Soviets, at any rate, killed countless millions of human beings either simply by shooting them in the back of the neck or allowing them to die in camps under miserable conditions. Surely it would have been simpler to leave the people deported to Auschwitz to their fate; they would have perished from hunger and epidemics within a very short time anyway. That is how the Americans murdered approximately 1 million German civilian internees after the end of the Second World War.[510] Instead, the SS at Auschwitz spent almost one billion dollars, in today's values, to bring the epidemics raging there under control, incurring huge expenditures on medical facilities, to cure the internees from the typhus epidemics, which were very often fatal.[511] This alone speaks volumes about the credibility of the conventional wisdom.

The academic question, therefore, of whether or not some other poison gas would have been better suited for the mass murders instead of hydrogen cyanide in the form of Zyklon B cannot, in the last analysis, be answered, since there are no scientifically documented experimental values for mass murder by poison gas.

Theoretically, one could, at that time, have chosen between nitrogen (N_2), carbon dioxide (CO_2), carbon monoxide (CO), phosgene ($COCl_2$), chlorine (Cl_2), hydrogen cyanide (HCN), nerve gases such as Tabun and Sarin, Diesel engine exhaust, internal combustion engine exhaust, producer gas, coke or city gas, process gas, and, possibly, still other, entirely different, instruments of mass murder, suitable even under completely different circumstances (shooting in the back of the neck, hunger, epidemics). But if one really wished to take the trouble to commit mass killings with poison gas, it is most probable that one would have used carbon monoxide, which is definitely lethal to human beings above 0.1%, for the following reasons:

---

[510] James Bacques, *Other Losses*, Stoddart, Toronto 1989; Bacque, *Crimes and Mercies*, Little, Brown & Co., Toronto 1996.

[511] Hans Jürgen Nowak, *op. cit.* (note 102), pp. 323f.; Manfred Gerner, Michael Gärtner, Hans Jürgen Nowak, "Die Kosten von Auschwitz," *VffG*, 6(2) (2002), pp. 146-158; on the medical care, see the unpublished studies by the late C. Jordan on the G. Weise case; see also *idem*, "The German Justice System: A Case Study," in G. Rudolf (ed.), *op. cit.* (note 24), pp. 145-179.

1. The poison gas CO was available in limitless quantities and in lethal concentrations at giveaway prices, substantially cheaper than Zyklon B, on almost every street corner in the Third Reich:
   a. Internal combustion engines easily attain a CO content of 7% by volume, so that they would have been suitable for mass murder. Nevertheless only a very small minority of eyewitnesses speak of the use of internal combustion engines in only one German concentration camp (Sobibor).[512]
   b. Producer gas generators generate a gaseous mixture with a proportion of CO of up to 35% by volume, using only wood or coke, air and water. These generators were installed in hundreds of thousands of vehicles all over German-occupied Europe during the Second World War, since it was necessary to convert to alternative fuels due to the Allied oil blockade. As F.P. Berg has shown, every member of the German Reich Government was familiar with these extraordinarily economical and easily operated installations with their quickly lethal toxic gas, especially the transport experts, whose duty it was to gradually replace all Diesel and gasoline engines with generator gas installations. These were, in some cases, exactly the same people who were entrusted with the deportation and allegedly with the killing of Jews – such as Adolf Eichmann, for example.[512] But it has never been claimed that these installations were used for purposes of homicide.
   c. Toxic city gas with a CO proportion of up to 30% by volume was available in every major city for a ridiculously low price. Consideration would obviously have been given to committing murder with it, had there been any extermination plan.
   d. Process gas: The German corporate giant *I.G. Farbenindustrie AG* had already built a coal gasification/liquefaction plant only a few kilometers away from Auschwitz concentration camp in the early 1940s. Here, by means of various conversion processes, coal was converted into chemical end products, from which oils, fats, fuels, and synthetic rubbers could be made. The first step in this procedure is the generation of process gas, which has a similar composition to coke gas or city gas. The *I.G. Farbenindustrie AG* factory had a concentration camp in its immediate vicinity by the name of Monowitz, which was connected to the extensive system of more than 30 different so-called satellite camps of the Auschwitz main camp in Upper Silesia and Western Poland. If the SS had looked

[512] See Friedrich P. Berg, "The Diesel Gas Chambers: Ideal for Torture – Absurd for Murder," in: G. Rudolf (ed.), *op. cit.* (note 24), pp. 435-469.

for a simpler way to kill millions of Jews, the center of extermination certainly would have been built in the vicinity of Monowitz, with a direct process gas pipeline from the *I.G. Farbenindustrie AG* factory.[513]

2. It would not have been necessary to order and store CO and pay attention to the use-by date, as was necessary in the case of Zyklon B; carbon monoxide would have been available at all times, as soon as the economical installations were completed.
3. The handling of CO would have been considerably simpler for the executioners. Almost the only thing to pay attention to would have been the opening and closing of the CO valve. The handling of Zyklon B, on the other hand, would have demanded a remarkable number of safety precautions on the part of the executioners. The wearing of gas masks, and, when possible, additional protective clothing (gloves), the careful opening of the cans with a suitable tool, the careful introduction of the carrier through the openings, the careful disposal of the Zyklon B residues.
4. CO can be introduced simply and quickly through pressure pipes or through a blower, while Zyklon B, on the other hand, releases its toxic fumes only slowly.
5. In the case of CO, there would not have been so many problems with ventilating the air in the mass execution areas as with hydrogen cyanide/Zyklon B, since the introduction of CO could be stopped simply by closing a valve, and because CO does not adhere to surfaces and is almost insoluble in water – in extreme contrast to hydrogen cyanide.
6. Since CO does not affect insects,[514] it could not be used to combat lice and other carriers of disease. Zyklon B was therefore desperately needed for this purpose, but it was scarce and expensive, because it was used to combat epidemics not only by the SS, but also by German civilian companies, by civilian government agencies, by the German army as well as by German-allied armed forces. Hence any evitable squandering of it for other purposes would have been avoided – even, and especially, at Auschwitz, where typhus threatened not only the lives of the inmates, but also the guards and civilians entering the camp or who lived in the vicinity. In plain English, this means that the typhus epidemic in Auschwitz concentration camp threatened the extremely important production of the war in-

[513] Curiously enough, Dr. Konrad Morgen, an SS judge who investigated criminal activities of SS personnel in various camps, claimed after the war during the *IMT* that exterminations at Auschwitz had been carried out at the Monowitz camp close to the I.G. Farben plant – in stark contrast to all other witnesses; *IMT*, vol. 20, 499, 503f.

[514] Most insects do not have haemoglobin, the blood pigment which transports oxygen in mammals, but which is blocked by CO; see Geraldine M. Baker, E. A. Wright, "Effects of carbon monoxide on insects," *Bulletin of Environmental Contamination and Toxicology*, 17(1) (1977), pp. 98-104; www.springerlink.com/content/u25073273n631311/

dustries located in Upper Silesia, the second-greatest industrial region in Germany after the Ruhr at that time. The struggle against epidemics, for which Zyklon B was undoubtedly needed, was therefore of the greatest importance, in larger quantities than the manufacturer, Degesch, was able to deliver at that time.

Naturally, CO would not necessarily speed up the execution procedure in comparison to hydrogen cyanide, but it would have been safer, more easily available nearby, less complicated, and cheaper.[515]

Certainly,

> *"the bottleneck in the extermination process* […would have been] *the incineration of the bodies, not the gassing itself.* [An appropriate equipment provided,] *A thousand people could be killed in a matter of minutes, or an hour or two at most, counting the entire operation from arrival at the camp to the final ventilation of the gas chamber.*
>
> *Yet to burn the bodies of those thousand people* […would have taken] *quite a long while."*[516]

As C. Mattogno has shown,[461] the cremation installations at Auschwitz were never able to cremate the bodies of the dead from the various epidemics and other unhygienic conditions of Auschwitz camp which occurred anyway, not to mention the bodies allegedly occurring as the result of mass murders. This is a further proof that there was never a program of mass homicide at Auschwitz.

[515] If for no other reason because, according to the establishment literature, CO was also already used in connection with the euthanasia action.

[516] According to a part of the answer from "Nizkor" (www2.ca.nizkor.org/features/qar/qar29.html) to question no. 29: "Why did they use this instead of a gas more suitable for mass extermination?" (www.zundelsite.org/english/debate/debatetoc.html) of a flyer distributed by the Institute for Historical Review: *66 Questions and Answers on the Holocaust*, IHR, Costa Mesa, undated.

8. Evaluation of Chemical Analyses

8.1. Test Sample Taking and Description

As far as I am aware, test samples from buildings at Auschwitz have been analyzed by four persons or groups so far.[517]

1. Fred A. Leuchter, Consulting Engineers, Boston, MA, on behalf of the defense of E. Zündel, Toronto. F.A. Leuchter marked the locations where he took samples from crematoria in maps of these buildings drawn by himself and reproduced in his expert report. Only Leuchter's samples taken from Morgue 1 ("gas chamber") of Crematorium II are reproduced in the sketch below (Fig. 67). J.-C. Pressac has subjected the sample taking to criticism.[49] Leuchter failed to indicate a more exact specification of the sample material; the designation is "brick" in all cases. The sample taking was done without regard for depth. From the traces left by Leuchter in the corresponding places in the masonry, one must calculate sample taking depths of up to 3 cm and more.

2. Prof. Dr. Jan Markiewicz, Jan Sehn Institute for Forensic Research, Toxicology Department, Krakow, on behalf of the Auschwitz State Museum. J. Markiewicz provides more exact data on the sample taking locations, the type of material, and the depth taken in a sample taking records for the samples he took in 1990. The control samples were taken from a disinfestation chamber in the Auschwitz main camp, the interior walls of which, according to the report, were painted during the war, so that only a pale blue tint is visible in places. This is not, therefore, unaltered masonry material; thus, in case the samples were taken from the upper layer of the wall only, one has to expect lower results in comparison to an untreated wall.[61] In 1994 Markiewicz et al. did a second series of analysis of more than 60 samples taken from various buildings at Auschwitz and Birkenau, plus they performed a series of experimental gassings. The descriptions of sampling locations, material type and depth are scanty at best.[62]

3. Dipl.-Chem. Germar Rudolf, Stuttgart, Germany, on behalf of the defense of the late Major General O. E. Remer. The samples were taken in the presence of witnesses by hammer and chisel and immediately sealed in plastic bags. The subsequent numbering of the bags was recorded by hand, including the measured sample taking location and type

[517] C. Mattogno (Rome) has also taken samples from some of the installations ("gas chambers") at Birkenau and has had them analyzed; the findings concur with those of F.A. Leuchter and G. Rudolf. C. Mattogno, letter to the author, Rome, May 26, 1992.

of sample. Table 20 shows buildings, sample taking locations and depths, as well as a brief description of the wall material. The exact locations are shown in the sketch of the corresponding buildings in chapter 5 of this book.

4. John C. Ball, Ball Resource Services Ltd., Delta, BC, Canada. John C. Ball has not given any details about where exactly he took his samples, nor what kind of material it was. According to his own description, at least the samples from the delousing rooms of BW 5a and BW 5b consist of a mixture of material taken at various places of these rooms, both inside and outside. Hence, the same might be true for his other samples. For this reason, we will only briefly list Ball's analysis results here without going into too many details about how they are to be interpreted.

8.2. Analytical Methods

The analyses were performed in each case respectively by:

1. Prof. Dr. J. Roth, Alpha Analytic Laboratories, Ashland, Massachusetts. For the cyanide analysis, this laboratory used a procedure carried out analogously to the German standard (see 3.).[518] Control analyses were prepared for some test samples near the detectable threshold of 1 mg cyanide per kg test material. The results fluctuated up to 40%.

2. Jan Sehn Institute for Forensic Research, Toxicology Department, Krakow, Poland, under Jan Markiewicz. The Polish scientist used the micro-diffusion chamber procedure, which does not permit the detection of Iron Blue.[519] The Poles claim that the detection threshold for other cyanides lies at 3-4 µg per kg sample material, yet the paper they cite clearly gives 0.2 mg/l (200 µg/kg) as a threshold for aqueous solutions.

3. Fresenius Institute, Taunusstein, Hessen, Germany, with no knowledge of the origins of the samples. Proof of the presence of cyanide was produced in conformity with DIN 38 405, section D 13. The detection threshold lies nominally in the range from 0.5 to 0.1 mg per kg.[520]

---

[518] The iron content was also determined by means of ICP spectrometer. The values lay between 6 and 7.5 g per kg.

[519] Joseph Epstein, "Estimation of Micro-quantities of Cyanide," *Industrial and engi-neering Chemistry*, 19 (1947), 272-274; In this procedure, the sample is to semi-concentrated sulfuric acid for 24 hours. The gases released are only collected by means of diffusion in a KOH collector.

[520] Driving out the hydrogen cyanide by boiling the sample for one hour in aqueous HCl in a slightly reductive medium ($SnCl_2$), Driving out in the continuous stream of air, collection in the

All values below 0.5 mg per kg are uncertain and are commonly marked as "not detected (ND)." Control analyses were performed by the *Institut für Umweltanalytik Stuttgart*, IUS (Institute for Environmental Analytics) using DIN 38 405, section D 14, which differs from D 13 only by not adding cadmium salts (Table 21). According to personal communication from the manager of the *Institut für Umweltanalytik Stuttgart*, the analytical method used is designed to detect cyanides in aqueous solutions. Since cyanides bound within solid samples are at times hard to dissolve, detection limits are expected to be considerably higher, but he did not know of any defined treshold value.

4. Unknown. However, the results indicate that the method used was similar to the one used by Leuchter/Roth and Rudolf/Fresenius.

8.3. Evaluation of Analytical Results

8.3.1. F.A. Leuchter/Alpha Analytic Laboratories

All of Leuchter's positive findings from the alleged homicidal "gas chamber" lie in the vicinity of the "official" detection threshold (1 mg per kg) and must be expected to exhibit very high fluctuations. Control sample no. 32 is from the disinfestation wing of building 5a (which Leuchter calls "disinfestation chamber 1"). The foundations of Crematoria IV and V are alleged to have been rebuilt from the rubble of other buildings (see chapter 5.4.2). Thus, the analyses of samples originating from these walls are nevertheless interesting, due to their positive findings in places.

That the analytical values of samples from areas protected from environmental influences are just as low as results from exposed locations, or not detectable at all, led Leuchter to the conclusion that the environmental influences could not have considerably reduced the cyanide content of the exposed buildings,[521] which would be in accordance with the findings in chapter 6.6. According to Leuchter, low cyanide traces may have resulted from an isolated fumigation of the morgues for pest control, since interior disinfestations were carried out in many camp buildings at that time. The positive result (1.3 mg per kg) of sample 28, which Leuchter took from the partition of the former washroom to the dissecting room of Crematorium I, a wall which never formed part of the alleged "gas chamber" and moreover was probably newly erected

aqueous KOH collector. Finally, photometric or titrimetric testing depending on the concentration in each case. Proof of iron was achieved here by the ICP spectrometer.

[521] F.A. Leuchter, press release, Boston, February 13, 1990.

during the conversion to an air raid shelter, is remarkable. This result is approximately as high as the rest of the samples, including those from the foundation walls of Crematorium IV and V, which were rebuilt after the war using unknown material. These values may be explained by either of the following reasons or a combination of them:

1. Cyanide traces of this minimal order of magnitude may be present anywhere, which is, however, improbable.
2. This air raid shelter, like all rooms in Auschwitz-Birkenau, was occasionally fumigated with Zyklon B for disinfestation purposes.
3. Analytical values in this order of magnitude (near the detectable threshold) are not reproducible and therefore cannot be interpreted due to the limited efficiency of the method. They are equivalent to zero values. In view of the results to be discussed below, this reason appears the most probable.

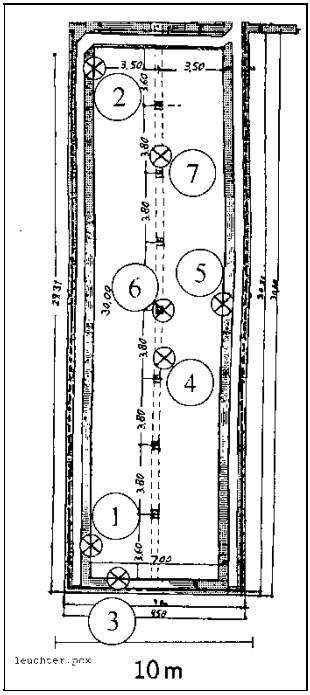

Fig. 67: *Sketch of Morgue 1 ("gas chamber") of Crematorium II in Birkenau with test sample taking locations by F.A. Leuchter:*[30]

- *Samples 1,2,3,5 from Masonry;*
- *Sample 4 from the ceiling;*
- *Sample 6 from the pillars;*
- *Sample 7 from the debris on the ground.*

According to Bailer, the high cyanide content of the control samples taken by Leuchter in the disinfestation wing is to be attributed either to an artifact, an error in the sample taking, or an analytical error. He understands an artifact to mean that the wall of the disinfestation wing was painted with blue paint, precisely, an Iron Blue paint, at an earlier time. Bailer further expresses the opinion that no Iron Blue could form in the masonry material due to the alkaline environment. In addition, the high cyanide content of 1,050 mg per kg is said to mean that the walls consist 0.1% of pigment, which in his opinion could not possibly be true.[522]

As shown in chapter 6.5., the environment is only alkaline in the non-carbonated masonry. It was also established that an alkaline envi-

[522] J. Bailer, *op. cit.* (note 56); similar to *ibid.*, in B. Bailer-Galanda *et al.* (ed.), *op. cit.* (note 58), pp. 112-118.

ronment even supports the accumulation of cyanide and certain other steps in the reaction towards the formation of Iron Blue. If one assumes, as an extreme case, a complete conversion of all iron compounds contained in the masonry into pigment (1 to 2% iron content), the values found by Leuchter are even rather low. Whether the walls of the disinfestation wing were painted blue, *i.e.*, whether a high cyanide content can only be found on the upper, *i.e.*, the paint layer of the wall, will be discussed at a later time.

Pressac opines that the low cyanide traces in the masonry of the crematoria are the final proof of the existence of the "gas chambers," since they are still detectable today after what was, in his opinion, a short exposure time and low reactivity of hydrogen cyanide on cool masonry and despite corrosion and erosion.[523] He furthermore expresses

Table 17: Cyanide concentrations in the masonry of "gas chambers"/disinfestation chambers: Leuchter

According to F.A. Leuchter/Alpha Analytic Laboratories, Ashland, Massachusetts, USA

Test sample no.	Sample taking location	CN^- [mg per kg]
1-7	Crematorium II, Morgue 1	0.0
8	Crematorium III, Morgue 1	1.9
9	Crematorium III, Morgue 1	6.7
10,11	Crematorium III, Morgue 1	0.0
12	Door sealing	0.0
13,14	Crematorium IV, morgue, chimney room	0.0
15	Crematorium IV, chimney room	2.3
16	Crematorium IV	1.4
17-19	Crematorium IV	0.0
20	Crematorium IV	1.4
21	Crematorium V	4.4
22	Crematorium V	1.7
23,24	Crematorium V	0.0
25	Crematorium I, morgue	3.8
26	Crematorium I, morgue	1.3
27	Crematorium I, morgue	1.4
28	Crematorium I, wash room	1.3
29	Crematorium I, morgue	7.9
30	Crematorium I, morgue	1.1
31	Crematorium I, morgue	0.0
32	Disinfestation chamber 1	1,050.0

The morgue of Crematorium I and Morgue 1 of Crematorium II are alleged to have been homicidal "gas chambers."

[523] *Op. cit.*(note 49); *ibid.*, *op. cit.* (note 72), p. 133.

the opinion that warm walls would be necessary for the formation of the pigment.[524] Just how unrealistic this opinion really is, has already been shown: Firstly, the pigment formed is durable (chapter 6.6.); secondly, cool and moist walls have a higher reactivity to pigment formation than dry and warm walls (chapter 6.5.); thirdly, Leuchter's sample no. 28 proves that the cyanide traces are not caused by homicidal gassings.

8.3.2. Institute for Forensic Research, Krakow

The analytical values shown in Table 18 were never published by the Jan Sehn Institute. Note that in this and in the subsequent table I have added a column to the right in italics listing the cyanide concentration as it should have been rendered, since the method used warrants a reliable detection only up to 0.2 mg/kg at best. The results of Table 18 became public knowledge only due to an act of indiscretion. The results

Table 18: Cyanide concentrations in the masonry of "gas chambers"/ disinfestation chambers: Krakow I

According to the Jan Sehn Institute for Forensic Research, Department for Toxicology, Krakow, Poland, 1990, data in mg per kg

#	Building	Sample taking location and -depth	Material	CN^-	*CN^-_**
1	Disinfestation Block 3	Room 4, around the ventilator opening, 2 mm	Plaster	0.068	*ND*
2	Disinfestation Block 3	Room 4, next to doors to Room 3, 2 mm	Plaster	0.036	*ND*
7	Disinfestation Block 3	Room 3, below window, opposite, 2 mm	Plaster	0.076	*ND*
8	Disinfestation Block 3	Door opening between Room 2 and 1, 2 mm upper left	Plaster	0.140	*ND*
9	Disinfestation Block 3	Like Nr. 8, lower left	Plaster	0.404	*0.4*
10	Disinfestation Block 3	Room 1, Ventilator opening, 2 mm	Plaster	0.528	*0.5*

15	Crematorium II, Morgue 1	Concrete support columns	Plaster (?)	0.024	*ND*

* Values as they should have been rendered if abiding by the proven detection threshold of the method; ND = not detected; 4 additional samples from Crematorium II, 1 from Crematorium I, 1 from Crematorium V, in each case an alleged "gas chamber," and 2 control samples contained no detectable traces of CN^-.

[524] J.-C. Pressac, *op. cit.* (note 72), p. 53.

appear to suggest that the alleged "gas chambers" exhibit either no cyanide residues at all or values which are clearly lower than those found in samples taken from the disinfestation chambers. The scientist responsible, Prof. Markiewicz, writes about the chemistry involved:[61]

> *"Hydrogen cyanide is a weak acid, which has the result that its salts decompose slightly in the presence of stronger acids. One of these stronger acids is carbonic acid, which arises from the reaction between carbon dioxide and water.* [Even] *stronger acids, such as, for example, sulfuric acid, decompose cyanide even more easily. Complex compounds with cyanide*

ions with heavy metals are more durable. Among such compounds is the already mentioned 'Prussian Blue' [=Iron Blue]*, but even this decomposes slowly in an acid environment.*

One could hardly expect, therefore, that building materials (plaster, brick) exposed to environmental influences (precipitation, acid oxides, especially sulfuric and nitric monoxide) would contain derivative compounds of cyanides after a period of 45 years."

This contradicts the facts established above, and so to repeat:

a) Carbon dioxide is only slightly soluble in water and hardly forms carbonic acid in water at all (see chapter 6.5.6.); actually, the water is primarily responsible for the decomposition.
b) Iron Blue (Prussian Blue) is extraordinarily stable in acids and is not destroyed by the influences of weathering, even over decades (chapter 6.6.).

In a private exchange of correspondence with Werner Wegner, Prof. Markiewicz displayed his ignorance once again:[525]

"VIII. Water activates many chemical processes. The chambers were certainly moist. What kind of influence this exerts upon the binding of HCN by cement (wall plaster) – is unknown to us. […]

IX. The blue stains on the exterior walls of building 5a are not easily explained. Above all, we must examine whether or not it is actual Berlin Blue [=Iron Blue…]*"*

In a later study, these authors published additional analysis results of samples taken later, using the same analytic method. According to these analyses, the cyanide concentration of samples taken in a disinfestation chamber and in alleged homicidal "gas chambers" were in the range of 0.0 to 0.9 and 0.0 to 0.6 mg/kg, respectively (see Table 19). This study also discussed the selection of the analytical method.[62] This was said to have been selected because the authors could not imagine how blue iron cyanide compounds could form in the masonry:

"It is hard to imagine the chemical reactions and physicochemical processes that could have led to the formation of Prussian blue in that place."

They furthermore assume, together with J. Bailer,[56,58] that the blue pigmentation of the disinfestation chamber walls could be due to a coat of paint. To exclude this pigmentation from the analysis, they decided to apply a method which is insensitive to iron cyanides.

---

[525] Letter from the Prof. Dr. Jan Sehn Institute for Forensic Research, Department for Forensic Toxicology, Krakow, to W. Wegner, undated (winter 91/92), (illegible signature) unpublished.

An exchange of correspondence with myself in 1995 once again revealed the general incompetence with which the Polish researchers approached this set of problems.[63,64]

A more detailed discussion of the Polish findings appears in chapter 8.4.2.

8.3.3. G. Rudolf/Fresenius Institute

Only a few samples were taken from the alleged homicidal "gas chambers." Care was taken to ensure that samples were only taken from material not exposed to weathering. Only a few places in Morgue 1 (the alleged "gas chamber") in Crematorium II at Birkenau, where a pillar supports the roof even today and has therefore visibly protected both the underside of the roof and parts of the wall from all influence of weathering, exemplified by the deposition of spider webs many years old and the absence of any trace of lime precipitation on the concrete or mortar, which would be caused by rain water.

Many samples have already been taken from the alleged "gas chambers" by the Krakow team and Leuchter, all with at least nearly negative results. Since it was above all a matter of clarifying the question of which circumstances favor the formation of pigment and since clearly positive findings were not to be expected according to the analyses performed in the alleged "gas chambers" thus far, the sample gathering took place chiefly in the disinfestation chambers of buildings 5a and 5b in construction section Ia and/or Ib. It is known that their walls not only contain large quantities of pigment, but that their age also corresponds approximately to that of the crematoria on the same location, which cannot be said of the buildings in the main camp. The age can, but need not, have an influence on the chemistry of the wall materials. Furthermore, these buildings are not so much in the spotlight of the museum activity as those in the main camp, and therefore rather permit hope of an absence of subsequent building alterations.

Finally, samples were taken from a few inmate barracks to examine Leuchter's argument that low cyanide traces could also result from a few fumigations for pest control. The numbering of the barracks corresponds to those found on the barracks today.[526] See also Fig. 12 in this regard.

[526] J.-C. Pressac, *op. cit.* (note 72), p. 514, plan of Birkenau camp with barracks numbering.

8.3.3.1. Samples 1-4: Crematorium II, Morgue 1

On the taking of samples 1 to 3, see Figure 28 (page 86). An extremely high concentration of cyanide on the surface of the material must generally be expected. To investigate this, sample 1 contains, principally, concrete prongs from the ceiling/underside of the roof (caused by wooden planking), that is, the most exposed part of the concrete, as well as material from the uppermost layer of concrete, 1 to 2 cm thick, including a piece up to a depth of approximately 3 mm.

Sample 2 contains concrete to a depth of 5 mm, taken from the place at which the piece extending inward up to a depth of 3 mm was obtained in sample 1.

Separation between material from the topmost layer (sample 1) and lower layers (sample 2) was not entirely possible due to the extreme hardness of the concrete.

Sample 3 is a harder plaster, obviously rich in cement, extending to the first row of bricks.

Sample 4 originates from the plaster of the concrete beam in the chimney wing (rubbish incineration) of Crematorium II. It is only interesting as a control sample in addition to the others.

The results lie in the same order of magnitude as Leuchter's positive findings from other alleged "gas chambers," although Leuchter had no positive results in samples from Morgue 1 ("gas chamber") of Crematorium II. The difference between samples 1 and 2 may indicate that a

Table 21: Analysis results from the Institut Fresenius and the Institut für Umweltanalytik, Stuttgart (IUS)

In both cases the cyanide demonstration took place according to DIN 38405/D13. Data in mg CN^- per kg.

Sample	Sample taking location	Fresenius	IUS
3	Morgue 1 ("gas chamber"), Crematorium II, wall plaster 0-1.5 cm	6.7	< NG
8	1b barracks 13, partition wall of berth, 3-5 cm	2.7	< NG
11	B1a, building 5a, interior side of exterior wall (west), 1-10 mm	2,640.0	1,430*
25	Untreated brick	9.6	9.6
26	3 additional samples of fumigated brick	-	<NG*

* This sample was examined according to DIN 35 405/D14. Here in contrast to D13 no cadmium salt was added. Nothing is known as to the effects on the results. Demonstrable threshold (NG) in each case 0.5 mg per kg.

depth profile is actually prevalent in the concrete. Table 21 shows a list of control analyses. Sample 3 mentioned above with a low positive result of 6.7 mg/kg now has a value below the detectable threshold (0.5 mg per kg). This confirms the statement made in chapter 8.2. that values near the detectable threshold are not reproducible.

8.3.3.2. Samples 5 to 8 and 23, 24: Inmate Barracks

Samples 5 and 8 are from a large lump of plaster a few centimeters thick taken from the large room of the respective barracks (see Table 20, p. 239). A depth profile was not drawn up; the values must therefore be viewed as average values. Samples 6 and 7 are from the special room located at the west end of these barracks. Samples 23 and 24 are from the exterior wall of the large room of a third barrack.

Quantities of cyanide on the order of magnitude of those found by Leuchter in the alleged "gas chambers" can apparently also be found in the wall material of the inmate barracks. This is indicated by the results of sample 8. All others are also positive, but notably lower. In this case as well, the control analysis (Table 21, p. 243) failed to yield reproducible results.

8.3.3.3. Samples 9 to 22: Disinfestation Building

With regards to the sample taking locations of the individual samples, see Figs. 18f. Judging from the consistency, the material used to build the brick walls of buildings 5a and 5b is a mortar rich in sand but extremely poor in cement (extremely crumbly), covered with a lime mortar plaster.

Building 5a: What is remarkable about the outside of the exterior walls of the disinfestation chamber of BW 5a is that, in places, it exhibits blue bricks and mortar joints (see 68, above). Sample 14 is a loose fragment of brick which is clearly dark blue at all points facing outwards and therefore exposed to weathering. Sample 15a is mortar from the south wall, only the topmost layer of which was blue to a depth of approximately 1 mm. The cyanide value at this point must have been above the average value of the first approximately 3 mm. Sample 15b is a fragment of brick, the blue layer of which was separated with a spatula (sample 15c). The mass of the remaining fragment amounted to approximately twenty times the layer scratched off; only slight cyanide concentrations are detectable here. The average concentration here must have been around 120 mg/kg. On the brick as well, the pigment has only formed in perceptible quantities on the outermost side, that which

is exposed to weathering (in this regard, see the exterior wall of the disinfestation chamber in Stutthof concentration camp, Fig. 65).

Very important is the confirmation of the fact that the pigment actually possesses an enormous environmental resistance, since samples 14 to 15c were exposed to intensive sunshine, wind, rain, etc. for more than 40 years. But how did the pigment arise in such high concentrations at this precise location, although the outside of the exterior walls were not exposed to any direct fumigation? The low quantities of cyanide which diffused through the masonry are apparently sufficient to enable the formation of pigment on the outside of the wall, which was moist, especially during rainy weather, and its iron compounds were certainly massively activated by environmental influences.

The inside of the exterior walls of the disinfestation wing of building 5a are almost completely blue, even dark blue (see Fig. 69, below). Interestingly, the pattern of the brick structure located below the plaster has made an imprint on the intensity of Iron Blue formation in the upper layer of the plaster. Such a phenomenon is similar to, *e.g.*, the well known condensation of excessive atmospheric humidity on cool walls (for example, in large groups of sweating human beings, such as at rock concerts, in discotheques, or, generally, in poorly heated rooms), which also leads to the formation of patterns exhibiting the underlying brick

Fig. 68: *The outside of the external wall of hydrogen cyanide delousing wing of building 5a in August 1991. Small amounts of cyanide which diffused through the walls are discoloring them at places still today. 50 years of the most detrimental environmental influences did not change this fact.*

structure of such walls. Differently-baked bricks have a different tendency towards accumulation through condensation due to their differing heat conductivity. Differing reactivity to the formation of cyanides due to differing moisture contents and temperatures may therefore be the cause of this effect, but also differing transport capacities for migrating cyanide salts due to differing moisture contents.

Underneath the first layer of wall plaster, only approximately 1 mm thick, the material appears, by contrast, pale blue, just like the entire east wall of the wing, which is an interior wall of the original disinfestation chamber and whose discoloration is much less intensive (samples 12 and 13).

The interior walls of the same room, which were incorporated at a later time, *i.e.*, those belonging to the hot air disinfestation chamber (see Fig. 19), exhibit, as expected, no trace of blue.

The results of samples 9 and 11, and 20 and 22, resp., confirm the first impression. The topmost layer of plaster on the inside of the exterior walls has a very high cyanide concentration; underneath, the concentration decreases. The high cyanide concentration of sample 11 could not, however, be exactly reproduced. The result of the control

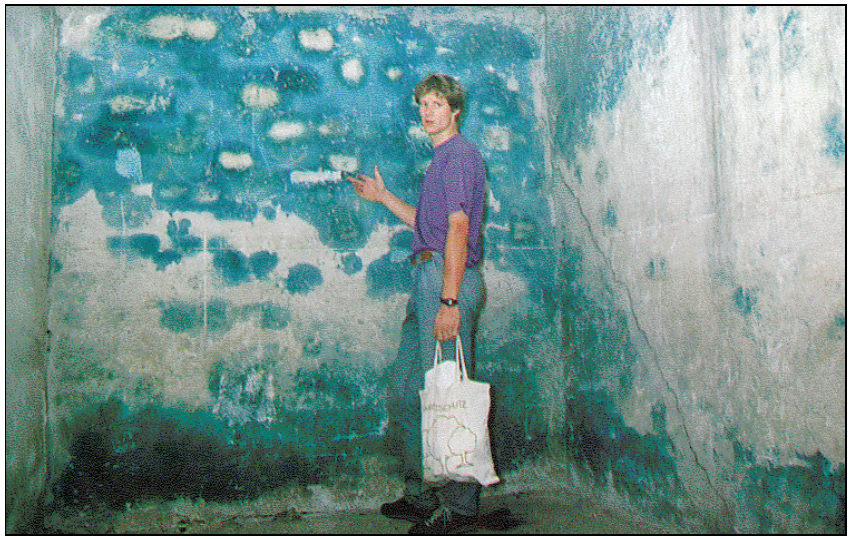

Fig. 69: *Picture of a room located in the northwest of the disinfestation wing of building 5a (see Figure 19). The exterior walls are located in the background and to the right, showing intensive blue discolorations caused by iron Blue. Taking locations of samples 9 and 11 are visible. On the left in the picture is the interior wall, erected during the conversion to a hot air disinfestation chamber. Sample 10, with a slightly positive cyanide content, was taken from this wall.*

Fig. 70: *Picture of the door frame in disinfestation wing of building 5a. the lower, rusty hinge has developed Iron Blue under the influence of hydrogen cyanide. Sample taking location of sample no. 18.*

analysis lies at only 54% of the first value. The slightly different analytical procedure may be responsible for this (see footnote in Table 21).

In pure Iron Blue, there is approximately 0.82 gram of iron for each gram of cyanide. The iron analysis, assuming that the cyanide is present completely in the form of Iron Blue, shows that, in sample 9, approximately ¾ of all iron was converted to pigment. If one considers that not all iron can be reached by the hydrogen cyanide, then one can speak of a near-saturation of the upper layer of material with the pigment. The drop in the concentration from the topmost layer to the lower layers is explained, for one thing, by the linear gradient which must be expected in non-isolated walls (see chapter 7.3.2.3.). Furthermore, as with the blue pigmentation of the exterior of the walls, the effect of accumulation of cyanides on the surface through evaporation of water carrying soluble cyanide compounds must be considered, even though this effect was certainly smaller on inside walls than on outside walls due to lack of air exchange in these rooms after the war (high relative humidity of the air, no wind), and due to the lack of sun activity in the room equipped with windows facing northwards only, see Fig. 69.

Samples 12 and 13 correspond to samples 9 and 11, taken from the interior wall only, from the east wall, near one of the hot air chambers. The surface concentration is considerably lower than on the inside of the exterior walls, there is no recognizable concentration profile. The

reason for this may be that the dry walls allow the hydrogen cyanide to diffuse more easily into the masonry, while the hydrogen cyanide more readily reacts superficially on the moist exterior walls. It is more probable, however, that no migration of soluble cyanide salts to the surface took place in the interior wall due to dryness. These samples are also interesting insofar as they prove that high quantities of cyanide compounds, highly-resistant for long periods of time, can form on warm and dry interior walls. Due to the high ground water table in Birkenau, as well as due to the lack of an effective heat insulation, the exterior walls must be expected to have been quite cool and moist even when the interior was heated, particularly during the cool seasons.

The samples from the walls added during the conversion to hot air disinfestation should exhibit no cyanide residues. Accordingly, sample no. 10 from the interior wall incorporated at a later time exhibits only a very low cyanide concentration near the detectable threshold. Sample 21 was taken from the mortar between the bricks of the wall installed later, at a depth of 1 cm to 5 cm into the masonry. There is a crack in the masonry of the interior wall at this location. The analysis shows minimal but hardly interpretable traces of cyanide below the detectable threshold in this interior wall as well. This finding may indicate disinfestation of these rooms after the conversion to hot disinfestation, if the slight quantities have not in any case lost all probative value, like the

Fig. 71: *In contrast to building 5a (see Fig. 68), the disinfestation wing of building 5b was used as a hydrogen cyanide delousing chamber for a longer period of time. Subsequently, the outside of its walls are covered with blue spots, unimpressed by 50 years of weathering here as well.*

control analyses of the other samples have shown.

Sample 18, finally, was taken from the door frame, which was only incorporated after the conversion to hot air disinfestation. Below the lower hinge, the wood exhibits a visibly blue pigmentation (see Fig. 70, p. 247). The pigment was able to form here due to the moisture in the floor, in connection with the rusting iron. This is assuming that the rooms were either charged with hydrogen cyanide after the conversion of the installation or that the floor of the installation continued to give off cyanide over longer periods of time. In the first case, the cyanide traces in the walls added later (samples 10 and 21) could actually be explained by fumigation of the rooms. However, during the conversion of this wing to a hot air disinfestation facility, this gas-tight door may have been removed from the access way to this wing and re-used here, so that the cyanide would result from earlier fumigations. The analytical results should only be conditionally considered as qualitative, since organic material can be a disturbing factor during analysis. In any case, the high reactivity of moist iron oxide mixtures (rust) is confirmed.

Building 5b: The exterior walls of disinfestation wing BW 5b are not only blue in places, as in the case of BW 5a, but rather, almost completely so, even below the ground (see Fig. 71, below). An exception here is the east wall, which hardly exhibits any blue pigmentation (see Fig. 20, p. 70). The analysis of a fragment of brick from the south side (sample 16) therefore shows an extremely high value. Here, the pigment extends farther into the masonry. Here as well, weathering has had no visible or measurable effect on the pigment concentration. Approximately 17% of the iron in the fragment of brick has been transformed into pigment, despite the only slight concentration in cyanides able to reach the exterior of the masonry wall here as well. The conspicuous difference between Building BW 5b and 5a, which is only blue in places, is explained by the longer period of use of the 5b wing as a Zyklon B disinfestation chamber. The reason for the perceptibly lesser blue pigmentation of the east side of the exterior wall of this wing can be explained by the lesser influence of weathering on this side (east winds are mostly accompanied by dry weather in eastern Europe).

When examining the interior of this wing, one is surprised by the walls, which are mostly white. Pale green stains are visible only in a few places. The analysis of the green-colored plaster underneath the upper layer, sample 17, however, shows the highest value found anywhere, despite the thick layer of plaster consisting of a compact, very hard material, 3 to 4 mm thick. With relation to the transformation of

the iron, what was said of the upper layer of plaster in BW 5a only, is true here: near saturation. The color of the material, here only greenish, is apparently not directly meaningful with regards to the cyanide concentration. Because even in the presence of maximum values, the proportion of pigment in the plaster only amounts to 1.5 %, the intense blue color in places on the surface of the inside of exterior walls of BW 5a cannot moreover be explained in this manner. Rather, the dark blue colors result from a still higher concentration of pigment in the uppermost layers in the micro-meter range of magnitude caused by the accumulation processes of migrating, soluble cyanide salts as described above.

That these accumulation processes did not occur on the surface of the inside of building 5b may be explained by the different type of material and its preparation. The hard, iron-poor interior plaster of lime mortar adheres very poorly to the wall and is already falling off in some places. The contact between plaster and wall is so poor in places, that when one knocks on the wall, one hears that there is a hollow space beneath. Such weak contact between wall and plaster, however, prevents moisture in the wall from diffusing through to the surface plaster and carrying soluble cyanide compounds (for example, iron(II)-cyanide) with it.

Sample 19 was divided in two, since the upper layer of plaster in this room is visibly different from the layer lying beneath: The first 4 mm of plaster consists of a white, brittle, hard material (sand-poor lime plaster), while the layer underneath consists of an ochre-colored, sand-rich lime plaster. The separation was not completely successful; parts of the sand-rich mortar remain in sample 19a. The analysis for iron, which might possibly have been even lower in the presence of complete separation, confirms the assumption that the upper layer is an iron-poor lime plaster. This explains the deficient formation of blue spots of pigment on the surface of the plaster in this room, since there is too little iron available for the formation of pigment. Nevertheless, even the upper layer of plaster exhibits quite high cyanide values. This shows that the layer of plaster was not applied after termination of the disinfestation actions.

8.3.3.4. Samples 25-30: Tests

For an evaluation of the reactivity of hydrogen cyanide with building materials, a series of tests was undertaken; during the first series, only brick was fumigated with hydrogen cyanide, generated from a defined

quantity of $KCN+H_2SO_4$ in a gas-tight container. Over the course of the tests, it became apparent by means of sensitive differential pressure measurements that only a part of the hydrogen cyanide added to 16% sulfuric acid was released as gas. Hydrogen cyanide is so easily soluble, even in this acid, that only a portion of it is actually released into the gas room. The actual quantity of gas in the reaction container therefore lay far below the mathematically calculated 3.7% by volume, while the pressure measurements consequently lay around 2 % by volume.

Regarding the design of the reaction container from a glass cylinder, sealed above and below by PVC plates with gas outlets and sealed with rubber O-rings, see Fig. 72. 16% H_2SO_4 was placed in a crucible, KCN was added by means of a magnetic lever mechanism with the container sealed. The mixing was performed by means of a magnetic stirrer.

The samples listed in Table 22 were analyzed. The following parameters were kept constant:

- 11°C air and sample temperature;
- 90% relative atmospheric humidity;
- Storage of the samples for approximately five weeks under these conditions prior to initiation of the tests;
- Sealing of the samples on all sides, except for one frontal surface, with paraffin 52/54[527] (thus fumigation on one side only);
- Fumigation with 2% by volume hydrogen cyanide;
- 24.75 hours fumigation time;
- Storage of the samples after fumigation at room temperature and low atmospheric humidity for 71 days.

Exceptions from these conditions are listed in the right column of Table 22 (p. 252). Following fumigation,

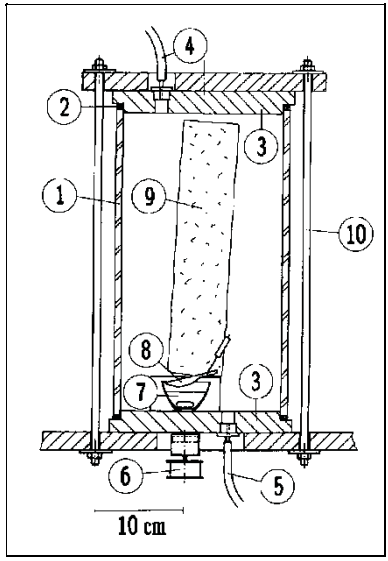

Fig. 72: *Construction drawing of the experimental container for the fumigation of material samples with hydrogen cyanide.*

[527] Melting point between 52 and 54°C.

the topmost layers of the sealed surfaces of samples 27 to 30 were removed, and hence the sealing layer of paraffin. The additionally moistened samples 27 and 30 made themselves perceptible by an intense odor of hydrogen cyanide during storage at room temperature, in contrast to samples 28 and 29 which were only moist by nature. The odor of hydrogen cyanide disappeared suddenly upon additional moistening. In the case of the cement mortar sample, the odor was no longer perceptible after a week, while in the case of the lime mortar sample, it was no longer perceptible after two weeks. Storage of the samples for more than two months at room temperature therefore perceptibly reduced the hydrogen cyanide content, while the drying of the samples strongly hindered the conversion to iron cyanide.

The analytical results relating to the brick samples (Table 20, p. 239, sample no. 25 and 26) are surprising for their values, which appear paradoxical: the fumigated sample, in contrast to the unfumigated sample, exhibited no traces of cyanide. The value of the unfumigated sample could be exactly reproduced (Table 21). Further analyses of the fumigated brick likewise resulted in no demonstrable cyanide concentrations. These findings prove that cyanide values up to 10 mg per kg have only very limited probative value, since these can be attributed to traces which occur everywhere.[528]

Table 22: Test sample preparation and fumigation

Nr.	Material	Conditions
25/26	Brick from demolished building from Bavaria; only sample 26 was fumigated!	16 h fumigation with 0.3 vol.%, Storage after fumigation for 120 days at room temperature. No sealing with paraffin
27	Cement mortar: 1 part sand, 1 part Portland cement, ½ part lime. Sample measurements: 55×60×20 mm, 100 g (ca. 1.5 g/cm^3)	addition of 1 g water
28	Cement mortar: 1 part sand, 1 part Portland cement, ½ part chalk. Sample measurements: 55×60×20 mm, 108 g (approx.. 1.6 g/cm^3)	
29	Lime mortar: 2 ½ parts sand, 1 part lime. Sample measurements: 55×60×20 mm, 94 g (ca. 1.4 g/cm^3)	
30	Lime mortar: 2 ½ parts sand, 1 part lime. Sample measurements: 52×58×20 mm, 96 g (ca. 1.6 g/cm^3)	addition of 2 g water

[528] It is also conceivable that the unfumigated samples were contaminated during preparation for analysis, perhaps through an improperly cleaned ball mill, in which samples with a high cyanide content had previously been crushed. The reason for the good reproducibility may be that there is hardly any carbonate in brick, since it acts as a disturbance ion.

The interpretation of the analytical results of samples 27 to 30 resulted in the following data:

- In total, 30 mg of cyanide were found in the samples during the analysis. Since 300 mg cyanide were used during this test, 10% of this quantity was found durably bound to the samples.
- The cement mortar samples, in contrast to the lime mortar samples, exhibit a higher cyanide concentration by a factor of two. The higher iron content of the cement mortar samples may be the reason for this, since the cyanide content increases proportionally to the iron content (see the last column of Table 20). In addition, hydrogen cyanide adsorption was certainly favored by the higher inner surface area of the cement mortar as compared to lime mortar.
- The increased hydrogen cyanide absorption caused by the addition of moisture was only slightly perceptible in the analytical results, since the samples were all very moist anyway, and because the material dried out during the final storage phase and therefore the hydrogen cyanide was only able to bind partially.
- Blue pigmentation of the samples was not to be expected, since even if all the bound cyanide were present in the form of Iron Blue, only 0.005-0.01% of the total material would consist of the blue pigment, which would cause hardly any perceptible coloration to the naked eye. An accumulation of cyanides on the surface of the sample, finally, could not occur due to the absence of water in diffusion. In addition, the dry storage of the samples probably blocked the conversion process.

8.3.4. John C. Ball

John Ball took samples from various locations, but according to his published data (see Table 23), he either had each group of samples taken at a specific location analyzed together or else he calculated an average of each location and published only the average. Hence his data cannot be used for any detailed analysis.

All samples taken from alleged homicidal “gas chambers” (no. 3-6) are around or well under the detection threshold and must therefore be considered zero. From these samples, only sample group no. 3 (taken from Morgue 1 of Crematorium II) has a well-defined history. Ball’s samples results from the delousing wings of buildings 5a and 5b do represent a fairly good average of my own results and therefore confirm them.

Table 23: Cyanide concentrations in the masonry of "gas chambers"/disinfestation chambers according to John C. Ball[529]

No.	Location	c(CN^-) [mg/kg]
1	Delousing Room B1b BW 5b, inside and outside	3,170.0
2	Delousing Room B1b BW 5a, inside and outside	2,780.0
3	Crematorium II, Morgue 1 ("gas chamber")	0.4
4	Crematorium III, Morgue 1 ("gas chamber")	1.2
5	White Farm House, remnants of foundation	0.07
6	Crematorium V, remnants of foundation wall	0.1

8.4. Discussion of the Analysis Results

8.4.1. Blue Wall Paint?

The hypothesis expressed by J. Bailer,[56,58] that blue paint could be responsible for the high cyanide values in the disinfestation chambers, does not correspond to the facts:

1. Iron Blue is not sold as wall paint at all, since it lacks sufficiently high lime fastness (see chapter 6.6.1.).

2. If this argument were correct, it would be remarkable that the SS, of all the rooms in the Third Reich, would apply blue paint only to their disinfestation chambers where no one could admire it; and, strangely, always the same blue. All other rooms were whitewashed. Were the SS practitioners of "blue magic"?

3. The disinfestation chambers themselves already had a coat of lime paint. Why would they cover this coat of lime paint with another paint which, in addition, is not even lime fast? They would therefore have had to wait until the lime paint and plaster had set before one could paint the walls. And then it would have been by no means certain that the paint would not furthermore have become stained as a result of chemical reactions.

4. A coat of paint on the interior of the room would not explain the patchy pattern of the blue stains on the interior of the exterior walls of the disinfestation wing of building 5a.

5. Neither would a coat of paint on the interior of the room explain the absence of blue coloration on the interior walls added to the disinfestation wing at a later time. Or are the SS supposed to have painted only certain walls, and then, not evenly, with paint brushes, but, perhaps, soiling the wall statistically by throwing and spattering?

[529] John Clive Ball, *The Ball Report*, Ball Resource Services Ltd., Delta, BC, Canada, 1993.

6. Bailer's argument is refuted by the fact that none of the colored walls shows any pattern of brush marks, and no identifiable coat of paint, since wall paint consists not only of pigment, but also of a not inconsiderable proportion of binding agents and other chemicals. The blue pigment is, however, simply one component of the lime paint and plaster.

7. Bailer's argument furthermore fails to explain how the artistic skills of the painters could have succeeded in imitating the brick structure lying beneath the plaster. Or did they not only practice "blue magic," but were equipped with X-ray eyes as well?

8. Bailer's argument does not explain the only pale blue tint of the interior south walls of the original disinfestation wing of building 5a.

9. Neither does Bailer's argument explain the high cyanide concentration in the superficially white, iron-poor material of the walls of the disinfestation wing of building 5b. Or is it his opinion that these rooms were, perhaps, painted with an "iron white," a paint color that does not even exist?

10. Bailer's argument furthermore fails to explain the still higher cyanide concentration of deeper, greenish-bluish coats of material in the walls of the disinfestation wing of building 5b; or does he perhaps intend to argue that the SS even applied iron-blue paint to wall plaster and wall mortar where no one could ever admire it? There, it would in addition have certainly have been decomposed into its component parts due to the alkaline pH value of fresh mortar and would have lost its color at least temporarily.

11. Finally, Bailer's argument cannot explain why even the exterior walls of the disinfestation rooms, exposed to weathering, have a notable cyanide content and are discolored with blue stains. Or did the SS employ the technique of statistically throwing and splashing paint about here as well, paying particular attention to the structure of the brick, resisting at all times the temptation to apply the coats of paint which are so typical of ordinary painting, simply because blotchy blue-stained brick is so sexy? Or was the Iron Blue applied to the bricks upon manufacture, resisting the baking process of the brick in a magical fashion known only to the blue-magic SS?

The Polish scientists, as indicated above, adopted Bailer's argument and therefore preferred simply not to prove the presence of Iron Blue at all. *Honi soit qui mal y pense*… (a rogue is he who thinks evil of it)

8.4.2. False Method of Analysis

Many people, both experts and laymen, rely good-naturedly upon the findings of the Jan Sehn Institute for Forensic Research in Krakow, *i.e.*, the study published in 1994 by Prof. Markiewicz and colleagues. These Polish scientists, however, tested their samples with an analytical method that was unable to detect stable iron cyanide compounds. They did this because they could not imagine how such stable iron cyanide compounds could form. It is, of course, no shame to fail to understand something initially. Anyone, however, who makes a claim to scientific reliability must, before making statements upon the subject, at least attempt to investigate and understand. But not so the Polish scientists. They assert their lack of understanding as a justification for their failure to act. Has anyone ever heard that failure to understand a phenomenon was any reason for scientists *not* to study it? To the Polish scientists, this was obviously the case. It would only be permissible to exclude Iron Blue from the study if it were possible to *exclude,* with practical certainty, that the effects of hydrogen cyanide on masonry could result in the formation of iron cyanide, and, consequently, Iron Blue, and if there were at least some indication that these rooms had been painted with Iron Blue or that there could conveivably be any other reason for its presence. The Polish scientists completely neglected to do this. And even worse: they did not even attempt to refute my arguments on the formation of stable iron cyanide compounds which I published in early 1993.[530] They were familiar with this publication, because they quoted it, yet not in order to discuss my arguments, as would have been expected, but simply to condemn it flatly as an example of the allegedly diabolical deeds of the "deniers" and the "whitewashers" of Hitler, who Prof. Markiewicz and his colleagues intended to refute – in their own words. This should suffice to show that the Polish actions were ideologically motivated to a high degree. If they had been neutral scientists, they would have applied the correct and interpretable method of analysis and would have discussed my publications in a scholarly manner instead of worrying about Hitler's dirty laundry.

Prof. Markiewicz and his colleagues did not even attempt to find any explanation for the high iron cyanide concentration in the walls of the disinfestation chambers and their blotchy-blue surfaces.

[530] E. Gauss, *Vorlesungen über Zeitgeschichte*, Grabert, Tübingen 1993, pp. 163-170; 290-294.

Table 24: Orders of magnitude of analytical results of various samples, in mg CN^-/kg

Author:	Markiewicz *et al.*	Leuchter	Rudolf	Ball
Results from:	Cyanide without iron cyanide	——— Total cyanide ———		
delousing chambers:	0-0.9	1,025	1,000-13,000	2,780-3,170
"gas chambers":	0-0.6	0-8	0-7	0-1.2

Although they had sought out an analytical method able to produce the results desired by them, the results of their first series of tests were obviously so disturbing that they decided to suppress them and never published them. These data only became public knowledge through an act of indiscretion in 1991 (see chapter 8.3.2.).[531]

The Polish scientists therefore rejected the undesired results of their first series of tests and took even more samples, until they finally produced the results that fitted in with their preconception: this time, both the samples from the disinfestation chamber and the alleged "gas chambers" showed cyanide residues on the same order of magnitude[62] – although in most cases they were clearly below the detection limit of the method they had chosen. So strictly speaking, most of their results should show "ND" = not detected, instead of ridiculously low amounts which are beyond the reliability of their method.

But even Prof. Markiewicz and his colleagues, during the test fumigations performed by them, at least confirmed that moist cement mortar (as was used in the morgues of Crematoria II and III) absorbs at least ten times more hydrogen cyanide than dry lime mortar (as used in the disinfestation chambers), as I had assumed for my calculations in this work.

Table 26 shows the analysis results of Prof. Markiewicz and his colleagues compared to those of Fred Leuchter, John C. Ball, and mine.

I will spare the reader any further discussion of these results, because analysis results obtained in a methodically incorrect manner cannot be corrected even by correct interpretation. Any attempt at interpretation is therefore a waste of time.

A few words, however, are due on the HCN-CO_2 mixture used by the Poles for their fumigation experiments. They claim that CO_2 has a

[531] The first series of studies, undertaken by J. Markiewicz, W. Gubala, J. Labedz, and B. Trzcinska, were never published by the authors of the studies. Only the revisionists have published their findings, after the article was smuggled out of the Jan Sehn Institute by unknown persons in 1991; see also note 61; for further remarks on this example of "political science," see G. Rudolf, *op. cit.* (note 63).

Table 25: Influence of CO_2 on the Absorption of HCN According to Markiewicz et al.
Data in mg CN^-/kg (values below 0.2 mg/kg are equivalent to ND = not detected)

Material:	Fresh Plaster		Fresh Mortar	
Exposed to 2% HCN +:	dry	moist	dry	moist
no added CO_2	(0.024) ND	0.48	(0.176) ND	2.7
10% CO_2	5.92	12.8	0.492	0.388
Factor	***247***	***27***	***3***	*0.14*

negative influence on the adsorption of HCN in the masonry. Their own (worthless) test results, however, contradict this view, see Table 25.

First of all, the Poles failed to define what they mean by "plaster," "mortar," "old," "fresh," "dry," and "moist," so this experimental series, apart from having used the wrong method of analysis, is also completely irreproducible due to the lack of any kind of definition of the materials used.

Next, the apparent absorption of cyanide by fresh plaster (dry and moist) and by dry mortar obviously increased in the presence of CO_2 (factors: 247 for dry, 27 for moist plaster, 3 for dry mortar) – yet the Poles had the nerve to categorically claim the opposite! Only in one case (moist mortar) did the absorption decrease (factor 7; the Poles did not test the influence on "old" material).

Again, since their flawed analytical method renders any interpretation of these results futile, I will not do this here. All this shows is that Markiewicz et al. obviously do not even get the basics of scientific experimenting and data interpretation straight.

I will come back to Markiewicz once more when discussing R. Green in chapter 8.4.4., though.

Even a direct comparison with my arguments and the open expression of suspected fraud could not move Prof. Markiewicz and his colleagues to justify or correct their unscientific behavior.[63,64] The director of this group, Dr. Jan Markiewicz, who is not a chemist, but rather, a "technical testing specialist," died in 1997. Both of his colleagues have remained silent.

One can understand that these Polish authors made their careers in Communist Poland, and, as Polish patriots, they feel that they can under no circumstances permit the undermining of "Auschwitz" as a moral justification for the Polish ethnic cleansing of the East Prussians, East Pomeranians, and Silesians after the end of World War Two, as a result of which some three million Germans lost their lives, as well as it being the greatest land robbery of modern history. Many Poles fear in their

hearts that the post-war state of Poland stands and falls with Auschwitz. This may explain Prof. Markiewicz's and his colleagues' scientific contortions, but it fails to be a justification for them. Even the possible circumstance that the scientists assigned to the topic were not and are not chemists and that their laboratory was perhaps not equipped up to Western standards, cannot explain this, since an analysis of the total cyanide concentration is not expensive in terms of laboratory equipment and the chemistry involved is anything but complicated.

The manner with which the Polish scientists approached the problem, however, gives rise to serious suspicion that this was an attempt at scientific fraud, a suspicion which is also supported by the fact that they were unable to justify their incorrect analytical method except through their incompetence and ignorance.

The conclusions to be drawn from the above is clear: the only "scientific" attempt to refute Fred A. Leuchter's sensational argument proves, upon closer examination, to be one of the greatest scientific falsifications of the 20th century.

How desperate must one really be, if it is believed necessary to stoop to such methods in an attempt to defend the established version of the Holocaust, *i.e.*, the alleged systematic extermination of the Jews in homicidal "gas chambers"?

8.4.3. The Memory Hole

At the end of chapter 6.6.5., I already referred to the bold lies of Albert Meinecke from the German press agency DPA regarding the alleged short life term of hydrogen cyanide in masonry. A new corny joke was recently added to this debate by Prof. James Roth from the Alpha Analytic Laboratories, Ashland, Massachusetts. I discuss this event here because Prof. Roth's allegations were widely publicized by the international media in connection with the libel case of British historian David Irving against Deborah E. Lipstadt.[532]

For his documentary movie *Mr. Death* on Fred A. Leuchter, Errol Morris also interviewed Prof. Dr. James Roth. In 1988, Roth's laboratory had analyzed the masonry samples from the alleged "gas chambers" taken by Leuchter in Auschwitz for their cyanide content. During the trial against Ernst Zündel in Toronto that same year, for which the Leuchter report had been produced, Prof. Dr. Roth himself was interro-

[532] This claim played a role in the verdict which should not be underestimated, cf. judgment Gray, *op. cit.* (note 71), §13.79; cf. note 73.

gated as an expert witness. Ten years later, Errol Morris interviewed Roth about this event. During this interview, Prof. Roth did all he possibly could to distance himself from the possible consequences of the analyses performed by his company. His interview gained importance only due to the fact that the Dutch architectural historian Prof. Robert van Pelt quoted Roth in his 1999 expert report prepared for the Irving trial. In it, van Pelt wrote about Roth's statements in Morris' movie:[533]

> *"Roth explained that cyanide will react on the surface of brick or plaster, penetrating the material not more than 10 microns, or 0.01 mm, or one tenth the thickness of a human hair* […]. *In other words, if one wants to analyze the cyanide concentration in a brick sample, one should take a representative sample of the surface, 10 microns thick, and no more."*

It can be shown that Prof. Dr. James Roth is wrong for the following reasons:

1. It is a fact that the walls of the disinfestation chambers in Auschwitz, Birkenau, Stutthof, and Majdanek are saturated with cyanide compounds, and this not only superficially, but into the depth of the masonry, as I have proved by taking samples from different depths of the wall, compare in this regard especially my samples no. 11, 13, 17, 19b, and 23 in Table 20. They prove that hydrogen cyanide can rather easily reach deep layers of plaster and mortar. But even the other samples taken from the surface prove that Prof. Roth's allegation is wrong: Provided that most of the cyanide detectable today is present in the form of iron cyanide (Iron Blue and other cyanoferrates), as Prof. Roth assumes himself, his thesis would mean that 10% to 75% of the iron content of these samples are located in the upper 10 micrometers of my samples (0.010 mm), *i.e.*, they are located in less than 1% of the entire sample mass, and the rest of the sample would have been massively deprived of iron. How this migration of a major portion of iron to a thin surface layer would have happened is inexplicable to me.
2. Furthermore, expert literature is detailed in that
   a) hydrogen cyanide is a extremely mobile chemical compound with physical properties comparable to water,[338]
   b) which can quite easily penetrate through thick, porous layers like walls.[427]
3. In addition, it is generally known that cement and lime mortar are highly porous materials, comparable for instance with sponges.[534] In

[533] *Pelt Report*, *op. cit.* (note 71), p. 307.

[534] DIN 4108, part 3 to 5, deals with diffusion of steam into building materials. The most important coefficient for building materials is the so-called coefficient of diffusion resistance; this is a

such materials, there does not exist something like a defined layer of 0.01 mm beyond which hydrogen cyanide could not diffuse, as there can also be no reason, why water could not penetrate a sponge deeper than a millimeter. Steam, for example, which behaves physically comparable to hydrogen cyanide, can very easily penetrate walls.

4. Finally, the massive discolorations of the *outside* walls of the disinfestation chambers in Birkenau and Stutthof, as shown in this expert report, are clearly visible and conclusive evidence for the fact how easily hydrogen cyanide and its soluble derivatives can penetrate such walls.

As a professor of analytical chemistry, Prof. Roth must know this, so one can only wonder why he spreads such outrageous nonsense. That Prof. Roth is indeed a competent chemist can be seen from what he said during his testimony under oath as an expert witness during the above mentioned Zündel trial:[535]

> *"In porous materials such as brick or mortar, the Prussian blue* [recte: hydrogen cyanide] *could go fairly deep as long as the surface stayed open, but as the Prussian blue formed, it was possible that it would seal the porous material and stop the penetration."*

Prof. Roth might have felt obligated to attack Leuchter in order to avoid becoming himself a target of certain lobby groups who already managed to destroy Leuchter's career. That would explain why the truth temporarily dropped into a hole in Prof. Roth's memory while being interviewed by Errol Morris. It is also revealing that Prof. Roth mentioned during this interview, if he had known where Leuchter's samples originated from, his analytical results would have been different. Does that mean that Prof. Roth manipulates his result according to whether or not he likes the origin of certain samples? Such an attitude is exactly the reason why one should never tell an "independent" laboratory about the origin of the samples to be analyzed, simply because "independence" is

dimensionless number indicating how much longer the diffusion of steam takes to penetrate a layer of certain materials compared to the time it takes to diffuse through the same layer of still air. This coefficient is valid not only for water vapor, but also for gaseous hydrogen cyanide as well as for any other gas. In the list of 100 different building materials compiled in DIN 4108 part 4, one can find lime and cement mortar with diffusion resistances from 15 to 35, in which case the resistance grows with increasing cement content; for gypsum plaster, the coefficient is 10, for brick walls 5 to 10, for glass wool mats it is 1. That means, if a gas diffuses through a layer of still air with a speed of 1 cm per second, it takes 15 to 35 seconds to diffuse through a 1 cm thick layer of lime or cement mortar and 5 to 10 seconds to diffuse just as deep into a brick wall. (I am grateful to Mr. C.H. Christmann for this reference.) In this regard, compare also the analysis about the porosity of masonry, graph 7, p. 172.

[535] B. Kulaszka (ed.), *op. cit.* (note 28), p. 363 (protocol p. 33-9291).

a very flexible term when it comes to controversial topics. What Prof. Dr. Roth has demonstrated here is only his lack of professional honesty.

8.4.4. The Moon is Made of Pizza

Another strange story is that of Richard Green, a self-confessed Jew[536] and PhD chemist with a similar educational background as I have.[68-70] The layman would expect two experts, with similar educational background, to come to similar conclusions in questions relating to their expert knowledge. But this is only partly the case. The reason for this is that Dr. Green ignores many facts that are either supported by documentary evidence – like the performance of the ventilation installed in Crematoria II and III, or the speed of executions in U.S. execution chambers – or by expert literature – like the higher tendency of cold, moist walls to adsorb HCN, and the longer lasting alkalinity of cement mortar compared to lime mortar.

However, Dr. Green makes some concessions which are important to note:

a) He agrees that basically all witnesses attest to very short execution times, indicating a rather high concentration of HCN used.
b) He also agrees "that Rudolf is correct or nearly correct regarding the formation of blue staining in the delousing chambers."

What he does challenge, though, is the possibility of formation of any noticeable quantities of Iron Blue in the homicidal "gas chambers." One of his flawed and deficient arguments to support his thesis is that in his view, no noticeable amounts of cyanide could have accumulated in the walls of the morgues ("gas chambers"). According to Dr. Green, one major factor for this is supposed to be the fact that masonry has a neutral pH value which does not allow the protolysis of hydrogen cyanide and thus the formation of cyanide salts. But if that were true, how come huge amounts of cyanides did accumulate in the walls of the disinfestation chambers?

My argument in this regard is that particularly cement plasters and concretes, as used in morgues 1 of Crematoria II and III, are noticeably alkaline for many weeks, months, or even years, which I documented thoroughly with expert literature on the chemistry of building materials (see chapter 6.7.2.). Hence, I concluded that these walls would have been very much inclined to accumulate cyanide salts and to form Iron

[536] See his polemic exchange with A.S. Marques, www.codoh.com/newrevoices/nrmarques/nrmgreen.html, where he stated in the mid 1990s: "Liar, I am a Jew and I receive no reparations."

Blue, even more so than the lime plaster of the disinfestation chambers, which in turn provoked the following answer by Dr. Green:[537]

> *"*[In 1993] *The IFRC* [Institute for Forensic Research, Krakow]*, on the other hand measured the pH* [of mortar samples from the alleged gas chambers] *to be between 6 and 7* [i.e. neutral]*."*

Dr. Green obviously did not consult any literature on the chemistry of building materials, as he quotes none. He solely relies on the findings of the Krakow institute. In order to make the reader see how flawed Dr. Green's way of arguing is, let me say it in a parable:

By referring to a couple of Italian expert pizza baking instructions, I showed that a pizza, when taken out of the oven, is hot or warm for quite a while (one hour). Now, Dr. Green comes along claiming that I am wrong because a Polish friend of his has just now measured the temperature of a pizza which was baked a week ago, and which has been lying around somewhere since. And the Polish scientist found out that this pizza is indeed cold right now. Surprise, surprise!

Of course, samples taken from the surface of walls erected 50 years ago or more are now pH neutral! Even this I have proved by showing how the front of neutralization slowly migrates into concrete and mortar (see chapter 6.7.2.2.). But what does the pH value of samples taken 50 years after the erection of these buildings prove regarding their pH value shortly after they were built? Dr. Green's way of arguing is childish to the highest degree.

When it comes to intellectual honesty, Dr. Green reveals some other very strange behavioral patterns, one of which I want to address here.

Dr. Green agrees with me that the Iron Blue found in delousing chambers is the result of gassings with hydrogen cyanide. Hence he disagrees with the opinion of Markiewicz and others that this Iron Blue may have its origin in residual paint (no wall paint containing cyanides exists). However, Green comes up with his own auxiliary hypothesis to shore up his ongoing defense of the Krakow frauds: He invents a scenario during which items "soaked with aqueous solutions of HCN" were leaned against such walls.[538] Now, how exactly would the SS have obtained such a solution, and how would items have gotten soaked with it? By throwing Zyklon B into water and then using this solution to soak lice-infested clothing? Is Dr. Green out of his mind?

One major rule of science is that it is impermissible to immunize a theory against refutation, here in particular by inventing untenable aux-

[537] R.J. Green, J. McCarthy, op. cit. (note 70); repeated in R.J. Green, op. cit. (note 218), p. 50, again without any attempt to address the issue by resorting to expert literature.

[538] R.J. Green, op. cit. (note 218), p. 18.

iliary hypotheses to shore up an otherwise shaky thesis.[539] This is exactly what Dr. Green is doing: coming up with a ludicrous attempt at explaining a fact which does not fit into his theory. Yet instead of fixing his theory, he tries to fix reality.

Let me draw a historical parallel here. When Galileo Galilei discovered with his telescope that the moon was not a perfectly smooth sphere, which had been the doctrine among astronomers ever since Aristotle, his opponents were outraged:[540]

> "[Galileo] *reasoned to no purpose with the slaves of the ancient schools: nothing could console them for the destruction of their smooth, unalterable surface, and to such an absurd length was this hallucination carried, that one opponent of Galileo, Lodovico delle Colombe* […] *attempted to reconcile the old doctrine with the new observations, by asserting, that every part of the moon, which to the terrestrial observer appeared hollow and sunken, was in fact entirely and exactly filled up with a clear crystal substance, perfectly imperceptible by the senses, but which restored to the moon her accurately spherical and smooth surface. Galileo met the argument in the manner most fitting, according to Aristotle's own maxims, that 'it is foolish to refute absurd opinions with too much curiosity.' 'Truly,' says he, 'the idea is admirable, its only fault is, that it is neither demonstrated nor demonstrable; but I am perfectly ready to believe it, provided that, with equal courtesy, I may be allowed to raise upon your smooth surface, crystal mountains (which nobody can perceive) ten times higher than those which I have actually seen and measured.'"*

If Dr. Green were honest, he would dismiss the misleading approach of the Krakow team to exclude Iron Blue from the analysis, because this would most likely exclude the major parts of the cyanide residues formed by gassings with HCN in general (not just in the case of delousing chambers). Even if we agree to disagree on what has happened at Auschwitz during the war, we surely can agree that Markiewicz et al. did not use cyanide paint to color the samples they themselves prepared for their gassing experiments or that they leaned them against items "soaked with aqueous solutions of HCN." So why did the Krakow team not at least analyze the samples from their own experiments with the international standard method of detecting the *total* cyanide content? Or at least they should have used both methods side by side, which would have enabled us all to compare the results of both methods and thus evaluate what they are worth. This in turn could have shed a lot of light

on chemical processes as well, like: how fast is HCN absorbed in mortar converted into insoluble iron cyanides no longer detectable with the one, but readily detectable with the other method? If we hold the results of my test gassings against those conducted by the Poles, then it appears that most of the absorbed cyanide present in gassed mortar samples is turned into long-term stable iron cyanides rather quickly. But since the conditions of our experiments were very different, such a conclusion would be premature. The Poles had the chance to find out. I had asked them to redo their tests with the standard method, but they did not react to that suggestion.

Subsequently, if Dr. Green were honest, he should say that the Polish scientists neither tried to understand what they claimed not to have understood, nor discussed the attempts to understand as made by others, which were known to them. No matter which results the Polish scientists produced and what their scientific opinion might have been: their behavior is extremely unscientific, as **the most important task of a scientist is to try to understand what has not been understood so far, and to discuss the attempts of others to make it understandable**. The Polish scientists did just the opposite: they decided to ignore and exclude what they did not understand. Finally, in their article as well as in a letter to me, the Polish scientists themselves stated that the purpose of their paper was to refute the "Holocaust Deniers" and to prevent Hitler and National Socialism from being whitewashed, *i.e.*, their purpose was *not* to find out the truth! Thus, by their own confession, they used unscientific methods in order to produce desired results for the purpose of achieving certain political goals.

Let me quote Prof. A.R. Butz in this connection, who stated another appropriate metaphor to emphasize the degree of intellectual dishonesty revealed by Markiewicz and his colleagues:[541]

> *"The argument* [of Markiewicz *et al.* for excluding Iron Blue from their analyses]*, to the extent that it was intelligible enough to be summarized at all, was that they did not understand how the iron-cyanide compounds got to be there, so they decided to ignore them in reaching their conclusions. I don't understand how the moon got there, so I will ignore all effects associated with it, such as tides. I hope I don't drown."*

And the amazing thing about Dr. Green is that he – and with him Prof. van Pelt, who relies on Green[74] – does not only defend Prof. Markiewicz's behavior in every regard, but he attacks me for my critique against the Polish scientists, while omitting *all the reasons* I gave for

[541] Arthur R. Butz, "Historical Past vs. Political Present," *JHR*, 19(6) (2000), pp. 12ff.

doing so. To crown this, Dr. Green even defends the fact that Prof. Markiewicz never bothered to address any part of my critique, even though addressing critiques is paramount for scientists. Dr. Green argues:

> *"Rudolf complains that Markiewicz et al. have not responded to his queries. Why should they do so? What credibility does Rudolf have, that demands they answer his every objection no matter how ill-founded?"*

However, since Dr. Green agrees that the Iron Blue detectable in disinfestation walls *is* the result of gassings with Zyklon B, he himself has indirectly admitted that all my objections against Markiewicz's method of analysis are well-founded, *i.e.*, just the opposite of "ill-founded."

And why does Dr. Green think I bear no credibility demanding a discussion of any of my arguments? Not because I lack scientific qualifications. No, he thinks I am an abomination because of my views, and because I have been subject to social persecution and political prosecution, leading to the total destruction of my social existence, my reputation, and finally my freedom. Dr. Green even resorts to calling me a "liar," "obfuscator," and "hater" because of my different well-founded opinions. And to top it all off: when I *defend* myself against his *ad hominem* attacks, he lambastes me for that as well.[542] So, whereas he has a right to attack me, I don't have a right to defend myself?

The scheme is as follows: first, people like Dr. Green attempt to do everything to destroy my reputation by name-calling, persecution, and prosecution, and when they succeed, they claim that there is no need to discuss anything with me anymore, since I do not have any reputation and credibility anyway. This way they can nicely ignore any argument refuting their flawed thesis. And they have the chutzpah to call themselves righteous scientists and to call me a pseudo-scientific liar and obfuscator of the truth.

Dr. Green unconditionally defends the scientific frauds from the Krakow institute, and both get away with it, because in the eyes of the public, both have the "politically correct" "scientific" opinion about Auschwitz. Birds of the same feather flock together.

---

8.4.5. Wikipedia – Wiki-Lies

Wikipedia is probably the world's most frequently consulted encyclopedia. In its English language entry about Germar Rudolf one can read:

> *"However, like Fred Leuchter in the Leuchter report, Rudolf did not discriminate against the formation of iron-based cyanide compounds, which are not a reliable indicator of the presence of cyanide, and his experiment was thus seriously flawed. This report has been critically analyzed by Richard J. Green and Jamie McCarthy from The Holocaust History Project."*

As is demonstrated throughout this book, it is utter nonsense to claim that "iron-based cyanide compounds […] are not a reliable indicator of the presence of cyanide." Not even Green has ever made such a nonsensical statement. In fact, Green's and, in extension, Markiewicz's position is that iron-based cyanide compounds are not a reliable indicator of *past homicidal gassings*. In chapters 8.4.2. and 8.4.4. it has been amply demonstrated why this position is untenable.

Any attempt to get this statement corrected or at least amended failed, as such changes were deleted only minutes later. Even an innocuous addition like "Rudolf's findings were eventually published in English in his book, The Rudolf Report, where he addresses the science community's response, including Green's criticism," was deleted by the censors at Wikipedia almost instantly.[543] Not even a bibliographic listing of the Rudolf Report was tolerated. Hence the Wikipedia entry about Rudolf is on the alarm list of several people who are monitoring every change and who make sure that bias and lies prevail.

8.4.6. Anticipated Values

The only case of the formation of Iron Blue through fumigation with hydrogen cyanide, which is fairly well documented, is the case of damage to churches in Bavaria as cited above.[24,25] Even today, buildings are fumigated with hydrogen cyanide, yet Iron Blue is rarely formed. The reason for this, however, is quite obvious. Fumigation with hydrogen cyanide is used to kill vermin, such as woodworm, meal moths, corn beetles, or lice. However, a massive case of vermin infestation requiring the use of hydrogen cyanide occurs, in practice, only in buildings which have already been in use for relatively long periods of time, *i.e.*, many

[543] In the entry's revision history, see the changes of Sept. 17, 2009 (10:51), which was reverted 91 minutes later, and of May 22, 2010 (17:08), which was undone 74 minutes later.

years. It is therefore to be expected that the interior plaster of such buildings has long since become thoroughly carbonized. Furthermore, the rooms to be fumigated are, as a rule, heated in order to enhance the effectiveness of the hydrogen cyanide (faster evaporation, slower adsorption losses, stimulated metabolism of vermin). Since it is not to be expected, according to the findings presented here, that a perceptible accumulation of cyanides, let alone the formation of Iron Blue, would occur after only one fumigation in warm, dry, and chemically set wall materials, one cannot be surprised that such building damage is the exception rather than the rule.

The damages to the churches in Bavaria are typical exceptions, since the unheated churches, notorious for their humid walls, had been plastered with cement mortar, which is known to remain alkaline for many months, only a few weeks before. These are exactly the conditions which in my view were favorable to the formation of Iron Blue. With increasing setting of the cement plaster over the course of months, the pH value of the masonry in the churches finally dropped, so that the final reaction led to the formation of Iron Blue, which is stable for long periods of time. This final reaction of the adsorbed cyanide into Iron Blue was only completed after approximately two years. The prior stage of this reaction, the formation of considerably paler iron cyanides, could already have been completed or well progressed prior to this.[544]

A comparison with the probable conditions of the disinfestation chambers and alleged homicidal "gas chambers" of the Third Reich is quite informative (see Table 26). The following assumes that both installations (tacitly assuming the existence of the homicidal "gas chambers") were put into use more or less immediately after their construction, *i.e.*, at a time when the concrete, mortar and plaster were still not entirely set. In addition, they were in near-constant use for one to two years.

That the entire plaster job on the walls of the churches referred to above turned blue even after only one fumigation is explained by the especially (un)favorable circumstances. The alleged "gas chambers" of Crematoria II and III in Birkenau show a striking similarity to this case. These cool and moist cellar rooms were only completed shortly before they were put into service and are then said to have been exposed to

[544] Incidentally, all the plaster in the church had be to knocked off the walls and replaced, since there was no other way to get rid of the Iron Blue. Communication from Konrad Fischer, head architect during the renovation of the church at that time.

Table 26: Comparison between cases of building damage, morgue and disinfestation chamber

LOCATION / PROPERTY	PLASTERING OF CHURCHES	CREMATORIUM II/III MORGUE 1	DISINFESTATION BW 5A/B
Iron Content	> 1 Weight.-%	1-2 Weight -%	0.5-5 Weight.-%
Type of plaster	Lime + Cement	Cement (+lime?)	Lime
Alkalinity	Medium-term high	Medium-to-long-term high	Short-term high
Moisture	Moderately high (hydrophobic plaster, cool, moist church)	High (unheated cellar below ground water table, condensing sweat*)	Moderate (exterior wall) to low (interior room) (heated room)
Time elapsed between plastering and fumigation	A few weeks	Between a few weeks and three months*	(a few weeks?)
Number of fumigations	1	Allegedly ≥ 400*, in each case at least one hour	Probably < 400, in each case many hours
CO_2 content	low	high*	low
Proof of cyanide	Clear	Negative	Clear (0.1-1 weight-%)

* = assuming the correctness of the alleged mass gassing scenarios

hydrogen cyanide on a constant basis, quite in contrast to the church mentioned above, which was only fumigated once.

The other major difference between the two cases is that only the normal atmospheric CO_2 concentration was present in the churches, whereas homicidal "gas chambers" would have had an elevated CO_2 level for the duration of the entire procedure (from the entrance of the victims to the ventilation of the chamber). The exact influence this would have had, if any, is not known. Testing this has always been beyond my own reach, as I could not afford the equipment to do experiments with added CO_2. This is a task for future research.

Finally, the interesting question of which analytical values were really to be expected, if the reported mass gassings with Zyklon B really occurred in the "gas chambers" at Auschwitz, must now be examined within what is possible.

First, consideration will be restricted to the morgues 1 of Crematoria II and III, since sufficient data are only available for these buildings and because it is only here that meaningful samples can be taken, since it is certain that the material is in its original condition.

As a comparative value, let us take two of the samples taken by myself from the interior wall of building 5a: samples no. 12 and 13, with a total cyanide concentration of 2,900 and 3,000 mg/kg, respectively.

The following is a list of individual properties which exert an influence upon the formation of Iron Blue.

1. Properties, which were approximately the same in both installations:
   – The (alleged) operating time (approximately 1 year).[545]
   – The (alleged) frequency of use (a few hundred times),[546] even if a document quoted in chapter 5.2.3.5. states that shortly after the putting into operation of these hydrogen cyanide disinfestation chambers, a decision was made to stop using them, see. p. 65. It may therefore well be that the cyanide residues to be found in these disinfestation chambers today result from considerably fewer fumigations.
   – The (necessary) application concentration.[547]
   – Both installations were (allegedly) put into operation more or less immediately after completion.[548]
2. Properties that were advantageous to the formation of Iron Blue in the disinfestation chamber:
   – The duration of the fumigation times led, in the disinfestation chamber, to a concentration of cyanide in the masonry between 16% and 30% of saturation; in the case of the homicidal "gas chambers," however, only to values of between 1.6% and 8% could be reached (factor 2-19).[549]
3. Properties which were advantageous to the formation of Iron Blue in the homicidal "gas chambers":
   – The morgues possessed cool, moist walls, which have a higher tendency, higher by a factor of 8, to adsorb hydrocyanic than the warm, dry interior walls of the disinfestation chamber under consideration (factor 8).[550]
   – Ceilings and walls of the morgue consisted of cement mortar and/or concrete, which, due to their longer-lasting alkaline proper-

[545] With regards to the homicidal "gas chambers," the period between March 1943 and the fall of 1944 is "attested to." Building 5a was completed in the fall of 1942 (*RGVA*, 502-1-214; acc. to 502-1-22-19, it was completed already by June 20, 1942), but converted to operate with hot air in the summer of 1943 (J.-C. Pressac, *op. cit.*. (note 72), pp. 55-58; acc. to *RGVA*, 502-1-24, equipment of BW 5a and 5b with hot air disinfestation facility started on Nov. 1, 1942).

[546] For the homicidal "gas chambers," this follows from the alleged victim totals of several hundred thousand victims per chamber; for the delousing installations, this follows from the maximum number of days available in ¾ of a year (approximately 270 days).

[547] See also chapters 7.1. and 7.3.1.3.

[548] Crematorium II was completed in February/March, after which the gassings are alleged to have begun in mid-March or the end of March. With relation to the delousing installations, we have no data, but one may assume that the building was used as soon as it was completed, even if it must be expected that the delousing chambers could not be used for a while, since, for delousing, it was necessary first to install all the equipment after completion of the building, *i.e.*, undressing rooms, showers, saunas, heating, etc. The same applies, of course, to the crematoria/morgues.

[549] See also chapters 7.3.2.2.f.

[550] See also chapters 6.5.1., 6.5.3., 6.7.2.f.

ties and due to their greater specific inner surface area, are able to adsorb and bind hydrogen cyanide for a longer time and more strongly than the cement-poor mortar and plaster of the disinfestation wing under consideration. Quantification in this regard is difficult, but a factor in excess of two must be anticipated (factor 2).[551]

4. Property with an unknown influence:
   – CO_2 content: whereas the disinfestation chambers will have had a normal atmospheric concentration (0.33% at that time), the level will have been considerably above that in the morgues as soon as the victims assembled inside until the room was ventilated. As discussed in chapter 6.5.6., the effect of CO_2 on the formation of long-term stable cyanide compounds is not clear. Whereas a high CO_2 does lead to a fast carbonization and thus neutralization of lime mortar, rendering it chemically less active, this is not the case for cement mortar, the material used in the underground morgue. This material is carbonized only very slowly, hence it retains its activity to bind HCN for a longer period of time.

According to these considerations, and leaving aside the yet unknown influence of CO_2, the known factors indicate that rather more iron cyanide would have had to form in the homicidal "gas chambers" than on the interior walls of the disinfestation chamber in question ($\frac{8\times2}{2 \text{ to } 19} \approx 0.4\text{-}8$). In actual fact, however, the homicidal "gas chambers" contain such low cyanide concentrations that they are neither capable of reproducible detection nor of adequate interpretation, but in any case at least some 150 to 10,000 times lower than those detectable in the walls of the disinfestation chambers. It seems unlikely that CO_2 could be the reason for such drastic differences.

Or in plain English: When analyzing wall samples from the alleged "gas chambers" of Crematoria II and III, we ought to expect results which are in the same order of magnitude as the results of samples taken from the walls of the delousing chambers of BW 5a and 5b. What we do find in those "gas chamber" samples, however, is practically nothing. Unless, of course, it turns out that CO_2 really has a dramatic effect in reducing the reactivity of cement mortar to bind cyanides irreversibly.

[551] See also chapters 6.5.2., 6.7.2.f.

8.4.7. Limits of the Chemical Method

The most recent development in the official school of thought tends to modify the marginal conditions for the homicidal mass gassings, even when this stands in shattering contradiction to the statements of eyewitnesses or the technical data.

Whereas it was still the rule, until a few years ago, for the eyewitness testimonies to allege daily, or even continuous, gassings,[552] today it is occasionally assumed, as a result of the drastic reduction in the number of victims to a maximum of 630,000,[472] 470,000 to 550,000,[473] or even 356,000 gassing victims,[474] that there were considerably fewer homicidal gassings per "gas chamber" than hitherto believed.

There is furthermore a tendency towards a strong reduction in the alleged quantity of hydrogen cyanide utilized as compared, for example, to the quantities alleged by the eyewitnesses.[53,58,59]

There is much unfounded fantasizing as to the existence of any ominous Zyklon B introduction devices, which would have permitted the toxic gas to be released through holes in the ceiling into the chamber – holes which, unfortunately, did not and do not exist – and to be removed again following conclusion of the gassings.[553]

Furthermore, the opinion is occasionally expressed that the homicidal "gas chamber" was sprayed with a water hose after every gassing. This assertion forgets that it would have lasted many hours until the "gas chamber" could have been cleared of bodies (they had to be cremated, which is time-consuming, after all) that the hydrogen cyanide does not merely sit on the surface of the wall, but rather, due to its extremely high diffusion capacity, penetrates deeply into the wall within a few hours, and that a water hose would be of no assistance in this regard, quite apart from the fact that such an action would have had the effect of causing the consequently extremely damp walls to adsorb even more hydrogen cyanide during the next hypothetical gassing. In addition, the samples taken from the ceiling, which was certainly not hosed down, likewise show no reproducible cyanide concentrations.

Yet there are also physical-chemical boundary conditions which can influence the analytical results. It is, for example, not inconceivable that, for whatever reason remaining unknown until the present time, the masonry of the alleged "gas chambers" was not, or only slightly, in-

[552] According, for example to the testimony of M. Buki in the Frankfurt Auschwitz Trial; see H. Langbein, *Der Auschwitz-Prozeß*, *op. cit.* (note 480), p. 96.

[553] Pressac (note 72) and van Pelt (note 74) are true masters in the composition of such inventions. The court historians either fail to notice or deliberately ignore the fact that these fairy tales are not based upon documents or physical reality.

clined to the formation of Iron Blue, or that possible residues were destroyed for unknown reasons. CO_2 could be one such compound not factored in so far.

The assumptions made in relation to the boundary conditions relating to hypothetical homicidal gassings were naturally subject to particular reserves, since no empirical data were available in this regard. Thus the question of how quickly the hydrogen cyanide contained in Zyklon B could diffuse in hypothetical "gas chambers" and how quickly it could have caused the death of all victims cannot be answered with absolute certainty. The assumptions made here are, of course, generally well-founded, but are not infallible.

All of the above makes prediction with *certainty* of the quantities of cyanide which one might have expected to find in the masonry of the alleged "gas chambers" impossible. The anticipated cyanide values indicated above and the subsequently following, summarized conclusions are therefore only the well-founded conclusions of an expert; under no circumstances do they constitute dogmatic truth. An extensive series of tests, for which neither the time, nor the equipment, nor the money are available to me, would have been necessary under the most varied conditions for a better prediction of the expected values. In view of the importance of the topic, it would perhaps have been proper, after 65 years, for some renowned institute to begin with such investigations at long last.

Matters are different, however, when coming to conclusions based upon architectural and engineering questions. Because the structural fabric of some of the buildings under discussion has remained in its original condition and due to the extensive documentation available about them, we are able to arrive at concrete statements, especially regarding the absence of alleged Zyklon B introduction holes in Crematoria I, II, and III.

9. Conclusions

- Even according to the statements of pharmacist J.-C. Pressac, who, in the late 80s and early 90s, was promoted as *the* technical Holocaust expert, eyewitness testimonies relating to the engineering of the installations and their capacity are, almost without exception, untenable. But even the corrections to the testimonies considered by Pressac to be necessary do not go far enough to make them credible. In particular, the testimonies relating to the duration of executions in the "gas chambers" (Morgue 1) of Crematoria II and III, as well as the ventilation times after the executions go completely awry. This is because of the over-estimation of the evaporation rate of hydrogen cyanide from the carrier of Zyklon B, as well as the incorrect concept of the effectiveness of the ventilation of the rooms. If the eyewitness testimonies relating to the quantities of Zyklon B used, and at least approximately relating to the rapidity of the execution procedure are to be accepted, then they are incompatible with testimonies, sometimes of the same witnesses, that the victims' corpses were removed from the "gas chambers" immediately after the executions and without gas masks and protective garments. This is particularly true for those alleged "gas chambers" without ventilation installations (Crematoria IV and V and farmhouses I and II), since working in poorly ventilated "gas chambers" with high concentrations of poison gas is impossible without gas masks. The extreme danger to the sweating workers of the *Sonderkommando*, who are supposed to have worked without protective garments, makes the witnesses untrustworthy. The eyewitness accounts are therefore completely contradictory, illogical, contrary to the laws of nature, and therefore incredible. The witnesses engage in particular contortions when it comes to the cremations (amount and kind of fuel used, speed of cremation, development of flames and smoke), which furthermore fail to accord with the analyses of aerial photography.
- The alleged installations for the mass murder of human beings are, in Pressac's judgment, impractical for their purpose, but were, on the contrary, illogically constructed in parts, so that they would not have been suitable as instruments of mass extermination. Once one considers the actual technical requirements, the impression remains of the total inadequacy of the installations in question – which were deficient to the point of uselessness – in gross contradiction to the

technically advanced disinfestation chambers in the immediate vicinity. The facts set forth here with relation to Zyklon B introduction pillars in the ceilings of the "gas chambers" (Morgue 1) of Crematoria I to III strengthen the suspicion of a subsequent manipulation almost to a certainty. These installations would have been even less suitable than Crematoria IV and V. It would have been impossible to introduce the gas into them.

- Due to the proven, enormous environmental resistance of Iron Blue pigment, the slight cyanide traces in alleged homicidal "gas chambers," which are demonstrable in places, but are not reproducible, cannot be explained on the basis of remaining residues of a disintegration process, since even on the weathered exterior side of the disinfestation wing large quantities of cyanide can be found even today. Towards the end of the operating period of the installations, therefore, the cyanide content must have been present in the same order of magnitude as it is today, as well as in the areas which were never exposed to weathering. But the cyanide values of protected areas in the alleged homicidal "gas chambers" are just as low as in places exposed to weathering. Weathering has, therefore, not actually diminished these slight traces. The low cyanide values cannot be explained by fumigation of the premises for vermin, as postulated by Leuchter, since such fumigation would probably have left greater quantities of cyanide in the moist cellars of Crematoria II and III. The cyanide values of the alleged homicidal "gas chambers" lie in the same order of magnitude as the results, among others, of the samples taken by myself from parts of other buildings (hot air disinfestation building 5a, inmate barracks, the washroom of Crematorium I). These values, however, lie so near the detectable threshold that no clear significance can be attributed to them, most importantly due to their lack of reproducibility. From the above, one can safely conclude that *no* cyanide residues capable of interpretation can be found in the walls of the alleged homicidal "gas chambers."

  It was further possible to show that, under the conditions of the mass gassings as reported by eyewitnesses in the alleged "gas chambers" of Crematorium II to V, cyanide residues would have been found in similar quantities, coloring the walls blue, as they can be found in the disinfestation wings of building 5a/b. Since no significant quantities of cyanide were found in the alleged homicidal "gas chamber," one must conclude that these installations were exposed to similar conditions as the above mentioned other installations (hot air disin-

festation, inmate barracks, washroom of Crematorium I), *i.e.*, that they most likely were never exposed to any hydrogen cyanide.

Final Conclusions

A. On chemistry

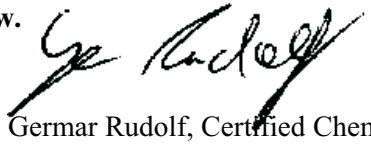
A: The investigation of the formation and stability of cyanide traces in masonry of the indicated structures as well as interpretation of the analytic results of samples of building material from these structures in Auschwitz show:

1. Cyanide reacting in masonry to produce Iron Blue is stable over periods of many centuries. It disintegrates on the same time scale as the masonry itself. Therefore, traces of cyanide should be detectable today in almost undiminished concentrations, regardless of the effects of weather. The outer walls of the delousing chambers BW 5a/b in Birkenau, which are deep blue and contain high concentrations of cyanide, are evidence of this.
2. Under the physically possible conditions of the mass-gassing of humans with hydrogen cyanide, traces of cyanide ought to be found in the same range of concentration in the rooms in question as they are found in the disinfestation structures, and the resulting blue discoloration of the walls should likewise be present.
3. In the walls of the supposed "gas chambers" the concentrations of cyanide remnants are no higher than in any other building taken at random.

Conclusion to A:

On physical-chemical grounds, the mass gassings with hydrogen cyanide (Zyklon B) in the supposed "gas chambers" of Auschwitz claimed by witnesses did not take place.

B: On building technology



The investigation of the events of alleged mass gassings in the indicated rooms claimed by witnesses, from a technical and practical standpoint, including physical-chemical analysis, showed:

1. The extensive documentation on the Auschwitz camp does not contain a single reference to execution "gas chambers"; rather it refutes such suspicions.

2. The supposed main gas chambers of Auschwitz, the morgue hall of the crematorium in the main camp and the morgue cellars I ("gas chambers") of Crematoria II and III, did not have any means for the introduction of poison gas mixtures. Holes in the roofs visible today were made after the war, and all other cracks are the result of the building's destruction at the end of the war.
3. The release of lethal quantities of hydrogen cyanide from the Zyklon B carrier requires many multiples of the asserted execution times.
4. Providing the necessary ventilation for the supposed "gas chambers" of Crematoria II and III would have taken many hours, contrary to all witness testimony.
5. It would have been impossible to provide an effective ventilation of the supposed "gas chambers" of Crematoria IV or V or of farmhouses I and II. The corpses could not have been removed from the rooms and carried away by the *Sonderkommando* without protective garments and the use of gas masks with special filters.

Conclusion to B:

The procedures of mass-gassing as attested to by witnesses during their interrogation before various courts of law, as cited in judicial rulings, and as described in scientific and literary publications, in any building of Auschwitz whatsoever, are inconsistent with documentary evidence, technical necessities, and natural scientific law.

Germar Rudolf, Certified Chemist, in exile, on September 13, 2002.
Edited by Dr. Wolfgang Lambrecht, December 2010.

DECLARATION

The author of this report can refer only to the *existing* eyewitness testimonies and documents, which *alone* are the basis for the widespread historical viewpoint in the matters dealt with here.

If the conviction should nevertheless become prevalent that the eyewitnesses erred in their corresponding testimonies, then an expert can only confirm that there is no longer any basis upon which to draw up an expert opinion, and, in the opinion of this author, there will no longer be any basis upon which court judgments, a method of historiography established by criminal law, or criminal prosecution of certain statements could be based.

10. Acknowledgements

Unfortunately, I cannot thank everyone who was directly or indirectly involved in creating this expert report or who expressed their support. However, I do wish to express my gratitude to the following institutions and individuals:

- The late Major General (retired) Otto Ernst Remer, whose forthright public statements were the reasons why this expert report became necessary in the first place.
- Mr. Karl Philipp, whose initiative on behalf of MajGen. Remer and whose logistic support enabled me to prepare this report.
- Dr. Robert Faurisson for critically reading the first manuscript in late 1991, and supplying me with abundant documentary material.
- Certified engineer Winfried Zwerenz for providing rooms and equipment to conduct experiments, as well as useful observations regarding ventilation and cremation techniques.
- Certified engineers Gerhard Förster, Emil Lachout, Arnulf Neumaier, Michael Gärtner, Harald Reich, Carl Hermann Christmann, R. Faßbender, and Konrad Fischer for their various support and research contributions.
- Certified engineer Walter Lüftl for manifold comments and suggestions on questions of engineering.
- Dr. Horst Leipprand and Otto Karl for their indispensable research on the properties of Zyklon B.
- John C. Ball for his broader investigations of Allied air photos regarding Auschwitz.
- Carlo Mattogno for his extremely detailed and productive critique as well as his excellent archival studies which he allowed me to use and quote extensively.
- Friedrich Paul Berg for his very valuable research on executions with hydrogen cyanide in the USA.
- Werner Wegner and Jan Markiewicz for their friendly correspondence in.
- Dr. Myroslaw Dragan for his productive critique regarding the inhalation of hydrogen cyanide by humans and for his instructive cremation experiments.
- The late Charles D. Provan for his fruitful, though unfortunately unpublished, critique regarding the alleged Zyklon B introduction holes.

- Attorneys Hajo Herrmann, Dr. Günther Herzogenrath-Amelung, Dr. Klaus Göbel, Jürgen Rieger and Dr. Herbert Schaller for their legal support.
- Dr. Heinz Knödler, Linda M. Faith, Andrew Fuetterer, Dr. Fredrick Töben for proofreading various versions of this report.
- Carlos Porter, Michael Humphrey, and James M. Damon for contributions getting this work translated from German into English.
- Historians Dr. Rainer Zitelmann, Dr. Werner Georg Haverbeck, Dr. Hellmuth Diwald, Dr. Emil Schlee, Dr. Robert Hepp, Dr. Ernst Nolte, Dr. Walter Post, and Dr. Joachim Hoffmann for their encouragement.
- Mrs. Elda and Dr. Robert H. Countess, who were there for me when I became a refugee and needed friends, who helped me build up *Theses & Dissertations Press* and launch the *Holocaust Handbooks* series. I particularly thank Bob, who discussed many details with me and did the final proofreading of the first edition.
- *Forschungs- und Materialprüfungsanstalt* (Research and Material Testing Agency) Baden-Württemberg, Otto Graf Institut, Department 1: Building Materials, Stuttgart, for informative discussions and their permission to use their extensive literature.
- *Forschungsinstitut für Pigmente und Lacke e.V.* (Research Institute for Pigments and Varnishes), Stuttgart, for permission to use their library.
- *VARTA Batterie AG Research Center*, Kelkheim, for performing mercury penetration tests of building materials.
- *Bundesarchiv-Militärarchiv* (German Federal Archive-Military Archive), Freiburg, for information regarding W.W. II era Soviet tank engines.
- *Degussa AG* for sending information material on Iron Blue (trade name Vossen-Blau®).
- *Detia Freyberg GmbH* and *ARED GmbH* for information on Zyklon B.
- *Institut Fresenius*, Taunusstein, for providing insights into their procedural and analytic methods, and informative discussions about analytic problems.
- *Institut für Umweltanalytik* (Institute for Environmental Analytics), Stuttgart, for assistance in the understanding of experimental control and analyses.
- *Zentralrat der Juden in Deutschland* (Central Council of Jews in Germany), which, by its highly inappropriate intervention, encour-

aged my dismissal and assisted in preventing me from finishing my doctoral dissertation, foiling any prospect of pursuing a post-doctoral degree, and liberating me from the duties of a professional career, thus allowing me to dedicate 24 hours a day to revisionism.

- The *University of Stuttgart* and the *Max Planck Institute for Solid State Research* in Stuttgart (MPI), which successfully prevented me from wasting my life in the ivory towers of science by denying my PhD and dismissing me without notice. However, I am also grateful that the MPI, through mutual agreement, converted my dismissal to an annulment of contract roughly a year later.
- The Stuttgart District Court, the Tübingen County Court, the Böblingen County Court, the Weinheim County Court, the Berlin-Tiergarten County Court, the Munich County Court, the District Court Mannheim, as well as the *Bundesprüfstelle für jugendgefährdende Medien* (German Federal Review Office for Youth-Endangering Media) for trying to drown me in uncounted criminal prosecutions for my revisionist publications, which had the consequence of allowing me to pursue my revisionist publishing activities in exile, undisturbed by the terror of the German authorities.
- Lastly, I wish to acknowledge the German and British media for their innumerable inflammatory articles and newscasts, forcing me into seclusion and a more focused devotion to revisionism.

Part II:
Persecution:
Hunting Germar Rudolf

1. What Makes Revisionists?

Bavarian Nostalgia

During the early 1980s, in my last three years at high school, I developed a passion for everything Bavarian: the soccer team *Bayern München*, Lederhosen, the dialect, and, of course, the Bavarian Party, the CSU,[554] which exists in Bavaria only. I also became a fan of Franz-Josef Strauß, who for many decades was chairman of this party and became kind of a symbol for everything Bavarian. I surely would have joined the CSU, also because of its strong conservative views, but unfortunately this party was open only to those residing in Bavaria, where I never lived.

At that time, I also joined the youth organization of Germany's semi-conservative party CDU,[555] but was active only a short time, because when my university studies took me to Bonn in 1983, I abandoned all political commitments for the time being.

When I started to study chemistry at the University of Bonn in the fall of 1983, Bonn, then capital of West Germany, was a hotbed of anti-government demonstrations mainly by leftist students. The German federal government, led by the CDU and CSU, had agreed to the stationing of Pershing middle range nuclear weapons in Germany by the U.S. armed forces and also planned a census of the German population. Both infuriated the German left, who was strongly opposed to any foreign military presence in Germany and to any governmental intrusion into the privacy of German citizens.[556] I, on the other hand, took the position held by the German federal government led by the CDU/CSU, arguing *for* the census and *for* the stationing of U.S. nuclear weapons to deter the Soviets.

However, my involvement was abruptly curbed when CSU chairman Strauß engineered a one billion Deutschmark loan to communist East Germany, a deal that contradicted everything Strauß stood for, in particular, the principle that one should never do business with the totalita-

[554] *Christlich Soziale Union*, Christian Social Union.

[555] *Christlich Demokratische Union*, Christian Democratic Union. They actually refused to be called conservative, and rightly so, since only a minority of their members has conservative views, the majority having quite liberal views. The CDU has no section in Bavaria, where the CSU plays its role, though the Bavarian CSU is more conservative than the "Prussian" CDU.

[556] Today the German government consists of those who protested against such politics in the 70s and 80s, and as was to be expected, they now do even worse: They wage war in Serbia and Afghanistan, and they are increasingly dismantling the Germans' civil rights.

rian powers of the East, unless some reciprocal benefit was forthcoming. The reciprocal benefit here, however, was only imaginary in that East Germany's communist government promised to remove the "robot" machine guns on the intra-German border, which automatically killed or maimed every German trying to pass from totalitarian East Germany to "Golden" West Germany. Subsequently, these atrocious weapons were indeed removed, but this was accompanied by the construction of a second border fence farther inland. As a result, the inner-German border became even more impenetrable. Hence, Strauß' deal did not lead to any humane relief for the East Germans, but instead stabilized East Germany's economy, thus delaying its – as we know today – unavoidable final collapse for a few more years. From today's perspective, my criticism at the time was entirely justified. But at that time, it was the opinion of a separate minority only, a minority subject to ridicule – it was a "peculiar view."

First jail experience

In October 1983, I had joined a Catholic student fraternity, founded in Königsberg (East Prussia) in the late 1800s, but relocated to Bonn after WWII. At the end of WWII, almost the entire German population of East Prussia either fled, was murdered, or expelled by the invading Soviets who divided this old German province in two parts, annexed the northern part and gave the southern part to Poland. In 1984, a "brother" of this fraternity persuaded me to accompany him on a trip to Czechoslovakia in February of that same year. This fraternity brother was a student of Catholic theology and had adopted the cause of the suppressed Catholic Church in the then still Stalinist Czechoslovakia. Also, he had acquaintances there, and his parents were from the Sudetenland, a once purely German border region of Czechia, from where most Sudeten-Germans had been expelled or murdered after WWII by the Czechs. This fraternity brother of mine believed in and fought for the rights both of the small Sudeten-German minority still living in Czechoslovakia and for the expelled Sudeten-Germans, most of whom had resettled in Bavaria and Austria after WWII.

With the knowledge and support of the Catholic Church, we attempted to smuggle theological and political books, as well as a photocopier, to a Catholic congregation in Prague. Our political literature included, for example, a Czech edition of George Orwell's *1984*, which was forbidden in the then Czechoslovakian Socialist Soviet Republic.

Although the books arrived at their destination, the photocopier was discovered at the border and my fraternity brother, another person traveling with us and myself were immediately confined to prison at Pilsen in the west of Czechoslovakia. After two weeks of nervous waiting, without any contact to the outside world, during which I was interrogated twice, I was told I could leave. My fraternity brother, however, was later sentenced to a year's imprisonment. He was forced to remain in jail for ten months until Christmas time 1984, when German Foreign Minister Hans-Dietrich Genscher intervened and managed to get him released early.

Justice, not brute force

For many others, this experience might possibly have convinced them to leave controversial topics well enough alone. For me, it was the opposite. When I find that I have been the victim of injustice, my reaction is to fight until amends are made.

It was at this time that I became familiar with the dark side of the Communist dictatorship. I swore to myself in prison, once I was set free, I would combat the evil of Communism.

During the following year and a half, I became more involved with those who had been the victim of expulsions: firstly, because my father had been expelled from the east German province Silesia, together with millions of German compatriots (after WWII, Silesia was annexed by Poland and is now its southwestern part); secondly, probably as a result of memories of the fraternity brother mentioned above; and thirdly, from a conviction that the expulsion and persecution of East Germans by the communist dictatorships of Czechoslovakia, Yugoslavia, Poland, and the USSR was one of the greatest crimes in history, a crime which ought never be forgotten, trivialized or minimized, approved or justified. Parallels with the arguments invariably made in regards to the persecution of the Jews inevitably come to mind.

First political thoughts

The year 1985 was marked by two events:

First, the so-called Engelhard[557] Law was discussed and finally enacted, according to which the offense to dispute, diminish, or justify the crimes of the National Socialist regime, or any other tyrannical re-

[557] Named after the then German Secretary of Justice.

gime, will be prosecuted automatically, without anybody needing to file a complaint. The original intention of those who started this discussion – the leftist Social-Democrats – was to make it easier for the legal system to prosecute "Holocaust deniers," without the necessity of a complaint by some Jewish individual or organization. Certain segments of Germany's semi-conservative party – especially those lobbying for the German expellees – demanded that this law should also apply to anyone minimizing or justifying the crimes of other dictatorships, for example, those who minimized or justified the criminal post-war expulsion of Germans from east Germany and eastern Europe.

In this discussion, I vigorously took sides on the wing of the conservatives often disparagingly referred to as the "steel helmet faction." By then, I had frequently experienced that those working and arguing on behalf of the German expellees are confronted with the argument that the Germans in general and the German expellees in particular have no right to insist on their claims, even if they were supported by international law.

After all, since Germany under Hitler had wanted war and started war, and since so much guilt had accumulated as a result of the "extermination" or "intended extermination" of the Jews and Slavs, any subsequent crimes committed against Germans by the peoples of Eastern Europe must be viewed as mere recompense. One had to take this view for the sake of a peaceful life. But by so doing, crimes, when committed against Germans by non-Germans, are considered to constitute a counterbalance to German crimes against other nationals, and are thus accepted as "fair punishment." This is common practice, it is a matter of good conduct in Germany to see it this way. But you will be sorry, should it ever enter your mind to turn this argument around and compare and counterbalance German crimes, actual or alleged, with those of other nationalities. This is, of course, *verboten*! In fact, continual reminders of German crimes, whether true or not, were and are still used to suppress any memory of crimes committed against my own people, the Germans, or to discuss justified claims resulting from the Allied crimes.

No doubts about the indisputable

Certainly, it would have been possible to try and dispute these German crimes, actual or alleged, as a means of overcoming the obstacles of discussing the crimes committed against Germans. But this course of

action was not open to me, since I could neither argue nor act against my strongly held convictions. I was a firm believer in the standard historical account of the extermination of the Jews. This approach was therefore closed to me – it did not even occur to me as a theoretical possibility. The only available way was to take the position that two wrongs do not make a right, and no good could ever come of a wrong. This applies to the National Socialist persecution of the Jews as well as to the expulsion of the Germans.

Tackling the *Zeitgeist*

The second significant event of 1985 was my joining a political party called *Republikaner* (not to be confused with the U.S. Republicans). I made contact with this party through my involvement with the youth branch of an organization of Silesian Germans. At that time, these *Republikaners* were relatively unknown and their members were thought of as conservative patriots, but not as a right-wing radicals. I discovered that this party had originated from a split with Bavaria's conservative party CSU. The reason for some members of the CSU to leave this party and form their own was dissatisfaction with the mediation of the billion Deutschmark loan to communist East Germany by CSU chairman Franz-Josef Strauß, as already mentioned. The party appeared to me as a kind of nation-wide CSU – minus the fear and trembling in the face of the Eastern bloc, and minus the marked patronage of offices and blatant corruption which was noticeable already then.

At first, I thought that this was just the party I had long been looking for, at least with respect to German national politics. However, their handling of the subject of immigrants repelled me, because as a Catholic I was very sensitive to programs or ideas that appeared to be motivated by hostility to foreigners.

An anti-fascist climb-down

The year 1986 was marked by two events as well:

First, I came to realize that the *Republikaners*, at least in the Bonn-Siegburg districts, were mostly a collection of hard-core right-wingers who had been expelled from East Germany after WWII. At the only membership meeting that I attended, it was obvious to me that they could not find anything more important to talk about than the question of whether and to what extent West Prussia was German, and whether

territorial claims to it could be asserted. This complete withdrawal from political reality, accompanied by a failure to recognize that which was politically necessary at the time the world was debating the reunion of West and East Germany, contributed to my decision to leave the party.

The most compelling reason for my decision was a recognition that the party included more than a few former members of the right-wing radical party NPD,[558] with whom I wanted no contact. After a membership of half a year, I left the party in early or middle 1986.

The second event that I wish to discuss here took place in January 1986, at a convention to celebrate the 115th anniversary of the founding of the German Reich in 1871, organized by the student fraternity *Verein Deutscher Studenten* (VDSt, Association of German Students), and held in Frankfurt. It was at this convention that I first learned that the VDSt Frankfurt was a nationalistically oriented student organization. And it was after this celebration that I had a long argument with a student member of this organization who claimed to be a member of the nationalist party NPD. The subject of our argument was the extermination of the Jews. He maintained that the established description did not fit the facts, and that there were not, in reality, six million victims, but three million at most. I was appalled by this manner of argument, and will explain why.

Repulsive numbers juggling

First, there was the natural repugnance aroused by a line of argument which tended merely to diminish a few numbers, although the issue is not really the actual numbers, but the intention behind the deed. My belief at that time was that Hitler had planned to exterminate the Jews, and had done whatever had been necessary to accomplish this goal. The actual "how" and "how many" were of secondary importance.

From the student's style of argument, it was clear that he had strong political motives for his way of thinking. He spoke of the use of the "Auschwitz bludgeon" against the political right, and in particular, against his party. His mixture of political objectives and scientific argumentation made me skeptical. I could not take his arguments at face value, because I was unable to trust him. I silently reproached him for his political involvement, believing that he was no longer willing or able to distinguish between truth and falsehood, between the justified and the unjustified.

[558] *Nationaldemokratische Partei Deutschlands*, National Democratic Party of Germany.

I have forgotten his exact arguments and conclusions. Perhaps I do him an injustice, but I still retain a bitter taste of his unbending, politically-motivated way of thinking. It is possible that this is merely an impression I had, because at the time, I thought of all NPD members as extremists with dishonest intentions. It is therefore possible that it wasn't the NPD member who had a distorted view of things, but rather, that I saw him distortedly by my own prejudices. That question will never be answered.

Politics prevents doubt

What can one say today about that event? Although I had dealt with this Holocaust "denier" and was well aware of the reality of the political misuse of the "Auschwitz bludgeon" against the political right or right-wing oriented people, this did not lead to my doubting the truth of the usual historical version of the National Socialist persecution of the Jews. The reason was that I could not, and cannot, take seriously any position maintained for obviously political reasons.

In the years that followed, I devoted myself chiefly to my studies; in 1986, I had entered the demanding graduate phase of my studies with subsequent preparation for the *Diplom* examination.[559] During this period, I abandoned all political activity and withdrew from my work with German refugee organizations and with my student fraternity. This was due not only to my academic work load, but also because I had had my fill of nonsense and no longer cared about activities which were partially unrealistic and mostly useless.

Turks into the "gas chamber"?

The pressure let up in the year 1989, as I had just completed my *Diplom* examinations and therefore enjoyed some free time for different intellectual pursuits. The same year was also marked by two significant events.

The first event was the elections for the Berlin Chamber of Deputies, during which the *Republikaners* gained their famous (or infamous) entry into the city's parliament. Like most people, I was completely surprised by this outcome, since I had lost almost all contact with this party. But, in contrast to most other people, I had some idea of what the *Republikaners* were, and were not. The horrifying media witch-hunt

[559] Regarding its difficulty, the German *Diplom* is almost an equivalent to an Anglo-Saxon PhD.

against this party immediately following the electoral success infuriated me. Characteristic of this witch-hunt was the question posed by a journalist on election eve to Bernhard Andres, then party chairman in Berlin, as to whether the *Republikaners* wished to do to the Turks what Hitler had done to the Jews. That was when things turned sour. It was clear to me in the flash of a moment's insight that I would rejoin the *Republikaner* out of pure defiance and democratic solidarity, even if I was displeased by some things about this party. One could take or leave a few isolated party positions as one wished. As long as the party was in compliance with the German constitution, it was entitled to treatment on the basis of equality.

Of course, nothing that has happened since then bears any resemblance to democracy. Party meetings were regularly harassed or prohibited, although Germans were guaranteed the freedom of assembly as a "basic right." The print and electronic news media were instructed to report nothing but negative information about this party, a fact not in conformity with the standards of ethics and the legal duty of the publicly-funded news media to report the news with objectivity.

The establishment parties placed the *Republikaners* beyond the pale of democracy and constitutional politics. It was therefore those establishment parties who had violated the constitutional right of the *Republikaners* to equal treatment, as well as to the freedoms of expression and assembly.

Professional disbarment due to loyalty to the constitution

One of my close friends, a long-time member of Germany's semi-conservative party CDU, had recently completed his studies in civil administration and was assigned to the city government of a large city in Saxony during his period of practical training. He then received orders from his supervisor, a CDU member, to prohibit the planned regional party convention of the *Republikaners*. Since it was his specific duty as a civil servant to respect the provisions of the German constitution, he refused to obey these orders on the grounds that the *Republikaners* were a legally constituted party, the unconstitutionality or undemocratic nature of which has remained unproven. Therefore, in accordance with the principle of equal treatment for political parties, as well as with the rights of free assembly and a respect for the duty of

democratic parties to hold regular meetings of their members, their party convention could not lawfully be prohibited.

The consequence of this disobedience was that my friend was told that he would not be able to complete his period of practical training. To avoid forced termination during this period, my friend agreed to a termination agreement to become effective subsequent to this training. His concomitant attempt to fight the agreement in the Labor Court naturally failed. In Germany, those who defend the constitution are dumped on the street, while those who continually violate the constitution enjoy offices and power while the media cheer them on.

"Reprehensible" German unity

I need to discuss another reason for my rejoining the *Republikaners* in 1989. My belief that one should hold fast to the unity of the German Fatherland has never changed. The left-wing German party SPD[560] had abandoned the goal of reunification in the mid-70s, while the left-wing radical GRÜNE (Greens) had always supported the division of Germany into two independent states. The small liberal party FDP[561] followed in the mid-80s in their support for two independent German states, and towards the end of the 80s, even within the semi-conservative CDU calls to put off the German reunification forever became louder and louder. In this connection (I believe it was in 1987), I remember the commentary of Dr. Helmut Kohl, then leader of the CDU and German chancellor, on a position paper of a certain CDU Member of Parliament, Bernhard Friedmann, concerning German reunification, which Dr. Kohl described as "blooming nonsense." After the political sea-change of 1983, when the semi-conservative/liberal CDU/FDP coalition replaced that of the socialist/liberal SPD/FDP government of the decade before, the new government dissolved all governmental departments in charge of administrative preparations for a German reunification. The left wing of the CDU, under Rita Süssmuth, Heiner Geißler and Norbert Blüm, campaigned openly for dual statehood. In the summer of 1989, the Federal Council of the CDU youth organization *Junge Union* (Young Union) took the initiative to recommend the deletion of the political goal of German reunification from the party program of the CDU– just a few months before the Berlin Wall fell and Germany actually was reunified!

[560] *Sozialdemokratische Partei Deutschlands*, Socialdemocratic Party of Germany.
[561] *Freie Demokratische Partei*, Free Democratic Party.

Now that Germany is reunited, a devastating judgment must be passed upon all the established political parties with regards to their political competence. From the standpoint of the present, the *Republikaners* were the only party, of those involved at the time, with a correct estimation of the historical and political forces, even if they were subsequently booted out by the turncoats of reunification. I was in the party because all the other parties had abandoned, or were about to abandon in an absolutely unconstitutional manner, the principle of reunification, a principle laid down in the preamble to the German constitution.

It is significant also that my membership in the *Republikaners*, which ended in the summer of 1991, was later used by the District Court Stuttgart as an indicator of my political mania – in full knowledge of what I have just described. Nowadays, support for the maintenance of constitutional political principles is deemed reprehensible, if not outright illegal. Further comments are superfluous.

Ready to go into a new era…

The young people that streamed into the *Republikaner* party at that time wanted to do something for German reunification, since this was impossible in almost any other political party. Former members of the CDU, the SPD and the FDP joined, as well as people from right-wing splinter parties and many people who had never been in any party at all. It was a motley group resulting in an unholy chaos. But among us students in Frankfurt, where I completed work for my diploma thesis and later performed my compulsory military service,[562] this plate of mixed vegetables was intellectually very fruitful. In the newly founded *Republikaner* university organization, we had one former member of the liberal party FDP, one from the socialist party SPD, one from the conservative ecologist party ÖDP,[563] three from the semi-conservative CDU, and many who were active for the first time. During this time, we were flooded with new ideas and discussed controversial issues as never before.

In this Frankfurt period, which ended in late 1990, I read nearly 200 books, mostly during my "loafer-service" in the *Bundeswehr*: I read right-wing and left-wing books, books from the middle-of-the-road, and books without any political viewpoint. It was one of the best times I

[562] In Germany, military service is compulsory for all men physically fit to do so.
[563] *Ökologisch Demokratische Partei*, Ecological Democratic Party.

have ever experienced. It was like preparing for an intellectual break-out.

…but instead into the offside

Our interest in involvement with the *Republikaner* party disappeared due to the fact that it was extremely anti-academic, both in its ranks and leadership. We had to let ourselves be mocked and called greenhorns and academic egg-heads by other members, and the work of our high-school organization was torpedoed by the *Republikaner* leadership which led to our resignation. From 1990 onwards, the *Republikaner* party has concerned itself mostly with internal conflicts; since every initiative for constructive work was received with malicious criticism, I resigned in the summer of 1991, about nine months after my relocation to Stuttgart in order to start my PhD studies.

A concentration camp inmate…

Now back to the question of how I became a revisionist. Certainly in the beginning of my second involvement with the *Republikaners*, I was repeatedly confronted with the use of the "Auschwitz bludgeon" used against both "my" party and myself. I have mentioned above the scandalous question of the journalist after the Berlin election, a question which was used continually to suggest that the *Republikaners* – after they had seized power – intended to "gas" the Turkish immigrants residing in Germany. Wouldn't it have been easy to have introduced the idea of disputing the Holocaust at such a time?

I had a chance to do this in the spring of 1989, when one of my friends, who had left the "liberal" FDP shortly before to join the *Republikaners*, addressed the Holocaust issue in one of our discussions. He recommended that I read the book *Was ist Wahrheit* ("What is Truth"), by the socialist Frenchman, Professor Paul Rassinier.[34] This may be regarded as the first fully revisionist book ever published. It deals with the supposed extermination of the Jews from the point of view of a former member of the French Resistance who had been incarcerated by the Germans in several concentration camps during WWII.

The remarkable thing about the book is its author. Since he was interned in several concentration camps as a member of the Resistance and was a pronounced left-winger – before and after WWII, he was a French member of parliament for the leftist socialists – he could not be

accused of wanting to whitewash anything or of having any kind of political agenda. Written in a factual and balanced style, the book was easy to read; we discussed it, and that was all. I felt no need to devote myself further to the subject, either through the examination of further revisionist or establishment literature or through undertaking my own investigations. If there had ever been a political reason for an involvement with Holocaust revisionism, it would have been when I was throwing myself intensively into debating on behalf of the *Republikaners*.

…a neutral Swiss…

The cause of my interest in the Holocaust problem, beginning in the fall of 1989, came from quite another source, one that was only secondarily political and which had nothing to do with the *Republikaner*. In the fall of 1989, I bought the book *Der Nasenring. Im Dickicht der Vergangenheitsbewältigung* ("The Nose Ring – In the Thicket of Coming to Terms with the Past") by the Swiss political scientist Dr. Armin Mohler.[564] I had already received an earlier edition of this book as a gift from my mother in the mid-1980s. This earlier edition was the result of an assignment given to Mohler by a semi-official institute of West Germany. Mohler was asked to study how and when German attempts to come to terms with their past – originally a purely moral impetus – had become a weapon in day-to-day political discussion and intrigues.

That "coming to terms with the past" could lend itself to misuse for dirty schemes is obvious. From my own experience, I can think of three notable cases, where prominent German figures were driven out of office and their reputation destroyed by political and media smear campaigns. In such cases, the media and/or competing colleagues either use (allegedly) "brown spots" in the CV of the attacked individuals' WWII history, or they distort and/or instrumentalize "politically incorrect" statements certain individuals made in public or private about Germany's WWII past.[565] Whatever the CV or the statements about the past of the victims of these campaigns are; the treatment which they receive by colleagues and the media must arouse the suspicion that the German past is being used today as a weapon of political intrigue against undesirables in one's own political party, in other parties, or in general against any unwelcome professional competitor.

[564] Heitz & Höffkes, Essen 1989.

[565] The names of those persons are: Hans Filbinger, Philipp Jenninger, and Werner Höfer.

The question of how true the historical picture is that hides behind the "coming to terms with the past" Mohler handled only peripherally in this early edition of his book. His new book, which I read in the fall of 1989, goes into this question very thoroughly and thereby naturally brings up the question of the validity of historical revisionism – something which first became clear to me while reading the book.

That I got hold of this book was due not so much to its contents, which I previously knew nothing about, but more to my interest in the analyses of a Swiss political scientist, someone writing from what I considered to be a neutral position.

…and an apolitical American…

This Swiss author also reported about a study on the alleged "gas chambers" at the Auschwitz concentration camp. This study, said Mohler, had been prepared by an American expert for execution technologies, who had come to the conclusion that there had never been any gassings with poison gas in Auschwitz. One of his main arguments was the absence of traces of the poison gas supposedly used in the walls of those locations identified as homicidal "gas chambers." Since this was a quite intriguing argument, I decided to order a copy of this study, for which Dr. Mohler even provided an address in his book. Thus were the factors brought together that I needed to compel me to get to the bottom of the problem: the report of an author I held to be politically neutral of a study by an apolitical non-partisan American on a discipline in which I had recently completed my diploma examination: Chemistry.

…enabled me to doubt

At that point, I was ready to put to the test my hitherto held opinion on the correctness of the established Holocaust dogma, because I had been presented with arguments from politically neutral persons that I could examine by means of my technical skill.

In late summer 1989, I received an English copy of the so-called *Leuchter Report*, which I have just mentioned, and I read and translated it into German immediately. But the report did not convince me entirely, because it was inexact at points and contained sloppy errors, as I described extensively in a letter to the editor published in the small right-wing monthly newspaper *Junge Freiheit* in 1990. But the *Leuchter Report* had embedded the thorn of doubt in my heart. I must now ex-

plain what that meant, since therein lies the real reason for my involvement.

Would only morons doubt?

It is generally known that none of the world's religions reproaches its adherents for doubting the faith. Religion teaches us that to doubt is human, and therefore acceptable. One who doubts is not guilty as a result.

After reading the *Leuchter Report*, I began to doubt whether the historically accepted view of the events of the Holocaust was correct. I nevertheless felt guilty, because in western societies we are imbued with our mother's milk that the history of the Holocaust is the purest truth, and those who doubt or deny this are evil or insane: extremists, National Socialists, Jew-haters, ethnic persecutors, weak-minded, morons, idiots, fruitcakes, cranks, crooks, anti-Semites, and so forth.

Yet, through a purely chemical argument, the thorn of doubt had been deeply embedded and I could only get rid of it by plucking it out or trying to forget it. I doubted, and felt guilty for doubting; yet I knew that it is not right to feel guilty for doubting.

From pole star to shooting star

Religions expect their adherents to believe in certain dogmas, but they do not demand doubters to feel guilty. At least the same must apply to science, where doubters should not be expected to feel guilty either. Here I was confronted with chemical-historical questions, and ideally speaking, science knows no dogmas, knows no compulsion to obedience, and no punishments for those who contradict the prevalent paradigm.

I therefore asked myself, why do western societies guard the Holocaust dogma closer than any religion does its own dogmas? The reason is certainly that western societies, and in particular German society, regards the Holocaust as one of their moral foundations. This I have explained elsewhere, in the book *Dissecting the Holocaust*.[566] The German elites almost uniformly maintain that the health and wealth of the German Republic depend on the observance of the current official description of the Holocaust. In the German Republic, we are raised

[566] 2nd edition, Theses & Dissertations Press, Chicago, IL, 2003, pp. 49-53.

with the conviction that the Holocaust is the moral pole star of our world-view, with respect to which everything else must be oriented.

That was my own unconscious belief until I began to question the standard historical version of the Holocaust. When these doubts surfaced, I was confronted with the possibility that the pole star might turn out to be only a meteor, that everything which had been held as fundamental truth may in reality be false.

Motivations

Here then are the reasons I have dedicated myself to revisionism:

1. Because of my upbringing, I felt bad merely for doubting. I knew something was wrong with a society when it instills guilt-feelings in its members simply because they dissent. The Holocaust is the one area, and almost the only area, where one is admonished to accept facts blindly; not to think critically. But we are taught to question practically everything else, even that which is kept in high regard, such as the reality of God, or sexual intimacy. We are primed to be docile subjects and kept fearful of any transgressions with respect to the Holocaust. That angered me then and it angers me still.
2. Because of my doubts, my entire outlook on life became unstable. I was no longer certain what was correct or incorrect, who lied and who told the truth. The eternal conflict of good and evil was revived in me. The question where the truth could be found concerning the Holocaust was so important, that I knew I could only recover my peace of mind by finding out for myself, personally, where the truth lay. I wanted to rid myself of uncertainty one way or the other.
3. There is no scientific area in which those who hold dissident opinions are persecuted more mercilessly by the "ruling order" than that of revisionism. That is probably why most people don't want to touch it, and most avoid it by convincing themselves that the subject is not relevant to current problems. But for me, this draconian persecution is the best proof there is that this is a crucial subject, because the powers that be regard it as most important that nobody touches this taboo. Comprehensive and critical research in this area is therefore very important for scientific, political and social reasons.[567]

[567] See also my paper "Wissenschaft und ethische Verantwortung," in Andreas Molau (ed.), *Opposition für Deutschland*, Druffel-Verlag, Berg am Starnberger See 1995, pp. 260-288.

4. The treatment of revisionism and its proponents in areas of science, journalism, politics and law is a scandal worldwide – it demands redress.

Almost stopped…

Up to the beginning of my PhD studies in the fall of 1990, I had read only two books on the subject: Wilhelm Stäglich's *The Auschwitz Myth*[45] and the book by Kogon and others entitled *Nazi Mass Murder*.[46]

After reading these books I collected information on the so-called Zündel trial in order to find out what arguments had been made there. I had discovered in winter 1989/1990 that Zündel, who had commissioned the *Leuchter Report*, was an admirer of Adolf Hitler. This revelation had the equivalent effect of a kick in the stomach, because now I had to deal with the possibility that the *Leuchter Report* was not the independent report of an apolitical American technician, but merely the instrument of a German-Canadian Neo-Nazi. But such considerations could not remove the points made by Leuchter and therefore could not remove my doubts about the historical picture.

In other words, I fully realized that a fact-oriented argument remains a fact-oriented argument – and needs to be treated as such by the examining scientist – even if it came from somebody who stated the facts for political reasons.

…but then getting into gear

I began my own research into this area at the beginning of 1991, at first out of pure personal curiosity regarding the question whether the pigment Iron Blue that developed in the walls of the buildings, where gassings with hydrogen cyanide from Zyklon B allegedly had taken place, was sufficiently stable to still be there today. After that had been proved, I concentrated on the question if, when, how, and under what circumstances this pigment could develop in walls of different compositions.

A revisionist had read my letter to the editor of *Junge Freiheit* in 1990, mentioned above, and after a phone conversation, he sent me a list of addresses of persons and organizations – almost all of them unknown to me.

After I had sent out my first research results in spring 1991 to this list, I was contacted by one person on that list, a friend of ret. Major

General Otto Ernst Remer, a retired Wehrmacht officer. At that time, Remer was engaged in publishing political pamphlets, some of which made quite blunt revisionist statements, which had led to several criminal prosecutions against him. Because of this, his friend and the Düsseldorf lawyer Hajo Herrmann, a well-known former *Luftwaffe* fighter pilot who was now Remer's defense attorney, were looking for an expert to support Remer's revisionist claims.

At that time, it even appeared to be possible for me to work jointly with the *Institut für Zeitgeschichte* (Institute for Contemporary History), an official German left-wing historical institute, whose address was on that list as well. However, they never responded to my letters, apparently because they were not interested in the technical-scientific side of the problem.

In summer 1991, I decided to leave the *Republikaner* party. I have already given the reasons for my decision. An additional and decisive motivation was that I did not want my involvement with revisionism to be interpreted politically because of my membership of a party or that my scientific activity in this controversial area would conflict with the political goals or principles of any party.

Sheer horror…

I should mention another reason that may be helpful toward understanding my involvement. Until my first trip to Auschwitz-Birkenau, I had had no exact idea of the condition of the camp's former crematoria, in which the alleged "gas chambers" were located, so I had no idea whether it would actually be useful to undertake technical or chemical research. Before my first trip, I had thoroughly prepared myself as to what I might expect with respect to the material remains at, for example, "gas chambers," if the generally accepted reports of the mass gassings in Birkenau were correct. It was clear to me, for example, if one was to believe the eyewitnesses, that the roofs of the morgues of Crematoria II and III should show three or four holes through which Zyklon B was to have been thrown into the room.

On August 16, 1991, I stood on the roof of Morgue 1 of Crematoria II at Birkenau. This location is commonly regarded as the "gas chamber" where the most mass-murders of the Third Reich are said to have taken place, a roof which was in various stages of collapse and yet still held together and partially rested on supporting columns; a roof in which I could find no trace of these holes, so that I asked myself wheth-

er I lived in a world of madmen. I found myself horribly duped by a judiciary which had never thought it necessary to make any special technical examinations of the alleged crime scene. I had been lied to by all the politicians of the world who to date had failed to assemble even the most minuscule investigation commission. I had been deceived by the innumerable "Holocaust historians" who to date had not deemed it necessary to make any investigation of the camps of Auschwitz or elsewhere, examinations which paleontologists and historians of antiquity have undertaken on the sites of ruins and other remains of ancient settlements. And I felt betrayed by the natural scientists and engineers world-over who swallowed any and every story whatsoever from the "eyewitnesses" without so much as a murmur that the material remains, the supposed crime scenes, and the eyewitness testimony itself should be subjected to some rudimentary scrutiny.

…leads to the collapse of a world-view

On this 16th of August, 1991, my world-view collapsed and I swore to do whatever necessary to advance clarification to this complex of questions. I will only abandon my position when my doubts are confirmed or rejected through convincing scientific arguments in a fair scientific discourse. Use of force will never change this position. On the contrary: it fortifies my conviction that I am right, because only he who lacks arguments must use force. And since I have been chased all over the world ever since by all sorts of government with brute force, I now know that I must be right.

The Eros of Cognition

In time, a further motivation was added to those mentioned above, namely what I call the "Eros of Cognition." Whoever calls himself a scientist and has not experienced this, is not, in my opinion, a real scientist. The excitement of taking part in decisive scientific research and discoveries, to push things forward which one knows are new and even revolutionary, the consciousness of standing at the forefront and helping direct "whither the ship of discovery goest"– those are things that one must know first-hand, in order to understand what is "Eros of cognition."

2. The Naiveté of a Young Revisionist

A Fleeting Acquaintance

In February 1991, I attended a seminar in Bad Kissingen put on by a Sudeten-German youth organization – I was not a member but had been invited. Toward the end of the seminar, I got to know another participant of about my age. He suggested that before we departed we pay a visit to Wehrmacht Generalmajor Otto Ernst Remer, who lived in that town.

Remer, I was told, was the person who had suppressed the Putsch of July 20, 1944, against Hitler, and I was told he held fast to his views of that time. Our intended visit would be a little bit like a visit to a museum containing a living political fossil. I was curious, so I agreed and off we went.

To a young man from a bourgeois home who had been fed a steady diet of anti-fascism, the living room of General and Frau Remer was creepy – Hitler busts, military decorations and all kinds of propaganda hand-outs caused a shiver to run down my back. We were given a tour of the house by Frau Remer and then treated to a showing of a video-film that portrayed the events of July 20, 1944, from Remer's viewpoint. Thus "enlightened," after an hour we left for home.[568]

Freedom to Witness

In summer 1991, when I was requested by Remer's attorney to prepare an expert opinion on the "gas chambers" of Auschwitz for a criminal trial against his client, I well knew the client for whom I would be acting. It was clear to me that there was a danger that Remer's political opinions and activities could rub off on "his expert witness," if the wit-

[568] Moreover, the Remer couple could remember as little from this chance meeting as from the two subsequent occasions on which I met them, when I appeared as an unknown, unimportant person among a crowd. (Summer 1991: On the return from my first Auschwitz trip, I accompanied Karl Philipp on a brief visit during a reception on Remer's 80th birthday. Philipp, who was a fried of Remer, had initially contacted me for an expert report, had driven me to Auschwitz and had helped me there. Later he also assisted me with all kinds of technical and infrastructural/logistical support. Autumn 1992: Dinner of the defense team during the trial against Remer, after the court had refused to accept me as an expert witness.) The Remers came to know me personally only in January 1995, when the Stuttgart District Court went to Spain to interrogate the Remer couple as part of the trial against me on account of the commentary that Remer had added to the report without asking me. Even then in Spain they needed to ask who I was. They got to know me fairly well only after I had fled to Spain in early 1996, where I resided for four months some 50 miles west of Remer's residence in exile.

ness came to a "politically incorrect" conclusion. Why I nevertheless decided to proceed is as follows.

In a state under the rule of law, a witness, including an expert witness, cannot be punished for what he says before the court or for what he presents in writing to the court, in good conscience and to his best understanding.

Also, in civil law an expert witness is only liable if it can be proven that he violated the rules and accepted practices of his profession in producing his report and in so doing caused someone bodily or mental harm.

Therefore, when an expert witness through painstaking effort evaluates all available sources and interprets them in a technically sound manner, in good conscience and to his best understanding, then even if the conclusions of the expert report were wrong he could not be made liable for any gross negligence.

Consequently, he could defend himself at law against any civil disadvantages that resulted from the presentation of a possibly politically incorrect expert report because a witness – here an expert witness – may not be made to suffer for having testified in good conscience and to his best understanding.

Though I could see there were storms threatening to come my way, I looked on them placidly since I believed that having the law on my side gave me the upper hand.

May one publish expert opinions?

It was intended from the beginning that the expert report arising from this request of Remer's attorney would be published. It is unusual to publish expert reports from judicial proceedings, but it does happen when the subject is of public interest. Expert reports drawn up for several trials against supposed National Socialist war criminals, for example, were later made available to a wide public for educational purposes. The Frankfurt Auschwitz Trial is a prime example of this. The expert reports produced during this trial by scientists at the *Institut für Zeitgeschichte* were later published as a collection.[569]

My report was ready for publication in spring 1992. The original document prepared for the court was enlarged by numerous substantial additions and the layout was improved. In summer 1992, the German publishing houses Ullstein-Langen Müller and von Hase & Köhler

[569] H. Buchheim *et.al.*, *Anatomie des SS-Staates*, Walter, Freiburg 1964.

showed active interest in the project. Dr. Fleißner, head of the Ullstein-Langen Müller publishers, quickly got cold feet due to the controversial nature of the theme, despite initial agreement, but von Hase & Köhler wasted no time presenting me with a signed contract. The problem with this contract was that it did not contain any specification as to when the book should appear. This meant publication could have been put off indefinitely while my hands were tied by my contractual agreement. When I pressed them to fix this they lost interest.

Waiting for the Doctor

Social and legal repression was a hint that the theme was a hot one, even when it was handled in a dry, scientific manner. On the advice of various people, I decided to postpone the publication of the document by a politically right-leaning publisher until after I had received my PhD degree.

In the European right-wing scene, the appearance of my report was awaited with increasing impatience throughout 1992; it was expected that my report would contribute decisively to a breakthrough of historical revisionism.

Various people began to prepare openly for the coming publication. I regarded these activities with mixed feelings and often needed to point out that my doctorate would not be properly completed until many months hence.

At the beginning of 1992, I reckoned that I could be in possession of the much-desired degree in the fall. Because of the workload of my doctoral supervisor Prof. von Schnering, however, I extended this period several times. I ended up waiting five more months to February, 1993, until Prof. von Schnering began to proofread my dissertation.

Various Distribution Activities

I came into conflict with German-Canadian revisionist Ernst Zündel in this time, because in summer 1992, without my knowledge, he gave out copies of the report as prepared for the court in February, 1992. In November, again without my knowledge, he went so far as to translate this outdated version of my report into English. Later he let it be known that he would like to be reimbursed for his translation costs to the amount of $10,000.

I had a more pleasant experience with an attorney in Austria, Dr. Herbert Schaller. In February, 1993, he asked me if he could have 100 copies of the report to distribute discreetly in Austrian high society. Up to that point, I had made a total of 50 copies of the report by photocopier and glued in color photos by hand, which was an enormous labor. I told the attorney that since my doctoral supervisor had begun to work on my dissertation, I had no time to make 100 copies for him. However, I agreed that he could make copies from the copy he had and could distribute those – on the condition that he do so as discreetly as I myself had done already without accompanying commentary and without publicity propaganda.

As far as I know, Dr. Schaller did make and distribute 100 copies in February or March, 1993. To this day, there has been no public report of his action.

Remer Acts

As fate would have it, the Austrian attorney Dr. Schaller was also one of Otto Ernst Remer's defense attorneys. Remer must have heard about the distribution of my report in Austria. Shortly thereafter, I was informed by one of Remer's friends, and without Remer's knowledge, as I found out later, concerning Remer's intention to do in Germany what his lawyer had done in Austria. According to what I was told, Remer intended to do exactly as the Austrian had done. But because Germany is more than ten times larger than Austria, Remer and his friends intended to do their distribution activity more professionally by having my expert report printed instead of photocopied. Though I knew this could put my PhD degree in jeopardy, I saw no reason to intervene. Naively I thought that Remer would stick to the rules the Austrian had followed, which were perhaps too natural to me to be pointed out specifically: the report must remain unaltered, no additional text, no publicity propaganda is to be made. As we shall see, these rules were not considered natural by Remer and his friends.

The Bull in the China Shop

In March, 1993, with a furious publicity campaign, Remer announced as a measure of self-defense that he was going to publish and distribute that piece of exculpatory evidence that he was not permitted to present to the court, because the Holocaust is assumed to be self-evident.[570] Thereby Remer broke the first unconditional rule for the protection of my doctoral title, namely that there be no accompanying publicity propaganda. Thinking that this writing would only circulate in Remer's circle of supporters, I paid little attention. When I received a phone call from a journalist of a west German radio station, informing me that some of those advertising sheets had surfaced at the University of Cologne, the situation changed. Soon the management of the Fresenius Institute was on the telephone asking me what was in the report – the Fresenius Institute had analyzed the masonry samples from Auschwitz for me. They hinted that they might consider joining me in taking legal action against Remer. An hour later the institute's attorney was threatening me with legal action. Remer had become a bull in the china shop.

Between a Rock and a Hard Place

My situation was precarious. At the request of an attorney, I had prepared an expert opinion to be used in the defense of his client. The conclusion of the report was potentially capable of reducing the culpability of said client with respect to the criminality of some of his factual assertions. I intended to publish the report a few months after completing my doctoral work anyway. Now the client took the step of publishing the report at a time that was uncomfortably early and, what was worse and unexpected, with an unhealthy press campaign. Should I now take him to court after having helped him in court? Should I take him to court for doing what I intended to do myself in a few months, though

[570] Chapter 244 of the German Criminal Code provides that the court may reject evidence on the grounds of "common knowledge" or complete unsuitability. This happens mostly in "Holocaust" cases, and, indeed, without examination of the submitted evidence in order to determine whether it is actually unsuitable or whether it may be able to defeat "common knowledge," which it might do if it were superior to evidence previously submitted. In trials against revisionists and also against supposed "National Socialist criminals," exculpatory evidence is de facto ***verboten***, a classic indication of a show trial.

with a smaller or different press campaign?[571] After all, I had been informed in advance and did not intervene then. The only thing that had changed was Remer's public relation activities.

The Industrious Additions

As if Remer's industrious publicity campaign were not enough, in April 1993, as my expert report was handed out for the first time, I learned that a one-page foreword and a five-page appendix consisting of a description of Remer's criminal trial had been added to my report.[572] I was not the least bit interested in whether or not the added commentary was criminally relevant. I only glanced at the foreword and took no notice of the trial description added after the end of my report. I was aggravated in that Remer had expanded and thus altered the text without authorization. Never mind what was in the commentary – it did not have my approval and that was aggravating enough. But now that this report of mine had been printed, what could I do about it? I thought that it was obvious that I could not be held responsible for something whose addition to my report I had had no knowledge of, not to mention that I had neither given my agreement to it nor had I participated in its preparation. So why should I care whether the content of Remer's commentary was criminal? As a matter of fact, I basically ignored Remer's comments. So it happened that I perused Remer's commentary for the first time at the end of 1994, fully one and three quarters of a year afterward, after my own criminal indictment because of that commentary.

The Hot Potato

In any case, in early 1993, I was concerned only about my doctoral work. This also was due to a passage in Remer's appendix, which my doctoral supervisor held under my nose shortly after he – as all professors of chemistry in Germany – had received his copy. In the abovementioned report on Remer's criminal trial, I had been mentioned in connection with the Max Planck Institute for Solid State Research in Stuttgart. Though I was preparing my PhD thesis in theoretical crystallography at this institute, my research about the "gas chambers" of Auschwitz and my subsequent activities as an expert witness had nothing to do with this governmental research institute. It was my private

[571] My hesitation in taking legal measures against Remer was later used by the court as an indication of my complicity with him.

[572] See Part II, chapter 5.1., for the text Remer had added.

activity. However, the fact that I was referred to in Remer's appendix as an "expert from the Max Planck Institute" had the consequence that the German news media and scientific, legal, and political circles unleashed a storm over the Max Planck Institute and demanded to have my head. At the insistence of the institute, I consulted an attorney specializing in copyright law. He, however, made it clear to me that no "serious" attorney would touch such a hot potato, both from conviction and for the sake of his reputation. Also, it was not clear whether I had any ground of action against Remer, since the copyright had probably gone to him because he had ordered and paid for the report as I had admitted, although I was only paid expenses.

The question of the copyright to the report has never been cleared up. The Remers always held the position that they have the copyright to the report because they paid for it, and that they can do with it as they please. There was a contractual agreement set to paper, but unfortunately I lost my copy as a result of house searches and changes of abode, and the Remers could not find their copy after their flight to Spain, so that the actual contents of the document cannot be determined. I remember only that I was promised to be reimbursed for expenses that I incurred through the production of the report, and that in turn I was supposed to publish my expert report, but no time limit was given for that. The copyright was not discussed.

Also, the Remers have silently accepted that since June 1993, without consulting them, I have on my own determined where, when, and how my report is to appear in each of several languages – German, English, French and Dutch.

Thousands of Dollars – for Nothing

Left out in the rain, as it were, in mid-April 1993, I tried to divert Herr Remer. At the start of May, I finally succeeded in persuading him to curtail his distribution activities because of the reprisals I was experiencing.

Aside from any legal aspect of Remer's commentary, I would like to make a few observations. First, Remer's remarks were composed in a style that would insult any average anti-fascist citizen – and that would be about 95% of the population. One could well assume for that reason alone that most recipients of this version of the report would toss it into the wastebasket unread.

Not only that, but Remer had done something that would cause nearly all his recipients who possessed a spark of pride to consign the piece to the fire. In his foreword on the inside front cover, he attacked our leading politicians, media people, and jurists with the words, "These liars need to be driven from their sinecure fortresses."

At the same time, Remer sent this version of my report to exactly these leading politicians, media people, and jurists, and apparently believed he could achieve some success thereby. It is certain that to send a piece of writing to someone in which he is criticized and threatened is a useless exercise. Remer's defense action must have cost him thousands of dollars – all for nothing.

In the Talons of Justice

After I had stopped Remer's defense action, the legal process ran its course. It was my thinking that no one could touch me for something I had not done. But the State's Attorney had to investigate, since many of those to whom Remer had sent his copies had filed criminal complaints against him and against me: the German Society of Chemists, many state attorneys and chief state attorneys, judges and presidents of district courts and federal courts, left-wing party representatives from various parliaments, professors of various disciplines from universities throughout Germany, and on and on and on. Not to mention that there were continual inquiries from Tel Aviv that persist even today.

Strangely, the state attorneys were active only against me. They made inquiries about Remer, but saw no need to search his house. With respect to Remer, they were satisfied to push papers around. With respect to me, over the following years they searched my house three times and took away everything that was not nailed down. Apparently, German justice did not consider Remer to be dangerous. The Remer problem, they probably thought, would solve itself biologically. My case, however, they decided, needed extra effort.

The End of Illusions

The trial, which lasted from the end of 1994 to the middle of 1995, destroyed what remained of my illusions about the rule of law in Germany. I have described this in Part II, chapter 4: "Flaws of the State Under the Rule of Law." On January 19, 1996, the Federal General Attorney determined that I was to spend 14 months behind bars, not for

my report but for Remer's commentary. The Federal Supreme Court concurred with this sentence in a decision on March 7, 1996 (Ref. 1 StR 18/96). On Remer's commentary, the District Court of Stuttgart stated in passing sentence (Ref. 17 KLs 83/94, S. 115):

> *"Although the preface and epilogue did not explicitly accuse the Jews of fabricating the descriptions of the Holocaust for political and material benefits, in the view of the court the Remer version of the report had the purpose of suggesting this and thereby arousing hostility toward the Jews. This follows from the fact that the reader, believing the claims of the report to be correct and influenced by the tendentious comments and rhetoric, would come to the conclusion that the surviving Jews as the most important witnesses of events, surviving relatives as directly affected and Jewish researchers must have intentionally concocted false reports on the Holocaust."*

According to the court, then, Remer's remarks were not punishable by themselves; only together with my report a reader so inclined could "read between the lines" and would supposedly be led to hostility toward the Jews, and that is morally indefensible because it must be clear that everyone ought to be "a friend of the Jews."

Therefore, not only was I punished for a crime I had not committed, but for one which no one had committed.

This would have made some sense, at least, if Remer had foregone his commentary and I had been sentenced for my report and not for somebody else's commentary, but that was not the case.

In Exile

On May 7, 1996, the criminal trial against me and others for the publication of the book *Grundlagen zur Zeitgeschichte*[573] (for this, see Part II, chapter 5.2.) began before the County Court of Tübingen. The sentence that could be imposed by such a court was one to four years imprisonment. Since I had already been sentenced to 14 months of imprisonment without probation, the sentence for me this time would probably not be less than two years – also without probation. Also, the public prosecutor of Tübingen was answerable to the General Prosecutor's Office in Stuttgart, and who knows to whom they are answerable. From the beginning, the following dicta overshadowed the trial:

> *"The moral foundation of this republic is at stake."*[574]

[573] See the English translation *Dissecting the Holocaust*, *op. cit.* (note 24), pp. 563-566.
[574] *Die Zeit*, Dec. 31, 1993, p. 51.

"All democracies have a basis, a cornerstone. For France it is 1789, for Germany it is Auschwitz."[575]

In its sentence, the Tübingen County Court decided the book *Grundlagen zur Zeitgeschichte* should be withdrawn from circulation, effectively annihilated and that the author and publisher should be punished. This, after prominent German historians had submitted to the court expert opinions to the effect that the book held to scientific standards and that therefore the authors, editor, publisher, sellers, printer and purchasers were owed the right of freedom of science and the right of freedom of expression (see Part II, chapter 5.2.).[576] It did not help:

"The Non-Jew Must Burn!"

Since I was the editor of the book *Grundlagen zur Zeitgeschichte*, a warrant for my arrest was issued and I fled the country. In view of all this I hope one may forgive and understand my reasons that I took my family and went into exile: After a brief stay in southern Spain in spring 1996, we moved to England a few months later. A busy young father had better things to do than breathe jail-house air.[577]

Hindsight is Insight

Today, nine years after these events, I know that it is precisely the serious, scientific revisionist work that the establishment considers threatening, since one cannot fight a professionally written work with cat-calls and jeers. Unlike shallow pamphlets, it must be taken seriously. Patrick Bahners stated the establishment view in the highly respected German daily *Frankfurter Allgemeine Zeitung*:[578]

"The state protects the freedom of science. It recognizes the scientist not by the result, but by correct form. [...] *But it can be seen that the intention to agitate can be recognized not only by errors of form that separate beer hall talk from scientific undertaking. On the contrary agitation that is perfect in form is the most perfidious.* [...] *But for those who survived Auschwitz it can hardly be a slighting insult when an expert using phony reasoning tells him there never was a mortal danger.*

Also the state is mocked here. If Deckert's [a German revisionist] '*Views about the Holocaust' were correct, the Federal Republic was founded on a lie. Every presidential address, every minute of silence, every*

[577] Unfortunately, my then wife took my two children and left me in January 1999, initiating divorce proceedings in early 2000. I got remarried to a U.S. citizen in 2004, though.

[578] "Objektive Selbstzerstörung," *Frankfurter Allgemeine Zeitung*, August 15, 1994, p. 21.

history book would be a lie. When he denies the murder of Jews, he repudiates the legitimacy of the Federal Republic."

However, Bahners proceeds from false premises.

First, Bahners does not make clear how an intention to agitate can be recognized, if not by errors of form. It is stated in the German constitution that science is free without restriction. Decisions of the German Federal Constitutional Court have stated that science is defined by formal rules alone and not by content. These decisions are in agreement with fundamental theoretical works on the nature of scientific knowledge. If Bahners thinks differently, he is anti-constitutional, anti-scientific, and anti-human rights.

Secondly, there are no experts who assert that the survivors of Auschwitz were "never in mortal danger." Bahners warms up the calculated lie that revisionists would present Auschwitz as a vacation resort without danger to life or limb and generally characterize the National Socialist persecution of the Jews as harmless to the Jews. Either Bahners doesn't know what he's talking about – in which case he should stay away from the keyboard – or he himself is agitating against others with different opinions, in which case the *Frankfurter Allgemeine Zeitung* should not allow Bahners to soil its reputation.

Thirdly, Bahners' conception that the legitimacy of the Federal Republic of Germany is based on the unconditional recognition of the established version of the National Socialist persecution and extermination of the Jews is absurd and utterly false. If the Federal Republic of Germany were actually founded on this historical detail, it would be a dire weakness, because every state that bases its existence on a version of history enforced under pains and penalties must sooner or later come to grief.

Certainly, the formal foundations of the legitimacy of the German Republic are very different – human rights, civil rights, acceptance by the people of the state, international recognition, political, historical and cultural identity and continuity with preceding German states – and there is no need to accept the harsh judgment of Bahners and some of his colleagues.

Pseudo-legal Contortions

However, it was made clear in 1996 by the Ministry of Justice of Baden-Württemberg that in the future Germany's judicial system will adopt Bahners' viewpoint, namely that revisionist works of a scientific

nature constitute incitement to hatred and must therefore be burned. In its answer to a question relating to the seizure of scientific revisionist books of Grabert Verlag it stated:[579]

> *"Legal intervention is not constitutionally excluded even when it is clear that the case involves a work of science or research. Article 5, Para. 3, Cl. 1 of the Fundamental Law contains no expressed prohibition of limits. In constitutional law it is recognized that even freedoms that are granted without expressed conditions have limits. Such limits might come from the fundamental rights of third parties or from other constitutionally protected goods. In these cases there must be a comparison of the competing claims of the equally constitutionally protected interests with the purpose of optimizing these claims. There must be a particular examination of the case making use of the method of proportionality. (Decisions of the Federal Constitutional Court (BVerfGE) 67, 213, 228; 77, 240, 253; 81, 278, 292ff.; 83, 130, 143) When these constitutional requirements are met, in special cases use of appropriate measures is consistent with freedom of science or of research."*

The assertion of the minister of justice that even a scientific work can be seized when the fundamental rights of others are involved is completely false, and the decisions of the German Federal Constitutional Court cited here are misleading. It is true that no fundamental right can be guaranteed unconditionally, and when there is a conflict with other fundamental rights that an optimal compromise of interests must be found by means of the principle of proportionality. However, this limitation of fundamental rights pertaining to the freedom of science can never extend to the determination of what theses may be studied and to which conclusions one may come.

Only the means by which research is conducted is subject to limitations, since research may not employ methods that compromise the rights of others – such as experiments on humans or endangering the environment. If it is forbidden to science to formulate new theses or to attempt to refute existing theories, however controversial these attempts and their conclusions might be, or if it is forbidden to science to use certain arguments or to come to certain conclusions, or to publish scientific conclusions in order to subject them to indispensable public scrutiny and scientific criticism, then one throws the fundamental right to freedom of scientific research entirely out the window. The critical examination of standing theories and paradigms through serious attempts

[579] Dr. Ulrich Goll, ref. 4104 – III/185, Sept. 23, 1996; cf. IDN, "'Appell der 500' vor Landtag," *Deutschland in Geschichte und Gegenwart* 44(4) (1996), pp. 9f.; VHO, "Zur Wissenschaftsfreiheit in Deutschland," *VffG* 1(1) (1997), pp. 34-37.

to refute them, and the publication thereof, is the heart of science, or even of human knowledge in general.[580]

The Consequences

The declaration of the Ministry of Justice given above is clearly unconstitutional, and one may hope that the German Federal Constitutional Court will say so at some point in the case of *Grundlagen zur Zeitgeschichte*. Of course, it is not likely to do so under present conditions, since in a similar case of Federal book-burning in the early 1980s, the German Federal Constitutional Court itself made a statement in accord with the Ministry of Justice's statement above.[581]

Therefore one cannot avoid the conclusion that the present situation in Germany is as follows:

1. With respect to the core of the Holocaust claim – gas chambers, the National Socialists' intention to annihilate the Jews, and the carrying out of such a program – there can be only one predetermined conclusion under penalty of law.
2. The most important condition to the free pursuit of science would then be suspended, that which states: Every thesis must be subjected to the strictest attempts at refutation and must be refutable in theory and in practice. Neither may any conclusion of scientific research be prescribed nor proscribed (cf. Article 3(3) of German Basic Law).
3. The fundamental dignity of humans that sets us apart from animals lies in the fact that we do not take our sensory impressions as being identical to objective reality, but that we doubt and can resolve our doubts through intellectual activity – research. This factor of human dignity is suspended in Germany in this particular field. (cf. Article 1, of German Basic Law).

It remains an open question what one is to do with Article 20(4) of the German Basic Law which states:

> *"All Germans have the right of resistance to anyone who attempts to overthrow this provision if no other means avail."*

3. Fleeing from England

The names of some individuals have been changed for privacy reasons.

A World Collapses

October 29 is my birthday. Due to the permanent threat of further persecution and extradition from Britain to Germany, my (first) wife left me in January 1999 with our two kids and returned to Germany, where I couldn't follow her. She couldn't cope with this lifestyle anymore. She had permanent nightmares and was very nervous, even had panic attacks. Later in 1999, she even started divorce procedures, which was totally unexpected, because we originally had agreed to try to get together again in a few years, if Britain refused to act against me. So, my 35th birthday, the first for seven years without my beloved wife and without the most gorgeous kids in the world, would at the same time be the most depressing one I ever had in my life. But, hey, there was light at the end of tunnel: my still-wife promised that she and the kids would visit me on this occasion. And my two siblings had announced a few days before that they would drop in the weekend after my birthday. So things weren't all that bad after all.

It is October 15th, 1999, and I follow my usual business. I had several orders collected over the last week, which needed to be sent off, so I decided to drive to Tony Hancock's printing company in Uckfield, which does a nice mailing service for me, and get rid of the packages. While preparing my departure, I get a phone call from Mrs. Corrine Hancock, Tony's wife, urging me to call the guys in Uckfield. For security reasons, they neither know where I live nor have my phone number. They always have to contact a third person out of any political or police focus, or Corrine, who is the only one of these people who is not and has never been into politics, but who is interested in me on a mere personal level, and therefore I consider her to be reliable. Safe is safe.

So I call the guys. I get Howard on the line, my best friend who helps me whenever he can. He collects my mail from the PO Box in Hastings, and I use his residential address for my services: bank, insurance, tax, to keep up the system's illusion that I am really there. Howard forgets to greet me. That isn't his style:

"Someone from the media is after you. The guy left a message at my place. He must have found out where you are officially registered," he tells me. I am shocked.

"What? What did he say?"

"First, he left a message on the answering machine, asking you to call him. But then he must have decided to pop in. He left a handwritten note under my door saying that he wanted to contact you."

"Damn. Do you have his name?"

"Yeap. A certain Hastings."

"Hastings? In Hastings? Or is that his name?"

"That's his name"

"That's strange. He *claims* that this is his name. And for which station or paper is he researching?"

"The Sunday Telegraph, he claims. I got his number. You better get up here, so that we can discuss this."

"Yes, alright, I am already on my way. Wanted to come anyway. See you."

"See you."

Damn. Now they tracked me down. Must be a repercussion of the Cincinnati Real History Conference from end of September. That was my first public appearance since 1994 or so, and David Irving was so reckless as to mention that I currently reside in England when he introduced me to the audience. And that was probably enough for the media to get going. Anyway, pack your stuff together boy, and get to Uckfield as quickly as you can!

So I collect my bits and pieces, jump into my car and drive up the bridle way leading from the Crowlink settlement where I live up to the main road in Friston, over the cattle grids and the speed bumps at 30 miles per hour. The shock absorbers at the front are already gone, so don't worry now, this is urgent. Let's hope that the cows and sheep to the left don't jump on my car, and that none are hiding behind a shrub, getting scared to death when I rush by.

No casualties this time. And down it goes from Friston to Jevington. This road drives like a runaway train. My kids always liked the feeling in the stomach when the car almost jumped over the road waves. My wife hated it. Through the chestnut alley I drive, rushing through Jevington and further on through Filching right into Wannock, a road so narrow and curvy that any truck or bus on the other side is a guaranteed death certificate with that speed (40-50 mph). Why am I doing that? Alright, I know and love this road as no second, but I had a couple of

"almost" cases before, so why risk it! Slow down, man! You are still a father, and your kids will miss you! So I calm down a bit.

As soon as I am out on the A22 towards Uckfield, I lose patience again. Did I ever have any? They forgot to build that into my genes, I guess. Anyway, I break a couple more English traffic rules, but I am not caught, as usual. They are very lax with speed control here. I really like it.

Half an hour later at the printers in Uckfield, Howard gives me the phone number of that Mr. Hastings and repeats what that guy told him.

"He called again this morning, and I talked to him," Howard explains.

"How long did you talk to him? And what did you tell him?"

"Well, we had a nice chat for some 20 minutes. I told him that you don't live here and that I am just collecting…"

"What did you?"

"I told him that you don't…"

"How dare you? I mean, I don't want you to lie, but why the hell did you tell him anything in the first place?"

"Well I thought that is no big deal…"

"Listen, these guys aren't stupid. They can think that if I am not there, I must be somewhere else, and then they start sniffing around again!"

"Hey, I am doing all this because I like you. I don't have to do it and I don't need that sort of tone."

"Sorry. I am just excited and scared."

"That's alright. Well, I told him that you live in Tunbridge Wells"

"In Tunbridge Wells?"

"Yes."

"Why?"

"It just came to my mind."

"I used to have fine lunches in Tunbridge once a month with my friend Robert. That's now ruined, too. Oh well. And he bought that?"

"Apparently."

"Uhh. At least something. And the other 18 minutes of your conversation?"

"That's about it."

"Jesus Christ. Please, Howard, the next time, please don't say anything to anybody. Just take messages for me, would you?"

"Alright. How did he find out about my address and your being registered there in the first place?"

"Well, I guess it is on the Internet. I entered the street address as the registrant's address of my website with InterNic. Pretty stupid. I guess I'll change that now."

"That would be nice indeed. I am not eager to get more of these guys, either."

Tony joins us in the office and warns me:

"Hi Germar. The Sunday Telegraph is just the weekend edition of the Daily Telegraph. I think you know that, don't you?"

"Hi. No, but now I do. So that is the famous German-hating newspaper renowned for their atrocity propaganda during both wars, yes?"

"Exactly. Don't expect fairness. You better not get involved with them."

"Well, what am I supposed to do? He is on my track, right."

"Yes."

"He is going to publish something, right?

"Yes, but don't think you can influence what he actually writes!"

"Well, one thing's for sure: If I don't try, I won't. Let me talk to him and see what he is up to. Can I use your phone? I didn't want to use mine."

"Yes, go ahead."

I quickly get through to this Chris Hastings. He wants to meet me as soon as possible, since he is going to publish something on Sunday anyway. I hate this rush. I tell him that I would call him back in ten minutes, and hang up.

"And now what?" I ask Tony.

"Well, if you go, make sure he doesn't get you in trouble."

"How long does it take to get to Victoria from here by train?"

"It depends on when the train leaves."

"Can we figure that out?"

"Sure, call Southern Railways. Their number is here in the Yellow Pages."

So I do, and it turns out that I will need roughly an hour.

"I shall give him, let's say, three hours from now, that is 3 o'clock in the afternoon, claiming that I will need that long to get there: That'll make him think into the wrong direction. And I'll give him a wrong platform where we will meet. And no photos!"

So it is arranged. I tell him that I will see him at platform ten, where I claim to arrive. In fact, the train I come in arrives more than an hour earlier at platform 17 or so. I nervously kill more than an hour by restlessly walking from one end of Victoria to the other, during which time

I notice that I am unshaven and wear my sweat pants. Fine setup for a star photo session, I think. I hope that he respects my wish to not be photographed, though I don't trust him. Finally, at 3 o'clock, I go to the exit of platform 10, and to my amazement I realize that trains from Tunbridge Wells arrive there. What a great shot! Someone else is waiting there, too. I approach him, but he is alienated by my approach. That wasn't the one. Some five minutes later he stands in front of me, extending his hand to greet me. A short guy, a bit stocky, perhaps my age. Well, admittedly, I take myself as a norm, and I shouldn't do it. So, he is normal, and I am tall and slender.

We agree to sit down in this uncomfortable cafeteria in Victoria, and we get ourselves something to drink. He turns out to be a year younger than I am. He says he just got the job at the *Telegraph*, and that this is his first big story. Oh dear, I think to myself, and I am going to be the fair game for it. He needs success. He needs to impress his employer. That promises to become funny.

We spend three and a half hours talking about god and the world. I tell him my entire story. He lets my words flow, only here and there asking a few simple questions. I tell him the story of my persecution, and about the deterioration of human rights in Germany in general. He allows me to go into details. I am somehow happy to have somebody from the media who listens. What can happen, really? By experiencing me the way I am and the way I argue, he must notice that I am not the evil neo-Nazi as which I am usually portrayed by the mainstream media. I hope he does. He does not even try to make any notes, strange enough. However, he appears to be a nice guy. But that is perhaps what all journalists need to be to have success. Nobody talks openly to assholes. I get some questions answered, too. He found out via the Internet that I was a registered citizen for a year in Pevensey Bay. The voters' data are publicly accessible, he explains. The current owner of the house where I used to live gave him the name of the estate agent who sold it to him, and this agent gave him the name of my former landlady. But none of them knew where I had moved. I tell Hastings repeatedly that I wouldn't tell him anything about where I live now. He understands and gives up.

No traces lead to my new residence. Well done, Germar! At least that works!

At the end he calls his girl friend to pick him up. We say good bye, and I pretend to go back to platform 10. But I make sure that he really leaves before going back to my train to Uckfield.

On Sunday evening I get another phone call from Corrine. The *Telegraph* article was out. She urges me to come to her place. So I jump into my car and drive the 40 miles westward to Hove. I am welcomed at the Hancock' residence, and Corrine gives me the newspaper article.

"Tony tried to hide that from me," she says.

"No, I didn't" he intervenes.

"Yes, you did! You took the newspaper away and hid it!"

"Would you do me the favor and let me read it first, before we start an argument?" I throw in.

The article's main purpose is to slander me as a neo-Nazi and to collect public voices to press for my extradition.

"At least he swallowed Howard's story about my living in Tunbridge," I notice. "And this picture of mine is so bad that nobody can identify me. That is good, too. Somebody must have taken it from a distant place at the very moment when Hastings and I shook hands."

Corrine is in a real bad mood. She is suspicious that her husband is trying to hide that trouble is ahead. He had done that frequently in the past, as she had told me before.

"What sort of links did you forge with right-wing extremists?" she asks me.

"Well, I guess I was too honest to Hastings," I respond. "He asked me if I had been in contact with any persons on the political right."

"And, what did you tell him?"

"The truth. I mean, that I met David Irving, this was not part of it, since I don't consider David to be part of any political movement. Irving was simply a part of my coming to the UK, and I told Hastings how and why I came here, and how David was involved in it."

In late May 1996, roughly two months after I had fled Germany to Spain, I learned that the Spaniards were about to introduce an anti-revisionist law as well. Hence, I told my wife that I would prefer to settle with the entire family in England instead of Spain, where no such laws seem to be planned. She was glad to hear that, as neither of us spoke Spanish, and Spain was culturally a bit too distant for her. So I started seeking a way out of Spain into England. David Irving, the world-renowned British historian, was the only person in the UK I knew at least remotely. I had met him in Germany in 1991 during a convention where he spoke, and at this occasion I had given him an early version of my expert report, so he knew my name. I called him from Estepona at the Costa del Sol, where I lived with friends during

that time, and he agreed to see me. He gave me a description of how to get to his place from Heathrow.

When I got to London in early June 1996, he didn't have any time for me, though, so all I did was actually baby-sit his daughter while he left that evening to see somebody. I had to stay at a cheap hotel behind Victoria Station during the three days I stayed in London, trying to figure out if I could finish my PhD in England, which I still intended then. Later, in fall 1996, while residing in Pevensey Bay, I accompanied David as a co-driver in a lorry on one of his book distribution tours through Southeast England. We had a big fight about my map-reading skills, since I led him in the wrong direction at one point, but when he took over control, he screwed up even worse, so I had to help him to get back on track. When we made it just in the nick of time to the shipping company he had an appointment with, he apologized for his bad behavior. During this tour Irving also asked me if I would agree to appear as a witness during his pending trial against Deborah Lipstadt, proving that revisionists are the victims of severe societal persecution and prosecution. He didn't want to have me as an expert witness, though, as he intended to discuss only persecution in court, but not history. I told him that I would be happy to be of service, but I never heard back from him about this matter.

"And what is this about the National Front and the British National Party?" Corrine doesn't like all these right-wing stuff. She despises it.

"I told Hastings that in 1998 I learned about a British censorship case against a guy named Nick Griffin. You know the Griffin case, don't you?"

"No, I don't know anything about these guys, and I am not even sure if I want to," Corrine rushes to declare.

"Well, Griffin had published an article in his 'Rune' magazine in which he somehow denied the Holocaust, and furthermore he was accused of inciting racial hatred against blacks. Since I was very interested in British legislation and jurisdiction about Holocaust revisionism, and what sort of 'incitement racial hatred' is considered to be a crime, I wanted to learn more about it. My own fate could depend on it. And last but not least, my historical journal is devoted to fighting censorship. Since I wanted to write about that case, I needed to get more information. I got in touch with Griffin via email. I didn't know anything about his involvement in politics. All I knew was that he was associated with the BNP. He said he had heard about my case, and he invited me to his place in Wales. That was in February 1999. My family had just left me

the month before, and in this period I had terrible nightmares about losing my kids and wife. I was a bit desperate to get in touch with other human beings and to get distracted from my misery, so I took that opportunity to get out of my loneliness. I actually had a nice stay at Griffin's house. We spoke a lot about his family and personal fate, the ethnic and language situation in Wales, and of course about Holocaust revisionism and censorship in England. It was there that I learned about his leading role in the BNP and that he was about to challenge the leader of the party. That is what I told Hastings."

"And the National Front?"[582] Corrine insists.

"Well, I cannot remember anything about that. As a matter of fact, I do not even know if I ever have been in touch with anybody from the NF. Hastings must have just added it. Or I dropped the name Martin Webster in some context."

I first met big, fat, nice and gay Martin Webster (pardon me, Martin) incidentally at Tony's printing company while he was doing some printing business there, and later again as a visitor at Tony's place. I don't know anything about his background. All I have is a faint memory that he might be or have been involved in some right-wing stuff, as many people are or were who turn up at Tony's place. I had a nice bicycle tour with Martin down to Oxford one Saturday, during which we talked about anything but politics and his inverted sexual orientation, which is no secret to anyone.

"I can't believe that you were that naïve! You shouldn't have told him anything about that. What does a bicycle tour have to do with politics?" Corrine asks. She somehow likes Martin Webster.

"I am just telling the truth! And I am not going to start lying just because of assholes like Hastings."

"It is not about lying," Tony says, "it is about being careful and staying silent where it is better to do so."

"Anyway, this is over now. I cannot undo it. I talked to Hastings for three and a half hours about human rights, censorship, persecution, and the only thing he has to say about it is 'NAZI', and how I forged links to right-wingers."

Corrine, Tony, and I agree to simply wait and see what would happen. In the meanwhile, my email box is overflowing with messages coming in from friends all over the world who received the *Telegraph* article by email. David Irving goes ballistic. He threatens that something serious will happen if the authorities touch me. I don't know what

[582] A British radical right-wing group about which I know next to nothing.

he means by that. He doesn't have any means to threaten anybody. But at least it is a nice sign of solidarity, and I appreciate that. He was not always that supportive. Apparently he fears that if they go after me, he is going to be next.

David Botsford from the Libertarian Alliance says I should take care of myself. He offers me his house as a refuge, should things get dangerous. I never met the guy, but we had a nice time working together to update and translate one of his works about historiography and censorship. We noticed during this year of co-operation that we think quite similarly. Nice to see all these guys offering their help.

In the meantime the media in Germany jump on the bandwagon and publish the *Telegraph* story: "Neo-Nazi," "Racist," "Fascist," "anti-Semite." I start hating myself for being such a devil incarnate as they portray me. How can humans be so mean to denigrate others totally without even knowing them?

My wife gets worried whether they might come and stay in the first place. She fears that I have to dive away again. I tell her:

"Don't worry. It is business as usual here. Nothing happens. This is just the blown up story of a young journalist with profile neurosis. He needed a story to impress his employer, and it is always easy success to drive a 'Nazi-sow' through town. So, this time I am the sow, but I think things will calm down quickly."

Though it is the end of October, the weather is still pretty nice. This summer was extremely warm and dry, and it seems as if it doesn't want to end. Sunshine still dominates. I have my daily 15 mile bicycle ride through juicy pastures full of cows and sheep, enjoying the most beautiful views over England's most scenic costal area in the South Downs, the Seven Sisters. Each time I try to improve my personal record, and I am proud to have reduced the time I need from an initial 65 minutes down to 45 minutes. Each time I do this tour, I feel great. Unfortunately, on Thursday before my family arrives, I get a flat tire, and so I cannot ride until this is repaired. Since I don't want to lose time while my family is there, I postpone it until afterwards. Little did I know then that this would be the last time I would have this absolutely fantastic bicycle tour, and that I would miss this experience of nature, landscape, and my own physical strength most of all.[583]

Anyway, on Friday I pick up my family from Heathrow airport. We have a wonderful time together. On Saturday, my birthday, we visit

[583] Until I got the chance to return to the same place in summer 2009, doing the same, well, similar tour almost every day for another year.

Hastings Castle and the Smugglers' Cave. The kids are in heaven, and so is daddy. We all spend the night together in my gigantic imperial bed, and no night can be more relaxing than those where I can hold my daughter's and son's hand while they fall asleep. Or is it the other way around? Who cares…

On Sunday morning I get another distress call from Corrine:

"They have another story about you in the *Telegraph*. You need to see this. It's getting serious now. Get here as quickly as you can. Rush, rush!" she urges me. She scares me.

I tell my wife, and her jaw drops down. Now it is about reacting quickly. She says that I can drop her and the kids off at Schumacher's, a German family and friends of ours living a few miles away in Stone Cross. No need for me to visit them with my family. I agree. So we pack our stuff, I drop them off at Schumacher's and I drive down to Hancock's place. The atmosphere in Hancock's house is icy. No nice welcome, no smiles, no hugs as I usually get. They show me the article, and I start to read:[584]

"Germany pursues Rudolf extradition"

I cannot swallow anymore.

> *"A FUGITIVE from justice and traced to Britain by The Telegraph is now facing the threat of extradition.*
>
> *Senior officials at the German embassy in London have confirmed that moves are underway to have Germar Rudolf returned to Germany…"*

And so it goes on. I knew since 1997 that things were critical, since I had been sentenced for something that – strictly formally speaking – does exists as an offense in Britain, too. A lawyer told me as early as 1997 that things didn't look too good for me. I simply hoped that Britain, with its tradition of free speech and anti-German politics, wouldn't bend to German orders. I was wrong.

"So what?" I ask Tony.

"We should plan ahead," he replies.

"I figure that they are searching for me, if not now, then tomorrow or in a week or so."

"It doesn't look good. First of all you need to get out of your place immediately. You need an apartment at a place where nobody knows you," Tony suggests.

"I don't think that they react that quickly. I live there under a different identity. It will take them months to figure that out, if they succeed

[584] This article and other documents connected to my persecution are posted on at www.germarrudolf.com/persecute/docs/index.html

at all. After all, I haven't committed a single crime in this country. They have more important things to do than hunting ghosts."

"And what if the estate agent remembers you, or if they start showing pictures of you in the media and asking the population to help searching you? Or if they tap phone lines and your Internet server? If they really want to find you, they will find you," Tony objects.

"This is only a worst case scenario. I don't think I am that important to them," I try to calm him down.

"Germar, we can help you out of this. But, Germar, look me in the eyes," Corrine says. There she goes again, I think.

"You know that I like you as a person," she continues. "I am going to offer you my help, but I need to be sure that you don't lie to me. Look into my eyes! – Alright. I asked you that before, and I ask you again: Have you ever been involved in any neo-Nazi stuff?"

"I told you that before. No, I haven't," I reply.

"Can you swear that you didn't?" she insists.

"Yes I can," I confirm, "and I do it herewith again. You know the story. You know why I am in trouble. It is about the comments that Wolfgang added to my report about which he didn't inform me. And even these comments weren't Nazi. They were just emotional, uncontrolled and stupid. All the stuff that I published was strictly scientific."

"I can't read German, so I have to trust you," Corrine responds. "I hate this Nazi pig Wolfgang. He destroyed your life, and he got us in trouble before."[585]

"It isn't that easy," I object.

"Yes it is. Everybody makes mistakes, but in contrast to you he never apologized. He just blames it on others and gets mad if you confront him about his misbehaviors, bad manners, and mistakes."

"What does this have to do with our problem," Tony interferes.

"A lot, because Wolfgang is our problem here. Listen, Germar! Should I ever find out that you lied to me, that you were indeed involved in any Nazi stuff, I shall not hesitate to give all the information I have about you to the police. Do you hear me? – Now, if you are right, and I hope and believe you are, than you deserve our help. You know that I like you. You are not one of these Nazi bastards with whom Tony associates. So I'll help you. I'll risk all I have to get you out of this

[585] I quote Corrine using the words she actually spoke, and at the same time I distance myself from her in this regard. Wolfgang did not deserve such words. It is apparently a result of bad behavior on Corrine's part. I apologize to Wolfgang that I did not defend his reputation during this exchange by starting a fight with Corrine. The only thing that was on my mind at that time was to save my own skin.

mess. I'll lie for you the dirtiest lies you've ever heard. Look into my eyes! If *you* lied to me, you are going to be in trouble, I promise you!"

That is Corrine live. It took me two years to figure out that this sort of behavior is her way of expressing positive sentiments for other people. Tony is a very indulgent guy. Even though his wife is frequently swearing at him, he just stands there and smiles. I wonder what he thinks during such moments.

"You can sleep here tonight." Corrine offers.

"Alright. Thank you. But I need to get back to my place, spend the rest of the day with my kids, make an arrangement with my wife for tomorrow to bring her and the kids to the airport, and get some important documents and my computer. So I'll be back in the evening, or so. Is that alright?"

"Ok. We'll be here waiting for you."

"Alright. Thanks. Bye."

"Bye."

I get into my car and sit there silently for a moment, trying to recover from Corrine's sermon. Then I drive back home in order to get my toilet bag, pyjamas, sleeping bag, my computer and several other important things. When approaching the parking lot at the top of the hill on my way down home, however, I see a blue BMW parked there senselessly with two middle-aged gentlemen sitting in it, looking around. As soon as I pass, they start their car and follow. I panic and drive down the paved way riddled with speed-pumps at 40 miles per hour. My poor Renault Clio. They don't follow that quickly. I quickly get to my place, collect the most important stuff, and drive back. I cannot see their car anywhere. Perhaps I am only paranoid.

I pick up my family at Schumachers', and we spend the rest of the afternoon at Fort Fun in Eastbourne, which is an indoor playground. I tell my wife about the BMW, and she asks if it wouldn't be better if she and the kids drove back in a taxi, but I insist in being their chauffeur. I try to forget the circumstances of my current existence. At Fort Fun we meet former neighbors from our time together in East Dean, including a former girlfriend of my daughter Tamara. The kids have fun together. Tamara drops back into her now broken English. Just one year ago she was perfectly bilingual. Merely ten months in Germany, and most of it is gone. Kay, my son, has forgotten almost everything. He was not even three years old when his mother brought him to Germany. He doesn't understand a word of English. But Tamara remembers quickly, including the nice East Sussex accent. "Noi" they say for no, exactly the same

as the Swabian do, the south-western German region where my kids grow up now. How quickly they learn, forget, and remember languages! And while the children play, the parents pretend that nothing had happened…

Around dinner time I drive the family back to Crowlink, telling the kids that I cannot stay with them tonight. This time my wife has to get them their dinner and bring them to bed. She is used to it from Germany, but nevertheless she is a bit disappointed, but worries about me predominate. I hope the kids don't ask where daddy is this night. Didn't they come all these hundreds of miles to listen to his bedtime stories and to fall asleep with him? It hurts to even think about disappointing the kids – and me, admittedly.

As soon as the kids have closed the car door, I drive back to Uckfield. I realize only after my arrival that I forgot my wallet. Damn, the most important thing. So back I drive. The weather has adjusted to the situation. A strong wind blows from the west. Even though it is dark, I don't dare to drive down the normal way to my place. Who knows who is waiting there for me. So I drive down a different road, park my car at the end of a bridle way at Birling Gap, and walk over pastures, approaching my place from the rear. The wind is so strong that on top of the three hills of the famous Seven Sisters which I have to pass on my way, I have to bend all the way over in order to keep my balance. White balls of sea spume the size of a fist are blown up the cliffs and all over the Downs. What a perfect adaptation of weather to mood!

In the little valley into which Crowlink is nestled everything is peaceful, though. I knock on the patio door, and after a while my wife opens. I ask her about the kids, and she says that everything is fine. They are asleep already. They weren't too happy that I wasn't there, but they didn't seem to be upset about it. I tell her about the wallet. She laughs.

"If your head weren't attached to your neck, you would forget that one, too, wouldn't you?"

I smile and give her a kiss on her cheek. We agree upon a time when I would pick up her and the kids the next morning, as her flight leaves around lunch time. I tell her that she should have everything ready to be dumped into the trunk so that we can make a blitz start. My instructions, through which a lot of nervousness and anxiety shines through, makes her feel uneasy, too.

"Shouldn't I rather take a taxi bringing us to a meeting point where no one expects us?"

"I don't think that there is any real danger," I try to explain. "I just want to do everything to minimize risks. That's all. So don't worry. It'll work out."

We give each other a long-lasting hug.

"Take good care of yourself."

My wife's voice is filled with sorrow.

I leave again through the patio, and while climbing over the fence, get stuck with my black jeans on a rusty nail. Rrrrutssshhhh. That was it! No blood at least, just fabrics. Now that I have to keep all my pennies together, I start wrecking my clothes. Great!

Back I walk over the pastures to my car, and swiftly I drive to Uckfield. Somehow, I am not too happy to sleep at Tony's place. Wouldn't the police find out that his printing company plays a major role in my business affairs? And wouldn't they look at his place first to find information about my whereabouts? I cannot but think that I am coming from rain to drain.

I park my car around seven corners. I am sure they know my car's number plate and will look for it. It shouldn't be close to Tony's house. So I have to walk quite a bit to get there, carrying my important papers, the overnight bag, and my pyjamas, but I leave my computer in the car (which makes me nervous). Corrine welcomes me and leads me into the attic where they have a sofa that can be transformed into a kind of bed. I hate these pieces of furniture. In most cases I have some back pain the next morning after having slept on such devices. And the blanket and pillows I get look crappy, too. But I am in no position to complain about such unimportant things. The first thing I do is find out where I could possibly hide or escape unnoticed, should Police come: Out of the roof window opening to the back yard one can easily climb onto the roof and from there down into the yard. I really am paranoid. But only the paranoid survive…

The night passes by without any particular events, except that I don't sleep very well. I get up very early, still before dawn. Tony is just about to leave for work. He says he is going to listen around if somebody can hide me for a while until I can leave. He opines that from now on I ought to live in apartments rented out to me by reliable friends, not by some unknown third party. These friends could then help me to build up a new identity. This alone would guarantee that no one else would really know who I am and where I come from. Well, isn't this a comforting perspective, I think to myself. So I will dig myself in even deeper into English soil...

I have my breakfast an hour later with Corrine. We sit in what is perhaps the dirtiest kitchen in the world. I still haven't lost my German attitude towards cleanliness and tidiness…

Half an hour later I am on my way back to Crowlink to pick up my family. When approaching the cattle grids that I have to pass to get to this remote settlement, I wonder what has become of that strange BMW. Just as I turn into the cul-de-sac leading to my place, I see it parked on a neighbor's parking lot. Uhhh, they are just visitors who didn't know the way! So they followed me yesterday not because they wanted to handcuff me, but because I lead the way into the lost world of Crowlink. A big sign on the fence at the cattle grid reminds people that no cars are allowed beyond this point, and who wants to drive into a cow pasture anyway? So most people cannot even imagine that there are houses hiding in the valley behind a dense wall of trees. This place is indeed great for all people who want to be totally cut off from the world. There is no mobile phone signal in this valley, and only very few radio and TV stations can be received in poor quality. When I got an ISDN line installed at my place, British Telecom did not even know where it is. They had a hard time finding their own equipment...

I get out of the car and meet my neighbor Andrew who is working on his car.

"Hello Michael, how are you doing" he asks me.

"Thank you, fine. And you."

"Fine, thanks."

So he hasn't read the *Telegraph* article, or at least he wasn't able to identify me with their help. My pseudonym is still safe.

I tell my wife about the BMW, and she sighs in relief. We take all the time we need to get the stuff into the car. Then we drive to the local train station and take the train to London. The kids are all excited. Riding a train is something special for them, even more so then flying. Times change! In London we make our way through the underground system and by bus to the zoo. The zoo, however, turns out to be rather disappointing, which may also be a result of the advanced season. Many animals are no longer outside. But also in other regards this zoo seems to be inappropriately tiny for a city of ten million people. My wife claims that the Wilhelma zoo in Stuttgart is much nicer. But the kids like it here anyway. Around 3 pm we have to leave toward the airport. We wait in vain for half an hour at the bus stop. In order to avoid arriving late at the airport, I decide to get a taxi to the next underground station. I take Kay onto my shoulders, a rucksack onto my back, and

two luggage bags into my hands und rush ahead. My wife and Tamara have problems following my pace. I swiftly find my way through the confusing London underground system from one line to another, stairs up, stairs down, left tunnel, right tube, onto the Northern Line southbound, change at Leicester Square, stairs up, left turn, stairs down, onto the Piccadilly Line, westbound. Everything has to go fast, and I drag my totally confused family behind me who have lost their orientation. While changing to the Piccadilly Line out west toward Heathrow, my wife says in desperation:

"How do you know we are right? Where are we in the first place? I would be completely lost here if I didn't have you."

"Well, I simply have understood how the system works. Just trust me. We don't have time for long explanations."

Only after we have sat down in the underground train to Heathrow, can we settle down, and I find time to explain her how the London underground system is organized and why I know my way around it. It is simply experience. On this 45 minute train ride out to Heathrow I explain to my wife that for security reasons I am not going to go with her to the check-in counter. I shall stay in the background, observing what is going on, while she checks in.

"I understand," she replies.

"I don't think there is any real danger," I continue, "but there is a theoretical possibility that they know you are here and when you leave. They could know, if they have access to the airline data. I don't have to remind you that in 1995 they handcuffed Günter Deckert right at the gateway when he returned to Germany from his two weeks' vacation on the Canary Islands. So they definitely can do such things."

Günter Deckert was prosecuted in Germany because in 1991 he had translated a "Holocaust-denying" speech held by the U.S. citizen Fred Leuchter, an execution technology expert who, in 1989, prepared an expert report about the alleged gas chambers of Auschwitz and Majdanek. Leuchter had concluded in his report, and summarized in his speech, that there were no such gas chambers. Deckert was eventually sentenced to two years for his translation. His leaving the country during his ongoing legal proceedings was interpreted by the German court as an attempt by Deckert to flee the country – stupidly enough. If he really intended so, he would not have returned.

I have a talent for scaring my own wife to death. I always tell her about the odds of what I am doing and the probability that something might go wrong, as well as about the implications. It is simply in my

genes. I hardly ever lie. I am bad at it. My wife quickly figured that out only a few months after we first met. She can recognize it at the tip of my nose when I try to hide something – Pinocchio. Everybody can do that after a short while. I am perhaps the worst liar in the world. In most cases, I do not even try to hide things, but instead demonstratively expose them. That has always gotten me into big, big trouble, even as an infant when dealing with my sometimes quite violent father, as my mother used to tell me.

At Heathrow Airport I indeed stay in the background while my wife checks in. I see the irritation in the faces of my kids who have lost sight of me and are now looking around for me. I try to prevent them from spotting me, as it might have bad consequences if they call my name and run over to me. It pains me to see the kids so confused.

And indeed, there is trouble ahead. The lady at the counter takes my wife's tickets and leaves for more than 5, 10 minutes. I get nervous. But it turns out that it was just a reservation problem. They get it sorted out, and as soon as my wife, who has lost sight of me, has checked in her luggage, she takes her carry-on luggage and the kids by her hands and walks over toward the security gates. When my wife is back in the crowd of people, I join her and help her carry her baggage. We spend some 30 minutes together in a restaurant before going to the departure door.

"Would you do me the favor and try not to cry when we say good bye?" my wife begs. "Otherwise we are all going to cry in the departure hall, and the kids will be in a terrible mood during the flight."

"I'll try my best." I really will. But then, when we give each other hugs, my eyes get wet. I manage to suppress more tears.

"Bye daddy." I fail to suppress, but regain control. And I lose it right now while I am typing this.

"Hurry on, I lose control," I urge my wife. She understands and passes the X-ray check without looking back. I turn around, not looking back either, going straight back to my car.

Preparing the Flight

On my way back to Uckfield I try to concentrate on the tasks ahead. As early as June 1999, during a journey across the United States, I researched possibilities to emigrate to the U.S. By that time I had learned that revisionism can have success only if presented in the world language English. I therefore decided that I would try to make this success

happen by working from within the U.S. Since my family has left me for good, there is nothing left that forces me to stay in England. Every corner, every road, even every store and supermarket there evokes painful memories of my family. Apart from that, the United States has this divine invention called freedom of speech, that is: the First Amendment. Is it therefore not logical to try to make my way to the country of infinite possibilities?

During my second visit to the U.S. end of September 1999 I managed to get an offer by a small publishing company called Theses & Dissertations Press, owned by Dr. Robert Countess, to work as their editor. I decided back then to emigrate to the U.S. It all depended only on immigration formalities, which could last for many months or even years, to be sure. But now, after the witch hunt against me has started in England, things look different. I can no longer wait until I receive a working visa or a green card. Tony and I decide instead that I would simply travel to the U.S. with a visitor visa waiver. Everything else would evolve later.

Back at Tony's place, Corrine informs me that Tony wants me to come to Uckfield to discuss things further. So I don't hesitate a second, turn around on my heels and drive up to Uckfield. I won't drive to Tony's printing company directly, though. Perhaps they are watching out for me. So I leave the car at the Tesco parking lot and walk down the main street instead of the side road leading to Tony's factory. I try to get into the factory lot from the back. I never went that way, did not even know that one can get access from the back side. But I am lucky: all doors and gates in fences are open. Safe is safe…

"Hi, Germar. How were things at Heathrow?" Tony greets me.

"Not too bad. We did it fast and painless, almost."

"Graham offered his help. You can stay with him in his house in Henfield for a couple of weeks if you like."

"Oh, is he in?," I ask Tony.

"Yes, doing his work. It's too noisy right now in there, but I'll tell him to finish that job and come here to discuss things with you."

"Thanks. Is Howard in, too?"

"No, he'll be around tomorrow."

Graham Jones is Tony's only professional printer, the jewel of his staff, and the only one not involved in any politics. So I wonder what makes him offer his help. We make it short. He gives me his address and phone number, and a description on how to get to his place. He says he'll be in at about six in the evening, so I shouldn't be there any earli-

er, since he lives alone. I can stay in one of the empty rooms of his sons who are at university, he suggests. I tell him that I would need to bring my complete computer equipment to his place in order to keep my business going for the next couple of days.

"Is that alright with you?" I ask him

"How much stuff is it?," he asks in return.

"You never saw a PC, huh?" I tease him. "It all fits on a medium size desk. So it's not a big deal. I just need to have a telephone socket close to it or an extension leading to the next socket."

He agrees to this, though I see a worry in his face that I might screw up his household.

"Don't worry," I try to comfort him. "I work silently in an orderly manner all day, and you will not even notice that I am there. And thank you very much for your help!"

I promise to be at his place early that night. I leave shortly afterwards, drive down to my rental apartment in order to pack all the stuff together that I would need for the next couple of days: clothes, food, paperwork needed to continue my work, and of course the computer equipment. It takes longer than I thought. At dusk I leave for Graham's residence. After getting lost once in the dark, I make it to his place at around 7 pm. He already expects me and helps me to unload my car and carry the stuff into his son's bedroom.

After having sorted my stuff, I join Graham in his living room. He is very polite and even switches off his TV when I enter. That is not normally the case when you visit English households!

"May I ask you why you offered your help? I mean, you don't know me, do you?"

"Well, I have seen you frequently at Tony's factory, and you don't seem to be a bad guy deserving that sort of trouble," Graham explains.

"Are you somehow politically involved in anything?," I am curious to find out.

"No, I have no political agenda whatsoever."

"How then did you get involved in Tony's printing business?"

Graham then tells me his story of how he was searching for a new job after he left a position where he had been absolutely unhappy as a professional printer. So he applied for several jobs, and one of them happened to be Tony's company.

"But that is a third world printer with totally outdated machinery, swamped in dirt and rubbish, and entangled in total organizational chaos. How can you volunteer to work there?"

As harsh as this judgment sounds, it stems from Tony himself. He himself stated once, he needs an arson or a flood every once in a while in order to have a good reason to muck out his factory.

"That's true," replies Graham, "but I am the only professional there, I can realize my own ideas, I am almost in a position of being my own boss. And I can get my favorite fish prints printed and marketed. Fish and fishing is my real hobby, you know, so it came in quite handy."

Now I feel that it is up to me to tell him my story.

"Do you know at all why I am in this mess?" I ask Graham.

"Not really. I heard bits and pieces. Tony explained to me once that Wolfgang has added something to your report without informing you."

"That's right. Now that you offered your help, are you curious to hear more about it? You should at least know the reason why even you might get in trouble now," I tell him with a smile on my face.

He is curious, and so I spend the next couple hours telling him my story.

"But why didn't you tell the court the entire truth about who actually did all of this, if not you?" Graham asks me toward the end.

"You mean I should have betrayed the real 'culprit'? It was certainly stupid what he did. But if you look at it objectively, it is nothing that anyone would deserve to be put in prison for."

"But you were sentenced for it."

"Yes, but I was so naïve to think that a German court wouldn't sentence someone for something he obviously didn't do. I assume that the court which sentenced me had a strong inkling as to who the real 'culprit' was. But they had no conclusive evidence against Wolfgang. What they found during the first house raid against me in September 1993 was a lot of circumstantial evidence pointing at the real 'culprit', who at that time was the central figure in German revisionist publishing activities acting from behind the scenes. It was also obvious that Wolfgang was a good friend of mine.

They launched a huge house search campaign against Wolfgang in August 1994. They searched eight places all over Germany where they thought he was hiding stuff. But for some strange reason, we were warned by someone inside the *Bundeskriminalamt*, which is Germany's equivalent of the FBI. So you see, we can count on having supporters hiding somewhere inside the system. Consequently, this gigantic house search action was a total failure.

I figured that the trial against me was their last attempt to get at Wolfgang by forcing me to betray him, or by forcing him to confess in

order to avoid that I, as an innocent father of two infants, would be sent to prison. That failed, too.

Make no mistake: Wolfgang would have gotten the maximum sentence, for sure, that is: five years in prison, because distributing my expert report was only one point on the long list of thought crimes he would have been indicted for. If anyone was obliged to tell the truth about what had happened with my Expert Report, then it was Wolfgang himself. But by so doing he would have incriminated himself massively, so you really cannot expect him to make such a sacrifice. Be that as it may. At the end of it all, none of us went to jail, and everybody else involved in these matters got away as well. We all keep publishing for revisionism. So what's the point?

Even though I certainly do not agree with everything my friend wrote and published – and I really was mad at him for his additions to my report – I would never betray anyone in free speech matters that would lead to his imprisonment. It is that simple. I don't want anyone to denounce me for what I said or wrote, so I am not entitled to denounce others either."

Graham is much more comfortable with my being in his house after I told him my story. People get excited and intrigued by such stories that almost sound like a spy or conspiracy novel. Being a small, not too endangered part in these adventures is something they really appreciate, provided they don't get into hot water…

During the next two weeks I organize all the things that need to be done: Doing my correspondence, filling orders, getting the book "Giant with Feet of Clay" and the issue 4/1999 of my German magazine to the printer, and last but not least shutting down my second identity at the settlement I call my home. Howard is a big help there. He rents a van, and we drive all my property up to Uckfield and store it temporarily in a shipping container on the lot of Tony's factory, waiting to be shipped to wherever I might go. Howard agrees to be my officially employed packing and mailing clerk and to get co-signatory status for my British bank accounts in order to do all the business that needs to be done. This way I can keep up the illusion to everyone – authorities as well as customers – that I am still in Britain. The only problem will be that correspondence has to be forwarded in a time-consuming way.

While filing the co-signatory form, the clerk at my bank's branch is friendly as usual:

"Hi, Mr. Scheerer! How can we help you today?"

It makes me feel at home when people know me by name and don't call me a Nazi. I will miss that. My small storage room I rented for my books and journals needs to be cleaned out, too. I hope the guy there hasn't heard about the *Sunday Telegraph* affair either.

"How are you doing today, Germar?" I am greeted. That is like pouring balm on my wounds. At least I don't appear as a monster to him – or he simply didn't hear about the *Telegraph* smear campaign. So I introduce Howard to the owner of the storage company as the guy who will deal with him from now on.

In the meanwhile, my siblings cancel their visit for the following weekend, which they had planned on the occasion of my 35th birthday. They had been informed by my wife about the mess I am in. I am sorry about that. I would have needed some distraction, but they are probably absolutely right about it. So my siblings won't need the bed & breakfast place I had reserved for them with my dear old friend John Ryder-Smith in Jevington. John is a nice fellow of more than 70 years of age who had become a close friend of ours, especially of my wife. I do not want to upset him with my own problems, so I wonder how I explain that to him. It was already hard on him to see that my wife left me and went back to Germany with my kids.

Graham tells me the next day that his mother will visit him at the very same weekend my siblings had originally planned to come: Hence I could not stay at Graham's place during these days, because he would not want his mother to ask any questions. So I drive over to John's place and tell him that my siblings will spend the upcoming weekend nights at my place, since they prefer a double bed (what John might think about that one?), and that I will use his room for that weekend instead. This way I get out of Graham's house for the weekend, and John won't get worried about my collapsing world and won't ask any funny questions…

That reminds me that I have another appointment for that weekend which I totally forgot. Marc Dufour, a French revisionist writer, wants to visit me to discuss his upcoming book *Die Lüge spricht zwanzig Sprachen* (The Lie Speaks Twenty Languages), which he had offered me for publication. He already bought the Channel Tunnel ticket. He is going to be pissed. I call him from a public phone and tell him that I cannot see him. He is upset, indeed. I cannot explain to him exactly why I cannot see him, so I have no way of placating his ire. Anyway, it had to be done.

Tony and Howard promise to get the shipping of my property going as soon as I inform them where to send it. I give Tony a check over £3,000 which I ask him to deposit *after* I left the country. In return, we agree that he will give me £3,000 in cash the evening before I leave, about which I will inform him two days in advance. This way I get enough money for the journey without triggering any alarm bells in the bank. You never know…

Next I have to figure out which way to leave this country. England, I really love you, I don't want to leave you. But you apparently don't love me. You hate me. I have understood, though I know that you wouldn't do so if only you would listen. It makes me already homesick to just think about leaving.

Leaving the country by plane is too dangerous. When I left Britain in June 1999 for a two week lecture tour to the States, the officer at Heathrow Airport checking the passports took mine and hesitated.

"You are a German citizen, right?" he asked me.

"Yes. Why?"

"Why do you start your journey here in London?"

"Because I live here in England."

"Where do you live?" he persisted.

"In Eastbourne."

"Do you have any British identity?"

"Mpff – I only have my Social Security Card."

"Alright, give me that."

I handed it to him, and off he went, vanishing for some two minutes behind a door. My heart beat faster and faster, I started sweating. That was the first time since I had fled Germany that I was subject to passport control. What would happen? And idiot me told him that I live in Eastbourne. Don't you know that your Social Security Card is registered with Howard's address in Hastings? Oh, boy! There was trouble ahead!

The guy returned, gave me back my passport and social security card, and said everything was alright.

Pooooooohhhhh.

Remembering these frightening minutes, I figure that a single entry in some sort of database that those security guys use to check identities might be enough to cause a different outcome the next time. It also would not be wise to leave an obvious trail by having my name on the passenger list of a flight from London to the U.S. So I better not leave from a British airport. Crossing the channel isn't an option either, be-

cause passport controls are pretty strict there, too. The only option is Ireland, indeed. Independent southern Ireland. Crossing the Irish Sea on a ferry shouldn't be a big deal, and since southern Ireland has no security problem as Northern Ireland has, I think that passport controls for passengers of a ferry should be quite lax.

Graham tells me that there are tickets available at railway stations that include the ferry fare. So while doing some business in Eastbourne I go to the local train station in order to get information about this. Most important, however, is the question: Do I have to give them my real identity when buying a ticket? I don't want to appear in any database as having left Britain towards Ireland. So that would be crucial. Since I don't want to risk anything, I leave all identification papers at Graham's place. It turns out that I indeed have to give my name and address, but I don't have to prove my identity with any kind of ID. What a relief. So I purchase a one-way ticket to Dublin in the name of my false second identity: Michael Martin. Everything is fine.

Next I clear and clean my rental apartment, so that Howard has only little work to do once my rental agreement runs out in January 2001. After this work is done, I leave my settlement for good. The sun is about to set and pours its golden beams over the pastures. Even the sheep look golden. I really do not want to leave. Isn't this just a bad nightmare? Can't someone wake me up?

I get out of the car, and sit down on a bench right at the fence near the cattle grid to watch the sun set a last time over my home. I will be terribly homesick. Look at this! Burn this colorful view into your memory. This is the last time you will ever see this.[586] It will be rare soul food for many years to come in foreign countries…

It is Thursday evening. My train leaves on Saturday, the 13th of November. I decide to have a last dinner in the Tiger Inn of East Dean, my favorite place to go. While standing at the bar ordering my food, I notice a young couple and a middle aged woman talking with heavy German accent, the two women talking entirely in German together. I decided to join them, just for the sake of not sitting around alone. I speak to them in English. The young guy is obviously English, but the young lady is German, and the older lady, her mother, too. Both Germans don't notice that I am German. The English guy notices my accent, but can't get it sorted, though he is engaged to a German. I let them guess

[586] Well, it turns out that I did return – 9 years later, to live in Eastbourne right next to these wonderful Downs for an entire year. But I never went to that particular spot in the Downs. I feared the emotions this would evoke.

what my native language is, and when I reveal it, the girls are stunned that I was able to follow their secret conversation all the time. I like these games. I was pretty bad at English in school. I finished with an E. And now, not even all English people would recognize my accent anymore. Anyway, this evening was successfully filled with something other than sorrow and pain.

The next day I finish the last bits and pieces and try to get things ready to go. In the evening, when getting all things ready, I notice that my passport isn't where I thought I put it last. I am totally upset and scared: Where is my passport?

I reopen and search every box that I packed (at least that is what I think I do). I turn every piece of paper upside down. Nothing. It is gone.

When Graham returns from work, I tell him the bad news. He calls Tony to cancel the meeting we had agreed upon to hand over the £3,000. Together we try to remember all the steps I took.

The next morning I go to Tony's place, telling him about my lost passport. We all search his house. Maybe I lost it there. Nothing.

I drive to my empty rental apartment to see if it is there. Nothing.

Did I lose it on the pastures the night I walked through the storm? No, that cannot be, as I definitely had it at Graham's place.

Did I lose it in the inn when carelessly throwing my windbreaker on the bench with the heap of all the other jackets? Or did I lose it at the Beachy Head restaurant the other day? All inquiries at these places lead to nothing. Where is that damn thing!

Tom Acton, the fourth guy of Tony's printing company, cheers me up that weekend by inviting me for a long walk around Devil's Dyke north of Brighton, and for a badminton game. He beats me. I have been out of practice for over ten years now, so no wonder I couldn't cope with him. He tells me that he is practicing secretly because Tony has been inviting him for several months to join his badminton group, and he wants to surprise him with a gigantic performance when he eventually joins this group as a greenhorn. You will do it, Tom! I had no problems beating Tony and his friends even with the bad shape I am in now, so you will certainly beat them all!

Not giving up on searching for my passport, I decide to simultaneously try to get a new, replacement passport from the German embassy in London. I gather all the information I need. It turns out that I can get a provisional passport in a few days. However, a proper passport requires some six weeks to be done, but it can be sent registered mail to a street address. So on Monday I have some passport photos made. I

haven't shaved myself for almost two weeks now, so the portraits look pretty terrible. I still have a German plug on my shaver, and Graham doesn't have an adapter for it, so I cannot do anything about it. Anyway, it'll do. The photos just resemble me the way I look now!

I get on a train to London Victoria and then make my way by the London tube to the German embassy. I enter the building with a sick feeling in my stomach. I quickly get the forms I need and fill them out. Then I hand them over to one of the clerks at the counter. She enters my details into her computer.

Let's see what happens.

She hesitates, looks closely at her screen. She puts my application down and comes back to the counter:

"Would you please sit down for awhile, Mr. Scheerer?"

"Why? What is wrong?"

"There is a problem. I have to check this first with my boss. Please sit down over there and wait awhile, would you?"

I smell a trap. I pretend to sit down. She looks at me, sees me sitting down, then goes out the door. I jump up from my seat, and out the door I go. You better not go back to German territory anymore, not even to an embassy! They have you in their system!

I cross the street and head for the next underground entrance. A big black limousine stops in front of me, blocking my way. I almost start to run. It turns out that the guy is just looking for an address. I cannot help him, though. I probably wouldn't, even if I could. I quickly get into the underground and vanish. Get me out of here!

As soon as I am back in Brighton, I look for the first public telephone and call the embassy. I manage to get through and get hold of the lady that dealt with me. I apologize to her that I couldn't wait and ask if she had found out what was wrong.

"There is a passport refusal ground in your record" she explains.

"What does that mean?" I ask.

"That means that there is some reason why the German authorities would not issue a new passport for you."

"What sort of reason is it, can you tell me that?"

"No, I am afraid not. Our records don't say anything about that."

She is probably right. It isn't her fault. She might really be ignorant. Well, I am not, but I certainly wouldn't tell her. So I hang up and get back to Graham's house. What else can be done? Perhaps I do not even have to leave Britain? Perhaps they cannot extradite me at all for legal reasons? How about getting some legal advice for a change? Already in

1997 I had been in touch with a lawyer who was experienced in similar cases. He is familiar with my case and might even have learned from the media what is going on. So I call him from a public phone. It turns out that he is already aware of my situation, as he had seen the *Telegraph* articles.

"So what do you think is most likely going to happen if they find me?" I ask him.

"European extradition law has massively changed during the last years. As I understand it, you were sentenced for a crime in Germany that formally is a crime in Britain, too, with similar punishment. Under such circumstances, citizens of the EU are subject to immediate extradition without any further legal ado."

"But the crime I allegedly committed would never lead to any prosecution in Britain, not to mention to a verdict," I retort.

"That is certainly true, but you won't get a single British judge to listen to you. Your case is to be handled on a mere executive level. The justice system does not even get involved. At least I consider it 99.9% likely that nobody will listen to what you have to say. You have no right to be heard legally."

"So there is no hope whatsoever?"

"No, I am afraid not."

"Thank you for your advice."

Was that the end of the story?

In the meantime, everybody is searching feverishly for my passport, but nothing turns up anywhere. Graham even makes an inquiry at local police stations, asking in general for lost German IDs handed in, but not a single one has been found. It would have scared me if they had one. It could be the perfect trap. I ask Howard that he may eventually try to get my unused ticket to Dublin reimbursed, which he promises to do. Due to the delay of my departure, I at least manage to correct some more errors in the forthcoming book. The proofs I get on Wednesday for "Giant with Feet of Clay" have a totally screwed up Table of Contents. Good that I could fix that…

Now a new plan is given out: I shall leave for Ireland, hiding there under a new fake identity, hoping that they won't search for me there for years to come. Even if I cannot reach the U.S. for lack of a passport, Ireland certainly is a safer place to be than England, not only because they are not looking for me there, but also because Ireland refuses to extradite individuals accused of having committed "thought crimes" – Sinn Fein and the IRA being the reason for that. I already got in touch

with a friend there who is willing to give me shelter for a few weeks until I find a place to stay, and who wants to help me build up a new identity by guaranteeing for tenancy agreement and bank account.

On Thursday night I finish my last correspondence and figure that on Friday I might get things sorted for a departure to Ireland on a different ferry, this time with my car. So I open a box in which I am collecting recent correspondence that I dealt with at Graham's place, in order to add the new correspondence to it.

I don't believe my eyes: My passport is patiently sitting in there, grinning at me!

When Graham comes home, I tell him the good news, but urge him not to tell anyone. If there is a leak in the system, this disinformation would serve wonderfully on my behalf.

"This is ingenious! Did you plan this right from the start? Was it all a big show?" he asks totally overwhelmed.

"No, it was unfortunately real. I really was at the end of my wits. I stupidly packed the passport and stamps and all other stuff into that last box that I kept open for the last documents that I wanted to collect. It never occurred to me that I could have been so stupid and include the passport in there. After all, I would need to have it with me all the time, not hidden in a box in Tony's container waiting to be shipped. At any rate, it comes in quite handy that everybody thinks I lost my passport. I even told David Irving about it. I am sure this bad news already has gone around the globe. And even the German authorities believe that I sit in a trap. Let them think this is true."

"That is perfect!" Graham said.

In the Land of Infinite Impossibilities

The next day, Friday the 19th Nov, 1999, Graham informs Tony that I would leave on Saturday. This is the signal for him to get the £3,000 and to meet me that night. I go to the Eastbourne train station to get a new ticket for Dublin, and this time nothing will stop me! (Hopefully)

I meet Tony at 8 pm at an Italian restaurant in Hove. He gives me the money and invites me to my last dinner in England. We spend some nice hours together talking about all sorts of things.

Where would I be without these friends?

My train leaves Saturday early in the morning from Eastbourne. I get out of Graham's house well before he gets up. I take a different route through Alfriston, Litlington and East Dean in order to see at least a

part of my beloved home for a final good bye. I park my car near the train station. Howard will eventually use a second key to try to sell it to the local Renault dealer.

The journey to the ferry harbor of Pembroke via London on the train is absolutely relaxing compared to the last three weeks. I hum a Carpenter song which I love while the train is leaving Eastbourne:

> *"I beg your pardon. I never promised you a rose garden. Along with the sunshine, there's gonna be a little rain sometimes."*

Well, such is life!

In the ferry port I have to hand over my luggage – just one bag – to a guy, and enter a coach. Being separated from almost everything I now possess makes me nervous. Don't screw it up, guys! I need my clothes! That's all I have! The bus drives right into the belly of the ferry – the right one, I hope. We don't need to get hold of our baggage. They do it all for us. Why is it that I don't trust them?

Of course nobody controls our IDs when leaving Britain's coast, but it makes me relax to actually see that it really doesn't happen. The journey is quiet, boring. What would you expect? I try to flirt a bit with one of the girls at the delicatessen counter. That is about all the excitement you can find here, I guess. The movies they show don't interest me. I cannot sleep either, so I just sit around and stare into the Irish Sea and let my thoughts wander around: First the coastal line of England disappears in the distance, a coast that had become home, and then, after some two hours, the Irish coast approaches.

Regarding ID control, it is of course different when arriving in Ireland, but it is nothing more than a guy taking a glance at my passport. No scanners or computers anywhere in sight. That is the difference between airports and ferry ports! I like it!

"Where do you come from?" the guy asks me. What sort of question is that?

"From England, of course. I mean, the entire ferry came from England, didn't it?"

Perhaps he wanted to know where I live, but the answer to that wouldn't have been any different. Anyway, he doesn't care and lets me pass. It takes a few minutes before I receive my bag, and a few more to find a bus driving to downtown Dublin. It turns out that the ferry port is at the far south of the city, whereas the airport is in the north. I get on a bus to downtown Dublin, and from there on a bus to the airport. It is already after 6 pm when I arrive there, and none of the airline counters offering direct flights to the States are open. I have to come again to-

morrow, some lady tells me. They would open at 8 am. What a disappointment. I wanted to get out of here as quickly as I can. But since nobody knows that I am here, it doesn't really matter.

I ask a taxi driver where I can best spend the night. He is a nice guy and tells me that prices are lowest in a certain area close to downtown and that he'll drop me off there. So I enter his van, and while driving to what turns out to be a youth hostel, we have a nice chat about the English, the Irish, and the Germans and their relations to one another.

At the youth hostel I have to deposits my ID card, which I don't like to see, and my details are being entered into a computer, which I hate to see. But I am quite sure that no hotline leads from this cheap youth hostel to London or Berlin. It is just that I hate to leave traces.

After eating some of my food supply, I decide to have a walk through downtown Dublin. We are approaching Christmas, and so the town has its usual Christmas decorations everywhere. However, I am a bit disappointed about this city. But I don't have to stay here, so why bother…

I spend the night together with some ten guys in a large dormitory, and I get up at around 5:30 in the morning, take a shower, have my breakfast, get my ID back from the clerk, and head for the airport in a taxi. I am too early and have to wait until the ticket counters open. It turns out to be not all that easy to get a ticket for today, Sunday, the 21st, but I manage to get one for roughly 1,000 Irish Pounds. Destination: Huntsville, Alabama. Right into Robert Countess' place. He wants to have me as an employee for his publishing business, so he will have to cope with my sudden arrival, even though I haven't said a word to anyone that I am coming.

As a matter of fact, my flight first goes from Dublin to Shannon, where we all have to leave the plane in order to pass through U.S. immigration and come back aboard afterwards. That is strange. I didn't know that they even do this abroad. So be it. Perhaps it is a huge advantage, because if anything goes wrong with the U.S. Immigration Services, then they don't have to deport me. They just dump me in Ireland, and that would be my second choice anyway. Getting caught in New York or Atlanta would be much worse. Any deportation to Europe, with the authorities there being informed about it, would certainly end with my incarceration. So, thank you Jesus!

I have to fill in the usual I-94W visa waiver form. I know that this is not the way to enter the States when getting employment. I had some fights with Bob Countess about it. Already in October he got in touch

with an immigration lawyer, and she claimed that I can come with a visa waiver and that it can be adjusted. I didn't believe it, because I remember from my first two times I filled in this I-94W form that it stated that one cannot be employed in the U.S. when entering the States with such a waiver, and that any adjustment is expressly excluded. But Dr. Countess insisted that he asked that lady twice, and she allegedly confirmed twice that it can be done. Anyway, I don't have much of a choice right now, and if it turns out that it cannot be adjusted, we have to find other solutions.

The immigration officer looks at me in my sweat pants and at my ticket.

"You have only a one way ticket. We cannot permit your entry with just a one way ticket. You need a return flight."

Sh... What do I reply to that?

"Yes, but I do not yet know when I am going to return. That is why I didn't book a return flight." I tell him.

"What is the purpose of your journey?" he asks.

"I am about to expand into the U.S. market and want to open a kind of business branch of my publishing company there. It'll take some time, and I will have to travel a lot."

He looks at me in my casual clothes and my unshaven face, and doesn't seem to really believe me. I certainly don't look like a business man who is expanding his company on a world-wide scale. However, that is what I really want to do and what my business with Bob Countess is all about. And finally, I really want to return to England's sunshine coast, once they let me…

The border official murmurs, makes his stamps in my passport, and says something like:

"You'd better get a return ticket next time you fly to the U.S."

Well, I like return tickets that work, but any return ticket to Europe is not going to work for me, I am afraid…

And off we go! Hallelujah! I made it!

The flight to New York is as boring as all flights are, and I need to wait several hours for my connecting flight to Huntsville. I arrive there at 9 pm local time. Bob Countess is already in bed at that time, so it doesn't make sense to call him. I call Craig Cox instead, a friend of Bob with whom I stayed already in June and September 1999 during my two lecture trips. He and his wife Suzan are certainly up at that time. But… they don't answer the phone. I try it again, and after a while I get through.

"Hello?"

"Hi Craig, it's me, Germar"

"Oh, how are you doing?"

"Fine, thanks. Listen, I am here at Huntsville airport."

"Oh, really? So you made it, huh? I didn't know that you were coming!"

"Well, that was the purpose of the whole exercise, wasn't it? Anyway, yes, I made it. May I ask you if I can stay the night at your place, and if you could pick me up here, please?"

"Sure. My home shall be your home. I'll be at the airport in half an hour. Does Bob know you are here"

"No. Nobody knows. You are the first I've told. You know, I didn't want to bother Bob, as he is certainly already sleeping."

"That's fine with me. You are really welcome here. You can even stay longer, if you wish."

"Thanks. And don't tell anyone yet!"

"Sure. See you."

"Bye."

Craig comes some 30 minutes later, and we drive to his place. Suzan welcomes me in her friendly way that really makes you feel welcome. I have seen these guys only twice for not too long, but that sufficed to make it a real friendship. I know I can count on them.

Craig calls Bob the next morning and tells him about a big surprise that is waiting at his place for Bob to be picked up. He doesn't tell Bob what it is, though Bob urges him to explain.

A few hours later, Bob drops in with his VW New Beetle and is really surprised to see me waiting for him. We have a nice drive back to his place, during which I tell him about how I again absconded the European Thought Police. I ask him if he would allow me to get in touch with Linda Faith, a lady I met in Cincinnati at Irving's Real History Conference in September this year. "Certainly," he agrees. I shouldn't even ask.

I have been in email contact with Linda for several months while still in Britain, and I hope to find more than just a friend in her. Since I don't know where to stay, I decide to call her and ask her if I can visit her. She is surprised to hear my voice and is happy to meet me, but urges me to wait until the coming weekend when her kids are at her father's place, so that she has time for me. So it is arranged. I get a plane ticket for the next Saturday, returning Sunday.

Bob informs me that he has dumped this lady lawyer, which appeared to be not very competent, and has found another immigration lawyer in Birmingham, Alabama, a guy from Bangladesh who made a good impression on him. We shall visit him next week.

On Saturday I fly to Cincinnati, where Linda picks me up at the airport. She invites me for lunch at LaRosa's Pizzeria. I take the opportunity to ask her if she would be interested in being employed by Theses & Dissertations Press, Bob's publishing firm that I am supposed to become the director of, once my working visa is granted. She is really enthusiastic about it and more than happy to say yes. After lunch, Linda decides to show me her house, which she is currently trying to sell. So we get back into her car and drive a few miles. While approaching the house, she slows down and gets nervous.

"Oh my gosh, police everywhere"

"Some four or five cars," I quickly count.

"You must know that I have trouble with my son Paul. He is on medication for schizophrenia and has absconded from the hospital where he was supposed to stay by police order," Linda explains.

"So the police are here because of him?" I ask.

"Almost for certain. Look, that is my house. They are all around that house!"

Linda drives by very slowly. Suddenly one of the police officers gets suspicious about the slowly passing car and goes after us. In a second we are surrounded by some ten cops, some of them pointing their guns at us.

"Oh my gosh, they are aiming at you!" Linda says.

"Get your hands up," one of the police officers shouts, but somehow I do not believe that they mean me. They cannot. Why should they? So I open the door in order to ask them what this was all about, which really is a big mistake. These cops are extremely nervous and excited. They interpret my move as a threat. One officer points a gun right in my face, another drags me out of the car and pushes me face down into the grass. A third one handcuffs me. That's it…

Everybody is totally excited, especially Linda who desperately tries to convince the police officers that this is not the guy they are looking for.

"This is not my son. You got the wrong guy. Please let him go!" Linda is extremely upset.

"Who are you?" they ask her. They pull me up from the lawn, and Linda identifies herself, explaining that the one they are most likely looking for, Paul, is her son.

"But this is not my son. This is a visitor, a friend of mine who just arrived in the U.S.!"

"Ma'am, don't get excited, stay back and wait until we have checked his identity. If you are right with what you are saying, then there is no reason to be upset."

I am shivering. The entire neighborhood is now gaping. I tell the cops that my passport is in the jacket on the backseat of Linda's car. They get it, and one officer gets in his car to check my passport. Another officer talks via a phone to someone, getting information about the guy they are looking for. They are informed that Paul has tattoos on his arms. So they quickly lift my sleeves, just to see that there is nothing.

"That's not the guy. We got the wrong guy. That's not him."

The officer checking my passport gets out and just says "Nothing. He is clean."

The officers take off my handcuffs and apologize for this.

"Well, having the usual prejudices about this country, this is pretty much what one expects to experience, isn't it? It was a nice adventure, at least," I tell them with a broad smile on my face.

Back in the car, Linda apologizes:

"Oh my gosh. You made it out of beleaguered Europe into the States to avoid being arrested, and I almost screwed it all up. I am so sorry for that."

Welcome to America!

At least now I know that there is nothing on U.S. records. You always have to see the positive sides of things.

The Chase has Begun

My move abroad, using several diversions and distractions like an animal that has to deceive its predator, took some time. A few days only after I left England, two gentlemen appear at my official Hastings address, where I have claimed to live since 1997. They tell my friend Howard that they are looking for me. Howard, however, can tell them only that he does not know where I am (which is fortunately true) and that he only takes care of my incoming mail. It is strange that these two gentlemen are quite satisfied with this explanation. But perhaps they already know that they cannot expect any more details from Howard.

After all, I have not committed any crime according to British law, so they cannot do anything against my operating my legal business from underground with the help of friends.

Things are quite complicated initially, however. Our new mail forwarding system is rather sophisticated for security reasons, and it takes many weeks before the mail finally reaches me. It thus happens that some requests of my customers are not being taken care of in due time, which upsets some of them. If only I could tell them about the circumstances under which I am forced to work!

During all this upheaval, David tries to contact me. He wants me to assess an expert report that his opponents filed for his upcoming libel suit against Deborah Lipstadt. For security reasons I had to cancel all my British internet accounts, and it took a while for me to find a way to get access to the Internet again without risking that the British or German authorities could track down the location of my telephone socket. It so happens that Irving receives my comments only shortly before he cross-examines the most important expert witness, Prof. van Pelt. Irving's libel suit probably suffers tremendously due to that. Some friends suggest that this was perhaps the reason why they started that witch hunt against me at exactly this time. They want to cripple David Irving's means to conduct his case properly. Perhaps there is some truth to it. In an article in the *Los Angeles Times* of Jan. 7, 2000, Kim Murphy states in a rather fair article about revisionism that I could very well appear as an expert witness on behalf of David Irving. Maybe the thought of that made certain groups panic. But who of them knows that Irving never even intended to present me as an expert witness...

On Jan. 16, 2000, right at the start of the Irving trial, Chris Hastings from the *Sunday Telegraph* brags about his alleged triumph of having successfully slain the evil dragon – even if it is only an innocent, powerless young man:

> *"Neo-Nazi accused of 'racial hatred' goes on the run*
>
> [...] *Germany has issued an international arrest warrant for Germar Rudolf, who fled to England to escape a prison sentence for inciting racial hatred."*

Not quite yet, Mr. Hastings, because the arrest warrant issued, which makes him so happy, is not the same as the actual execution of it! But the language is rather clear: a manhunt for a dissident in the "free" western world.

The manhunt turned completely into hysteria with a BBC report about me on March 28, 2000, which was repeated the day after by the

south English regional TV station ITV at 23:20. Six or seven photographs of mine were shown during the report which had been taken from my website www.vho.org. The public was warned to beware of this "Nazi sympathizer." Mr. Michael Whine of the British Jewish Board of Deputies was pleased to appear before the cameras and announce that regarding me, England was dealing with a "new breed of dangerous Nazis."

To understand the full extent of this witch hunt, one must realize what the British audience most likely considers to be a "new breed of dangerous Nazis": In 1999 two severe bomb explosions in London killed many people. Most of the victims where members of colored ethnic minorities and homosexuals. The media claimed – prematurely, as usual – that "dangerous Neo-Nazis" were responsible for these bombs. Not even a year later, the BBC called me a "new breed of dangerous Nazis" hiding in the area of Hastings. What would the average Englishman have thought when watching this? A mass-murdering criminal running around with lethal weapons?

The local press chimed in once more with "Escaped Neo-Nazi still hiding in Hastings [...] he [...] was still being hunted." (*The Hastings and St. Leonards Observer*, March 31, 2000). Obviously, the powers that be are striving to familiarize the local populace with my likeness and condition them to be afraid of me. It wants them to complain to the police about the desperado in their midst.

But did anyone really care? Well, on May 22, 1999, the British House of Commons felt obliged to briefly mention my case. The busy Labour member Andrew Dismore had asked the Secretary of State for the British Home Department during a session on prevention of crimes [sic!] to make a statement about my case. Although the home secretary's response was not long, it was very clear nevertheless:[587]

> *"The Government are aware of the reports in some quarters that Mr. Rudolf may be in the United Kingdom. The police have also been informed of the allegations against Mr. Rudolf."*

This indicates clearly that my case has found attention in the highest circles, which assume that the police will solve that issue – with handcuffs, with what else…

Each year the Stephen Roth Institute of the University of Tel Aviv compiles a report on alleged anti-Semitism around the world. Following typical Jewish persecutorial paranoia, historical revisionism is listed in

[587] www.parliament.the-stationery-office.co.uk/pa/cm199900/cmhansrd/cm000522/text/00522w13.htm#00522w13.html_sbhd1.

that report as well. Since the year 1999/2000, the section about German revisionism of this report is about one individual only: Germar Rudolf. For decades now, the reports of the German Agency for the Protection of the Constitution list historical revisionism as an act directed at undermining the German state, an outrageous claim indeed. The report of 2003 states that I am the only revisionist left over in the entire world that does any work worth mentioning: "Only […] Germar Rudolf continued his activities as before."

Change of Scene

End of July 2000. All attempts to get a working visa in the U.S. have failed. I have left the U.S. to avoid trouble with the immigration services and have temporarily settled in Rosarito, Baja California, Mexico. I have rented a little house next to the home of Bradley Smith, head of the Committee for Open Debate on the Holocaust. From here I am planning my next move: to apply for political asylum in the U.S. It will be a desperate last attempt to get in.

During my 10 weeks' stay in Mexico, Bradley and I become close friends. In August I book a flight to Iceland via New York. Although Iceland is only associated to the European Union, it makes me nervous to have to show my passport when leaving the airport, but nothing happens.

The wind blows cold in Iceland's capital, chasing the clouds across the sky, and the sun struggles to keep temperatures within an acceptable range, even though it is August, just a few days after my mother's 59th birthday. She has come to see me, together with my ex-wife and my two small children. We meet in the middle between Europe and Mexico, where the continents divide and the earth's innermost is turned outside. By that time I have gone through an ordeal of persecution and prosecution because the powers that be could not let me get away with my knowledge and skills. And as it lies in my nature, I have not caved in, but resistance and pressure have made me even more resilient. The young student of days past has turned into a scientist of the most upsetting sort: I do my research where many powerful people do not want me to, and I publish the results of other peoples' and my own research that many authorities want to see censored. I have decided long time ago to abandon my splendid career chances of becoming a professor for crystallography, and to pursue what I see as the greatest of all adventures instead: to boldly go intellectually where no-one has gone before, just

because no-one wants to allow me to go there. Ostracized, slandered, prosecuted, sentenced, deprived of my academic title, kicked out of home, job, clubs, avoided by "friends" and even parts of my family, and finally also abandoned by my own wife, I now live abroad, on a different continent, all bridges burnt behind me. Looking back at the path of destruction my activities caused in my life, but also the havoc I have wreaked and still wreak as a one-man-show on a national as well as international level, my mother finally agrees:

"Yes, you are right, it is of tremendous relevance, but still, I cannot accept as a mother that one of my children puts itself in harm's way."

I am stunned by this late confession that my mother has been dishonest or misjudging:

"Now, after eight years, I have the first honest statement out of your mouth that I can accept. Was it so hard? I understand that it is the duty of a mother to keep her children out of danger, but mom, I am well over thirty now. I am responsible for myself, don't you think? You know very well how I react when someone wants to force me to act against my will. You know me better. Whether it is my father who wanted to break my will or the German authorities that threaten me with incarceration for doubting the indubitable, it is the same thing. So why did you oppose me with these stupid dogmatic paradoxical statements? It drove me even deeper into it!"

They walk along Reykjavik's beach promenade, and she goes on:

"I accuse myself for having raised you with this extreme moral outlook. Do you always have to be so honest and do you always have to tell the entire truth? Can't you lie once in a while, or at least tell only part of the truth, if you know that your environment doesn't want to hear the truth? As a boy you were always looking for a reason to understand why your father treated you so harshly and often unjustly. I told you about how he and his family were treated unjustly after the war, and I think that this is what caught your attention, looking for injustice done to your family, to your tribe, to your nation ever after. You are an extremist when it comes to justice, and you won't stop until justice is done. I think I put you on the wrong track when blaming the unjust treatment you received from your father on him and his family having been ethnically cleansed from East Germany."

I feel that I have to intervene; though there might be something to it, it surely isn't all her fault.

"Until I turned 19, I had no desire to do any historical studies, not to mention research. I actually hated history at school. So I think you are

basically off the hook here. This impulse came from elsewhere. It came from the East German student fraternity I was a member of, from being held back in a Czech prison, from the insights into the power games in German society using falsified German history as a weapon. And I also think that my extreme sense of justice and my sincerity and honesty, combined with my strong will, are something that lies within my nature. I do not believe that things would have turned out differently even if I had not had your Catholic morals around for most of my life."

A few days later we part, not knowing that the next time I will see my son will be in summer 2004, and my daughter a year later, when she will be almost 11 years old.

Two months later, in October 2000, I apply for political asylum in the U.S. And this will be the last time I will ever trust authorities again.

INS # A 78 66 00 16, Case Pending.[588]

[588] This case was closed in early 2006: Asylum rejected; dissident deported to Germany and promptly imprisoned, thereafter kept in custody for a new indictment, tried, sentenced and again imprisoned; finally release on July 5, 2009, but I am skipping ahead…

4. Flaws of a State under the Rule of Law

Introduction

Where politics and the *Zeitgeist* exert heavy pressure on justice, one must expect that unjust judgments will be handed down on purpose. For this there is no need either for a state with a constitution which is openly contrary to the rule of law or a condition similar to civil war. With respect to normal prosecutions of criminals, the legal procedures of nations observing the rule of law and those not observing the rule of law are similar. Only in politically motivated prosecutions will it show whether or not judges follow the rule of law, that is, whether they can be forced by trial procedures not to deviate from it. For some time there has been a discussion as to how far the character of the Federal Republic of Germany, as a nation observing the rule of law, has been endangered by certain phenomena of the *Zeitgeist*.

One case in particular caused severe accusations from many sides of the German society, so that the political distortions within the German legal system have indeed reached such a degree that even legal experts are seriously troubled: In 1991, Günter Deckert, then leader of the German nationalistic party NPD (Nationaldemokratische Partei Deutschlands), organized a convention where Fred. A. Leuchter, a U.S. expert for execution technologies, lectured about his technical and chemical research regarding the alleged "gas chambers" of Auschwitz. Deckert translated his speech for the audience into German. He was subsequently prosecuted for this and eventually sentenced to 12 months on probation. Following a huge media-outcry and massive intervention of national as well as international politicians, Deckert was put on trial again – at a different court with different judges – and sentenced to two years without probation.

His first judge, Dr. Rainer Orlet, was threatened to be prosecuted for violating the law – his sentence was considered to have been too mild – but was eventually only forced to retire.[589] Deckert's publication about this affair,[590] together with other "thought crimes" like writing naughty letters to Jewish representatives and selling prohibited revisionist literature – were prosecuted as well and, together with his first conviction,

[589] See G. Herzogenrath-Amelung, *Expert Report,* www.germarrudolf.com/persecute/docs/ListPos93_e.pdf.

[590] Günther Anntohn (= Günter Deckert), Henri Roques, *Der Fall Günter Deckert*, DAGD/Germania Verlag, Weinheim 1995 (District Court Mannheim, ref. (13) 5 Ns 67/96).

led to an accumulated prison term of more than five years. Eventually, even his defense lawyer Ludwig Bock was prosecuted and sentenced for too vigorously defending Deckert by asking for permission to introduce revisionist evidence. This was considered criminal behavior because Bock allegedly indicated with this that he identifies himself with revisionist thoughts.[591] In a similar case, the late German right-wing defense lawyer Jürgen Rieger was put on trial in 2000, because during the proceedings against one of his clients in summer 1996, he had filed a motion to introduce me as an expert witness as evidence for the fact that his client's revisionist claims were well founded. Though Rieger was initially acquitted by the Hamburg District Court,[592] the German Federal Supreme Court subsequently overturned this verdict, demanding the sentencing and punishment of every lawyer who dares to ask for, or introduce, evidence challenging the common "knowledge" about the Holocaust.[593] Thus, it is clear that every judge who dares to hand out lenient sentences to revisionists at least risks an abrupt end of his career, and defense lawyers trying to defend their clients effectively may themselves be prosecuted for that.

In what follows, I shall show by my own experience which indicates that the rule of law in the German state has many flaws that make it easy for the judicial system in general and the judges in particular to deliberately make bad decisions uncorrectable, because they have the appearance of being decided according to the rule of law.

Again and again in various sorts of company I encounter the same disbelieving astonishment as to the state of the German criminal justice system at the beginning of the prosecution avalanche against me. Despite my lack of formal qualification, I believe I have been called upon to raise my voice on this subject, since the numerous formal defects of the German legal system have apparently not been dealt with by those with the professional competence to do so.

Since I am no legal expert but only one who has been self-educated on the subject through painful experience, I hope readers will excuse my ineptness of expression. If I make frequent reference here to my trial

---

[591] *VffG* 3(2) (1999), p. 208. As a consequence of his prosecution, Bock subsequently changed his defense strategy, and when assigned to defend the Australian revisionist Dr. Fredrick Töben in November 1999, he remained completely silent in order to prevent further prosecutions, hence rendering any defense of Dr. Töben impossible.

before the District Court of Stuttgart (ref. 17 KLs 83/94), it is because these examples serve to indicate major problems in the German system of government and its judicial system.

No Word-For-Word Record

Until the end of the 1970s, a record of the proceedings was kept during German criminal trials, in which the statements of witnesses and responses of the defendants were set down. The contents of this record were never relevant for an appeal or revision. For example, if in the record it said "The witness said A," but in the decision the court stated "The witness said B," the assertion in the decision would be taken as the fact and that in the record would be considered meaningless.

In the course of a change in the German criminal law at the end of the 70s, the duty to make entries in the record of the proceedings was removed for reasons of economy for all courts higher than the county courts. What appears now in German trial records is something like "The witness made statements on the subject" or "The defendant made a declaration." The substance of what was said cannot be found there and it can no longer be proven by documentation when the court uses statements incorrectly.[594]

In other nations observing the rule of law, such as the United States, Canada, Australia, or Austria, word-by-word transcripts of the proceedings are prepared.

The anti-justice consequences of the present German system can easily be imagined, and I will briefly illustrate it with three examples from my own trial.

1. The issue in this trial was whether or not I had participated in the distribution of a version of my expert report with added commentary by Generalmajor O.E. Remer in April 1993. The court was interested in, among other things, how Remer had come into possession of that par-

[594] There is always the possibility that the defense can hire its own stenographer to record the proceedings and type them up later. Then there would have to be a motion to insert this record into the record of the proceedings. Motions of this sort are always denied because the German Code of Criminal Procedures does not provide any rules for such records. In order to defeat the usual refusal of the court to accept such a motion on the grounds that the transcript is factually incorrect, the motion would have to be made either before the dismissal of the witness or immediately after the response of the defendant or the defense attorney. Thereby the doubts of the court could be allayed through requestioning of the witnesses or the defendant. Although the record of the statements can be entered into the record of the proceedings with the (denied) motion in this way, they will still be irrelevant in appeals and revision procedures. Considering the expense to the defendant in time and money of such an effort over the course of, say, a thirty-day trial with twenty witnesses, it should be clear how impractical this scenario is.

ticular version of my report which he used for producing his printed version. In the trial I had stated that Remer had probably received it from his attorney Hajo Herrmann. The court was more than eager to nail me as a liar, so they were trying to make Hajo Herrmann concede that he never sent a copy of this particular version to his client. Remer had reproduced the "second version of the 3rd edition" of my report, which the court called version "F2."[595] In the trial report made by an observer, the questioning of Herrmann on December 6, 1994, ran somewhat as follows:

> *"Then the witness Hajo Herrmann, year-of-birth 1913, was questioned. He confirmed that in the summer of 1991 he had assigned the preparation of the expert report to the defendant (Germar Rudolf). The witness states that he had received every version of the expert report from the defendant and had sent a copy of each to his client Remer. Later the witness stated that he did not know whether he had received another expert report in November or December 1992. When the judge inquired about it further he said that he could almost exclude this. He also did not believe that he had provided Remer with a new version of the expert report during the appeal to the Federal Supreme Court. Later, Herrmann said that the first version of the 3rd edition sent in November 1992 was the last that he had received. When the defendant (Germar Rudolf) interrogated Herrmann (which the judge at first objected to) whether the witness thought that the arrangement of the chapters of the first version of the 3rd edition was correct, the witness remembered that he had requested a change by telephone. At that point the witness decided that he must have received the second version of the 3rd edition that had been changed due to his request* [this was the version called "*F2*" by the court, which Remer used to produce his published version]. *Herrmann could also not exclude that Remer might have obtained documentation with new versions of the expert report during the appeal to the Federal Supreme Court. He said he had submitted the expert report both during the appeal to the District Court and during the appeal to the Federal Supreme Court. At this moment, the presiding judge interjected that the expert report was not to be found in the records of either of these proceedings. Made aware of the error of his statement, the witness said that due to the voluminous material in the numerous trials in which he was involved he was not able to pay such particular attention to any one document, hence he could not remember every single one. In the course of time he had been involved in 12 to 15 trials in which he used Rudolf's expert report, in addition to all his other trials. For him, the witness, the expert re-*

[595] The first edition was mailed out in some 15 copies in January 1992, the second in February 1992, the first version of the third edition in November 1992, and a slightly revised version of this edition (second version) in December 1992, each numbering some 20-50 copies only.

port of the defendant was just one document among many others and so he was not able to remember details."

What can be seen from this is that the witness Herrmann was basically confused and could not remember details about which version he had sent to whom and when. But at least Herrmann remembered clearly that he had requested changes to the expert report, so he concluded logically that I must have sent him copies of this rearranged version; after all, I had prepared this version on his request. The court, however, described the statements of the witness on page 199 as follows:

"The taking of evidence has shown on the other hand that attorney Herrmann never, and in any case not during 1992 nor in the first quarter of 1993, had come into possession of draft 'F2' and that he did not send it to Remer. The witness Herrmann affirmed that the draft 'F1' was the last version of the 'expert report' that had come to him, and in addition he could not say when he came into possession of this version. In the rest, he believably reported that he had had no further contact with Remer after the trial in Schweinfurt on Oct. 22, 1992, due to the 'expert report.' He could not remember having sent a copy of the 'expert report' to Remer in December 1992."

The difference between the two texts is obvious: The independent observer reported that Herrmann did revise his initial statement after I made him remember that it was Herrmann himself who made me prepare this particular version "F2," which leads to the logical conclusion that he did, of course, receive at least one copy of this version he had specifically demanded. But the court simply "forgot" about this detail. From its own faulty reasoning, the court concluded on page 202f.:

"The fact that the defendant knowingly spread an untrue account of how the Remer operation came about is a particularly clear indication that he was involved in the Remer operation."

2. The court was also eager to try to prove that I did tell my sister about Remer's commentary before Remer had even started to distribute my report, which would have been possible only if I had been involved in the production of said commentary. The first copies of my report mailed out by Remer arrived at their destinations briefly after Easter 1993. If I had told my sister already before Easter about these comments, then this would put a "nail into my coffin." According to the above-mentioned independent observer, the sister of the defendant made the following statement on January 24, 1995:

"The sister of the defendant states that she learned from her brother during a visit shortly before Easter 1993 (April 10-12, 1993), that Remer had joined a racist and anti-Semitic commentary to the expert report, which

he had obtained from his attorney, and distributed it against his will. In this connection there was talk [between my sister and me] *of a measure against Remer at one time. The inquiry, whether her brother described the Remer operation as a threatening event or as a completed happening, she could not answer because she could not remember. It was possible that the operation had already happened. Actually she had spoken with her brother on this subject numerous times since there had been telephone communications between them once a fortnight. Under intensive questioning by the court about details of content and chronology of the events at that time, the witness appeared stressed and appreciably abashed. On inquiry of her brother she said she could no longer remember exactly when she had heard what news from her brother on this subject. She could only describe her overall impression."*

The court described this witness statement as follows (p. 210):

"Moreover the sister of the defendant said he had expressed to her already in Easter 1993 (April 11/12, 1993) the intention to follow the Remer version with an 'authorized' version. The reason he had given was that Remer had scattered racist expressions through the 'expert report.' But in his testimony the defendant says he saw the Remer version first from his doctoral supervisor on 16th April 1993 and first knew of the Remer additions at that time. The fact that he referred to Remer's 'racist expressions' previous to this is a further indication that the defendant had knowledge of the Remer operation beforehand."

However, according to the independent observer, my sister thought "it was possible" that Remer's mail-out had already taken place before Easter 1993, which is clearly incorrect – all copies of Remer's version were mailed to their recipients only after April 15, 1993. This proves that my sister's memory was wrong regarding the chronology, which is also supported by her own statements under intensive inquiry both by the judges and by me that she simply could not remember when she had heard what from me. The fact that the witness could no longer remember the exact chronology was duly omitted by the court for obvious reasons. Who of us can remember, down to the exact day, what we heard from our siblings two years ago? But for the court, this was a major stepping stone to its verdict.

3. Another way to prove me a liar was the court's attempt to prove that my statements regarding contacts with the Remer couple were a lie. By showing that I was hiding my contacts to Remers, they sought to prove that I was in fact involved in their plot to hide the truth from the court. On my contacts with O.E. Remer, the independent observer wrote the following on the trial day November 11, 1994:

"At that point he [the defendant] *mentioned among other things his four meetings with O. E. Remer, of which the last took place at the beginning of May 1993. At this time, he had negotiated a declaration of injunction with Remer through an intermediary. The intermediary had rephrased it and given it to him, the defendant. Shortly thereafter, Remer had signed it in the presence of the intermediary and himself. When asked, why he had not handled the declaration of injunction himself, the defendant explained he had not had any contact with Remer and did not desire to do so."*

For January 24, 1995, one reads there:

"Next was introduced an application form to participate at a revisionist gathering in Roding in summer 1991, organized by O. E. Remer, which had been filled out by the defendant but not sent in. The defendant said he had been interested in the proceedings because of the announced participants Prof. R. Faurisson and Dr. W. Stäglich. In any case, he was not there, which is also proved by the fact that he had not sent in the application form. He had not noticed at the time that Remer directed the proceedings.

The defense attorney said that he had himself participated in this gathering but could not remember that he had seen his present client there."

But the court portrayed both happenings, which it interpreted as evidence of my lack of credibility, as follows (p. 148ff.):

"For one thing he [the defendant] *took part in the closed revisionist proceedings called by Remer on 29 June 1991* [in Roding]*, in which Remer gave the welcoming address (p. 49). The copy of the filled out application form that was found at his house shows that. The defendant has not contested this.* [...]

In addition, he finally admitted to have stopped by Remer's place in Bad Kissingen on May 2, 1993, together with Philipp in connection with the completion of the declaration of injunction (p. 124). The defendant at first attempted to disguise this contact. In his first response during the trial, when talking about how this declaration evolved, he said he had communicated with Remer 'through an intermediary' after the latter had not responded to his written warnings. This intermediary had worked out the text of the declaration with Remer and had given it to him. As reason for having made use of an intermediary he said he did not want to have direct contact with Remer.

The defendant attempted to deliberately misrepresent his attitude to Remer in other cases as well. The above-mentioned letter of the defendant to attorney Herrmann on Dec. 20, 1993, shows this. [...] *At the same time the defendant described* [in this letter] *the supposedly only three meetings with Remer.* [...]

It is noteworthy that his letter to attorney Herrmann deliberately describes his relation to Remer incompletely by leaving out both of these events [revisionist gathering in Roding and arranging publication of the

brochure *Die Zeit lügt!*,[596]]. *The chamber is convinced from this that it does not reflect the true relations and the actual opinion of the defendant on Remer, but was written expressly for the purpose of misleading the investigation process."*

Since the original of the application form to the revisionist gathering in Roding had been introduced as evidence during the trial and not a copy, as the court falsely claims in its written verdict, it is easy to see that I was not present at the gathering in Roding. In a later publication, my defense lawyer confirmed the report of the independent observer and criticized the court harshly for this rather odd mistake.[597] One can see even further that the report of the independent observer is correct with respect to my responses. If one considers that Remer was absolutely not involved in arranging the publication of the brochure *Die Zeit lügt!*, *i.e.*, that it did not lead to any correspondence or meetings between Remer and me (not even the court claimed that), that it was not me who decided to put Remer's name and publishing house on the imprint of the brochure,[598] and that in the letters and statements quoted by

[596] "The (German weekly) Time lies!", edited by O.E. Remer, Verlag Remer Heipke, Bad Kissingen 1992; revised in G. Rudolf. C. Mattogno, *op. cit.* (note 58), pp. 71-112.

[597] G. Herzogenrath-Amelung, *op. cit.* (note 589), pp. 186f.

[598] This brochure was mainly written by me (under four pen names), but made fit for publication by Karl Philipp, who made some changes to it and chose Remer as editor and publisher to protect me legally (which worked). As far as I know, Remer was not involved in the actual production of the brochure, and I was never involved in its distribution. Therefore, no link ever existed between my writing the brochure – without any intention to do it *for* Remer – and the fact that Philipp put Remer's name on it (probably even without Remer knowing it) *after* I had finished my writings. True, I never complained about it, but there was, realistically seen, no other way than Philipp's way to have this brochure published swiftly – which was necessary since it was a reaction to a series of articles in a weekly newspaper – and I did not intend to reveal my pen names to anybody anyway, so why bother?
It should be mentioned in this context that this brochure still causes me some trouble in that my use of four pen names for it (Dipl.-Ing. Hans Karl Westphal, engineer; Dr. Werner Kretschmer, barrister, Dr. Christian Konrad, historian, Dr.Dr. Rainer Scholz, chemist and pharmacologist), all of them pretending to have a different academic degree, led to the accusation of dishonesty and attempted confidence trickery (see, *e.g.*, www.holocaust-history.org/auschwitz/chemistry/not-the-science/). The background of these pen names was not an attempt to impress people with phony doctorates, though I must admit that it can have this effect. I therefore wish to set the record straight by repeating what I stated already elsewhere (www.vho.org/GB/c/GR/CharacterAssassins.html):
The brochure *Die Zeit lügt!* was the first revisionist publication I was involved in. It was a reply to two lengthy articles of a certain Till Bastian published in summer 1991 in the German weekly *Die Zeit* (no. 39, Sept. 18, 1992, p. 104, and no. 40, Sept. 25, 1992, p. 90). This brochure is the fairest writing about the Holocaust controversy that ever appeared, simply for the reason that both articles of Bastian were reprinted *in their entirety*, and discussed afterwards. The reader always has the means to check both points of view. Nobody else has ever done that before or since – on either side of this discussion.
Nowhere in that brochure is reference made to the special expertise and qualifications of the authors given – simply because these names were added after the brochure was written – nor would the claims and arguments brought forward in this brochure require the qualifications of

the court I was always writing and speaking about actual dealings with Remer – there was none in connection with the brochure *Die Zeit lügt!* – it must be asked: who lacks credibility here?

A large number of similar cases could be shown in which the court made observations on the statements of mine or of witnesses that differ from the trial report. Since the differing interpretations of the court were always disadvantageous for me, the question must be raised whether we are supposed to believe that these errors were made unintentionally.

Hiding the Purpose of Evidence

It appears possible that in German courts, the written judgment will suddenly present evidence as the main proof of guilt which had remained in the background during the proceedings of the trial, in that the court reinterprets it in a way that had not been mentioned during the proceedings. In this way, it is impossible for the defense to bring in evidence to refute evidence which at first appears to be harmless since no one can tell what evidence the court will use as proof of what fact.

When the defense attorney wants to introduce a piece of evidence, he must always provide a reason for it so that the court can decide on the request. On the other hand, this rule does not seem to apply to the court itself.

Here is one example of that. The court interpreted certain publication details of the original version of the Rudolf expert report used by Remer in his version as well as of the version without comments pub-

these experts. Though it was certainly incorrect to do this, I would like to explain why it was done, as it was certainly not done in order to claim qualifications that are actually not present. Let me therefore be a bit more detailed.
In spring and summer 1992, I was called by several defense lawyers as an expert witness in several trials imposed on revisionists in Germany (Udo Walendy, District Court Bielefeld, February 1992; Gerd Honsik, Upper District Court Munich, March 1992; David Irving, County Court Munich, May 1992; Detscher, County Court Munich, July 1992; Max Wahl, District Court Munich, July 1992). In these trials – as in all trials against revisionists – the judges rejected any evidence presented by the defense, including all expert witnesses. In one case, I had to learn that a chemist (me) was rejected because he was neither a toxicologist nor a historian, an engineer (Leuchter) was rejected because he was neither a chemist nor a historian, and a historian (Prof. Haverbeck) was rejected because he was neither a chemist nor an engineer. My conclusions were that one obviously had to be at the same time an engineer, a chemist, a toxicologist, a historian and perhaps even a barrister to be accepted as an expert witness at a German court of law. The legal process being so perverted in Germany, I decided to mock it with a parody by inventing a person with all these features, but then Karl Philipp and I realized that this would be a bit unrealistic, so we split that person into many. That is the background. I think it is both tragic – for the victims of those German kangaroo trials – as well as funny – for the neutral observer to see the desperate attempts of German judges to keep any evidence out – , but the reader does, of course, not have to agree with me on that.

lished by me a few months later as proof that Remer's distribution activities of his version and the subsequent publication of my authorized version were one single operation planned in advance. As one of the main proofs for this the court pointed to the fact that in the draft of my expert report produced in November 1992 (version F2), Prof. R. Faurisson had not been mentioned in the acknowledgements at the end of the report. He had first been expressly thanked in the authorized version of my expert report published in July 1993 on the inner cover. According to the court, this allegedly proves that the authorized version was planned already in November 1992 (decision, pp. 93, 208ff. Don't try to find logic in it. There is none.). It did not enter the judges' minds that I had deleted the acknowledgement to Faurisson from the November 1992 version simply because I feared to be rejected as an expert witness, should any court recognize that I had been in contact and on good terms with the world's leading revisionist, and not because I already planned to thank Faurisson later in a prominent place in the authorized version. The whole argument spun around this point about the acknowledgement, which first surfaced in the decision and was based on different versions of the expert report that had been introduced as evidence, had never been mentioned even peripherally in the 29 days of the trial proceedings, so that the defense was unable to bring in any evidence to counter this supposed evidence proving the guilt of the defendant.

Introduction of Evidence After the Verbal Decision

It is doubtful whether the introduction of evidence following the trial is admissible. Nevertheless, the District Court of Stuttgart used exactly this method in order to portray me as untrustworthy. As supposed proof that I had manipulated witnesses, on page 170f. of its decision the court stated:

> *"Further, during a search of his living quarters on March 27, 1995, which took place in the context of an investigation conducted by the state attorney of Tübingen on the book 'Grundlagen zur Zeitgeschichte,' another computer belonging to the defendant was found on which there was an answer list that concerned the interrogation of the witness Dill by the court, as the defendant himself declared in the trial."*

First, the description of the court is misleading, since I had only declared that my computer had been seized, but not that an answer list had been found on it. This document had been mentioned by the court in the trial but it had not been introduced as evidence in the trial. For this reason, the defense attorney did not think it necessary to produce evidence

to oppose this imputation, which might have explained that the item was not an answer list intended for use in an upcoming questioning of a witness. In fact, it was a detailed record I had prepared about what Dill was asked and what he answered when he appeared for the first time in front of the court, and this list was prepared *after* this interrogation, hence could not be used to manipulate this witness at all.

Refusal of Foreign Witnesses Without Reason

In the middle of the 1980s, the German criminal justice system was altered so that motions could effectively be denied to hear the testimony of foreign witnesses in their own country. In the course of the trial concerning Remer's distribution of my report, it became obvious that several foreign revisionists had participated in the operation indirectly or directly. Since these revisionists faced the possibility of arrest if they traveled to Germany, due to their revisionist activity, they would have had to give their testimony outside the country. Because of the reformulation of the German law, however, it was possible for the court in the final phase of the trial to deny numerous motions of the defense that were intended to hear the testimony of foreign witnesses outside the country on key questions. The effect this can have on the judgment is obvious.

Prevention of Appeal

In criminal proceedings caused by crimes that are considered by the German authorities to have caused major violations of law and order, the trial is held immediately on the district court level, *i.e.*, on what normally is supposed to be the appeal level (the first level is the county court). In such cases, the defendant has only one trial during which evidence can be presented, that is, there is no appeal possible to the verdict of this court! Only a so-called application for a revision of the verdict with the German Federal Supreme Court is possible, but such an application can only criticize errors of form (matters of law). The factual assertions of the deciding court, *i.e.*, description and evaluation of evidence (matters of fact), will not be discussed anymore. Furthermore, it is usually the case that applications for a revision will be denied by the German Federal Supreme Court, if the defense is the only party to request it.

Whoever determines, and on whatever basis, whether or not law and order have been seriously violated by an offender, must remain open. But such a serious violation seems to be always given, if the offense involves massive attacks on political taboos. In such cases – where the defendant's entire existence is at stake – he has no possibility of reopening the taking of evidence in an appeal.

The fact that recent attempts were made in Germany to deny an appeal even for trials of minor misdemeanors held before county courts for the sake of relieving the workload of the courts, shows how little room for maneuver is left to him who gets caught up in the wheels of German justice.

The Arbitrary Evaluation of Evidence

Even if a court has introduced evidence in the course of a trial that made its delicately constructed bridge of circumstantial evidence to collapse by refuting it, this is no reason not to impose a sentence. Here is an example.

In my case, the court had come up with the idea that, already in October 1992, I had planned Remer's distribution activities of his version and the subsequent publication of my authorized version as one single operation planned in advance (decision pp. 207ff.).

At the same time, on Feb. 16, 1995, the court introduced a letter of mine to the then director of the Institute for Historical Review, dated May 22, 1993, from which it was clear that up to the end of May 1993, a month after the end of Remer's distribution operation, I still did not know where I could publish my authorized version of the expert report, which indisputably contradicted the court's thesis that I was already planning to publish the authorized version at the same time as I was allegedly helping to plan the Remer operation.

Here is a second example of the court's logic-free evaluation of the evidence. In its written verdict, the court conceded that I intended to get the attention of the lay public for my expert report (decision pp. 23f., 108f., 210), so that I had paid attention that there was no reason for the general public to suspect any lack of technical merit and reputation, *e.g.*, by including political comments (decision pp. 17ff., 196f., 218). This was supported by the evidence as a whole and in particular by the documents introduced on June 13, 1995, which were a series of letters that I had written to various persons between 1991 and 1993, all clearly stating that I did not want any political or polemic comments included

in or associated with my expert report. However, if one was to follow this logic, one has to assume that I would have sent out – or agreed to the distribution of – a version of my expert report which confined itself to technical discussion but would *never* have sent out one such as the Remer version with its polemical/political commentary. In the decision the court can escape this logical contradiction only by claiming that I had miscalculated the effect of Remer's commentary (p. 228).

Incriminating Mitigating Evidence

Having arrived at a verdict in this way, the tens of pieces of exonerating evidence – documents and witnesses – that my lawyer had introduced served the court as evidence of my "criminal energy," since, according to the court, this exonerating evidence was all partly made up (decision pp. 13, 22, 65, 118-126, 131, 175, 192) and served only to deceive the court:

> *"The culpability of the defendant is even greater when one takes note of the high criminal energy with which the crime was committed. The defendant acted on the basis of a calculated and highly refined strategy carried out in a hidden manner that was chosen beforehand with great deliberation, involved numerous deceits and manipulations and was therefore very difficult to penetrate."* (decision p. 237)

Which leads to the court's conclusion:

> *"The sentence of imprisonment is not subject to probation, by sec. 56 of the Criminal Code (StGB)."* (decision p. 238)

since:

> *"On the contrary,* [the crime of the defendant] *as described, because of the calculated and refined and clandestine manner in which it was carried out, should be seen as particularly grave."* (decision p. 240)

Conclusions

Given the present circumstances of the criminal justice system in the Federal Republic of Germany, when a judge or a panel of judges intends to render an unjust verdict, they will have no difficulty in doing so as long as they are assured there is no organized public resistance from the media, academia, the police, or the churches.

The statements of witnesses and defendants may be manipulated at will. Evidence may be interpreted any which way in the decision or may be brought in after the process is over. Submitted evidence may be

passed over without mention and use of foreign witnesses may be denied arbitrarily.

Exculpatory evidence may be discredited as a deceptive maneuver of the defendant and serve as evidence that the defendant is particularly deserving of punishment. A second trial to try to correct these measures can be denied in case of public necessity. The evaluation of evidence is bound neither by the evidence introduced nor by logic.

The question, how these conditions can be overcome so that further misuse can be reduced as much as possible, needs to be answered by honest jurists and politicians.

Closing Remarks

The court based its refusal to allow for a probation of the sentence of imprisonment not only on my supposedly high "criminal energy," but also on the fact that I did not seem to have a favorable social prognosis, since I had not only not repudiated my revisionist views, but defended them even more vehemently and kept propagandizing them. As proof for this the court pointed to the book *Grundlagen zur Zeitgeschichte*,[599] edited by me under a pen name, which had come onto the market just at the beginning of this trial, as well as to the almost-complete book *Auschwitz: Nackte Fakten*[600] found on my computer during a house search conducted in March 1995, *i.e.*, right in the middle of the ongoing proceedings.

With this, a fact was used to harden my punishment that had not even been determined to be a criminal offense in a legally binding decision by a German court in the first place, as was a work which had not yet been published and which therefore could not even theoretically have been a crime. By German law, it is admissible for a German criminal court to take account of the opinions of the defendant – here my historical revisionist opinions – in the weighing of punishment. Through this back-door, the trial against me was turned into a political trial.[601]

[601] This article was completed after the house search of the small Berlin publishing house *Verlag der Freunde* at the end of November 1995 (triggered by a revisionist article of mine they had published), when it had become clear that the documentation of my trial intended to be published by this publisher could not appear; taken from *Staatsbriefe* 1/1996, Verlag Castel del Monte, Postfach 14 06 28, 80456 Munich, pp. 4-8.

5. Rudolf's "Thought Crimes"

5.1. The First Crime: Remer's Commentary

Reprinted below is the commentary of retired Major General Otto Ernst Remer, which he included in his version of the Rudolf expert report, as it was printed on pages 109a to 114 of the court decision against Germar Rudolf.[602] After reading this chapter 11 so far, readers should be in a position to judge whether this commentary was sufficient cause to sentence expert witness Germar Rudolf to 14 months of incarceration, had he agreed to the inclusion of these commentaries, which he had not, though the Great State Security Chamber of the District Court of Stuttgart disregarded the evidence and said he did.

On Jan. 19, 1996, the German attorney general demanded that Germar Rudolf should spend 14 months behind bars for nothing other than this commentary. The German Federal Supreme Court concurred with this demand in a decision on March 7, 1996 (ref.: 1 StR 18/96).

In addition to these judicial issues, there were other problems with Remer's commentary. In his preface printed on the inside front cover, under the caption "To all friends, countrymen ..." he attacked our leading politicians, media people and jurists harshly with the words, "These liars need to be driven from their spoils fortresses." At the same time, Remer mailed this version to exactly these leading politicians, media people and jurists. It is certain that to send such a piece of writing to these leading politicians, media people and jurists was entirely useless – though it must have cost many thousand DM.

Remer attached a comprehensive five-page article on the October 1992 trial, in which Remer himself had been sentenced to a 22 months prison term for denying the Holocaust and other things. This article was written by a close friend of Remer who had attended Remer's trial. It basically summarizes the major events of this trial, like a description of various pieces of evidence presented by the two defense lawyers, their rejection by the court, and the final pleadings of the public prosecutor and Remer's defense attorneys. The Rudolf Report had been prepared for this and for other trials.

In the trial against expert witness Rudolf, the District Court of Stuttgart took exception against this article, which had been entitled "Justice

[602] For this version, the text of Remer's comments were retyped, trying to keep the layout as close to the original as possible. The original German version of this is available online at www.vho.org/D/Kardinal/Remer.html.

in Germany 1992." For example, they criticized that the quotation from the Foreign Office saying that it was known that there were no gas chambers in Auschwitz (p. I) was incomplete, as the ellipses showed. The quoted German official Dr. Scheel had stated later in his letter that the gas chambers had been located in the Birkenau camp which was 3 km to the west. Thus he had not denied the existence of gas chambers in the complex Auschwitz-Birkenau, as the quotation suggested, but only with respect the main camp Auschwitz. This determination of the court is correct and demonstrates that Remer's friend misconstrued documents to mislead the public. However, it should be pointed out that the statement of the Foreign Office that there had been no gas chambers in Auschwitz contradicts many witnesses, such as Pery S. Broad or Rudolf Höß. If these witnesses were wrong with their statements about the main camp Auschwitz, how can we be certain that other witnesses to other camps were not just as wrong? How can it be that under such circumstances to doubt the existence of gas chambers in other camps, or even to dispute their existence, is a criminal offense?

The District Court of Stuttgart also commented that the "Comparison of official figures on the number of those killed in the gas chambers in Auschwitz" (p. II) was insulting and constituted incitement to racial hatred. But in the meantime, quite official and well reputed sources have added even lower figures to this list of massively differing numbers: in 1993 and 1994, the French pharmacist Jean-Claude Pressac claims between 630,000 and 470,000 "gas chamber" victims, and in 2002, a German mainstream journalist reduced the death toll of the Auschwitz "gas chambers" down to as little as 356,000.[603] One could certainly agree to the view that any number of victims which is too high or too low can have an insulting effect on some people or can incite to hatred against others. However, it was not Remer who had put these widely differing figures into the world, among which only one can be correct at best – and all others potentially inciting to racial hatred.

Also, Remer's statement that the Frankfurt Auschwitz trial had determined that there were only 45,510 deaths in the gas chambers was not strictly true. In 1965, the Frankfurt Jury Court had sentenced some of the former camp staff on grounds of murder of a certain number of people by poison gas, and for other reasons. All told, it repaid 45,510 gas chamber murders in that it found some defendants guilty of having killed or contributed to the murder of a certain number of inmates. As to the question, how many prisoners had been killed by poison gas in

[603] See notes 472-474.

Auschwitz all in all, the court had given no answer and did not have the duty to do so. The determination of the total count of victims is properly a scientific question. That having been said, this would also mean that the Stuttgart Court did not have the duty nor the competence either to make a judgment about the total death toll of Auschwitz, that is, it should not have criticized others for asking questions and having different views in this regard.

It remains true that German justice has judicially determined a figure of 45,510 gas chamber deaths, no more, no less, and that anything more is a scientific question and not a question of criminal justice. It must be asked then, why one should proceed against people with threats of criminal penalty and use of the magic formula "common knowledge," who do nothing else but to assert that counts of victims as high as several hundred thousand or even several millions are greatly exaggerated, particularly since several well-known mainstream authors do make similar statements. Only that can be judicially claimed to be "common knowledge" which has been determined to be so in court on examination of evidence. With respect to the number of victims of the gas chambers of Auschwitz, that has not been done.

In the written basis for the decision, as proof of their assertion that the epilogue of the Remer version had deliberately created the impression that the Holocaust was used by Jews to exploit Germany, the court gave this one example (decision, p. 235):

> *"This applies especially to the reprinting of a letter claimed to have been written by a Jew on May 2, 1991 (p. IV of the epilogue, p. 113 above). Together with the assertion that the Holocaust was an invention of the Jews, this deliberately inflames hatred against the Jews."*

In the epilogue in a display box one sees that Remer has quoted a letter with a sender's address in Israel, in which the writer inquires about financial reparations based on the claim that his uncle was allegedly gassed in the concentration camp at Dachau. That this letter was written by a Jew is not mentioned anywhere, nor is there any reference to the religious affiliation of this person in this article. There is also no assertion in Remer's (or his friend's) comments "that the Holocaust was an invention of the Jews," quite contrary to what the court claims. All that Remer's friend did was to juxtapose the letter from Israel with a letter from the City of Dachau, in which the latter clarifies that there had never been any homicidal gassings in the concentration camp at Dachau.

The court had not examined whether or not this letter existed, therefore, on the principle "*In dubio pro reo*," it had to assume that it did exist. In fact, not just Remer but also many other activists had photocopies of the letter which Remer's friend had reproduced in the appendix to Remer's version. It is a fact that there is a large number of statements from witnesses attesting to homicidal gassing in Dachau, but it is also well known that both the official Dachau Concentration Camp Museum as well as the City of Dachau clearly state that there were never any homicidal gassings in this concentration camp.[604]

These well-recognized facts were given with the documents published or quoted by Remer (or his friend), which cannot be a crime. In his commentary on this letter, Remer points out that false witness statements like the one quoted here, attesting to his uncle's death in a Dachau gas chamber, serve as a basis for "common knowledge" in Germany. Nowhere did he make the claim that anybody had lied for purposes of material enrichment. It is the court that is to blame for the charge that the reader would get the impression from these two reproduced documents, implying that Jews had invented a lie for the purpose of exploiting Germany.

That even Jews sometimes make false statements about the period between 1945 and 1993 cannot be disputed. This was particularly clear in the criminal trial of John Demjanjuk in Jerusalem. The trial ended with an acquittal for the defendant, since even the Israeli court could not shut its eyes to the flood of false documents and false witness testimony.[605] Fortunately, in this case also, Jewish personalities turned against the flood of untruths that appeared in this trial.[606]

That the same untrustworthy witnesses who appeared in this Jerusalem trial had made similar (incredible) statements in trials in Germany and elsewhere, did not affect their credibility in the eyes of the German court, of course.

In addition, an advertising blitz of the German Jew Aze Brauner and his friends on May 6, 1995, in the German daily newspapers *Frankfurter Allgemeine Zeitung* and *Süddeutsche Zeitung*, rehashed the old lies about soap made of the fat of Jews and lampshades made of human skin. These claims have been repudiated even by the Holocaust Insti-

---

[604] There are, of course, other sources contradicting this, see Reinhold Schwertfeger (=Germar Rudolf), "Gab es Gaskammern im Altreich?," *VffG*, 5(4) (2001), pp. 446-449.

[605] Cf. the summarizing article of Arnulf Neumaier, *op. cit.* (note 456).

[606] Asides from note 605 compare the book of Demjanjuk's defense lawyer: Yoram Sheftel, *The Demjanjuk Affair. The Rise and Fall of the Show Trial*, Victor Gollancz, London 1994.

tute Yad-Vashem of Jerusalem.[607] But this did not serve to make our jurists consider that not everything a Jew says about the years 1933 to 1945 is necessarily true.

Even the recently reconfirmed information that the Jew Ilya Ehrenburg, who was Stalin's chief propagandist, was one of the worst deceivers and liars in questions of the supposed National Socialist annihilation of the Jews[608] does not appear to impress anyone in Germany. On the contrary, the Federal German justice system seems to opine that a Jew always tells the truth and that a non-Jew who accuses a Jew of reporting falsehoods or even lies belongs in jail.[609]

In the decision of the 17th Criminal Chamber of the District Court Stuttgart, there is this discussion on Remer's preface and epilogue (p. 115):

> *"Although preface and epilogue do not expressly accuse the Jews of having invented the accounts on the Holocaust particularly to gain political and material advantages,"*

– read: although the crime of which Germar Rudolf was accused of had not been committed…

> *"in the eyes of this court the purpose of the Remer-Version of the 'Expert Report' is nevertheless to suggest this"*

– read: the judges can read the mind and intention of the defendant…

> *"and hence to stir up hostile emotions against the Jews. Provided that the claims of the 'Expert Report' are correct,"*

– the court did nothing to find out whether or not Rudolf's Expert Report is correct, so it had to assume that it indeed is correct…

> *"this arises already from the fact that the reader, among others due to the tendentious statements and attitude, had to come to the conclusion that the* […] *Jews must have consciously forged the accounts on the Holocaust."*

– read: even if the Expert Report is correct, the publisher has to make sure that his readers don't think wrongly, or he will be punished for that, and the judges know the effect of this publication on the reader even without having any evidence for it.

---

[607] Shmuel Krakowski, archives director of Yad Vashem, and Professor Yehuda Bauer finally admitted in 1990 that "the Nazis never made soap from human fat," *The Jerusalem Post International Edition*, May 5, 1990; see *JHR* 11(2) (1991) pp. 217-227.

[608] Joachim Hoffmann, *Stalins Vernichtungskrieg*, Verlag für Wehrwissenschaften, Munich 1995; Engl.: *Stalin's War of Extermination 1941-1945*, Theses & Dissertations Press, Capshaw, AL, 2001.

[609] As such Helge Grabitz, *NS-Prozesse – Psychogramme der Beteiligten*, 2nd ed., C.F. Müller, Heidelberg 1986, pp. 64-90.

This meant the expert witness was not only punished for a crime that he had not committed, but also for one that no one had committed in the first place. The crime was invented by the court – they ignored the facts and fantasized about what may be written between the lines!

Even though this was Rudolf's first conviction, this sentence could not, according to the court, be suspended (p. 239):

> *"if only because no positive social prognosis can be made for the defendant (§56 para. 1. Penal Code), who is to be categorized as a* ***fanatical, politically motivated criminal****. During and despite of the current trial, the defendant did publish more 'revisionist' works or prepared them,* ***which once again proves his views.*** *These, too, use the same strategy of apparent* ***objectivity*** *to deny the Holocaust. For example, in fall 1994 the book 'Grundlagen zur Zeitgeschichte'* [=*Dissecting the Holocaust*, August 2000] *appeared, and the book against Pressac was prepared. The court has therefore no doubt that, in regard of the laws mentioned, the defendant is not willing to be a law-abiding citizen."* (emphasis added)

Here the court openly admits that it sentenced Rudolf to a prison term because of his scholarly convictions which allegedly render him an incorrigible criminal. No more proof is needed to show that Rudolf is politically persecuted in Germany.

Furthermore, the court uses publications, which it had called "scholarly" at the beginning of the verdict and which at that time had not yet finally been declared illegal by any court decision, to justify a prison term without probation.

By the time the judges handed down their verdict in June 1995, Rudolf had published three books. About the first, Rudolf's Expert Report on chemical and technical details of the alleged gas chambers of Auschwitz, the verdict states at page 23:

> *"This work, the basis of his publishing activities, is essentially written in a scholarly style. It addresses a chemical detail (the problem of hydrocyanic acid) and does not make any general political conclusions."*

In general, the verdict says about Rudolf's three main works (*Expert Report*, *Vorlesungen zur Zeitgeschichte*, *Grundlagen zur Zeitgeschichte*):

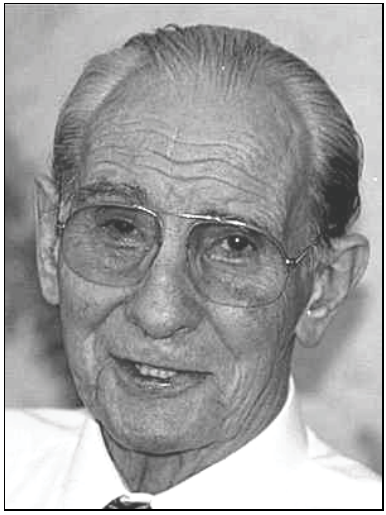
> *"They are characterized by a scholarly attitude with reference to his expertise as a scientifically trained chemist. Tone and form are generally held in a way, as if they were interested only in the matter. Additionally, intensive discussions of details, tables and graphs as well as voluminous references to literature are meant to give the impression of an unbiased and open-minded scholarship. This is primarily true for the three large publications of the defendant."* (p. 23 of verdict)

About *Grundlagen zur Zeitgeschichte* – now published in English under *Dissecting the Holocaust* – the verdict says, it includes "a maximum appearance of objectivity" (p. 26), which later was confirmed by two German mainstream historians in expert reports they wrote in support of Rudolf's scholarly work. Of course, the court had to insert the word "appearance," to cast doubt on the quality of these works, because otherwise it could not possibly have sentenced Rudolf.

Considering the contempt and hate this verdict shows against Germar Rudolf, such words of open endorsement cannot be underestimated. Since the court had to admit that Rudolf's main works are formally scientific and scholarly (form, *i.e.*, appearance, not content, is the only criterion for scholarly works!), the defendant could not possibly have committed any crime by publishing them, since the German unofficial constitution guarantees the freedom of science without restriction in article 5.3 of the German Basic Law. So Remer's additions were used instead to tie the rope around Rudolf's neck.

With this finding, the court turned the historical dissident (revisionist) Germar Rudolf into a "thought criminal."

It should be pointed out here that in May 2002, Fritjof Meyer, an editor of Germany's largest, left-wing weekly magazine *Der Spiegel*, stated in a scholarly article addressing the alleged death toll of Auschwitz that the evidence indicates only some failed test gassings for the Birkenau crematoria, but no mass murder on a genocidal scale.[329] This sensational statement is close to the claim Rudolf has been making since 1992, *i.e.*, that "the mass gassings […] did not take place [as] claimed by witnesses." Hence, Meyer's article is nothing short of a partial but timely rehabilitation of Rudolf, and it might take only one or two more revisions of the official historiography of Auschwitz to reach the point where it agrees totally with what Rudolf is stating in his expert report.



I pondered a long time over the question whether or not to reprint Remer's comments, since they caused me an awful lot of distress. But I think he had a perfect right to say what he had to say, and it was really a scandal how the German legal system persecuted this old man. Though I do not agree with everything Remer and his friend wrote, and much less with their style, I decided to reprint these comments in full, so that the reader can understand, how easily one can get imprisoned in Ger-

many for making, endorsing, or – as in my case – simply being associated with hot-headed, but perfectly legal and harmless statements.

Remer's commentary [Preface]

Otto Ernst Remer, General-major, retired, Winkelser Str. 11E, 8730 Bad Kissingen, Tel: 0971-63741, Fax: 69634

To all friends, countrymen and people who love the truth: I am in distress!

ret. Major General Otto Ernst Remer in 1992

On October 22, 1992, the District Court of Schweinfurt, Judge Siebenbürger presiding, sentenced me to 22 months prison without probation. This is the equivalent of a death sentence for me.

The trial against me was not a real trial. The main session of the trial ended in a deadlock. The sentence was equivalent to the destruction of an 80-year-old man. I was not permitted to defend myself against charges consisting of lies, harassment, and attacks on my honor. The court denied me the possibility of defense by means of sec. 186 of the German Penal Code. It refused to put my assertions to the test of examination.

My defense attorney had asked the expert witness Rudolf to appear. This expert witness was in the courtroom, his expert report had already been submitted along with other official records. However, the expert witness was not allowed to speak and the expert report was not allowed to be read. The expert report and irrefutable scientific facts were denied by presiding judge Siebenbürger.

Earlier, Diplom-Chemist Rudolf had been assigned by my defense attorney, retired Colonel Hajo Herrmann, as expert witness to investigate testimony concerning alleged homicidal gassings at Auschwitz. Rudolf used modern scientific, precise measurement techniques to establish the presence of cyanic residue.

The masonry samples taken by Rudolf were analyzed by the renowned Institut Fresenius.

No physical evidence has ever been presented in court to support claims of homicidal gassings: no document, no photo, and no orders from military or civil authorities. Can you imagine that a group of people as large as the population of Munich could be annihilated without leaving any traces of the crime? The only proofs of mass homicidal gassings are absurd witness statements. In the great Frankfurt Auschwitz trial (50/4 Ks 2/63) the court "proved" the existence of homicidal gas chambers with the testimony of a single eyewitness, named Böck, who reported having seen thousands of Jews killed with Zyklon B. He testified that he "saw with my own eyes" how the prisoners' commando worked without any protective garment in the midst of this Zyklon B gas, still hovering in blue clouds over the corpses, without suffering ill effects. What is the difference between Böck's testimony and that of eyewitnesses who confirmed under oath that they saw witches riding brooms on their way to the Blocksberg?

In a powerful and irrefutable scientific work, my expert witness made a shattering discovery: The buildings in Auschwitz which are pointed out to tourists as homicidal gas chambers, in which millions of Jews were allegedly killed, never came in contact with Zyklon B. The analyses were carried out by no less an organization than the renowned Fresenius Institute. Notable historians agree that this research will revise world history.

This expert report has been in the hands of the federal chancellor, the *Zentralrat der Juden in Deutschland* (Central Council of Jews in Germany), the federal attorney general, the Ministry of Justice, and notable scientists and personalities for more than a year. Every one of them remained as quiet as a mouse.

The condition under which my expert witness agreed to testify was that his report should be presented only to the court. He specifically forbade me to make his report available to the public. However, since the Auschwitz Lie has become an instrument which threatens the existence of all Germans, I can no longer allow myself to be bound by this condition.

I myself shall die in prison for publishing scientific facts. By means of an unbelievably satanic twisting of history our people will be held defenseless and "subject to extortion," as the Association of German

Veterans wrote in its journal *Soldat im Volk* no. 7/8 in 1992. In this condition of eternal abject surrender we shall be destroyed by means of a horrifying "multiculturalism." This has forced me to a desperate defensive measure, which takes the form of unauthorized publication of Rudolf's Expert Report on the alleged gas chambers of Auschwitz.

Since 1945, generations of German politicians have not only acquiesced in these ghastly lies against the German nation, they have participated in manufacturing them. The same applies to the mass media. These elements are doing everything they can to propagate the most vicious lies in the history of mankind through the German criminal justice system. When the truth comes to light, these corrupt and venal politicians know that they will be scorned by the public. The media brotherhood know they will be reviled as liars and driven from their posh editorial offices.

This whole pack of liars should be scorned and despised, deprived of position and driven from their spoils fortresses for what they have done to our people. I would like to contribute to this.

You too can help distribute this Expert Report. In the first phase of this operation, I myself will send copies to 1,000 leading Germans. Among them will be leaders of the military, business, scientific, and university communities, in particular members of chemistry and history faculties. I shall send a copy to every representative in parliament as well as media personalities.

In the second and third phases, I shall send another 1,000 copies of this scientific report. No person of prominence will be able to say that he did not know the truth.

These operations will be very expensive since postage alone costs 4 Marks per copy. Therefore I need your support. By ordering a copy of the Expert Report, you will be helping help me to distribute this irrefutable scientific document. Additional contributions will enable additional distribution. I am counting on your help.

Faithfully yours, Otto Ernst Remer 25th October 1992

I have added Sections I-V of the report of my trial in Schweinfurt. After reading this report, you will understand the desperation of my defense effort.

[Appendix]

Justice in Germany 1992: "Death Sentence for General Remer"

This trial report by E. Haller is taken from REMER DEPESCHE no. 6/1992

Kahlenbergerdorf
(Austria), June 2, 1988

Source: Honsik, *Acquittal for Hitler?*

As a Roman Catholic priest I say to you ... question the existence of gas chambers in the Third Reich. It is the right of those who seek the truth to be allowed to doubt, investigate and evaluate. Wherever this doubting and evaluating is forbidden, wherever someone demands that he must be believed, an arrogance arises that is a blasphemy to God. This is why. If those whom you doubt have the truth on their side, they will accept any questions gracefully and answer them patiently. They will no longer hide their proofs and their records. If these are lying, they will cry for the judge. That is how you will recognize them. The truth is always graceful, while lies cry out for earthly judges.

Respectfully,

with best regards,

/s/ *Pastor Viktor Robert Knirsch*

Schweinfurt (EH) – On October 22, 1992, the First Great Criminal Chamber of the District Court of Schweinfurt, Judge Siebenbürger presiding, sentenced General Remer for publication of a scientific expert report. The main point of the expert report Remer had published was: there were no mass killings in Auschwitz with Zyklon B. The court called this publication "incitement to racial hatred," and Siebenbürger imposed on General Remer a sentence of 22 months imprisonment without probation. State Attorney Baumann demanded a 30 months prison term and moved for the immediate arrest of the 80-year old defendant in the courtroom. Observers of the trial began to suspect that the sentence had been decided before the trial began. At 9:00 hours on October 20, 1992, the day the trial opened, radio BAYERN 1 had announced: "*This time it will cost Remer.* […] *this time the punishment will be harder*." How did the announcer from B1 know that General Remer would be punished more severely than in previous trials? Why was an acquittal not conceivable?

This document is one of many that were presented to the court as evidence. Answer: "Denied on grounds of common knowledge."

GERMAN FOREIGN OFFICE

214-E-Stuparek

Bonn , 8th Jan. 1979

Dear Mr. Stuparek!

Federal Minister Genscher has asked me to respond to your letter of December 21, 1978.

As far as I know, there were no gas chambers in the camp of Auschwitz ...

Best regards,

For the Federal Minister,

/s/ Dr. Scheel

What had Remer done? As editor of the periodical *Remer Depesche* (Remer Dispatches), the highly-decorated front-line officer had published the results of a number of scientific expert reports. One of them was the Leuchter Report, which former Minister of Justice Engelhard described as "scientific research." Fred Leuchter is a constructor of execution gas chambers that use hydrogen cyanide in the USA. Later, the director of the Auschwitz Museum, Dr. F. Piper, assigned the Jan Sehn Institut in Krakow to make a similar expert report. A technical expert report in German in conjunction with the renowned Institute Fresenius followed in February 1992. The discussion that the general had opened up with his publications was desired even by the federal president. A letter from the Presidential Office on October 23, 1989, states that von Weizsäcker "will follow the discussion [on the Leuchter Report] closely." Had the federal president lured General Remer into a trap with this letter? Remer naturally felt that ex-Minister of Justice Engelhard and the federal president had encouraged him to publish his facts.

Homicidal gas chambers that never came in contact with gas

All three expert reports came to the same conclusion: The gas chambers of Auschwitz and Birkenau testified to by witnesses never came in contact with Zyklon B. In legal terms: the weapon was not loaded. For better understanding: When hydrogen cyanide (Zyklon B) comes into contact with concrete or stones, it forms permanent compounds with traces of iron in such building material. The compound that develops is blue (hence the German name Blue Acid (*Blausäure*) for hydrogen cyanide, although the gas itself is colorless) and occurs on the surface and within the walls exposed to gas. Today, one can easily see a massive blue dyeing on both inner and outer walls in the delousing buildings. There is no such dyeing in the alleged homicidal gas chambers. Chemical analyses of samples from the delousing buildings show very high concentrations of cyanide, while no traces can be found in samples from the alleged gas chambers. Scientific expert reports were never produced for any of the numerous National Socialist trials. No physical proof was ever offered.

In Nuremberg, the propaganda lies of the victors were given reference numbers. Since then they have become "facts."

All courts have continually prevented all gas chamber skeptics from use of any evidence for their scientific investigations. The courts have taken the point of view that the homicidal gas chambers should be re-

garded as commonly known "facts." "Commonly known" means that the existence of homicidal gas chambers is as certain a fact as that the day has 24 hours. The Nuremberg Military Tribunal introduced the use of "common knowledge" into judicial practice. Pure war horror propaganda items from the Second World War were turned into "facts" (IMT-Statutes 19 and 21) which had to be accepted without question by the defendant. Defense attorneys who attempted to prove the opposite were threatened with the death penalty. The Stalinist massacre at Katyn was one of the charges, as well as homicidal gassings in the former concentration camp Dachau (IMT Document 2430-PS). In Document 3311-PS, the Polish government "put the victors' tribunal on notice" that hundreds of thousands of Jews had been "steamed" at Treblinka. Note: "steamed," not "gassed." Today, the Holocausters look down shamefully when they are confronted with this nonsense. In the great National Socialist trial before the District and Chamber Court of Berlin (ref. PKs 3-50) it was determined: "There were no gas chamber structures in the concentration camp Majdanek." But in Schweinfurt, General Remer was sentenced to imprisonment because he had published in his *Dispatches* the court's determination on the absence of gas chambers in Majdanek.

To destroy the German people, only these words are necessary: "common knowledge."

Concerning the alleged gas chambers, no one can speak of the kind of common knowledge such as that which underlies the fact that the day has 24 hours. Only such assertions, as that the day has 24 hours, require no proof. In all other cases there must be proof.

Remer's proofs are new and far superior

The defense attorneys, Hajo Herrmann and Dr. Herbert Schaller, had prepared comprehensive evidence. They prepared their evidence to conform with a decision of the Upper District Court of Düsseldorf. In a "gas chamber denial" case, this court held that evidence must be admitted when it was superior to the "proofs" in the former National Socialist trials. New, superior evidence trumps "common knowledge," according to the Düsseldorf court. The evidence submitted by the defense is new and far superior to that from the National Socialist trials, since there was no physical evidence presented there.

Herr Judge Siebenbürger, Herr State Attorney Baumann, please tell me which of the following figures is "common knowledge." Why have you not told the General during the trial which number he should believe in? For which number should Remer now die in prison?	
Comparison of official figures on the number of those killed in the gas chambers of Auschwitz:	
Jul. 26, 1990: *Allgemeine Jüdische Wochenzeitung* **4,000,000**	June 11, 1992: *Allgemeine Jüdische Wochenzeitung* **1,500,000**
Apr. 20, 1978: French newspaper *Le Monde* **5,000,000**	Sept. 1, 1989: French newspaper *Le Monde* **1,472,000**
1945: International Military Tribunal in Nuremberg **4,000,000**	1985: Raul Hilberg: *Die Vernichtung der europäischen Juden* **1,250,000**
1979: The Pope during his visit to Auschwitz **4,000,000**	July 1990: The left-wing *TAZ* and other newspapers **960,000**
April 1990: Chief State Attorney Majorowsky/Wuppertal **4,000,000**	1974: G. Reitlinger: *Die Endlösung* **850,000**
1945: French War Crimes Investigations Office **8,000,000**	1989: USSR releases death-books. Total deaths **66,000**
1989: Eugen Kogon: *Der SS-Staat* **4,500,000**	1965: Auschwitz decision 50/4 Ks 2/63. including claimed gassing deaths **45,510**
1989: Lie-memorial tablet in Birkenau removed, with number **4,000,000**	1965: Auschwitz decision 50/4 Ks 2/63, without claimed gassing deaths **619**

Auschwitz: "Annihilation camp" with a brothel, legal advice, sauna and soccer ...

Before the examination of the evidence that had been submitted, attorney Herrmann addressed the state attorney and judge: "It must be proven, whether there were gas chambers or not, before there can be a decision on common knowledge. The court must determine facts." Attorney Herrmann then presented evidence taken from anti-fascist literature and from court documents that showed that Auschwitz was no annihilation camp. The attorney read how there had been a brothel for prisoners in the Auschwitz camp, that there had been weekly soccer games between SS staff and camp inmates, that there was a central sauna, that legal advice was available to the inmates, that in case of non-natural death the camp administration had to notify the appropriate state attorney with over 30 signatures, that prisoners could be released, that

SS-men were not allowed to hit prisoners, that 4,800 sick persons were under medical care (although in the usual version, they landed in the "gas chambers" right away), and that, when the camp was abandoned, the prisoners preferred evacuation by the SS over Soviet "liberation"…

The State Attorney roars

This piece of evidence made the state attorney roar. "This piece of evidence is an insult to the victims," he yelled into the courtroom with a red face. Herrmann replied, "Then your victims were insulted by the decision in the Auschwitz trial in Frankfurt, Herr State Attorney. Most of what I have just read are observations of the court in the great Auschwitz trial in Frankfurt. You can read them in the decision." At this the state attorney was speechless. It is peculiar, how a state attorney can free himself from almost any evidentiary difficulty with only two magical words: "common knowledge." He knew nothing about the decision in the National Socialist trials and he knew next to nothing about historical connections or physical facts. All a state attorney needs in such a case is to be able to pronounce the words, "denied on account of common knowledge."

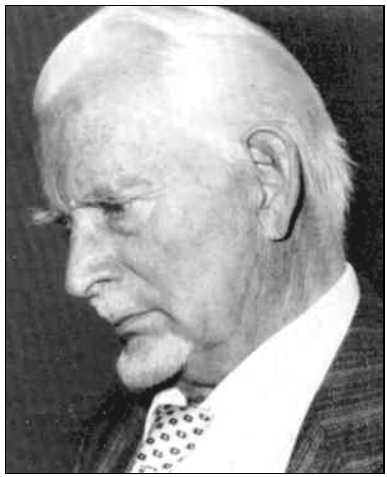
The court refused to accept this evidence. That is, it refused to accept whole passages from the decision in the Auschwitz trial in Frankfurt as well as passages from the writings of "survivors" such as Langbein. Naturally, on account of "common knowledge."

The English crown: no gassings

As part of the evidence he submitted, Dr. Schaller presented the book of Jewish Princeton Professor Arno J. Mayer. In his book, Mayer concludes that the majority of Auschwitz prisoners died of natural causes and that there was no "Hitler order" for the "gassing" of the Jews. Mayer confirms that "proofs" for the gas chambers are "rare and unreliable." As evidence against the "common knowledge of gas chambers," the attorney submitted a book by British history professor F. H. Hinsley. Hinsley is the official historian of the English crown. His book *British Intelligence in the Second World War* can be obtained from the royal stationer's office. There was a new edition in 1989. On page 673, Hinsley states that from 1942 the English were able to break the coded messages from the German concentration camps. The English found that the main cause of death in the camps was illness. Hinsley reports that there were also shootings and hangings. The official historical

scientist of the English royal house states: "There was no mention of gassings in the decoded messages."

The state attorney moved that this evidence, too, be refused on account of "common knowledge." One more time, the court agreed with the state attorney. At this point, the trial was suspended. It resumed on October 22, 1992. Every time General Remer reentered the courtroom after a pause in the proceedings, the public stood respectfully. Many remained sitting when the court entered, however.



An expert witness is kept out

The defense surprised the court with an evidence physically present in the courtroom, the technical expert Diplom-Chemist G. Rudolf. By the court's rules of procedure, evidence that is physically present cannot be refused, even on account of "common knowledge." The technical expert sat in the courtroom. He had researched the alleged gas chambers in Auschwitz from a physico-chemical point of view. He had taken samples of mortar and had them analyzed by the Institute Fresenius. Also he had conducted his own laboratory experiments in which he had gassed masonry with hydrogen cyanide. The expert witness could present scientific proof that the alleged gas chambers never came in contact with Zyklon B. The expert report prepared by the expert witness was submitted to the court with the rest of the evidence. The expert witness could also prove that prisoner commandos could not have "gone into blue clouds of Zyklon B still hovering over the corpses," without having been killed themselves. This nonsensical testimony on work in the midst of clouds of Zyklon B had been given by Richard Böck, the principal witness in the Auschwitz trial in Frankfurt. Thus Böck was asserting that the commando had been immune to Zyklon B. Yet the judge in the Auschwitz trial in Frankfurt believed that he had proved the existence of gas chambers in Auschwitz with Böck's statement. Böck had witnessed the gassings in two farm-houses which never existed, according to a technical report of HANSA LUFTBILD, which analyzed Allied air-reconnaissance photos. The expert witness could also prove that hydrogen cyanide is a colorless poison. The expert witness was sitting in the courtroom. He could provide clarification. What did the state attorney have to say about that?

"I move that the expert witness be refused, since the gas chambers are common knowledge fact," was state attorney's monotonous refrain. He demanded that the expert witness be refused without his technical qualifications having been examined. The court agreed with the motion

of the state attorney and refused the expert witness, without having heard a word he had to say, as "completely unsuitable evidence." In addition, the court refused to read the expert report, because of "common knowledge."

No one can see the Auschwitz death-books

Defense Attorney ret. Colonel Hajo Herrmann

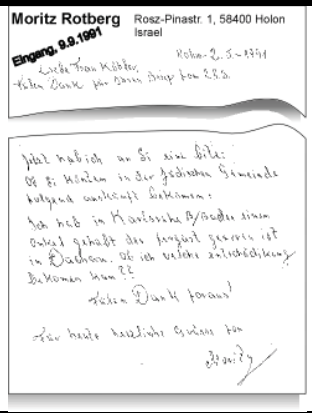
Attorney Herrmann next submitted a large selection from the official death books of Auschwitz. In 1989, these death books had been released by the Soviet Union. These official papers documented 66,000 cases of death in minute detail. All of them are under seal at the special effects office in Arolsen. No one is allowed to look at them. A ten country commission, including Israel, prevents any inspection of these documents. Recently, the journalist W. Kempkens succeeded in photocopying these documents in the Moscow archive. Herrmann submitted a representative sample to the court. The defense attorney moved that Kempkens be allowed to testify. The Holocausters keep talking about how the old and unfit-for-work Jews were sorted out on the "ramp" and "gassed" immediately, so they could not have been entered in the camp register. The death books prove the opposite. Most of the entries were elderly men and most were Jews. The state attorney moved that the documents should not be admitted as evidence, since the gas chambers are "common knowledge" fact. The court agreed with the motion of the state attorney.

The State Attorney's pleading

At that point, the taking of evidence was ended and the state attorney began his pleading. He did not need any evidence, since for him the "gas chambers" are "common knowledge." He described Remer as Mephisto (the devil) for "denying" what is "common knowledge." For such a "devil," he argued, the absolute minimum sentence should be imprisonment for two years and six months. He moved that the imprisonment begin immediately.

Defense Attorney Herrmann's pleading

The attorney protested, "We have submitted evidence in many areas, but the court has never undertaken to examine whether the defendant had a valid claim." Once more Herrmann discussed the denial of evidence in connection with the "confession" of the former camp commander of Auschwitz, Rudolf Höß. "The court had refused to allow the reading of Höß's torture with the comment that it had not been proven that Höß had made a false confession because of torture. But Höß's confession is false," thundered the retired colonel, a former inspector of Germany's WWII night fighters, in the courtroom. "Höß confessed 3 million murdered Jews. Today Holocaust historians say the number killed is 1.5 million," he flung at the state attorney and judge. Then Herrmann read the record of the capture of Höß. It is described there how the former commandant was thrown on a butcher bench and how his face was smashed for hours. The Jewish sergeant shoved a guidelamp staff deep in his throat and dumped a whole bottle of whiskey into his victim. His handcuffs were left on for three weeks. "That's what you don't want to hear, Herr State Attorney," the defense attorney's words rang out. Then Herrmann read relevant paragraphs from the transfer treaty of the occupying powers. In these paragraphs, Germany was forced to recognize forever the historical "facts" that were the basis of the Nuremberg trials. And so German courts still say "common knowledge" to the four million Auschwitz lie, to the lie about gassings in Dachau and the lie about "mass steamings" in Treblinka. Nonsense and oppression know no limit.



"I note," said the attorney, "that the defendant was denied his right. Not only the state attorney is bound politically. This is about an obligation imposed on the state by the transfer treaty of the victorious powers. But this treaty has no place in this court of law."

Then he continued, "I have never before seen the public stand when an defendant enters the courtroom. Yes, the general is no turncoat, and that is basically what you are accusing him of." Herrmann pinpointed the state attorney's error: "The state attorney refuses to accept as evidence the decision of the Auschwitz trial in Frankfurt, which counted 45,510 dead." Herrmann hammered on the conscience of the state attorney, which unfortunately does not exist. Then he continued, "But, according to the state attorney, the defendant must know that 6 million Jews were gassed." Herrmann turned to the judge's bench and shouted: "The court intends to prove that the defendant acted with criminal intent, that 'he knows it.'"

The public realized that this great man had lived through times where just dealing, dignity, honor, and decency were still common. A trial like the present was very difficult for him. Once again, Herrmann counted the denied pieces of evidence and asked, "Who in this courtroom was not well served by the defense?" Then he confronted the state attorney and said, "The state attorney will try to convince the defendant that he knew that what he said was not true. Herr State Attorney, you do not sit in the back of the defendant's head."

Then the attorney said what he thought was behind the court's – in

Judge Siebenbürger and state attorney Baumann justified themselves with this kind of witness when they yell, "*Evidence denied on account of common knowledge.*"

Moritz Rotberg Rosz-Pinastr. 1, 58400 Holon Israel

Eingang. 9.9.1991

Holon 2.5-1991

Liebe Frau Köhler,

Holon, Israel 2.5-1991

I once had an uncle in Karlsruhe B/Baden that was gast in Dachau. I can get some damajes frm this?? Much thank in advans!

[misspellings in original]

This text is taken from a letter that was mailed on May 2, 1991, from Holon/Israel to a German acquaintance with the request for help with an application for compensation. The writer's uncle was "gast" in Dachau and he wanted "damajes." For Judge Siebenbürger and state attorney Baumann, this served to prove that the gas chambers are "common knowledge."

Response of the City of Dachau:

City of DACHAU

District capital

(coat of arms)

Our Ref.: 4.2/Ra/Sa **Artists' town for 1200 years** Date: 14.11.88

Dear Herr Geller!

With reference to your question, I must inform you that there were no gassings in the former concentration camp Dachau ...

Best regards - Rahm; Director of Administration

Defense Attorney Dr. Herbert Schaller

many people's opinion – scandalous handling of the trial: "I believe that there is another power that hangs over our legal system that gives you your orders. I know that if you were to acquit, there would be a great howling – not just here, but mostly in other countries. If you fear this, you should decline to conduct the trial. How can you designate even one piece of evidence as superfluous when the issue is life or death, as it is here? You should recollect that the chief prosecutor at Nuremberg described the victorious powers' tribunal as a continuation of the war against Germany. One cannot so totally destroy and plunder a civilized people such as the Germans without an ostensible reason or pretext. Auschwitz was that pretext.

If 'common knowledge' does not endure forever, at what limit of common knowledge do we find ourselves now? Yes, this 'common knowledge' will collapse, but will the defendant die in his prison cell beforehand?" With that, Attorney Herrmann ended his pleading.

Dr. Schaller's pleading

"This is a political trial of a very peculiar nature," the courageous Viennese attorney threw at the judge and state attorney. "For the reason that it deals with a crime of opinion, where there was no violence. The defenders of democracy sit on the accuser's bench. When a democratic state takes upon itself the power to determine what the truth is, it is no longer a democracy," the attorney admonished the state attorney and court.

Dr. Schaller told of a case in Frankfurt of an African drug dealer with a criminal history who stuck a 17 centimeter long knife into the abdomen of a young German because the latter did not want to buy drugs. The attorney quoted the *Frankfurter Allgemeine Zeitung* newspaper, as to how the judge in this case would not regard the assault as attempted murder or even as attempted manslaughter. She regarded it as a case of the African merely wanting to "teach the German a lesson." This example of justice in modern-day Germany that Dr. Schaller so

graphically portrayed is reminiscent of the case of two Turks who stabbed an 18-year old German in Berlin because the latter had blond hair. Both Turks had already been convicted of manslaughter, yet they received probation. For the 80-year-old General Remer who published scientific papers, the state attorney wants the "death sentence." In the waiting room, people passed around articles from large German newspapers relating how foreign murderers, robbers and mankillers are set free because indictments cannot be prepared in time due to "shortage of staff." Every spectator was outraged that there was no shortage of judges to handle the prosecution and indictment of an acknowledged national hero because of his publication of the truth. Dr. Schaller said further:

> *"To prosecute assertions of fact in the same way that murderers should be prosecuted – but today no longer are – will lead to social collapse.*
>
> *The state should take care that arguments are expressed in words. The truth does not need criminal justice. The truth will prevail of its own power,"*

the attorney scolded the state attorney. The attorney further said:

> *"Doesn't the state attorney's demand for a two and a half year sentence for the publication of scientific knowledge smell of* [communist east German] *GDR justice? And such a thing for an 80-year-old man? Is this Bautzen?*[610]*"* demanded Dr. Schaller.
>
> *"This defense team has introduced a plethora of evidence that supports the claims of the defendant. A plethora of proofs and expert reports that has never been presented to any court of the victorious wartime Allies. And yet, the Allies' magic words from Nuremberg, 'common knowledge' should still apply here?"*

Facing the state attorney, Schaller asked:

> *"Suppose that we had a new government in Germany and this government were to examine the manner in which you servants of the state are proceeding, keeping in mind paragraphs 56 and 62 through 65 of the Basic Law. Do you think you would escape harm from the hands of the German people?"*

Then, facing the public:

> *"Suppose the state attorney had to justify his charges against the General. Suppose a judge should ask him, what proof do you have of the existence of homicidal gas chambers? He would have nothing to show. But as of today, no state attorney needs to produce evidence. We have not arrived at that point yet."*

Next he quoted the Jewish revisionist, Rabbi Immanuel Jakobovits, who says:

---

[610] An infamous prison for political prisoners in former communist East Germany.

"Today, there is a whole spectrum of business relating to the Holocaust Industry, with authors, researchers, museum curators and politicians."

To the judges' bench, Dr. Schaller hollered:

"The real threat to public order begins when one demands of the German people that they should assume guilt for gas chamber murders.

These are dangerous perversions which construe publication of scientific investigation of alleged gas chambers as defamation and incitement to racial hatred. How does the state attorney dispute this scientific evidence which the defendant has published? He merely tells us that we Germans should and must remain guilty as charged at the Nuremberg trials following World War II. That is all.

On the other hand, the defense counsels have an expert witness here in the courtroom who has produced an expert report that leaves no question unanswered. The expert witness has come to the indisputable scientific conclusion that the so-called gas chambers never came in contact with Zyklon B gas. Never!"

Schaller continued:

"There sits the technical expert, who is not allowed to say a word. A scientist from the world renowned Max-Planck-Institute is not allowed to testify in a German court! And you want to send General Remer to prison? Are you willing to accept responsibility for that?"

Then, raising his voice:

"The defendant has the right to expect that the court will fulfill its duty. that is, to inquire into the innocence of the defendant. This kowtowing to the victorious Allies of World War II cannot go on forever!"

With the following words tears came to his eyes:

"Why should a man be put to the sword to keep alive this mythology of wartime propaganda? Mr. state attorney, you should not continue believing novels that become ever more lurid with the passage of time. It cannot go on like this, to leave one's own people standing out in the cold. Please allow the introduction of evidence once more."

Thus the defense attorney closed his pleading.

The General's closing words

"To this kangaroo court that has denied me the introduction of scientific evidence I have only one thing to say."

General Remer pointed at the state attorney and the judge:

"Germany will one day hold you responsible for what you have done in this courtroom."

Résumé

General Remer seems to be dangerous to the former victorious powers because he has brought about a discussion of Auschwitz with his scientific publications. If Remer can prove his case, the Allies will lose their justification for having butchered and looted the German people. The Jews will lose, as Prof. Wolffsohn says, "their only remaining identity-forming myth." For these reasons, General Remer is condemned to die in jail. This death sentence is reminiscent of other cases of unsolved deaths such as those of Franz Josef Strauß and his wife Marianne. First Marianne died of unexplained causes in a traffic accident, then the fit, healthy former minister president of Bavaria passed away under unusual circumstances which are not medically explicable.

The *Allgemeing Jüdische Wochenzeitung* (German Jewish weekly newspaper) of October 29, 1992, recalled Strauß' goals: "The declaration of Franz J. Strauß on February 1, 1987, that the federal republic should come out from under the shadow of the Nazi past and begin a new chapter in the book of history..."

The transfer treaty of the victorious powers forbids Germany to "come out from under the shadow of the Nazi past and begin a new chapter in the book of history." The Allies would lose forever their justification for the horrendous crimes and ethnic cleansing which they committed against Germany, and the Jews would lose their identity-forming principle. This might endanger the existence of the state of Israel. Are there parallels between Remer's "death sentence" and the death of Marianne and F. J. Strauß?

5.2. The Second Crime: A Scientific Anthology

Beginning on 7th of May 1995, Judge Burkhardt Stein of the County Court of Tübingen, southwest Germany, held court on the fates of the publisher, editor, and some of the authors of the fundamental revisionist work *Grundlagen zur Zeitgeschichte* (ref. 4 Gs 173/95).[599] First, the proceedings against the authors were separated on various grounds. Next, the trial against the editor Ernst Gauss alias Germar Rudolf was separated, because the defendant was not present at the proceedings. For that reason, Judge Stein issued an arrest warrant against Rudolf.

During the trial, the public attorney and the judge accused the publisher Wigbert Grabert that the incriminated book would meet the test

for the crime of inciting to racial hatred, in that it used a number of Holocaust denying adjectives such as "alleged," "claimed," "supposed," "presumed" and "so-called." In order to show that the book had scientific merits, the defense attorney insisted that, while reading certain passages from the book, one needed to consult the comprehensive and detailed footnotes that it contained, which made reference mostly to books of establishment sources. The judge merely turned toward Susanne Teschner, the public attorney, and answered that the court would not think out loud during the trial. The court denied numerous motions of the defense for recourse to relevant expert reports or for access to court records that might show that the words "supposed," and so forth, did not *per se* constitute an intentional denying.

The court also denied two motions of the defense to suspend the trial on grounds that in this trial there was theoretically no possibility that the judge would acquit the defendant, because in such a case the judge himself might encounter social harassment or even criminal reprisal from the judicial system, as the case of Judge Orlet in the trial against the revisionist Günter Deckert had shown.

Several days after the beginning of the trial, the expert witness Dr. Joachim Hoffmann was interrogated as to whether the book *Grundlagen zur Zeitgeschichte* was scientific. Dr. Hoffmann, for decades a historian in the *Militärgeschichtliche Forschungsamt* (Research Department for Military History) of the German Armed Forces (*Bundeswehr*) in Freiburg, wrote an expert report on request of the defendant Germar Rudolf, in which he confirmed that the book at issue was scientific in nature and should therefore be protected by Germany's Basic Law. The text of his expert report has been published in English elsewhere.[611]

During his interrogation, the expert witness stated that terms such as "presumed" or "supposed" did not please him, yet he did not consider that they put the scientific merit of the book in question.

The public attorney's pleading was next. The phrases in the book that offended her most – "supposed annihilation camp," "Auschwitz bludgeon," "Holocaust religion," "identity-forming group fantasies," "supposed genocide," "established Holocaust scene," "lead ad absurdum" – although taken partly from established publications, deny the National Socialist murder of Jews and therefore qualify as incitement to racial hatred. According to the public attorney, the expert witness Dr. Hoffmann was no more competent to judge whether the book was scientific than a judge or a state attorney is, and his expert report should

[611] G. Rudolf (ed.), *op. cit.* (note 24), pp. 563-566.

therefore be disregarded. The publisher Grabert should be sentenced to 9 months imprisonment on probation.

On the last day of the trial, held on a Saturday(!),[612] June 15, 1996, in his pleading the defense attorney referred to the denunciations of the public attorney, whereby the book was allegedly a pseudo-scientific hack-job of the vilest sort, saying that this sort of speech was "pseudo-legal browbeating" without content or definition. The defense pointed to the high degree of scientific expertise that had been necessary to produce the book and also to the fact that the expert witness had unreservedly confirmed the book's scientific quality. He also pointed out that section 130, paragraph 3, of the German Penal Code (incitement to racial hatred) was unconstitutional when it served to deliver proven scientific publications up to book-burning.

The judge sentenced the publisher Grabert to pay a fine of DM 30,000 ($15,000) and ordered the seizure – in effect, the burning – of all copies of *Grundlagen zur Zeitgeschichte* as well as all materials needed to produce it. In the written verdict he stated that, although parts of the book had scientific merit, phrases such as "supposed," "presumed," "burnt sacrifice of the Jews," "imputed systematic nature," "furious fantasies," although partly drawn from citations of established personages, denied the Holocaust and therefore qualified as the crime of incitement to racial hatred.

5.3. More Thought Crimes…

Since I fled my home country in early 1996, many more criminal prosecutions were started for publications I authored, edited, published, or distributed, and keep authoring, editing, publishing, and distributing. The following list contains cases where such proceedings came to my knowledge. Since distributing literature banned by the German Federal Review Office for Youth-Endangering Publications (*Bundesprüfstelle für jugendgefährdende Schriften*) is a criminal offense in Germany, and each confiscation of literature by a German court is accompanied automatically by criminal prosecution against those who authored, edited, published, distributed, printed, imported, exported, stored or otherwise made available the confiscated literature, each of the following cases is considered to be a crime under the tough German thought crime legislation. One must therefore assume that each of the following cases may

[612] In Germany, courts of law do not hold sessions on Saturdays – with this exception.

result in at least one criminal proceeding against me. Finally, I have added a list of works published by me for which it is unknown if any criminal proceedings were started. Since the content of these publications is comparable to the other publications listed here, it must be expected that in any of these cases criminal investigations have been or will be started.

1. In 1994, the State Prosecution Office of Böblingen confiscated the following books written by Germar Rudolf. It is likely that Rudolf's ongoing distribution of these publications since 1994 – both in printed form as well as online – led to further criminal proceedings against him (County Court Böblingen, 9 Gs 521/94):
   - Rüdiger Kammerer, Armin Solms (ed.), *Wissenschaftlicher Erdrutsch durch das Rudolf Gutachten*, Cromwell Press, London 1993.[613]
   - Manfred Köhler, *Prof. Dr. Ernst Nolte: Auch Holocaust-Lügen haben kurze Beine*, Cromwell Press, London 1994.[614]
   - Wilhelm Schlesiger, *Der Fall Rudolf*, Cromwell Press, Brighton 1994.[615]
2. In 1996, the County Court Munich ordered the confiscation and destruction of the issue 6/1995 of the periodical *Staatsbriefe* (Castel del Monte, Munich), because of an article authored by Germar Rudolf (County Court Munich, 8440 Ds 112 Js 10161/96)[616]
3. In 1996, the County Court Berlin Tiergarten ordered the confiscation and destruction of the issues 2 and 3/1995 of the periodical *Sleipnir* (Castel del Monte, Munich), because of an article authored by Germar Rudolf (County Court Berlin-Tiergarten, 271 Ds 155/96)[617]
4. During a search of his property in March 1997, the Judge Dr. Payer of County Court Böblingen orders the search of a German PO Box

[613] An (outdated) translation of it was published without my knowledge: Rüdiger Kammerer, Armin Solms (eds.), *A Scientific Sensation—The Rudolf Report*, Historical Review Press, Uckfield 2002.

[614] Online: www.vho.org/D/Nolte; updated in G. Rudolf, C. Mattogno, *op. cit.* (note 58), pp. 127-183; no Engl. version available.

[616] "Naht ein deutscher Bürgerkrieg?," *Staatsbriefe* 6(6) (1995), pp. 6-8, online German only: www.vho.org/D/Staatsbriefe/Rudolf6_6.html.

[617] G. Rudolf and J. Markiewicz, W. Gubala, J. Labedz, "Briefwechsel," *Sleipnir*, 1(3) (1995) pp. 29-33; Engl.: *op. cit.* (note 64); G. Rudolf, "Kein Brief ins Gefängnis?," *Sleipnir* 1(2) (1995), not online. The criminal investigation against me in that case, Public Attorney's Office I in the Berlin District Court, ref. 81 Js 1385/95, was dropped on March 21, 1996, under sec. 154 German Penal Procedure Rules (StPO), because the expected punishment "would not carry much weight" in comparison to the one expected from the District Court of Stuttgart in my first "thought crime" trial.

used by Germar Rudolf, and its formal owner, because of a prosecution launched against Rudolf for disseminating revisionist literature via the Internet address www.codoh.com, where this PO Box is given as a contact address (County Court Böblingen, ref. 9(8) Gs 228/97).

5. In 1997, the County Court Weinheim ordered the confiscation and destruction of the book formally edited by Herbert Verbeke, but factually written and published by Germar Rudolf, *Kardinalfragen zur Zeitgeschichte* ("Cardinal Questions of Contemporary History"), Vrij Historisch Onderzoek, Berchem 1996 (County Court Weinheim, ref. 2 Ds 11 Js 5428/97).[618]
6. In 1997, the County Court Böblingen ordered the confiscation and destruction of the book edited by Rüdiger Kammerer, Armin Solms, and authored by Germar Rudolf, *Das Rudolf Gutachten*, Cromwell Press, London 1993 (County Court Böblingen, ref. 9(8) Gs 228/97).
7. In 1997, the County Court Böblingen ordered the confiscation and destruction of the book formally edited by Herbert Verbeke, but factually edited and co-authored by Germar Rudolf under the pen names Ernst Gauss and Manfred Köhler, *Auschwitz: Nackte Fakten*, Vrij Historisch Onderzoek, Berchem 1996 (County Court Böblingen, ref. 9(8) Gs 228/97).[619] On April 8, 1999, the German Federal Review Office for Youth-Endangering Publications put this book on its list of prohibited literature (*Bundesanzeiger* No. 81, April 30, 1999)
8. On December 2, 1997, the German Federal Review Office for Youth-Endangering Publications informs the publisher of the journal *Vierteljahreshefte für freie Geschichtsforschung* ("Quarterly for Free Historical Research"),[620] formally Herbert Verbeke, but factually Germar Rudolf, that it is going to put issues one and two of the year 1997 on its list of prohibited literature.
9. On May 12, 1998, the German Federal Review Office for Youth-Endangering Publications informs the formally responsible person of the website www.vho.org, Herbert Verbeke, but factually and since summer 1998 even formally Germar Rudolf, that it is going to put the entire content of this website on its list of prohibited literature (Ref. No. BPjS, Pr. 273/98 UK/Schm).[621]

[619] Engl.: www.vho.org/dl/ENG/apf.pdf.
[620] Engl. equivalent: www.vho.org/tr.
[621] See the transcript of this document at www.vho.org/censor/BPjS_vho.html (German).

10. On August 25, 1998, the Office of State Prosecution in Munich I informs the publisher of the journal *Vierteljahreshefte für freie Geschichtsforschung*, formally Herbert Verbeke, but factually Germar Rudolf, that criminal proceedings have been started against them for an article published in the issue 1/1998 of this journal, dealing with the ground water table in the region of the former concentration camp Auschwitz-Birkenau (Staatsanwaltschaft Munich I, ref. 112 Js 11282/98).
11. On January 12, 1999, the German Federal Review Office for Youth-Endangering Publications informs the publisher of the journal *Vierteljahreshefte für freie Geschichtsforschung*, formally Herbert Verbeke, but factually Germar Rudolf, that it put issues three and four of the year 1997 on its list of prohibited literature (Ref. No. 5490 (V)).
12. On March 30, 1999, the County Court Munich ordered the confiscation and destruction of the issue 2/1998 of the journal *Vierteljahreshefte für freie Geschichtsforschung* (Quarterly for Free Historical Research), published by Germar Rudolf, and informs him that criminal proceedings were initiated against him. Reasons for this were mainly two articles dealing with the concentration camp Majdanek[622] and with microwave delousing facilities in the concentration camp Auschwitz[623] (County Court Munich, ref. 812 Gs 16/98).
13. On January 5, 2000, the German Federal Review Office for Youth-Endangering Publications informs the publisher of the book *KL Majdanek. Eine historische und technische Studie* (*Concentration Camp Majdanek: A Historical and Technical Study*), Germar Rudolf, that it put this book on its list of prohibited literature (Ref. 5715(V), *Bundesanzeiger* No. 20, Jan. 29, 2000).[624]
14. On April 19, 2000, the police of Baden-Württemberg confiscated and destroyed all copies available of the book *Vorlesungen über Zeitgeschichte* (Lectures on Contemporary History), authored by Germar Rudolf under the pen name Ernst Gauss, as ordered by the County Court Tübingen (County Court Tübingen, ref. 4 Gs 312/2000).[625]

6. The Media and the Case of Germar Rudolf

The Object of Zeal[632]

When in spring 1992 Germar Rudolf sent out the first draft of his "Expert Report on the Formation and Detectability of Cyanide Compounds in the 'Gas Chambers' of Auschwitz" to a narrow circle of recipients in science and politics, several historians responded with interest. The media, however, received no notice of the existence of the report. Only in spring 1993, when retired Major General Otto Ernst Remer took a later draft of the expert report, provided it with a peppery political preface, and then sent some 1,000 to 2,000 copies to the media, public attorneys, politicians, and scientists, did a certain circle of the Establishment learn of the existence of this report.

The press was quiet, except for two short articles that appeared on May 8/9 and 13, 1993, in the *Wiesbadener Kurier* reporting on the embarrassment the expert report had caused to the chemical analysis Institute Fresenius hired by Rudolf, located in Taunusstein near Wiesbaden, and an announcement in the *Märkische Allgemeine Zeitung* of May 14, 1993, that a certain Prof. L. Bisky had filed a criminal complaint. Finally, in spring 1994, when the Labor Court heard the case between Rudolf and his former employer, the Max-Planck-Institute for Solid State Research at Stuttgart, which ended with a compromise, the DPA (German Press Agency) issued a press release that appeared in many newspapers and even on the radio. That prompted the ARD (German Public Broadcasting) television program *Report* to make a witch-hunt broadcast.

In the regional press of the Stuttgart area, where Rudolf resided at that time, there appeared mostly factual police notices, reporting that the State Security Department of the Criminal Police of Baden-Württemberg[633] for various reasons had ordered house-searches (Sep-

[632] First published in German in *Staatsbriefe* 2-3/1996, pp. 23-30.

[633] The uninitiated reader may be unaware that in Germany there is a division of the Criminal Police called the State Security Department which prosecutes politically motivated crimes. This department, by far the largest of the criminal offices, has separate areas for right-wing extremist, left-wing extremist, and foreign-influenced political crimes, respectively. Those employed in one department tend to have a political opinion hostile to their target group. For example, those in the right-wing extremist department tend to have left-wing, anti-fascist orientations. In addition, the German Federal court system includes State Security Chambers whose only work is to punish politically motivated crimes. The prosecutors who work in these courts were politically trained to deal with such crimes.

tember 30, 1993,[634] August 18, 1994,[635] and March 27, 1995[636]). However, the headlines were occasionally ridiculous. For example, the headline "Nazi book depot in Steinenbronn" appeared in the *Böblinger Bote* of March 29, 1995. In fact, there were neither Nazis, Nazi material nor a book depot in Rudolf's home.

The authorized version of the expert report was published in summer 1993 in Great Britain with the title *Das Rudolf Gutachten* and has been distributed and sold in Germany since then.[637] There has been no echo about this version in the media.

The media showed increased interest when the 17th State Security Chamber of the Stuttgart District Court began the criminal investigation against me on account of suspicion of participation in the preparation and distribution of Remer's commented version of my report. However, they were not interested in the Expert Report nor in me, but merely in the question, whether there should be made an example "to punish the right-wing" for reasons of public instruction.

The trial proceedings did not center upon the actual contents of my expert report, but on Remer's political commentary and my (alleged) political views. This was despite the fact that prosecutions for dissenting political views are forbidden according to the German constitution (cf. article 3.3. of the German Basic law). They have a strong tendency to turn into show-trials, and this is exactly what happened in this case.

Later on, several of the media reports that were published in the course of the hubbub over the Rudolf expert report and its author attempted to critically evaluate how true – or rather how false – this expert report was.

The Expert Opinion of the DPA – Invented from Whole Cloth

On March 28, 1994, the Max-Planck-Gesellschaft (MPG, M. P. Society), an umbrella organization of some 200 Max Planck Institutes all over Germany and Austria – I had been a PhD student at one of them – issued a press release on my expert report. They reported on internal

[634] This house search concerned the commented version of my expert report distributed by Remer.

[635] This house search was due to suspicion of participation in the production and distribution of the newsletters *Remer Depesche* and *Deutschland Report* (later renamed to *National Journal*, see www.globalfire.tv/nj/).

[636] This house search concerned the revisionist anthology edited by me under the pseudonym Ernst Gauss entitled *Grundlagen zur Zeitgeschichte*, Grabert, Tübingen 1994; Engl.: G. Rudolf (ed.), *Dissecting the Holocaust*, *op. cit.* (note 24).

[637] R. Kammerer, A. Solms (ed.), *Das Rudolf Gutachten*, Cromwell, London 1993.

measures taken by my former employer, the Max Planck Institute for Solid State Research in Stuttgart, against me. The MPG made it clear that since they agreed with the German Federal Constitutional Court and the Federal Supreme Court as to the commonly known fact of the Holocaust, they would not involve themselves in the discussion of the issues raised by my expert report.

The news release of the DPA Press Bureau Stuttgart which appeared the following day in almost all German newspapers and also on the radio contained the following passage:[638]

> *"According to their spokesman, the Max Planck Society has no proof that the samples are really from Auschwitz. Even if they are from there, according to expert opinion, it is certainly no wonder that no traces of hydrogen cyanide were found, because cyanide compounds disintegrate quickly. In earth this takes six to eight weeks and in stone they can only be preserved by "absolute conservation conditions, including complete exclusion of air and bacteria."*

Of course, the Max Planck Society had no evidence about the origin of the samples, since they did not ask me for any and I had no reason to give them any without having been asked. This is nothing else but a clumsy diversion from the main question. And by the way: if this topic is important to anybody, no one is prevented from verifying the results of my expert report and the test results of others as discussed in chapter 8.

On inquiry about the supposed expert opinion about the instability of cyanide compounds, Albert Meinecke, the person at DPA apparently responsible for the notice, referred first to the press statement from the MPG.[639] After it was shown to Meinecke that the statement contained no comment on the factual content of the expert report, nor any comment on the stability or presence of cyanide compounds,[638] he made various claims, depending on the caller and the time of the call:

a) He did not have the source for the expert opinion at hand.[639,640]
b) He did not know who was responsible for the press notice.[639]
c) The person responsible for the notice was out of the office.[639]
d) The person responsible for the notice was possibly on vacation.[639]
e) Since Meinecke had said both b) and c) in the same conversation, he was confronted with the fact that he had contradicted himself and that he must know very well who the responsible party was if

[638] Daily newspapers, such as *Süddeutsche Zeitung*, *Stuttgarter Zeitung*, *Südwestpresse-Verbund* (March 29, 1994), *taz*, *Frankfurter Rundschau* (March 30, 1994).
[639] Telephone conversation of K. Philipp, Frankfurt/Main, March 30, 1994.
[640] Telephone conversation of G. Rudolf, Jettingen, March 30, 1994.

he could say the person was not in the office. When asked if he had not made a great pile of goat-dung with his press notice, he opined that no one was without fault.[639]

f) He would call Rudolf when he knew more about who was responsible and what the source was.[639] As of January 2003, this has still not happened.

The connection between the MPG and the unnamed expert opinion created by the phraseology of the DPA notice would suggest to the reader that the expert opinion was that of the MPG. The latter declared by fax on April 12, 1994, that this was not the case and that the claim in the DPA notice was mistaken.

After two weeks of silence, on April 13, 1994, DPA Editor-in-Chief D. Ebeling of Hamburg, speaking for the agency, announced in a fax message to me that the unnamed expert would remain unnamed to protect his privacy. Two days later, in an unsigned faxed notice, A. Meinecke denied my accusation of falsehood[641] and referred me to the Editor-in-Chief in Hamburg.

The Technical Issues

Among others, the DPA notice contained the following assertion:

> *"Even if they* [the samples] *are from there* [Auschwitz]*, according to expert opinion, it is certainly no wonder that no traces of hydrogen cyanide were found, because cyanide compounds disintegrate quickly."*

Evidently the writer of these lines does not know the difference between hydrogen cyanide and cyanide compounds. If he should wish to subsume cyanide compounds under hydrogen cyanide, which might make it easier for the layman to understand, then it is clear: This sentence and the following one discuss the stability of cyanide compounds, the only thing that makes sense with respect to the Rudolf Report. The question as to the stability of hydrogen cyanide itself, as raised by Ebeling in his fax to me, is of no concern to anyone[642] – the question is a useless diversion from the subject.

The supposed statements of the unknown expert assert that cyanide compounds disintegrate quickly. This blanket claim is and will always be untenable and shameful for any expert to make. As proof for this, the reader may simply go back to chapter 6.6. of this book, and there in particular to chapter 6.6.5. (page 166).

---

[641] Press release, G. Rudolf on April 8, 1994.

[642] D. Ebeling's response to numerous queries to the Stuttgarter DPA bureau, April 13, 1994.

Ebeling's assertions that stable compounds may form but do not necessarily form[641] needs no confirmation from competent authority, since the fact that every acid in the world forms stable as well as unstable compounds is as trivial as an "Amen" in church.

In the DPA notice it was stated that cyanide compounds will last in stone only under "absolute conservation conditions," but in contrast to that, in the masonry of the cases of interest here and investigated in detail in this report, the disinfestation chambers of Auschwitz, hydrogen cyanide formed extremely long-lasting iron cyanide compounds of the Iron Blue type. See the arguments given above for proof of this.

Therefore, not only is the claim of the DPA press release wrong that this statement stemmed from an expert, but the actual content of this release is absolutely untenable. No expert would have endorsed such a embarrassingly absurd statement. It is not hard to see why the person responsible for having released this article did not want to be named, as Herr Ebeling said.

Report Portrait: Incitement to Hatred

One of the main incidents of the witch-hunt against Germar Rudolf was the left-wing *Report* broadcast of the German public TV station ARD on April 11, 1994. In the footage by Stefan Rocker, everyone from Conservative to neo-Nazi personalities, including Germar Rudolf, were thrown all together into one pot. By this sort of undifferentiated reporting, one can produce in certain sectors of the German population a pogrom mood against everything which is or might be right-wing. *Report* showed pictures of a synagogue in Lübeck which had been firebombed just a few months before, using the words, that as soon as Auschwitz denial would boom again, synagogues would be burning. The next picture shown in this footage was that of Germar Rudolf on his way to the Labor Court in Stuttgart. Thereby, Herr Rudolf was made into a sort of paper accomplice of the Lübeck arson. This was strengthened by the commentator's choice of words, when he mentioned the title of the well-known play *Biedermann und die Brandstifter* (Everyman and the Arsonist).[643]

If that does not constitute criminal incitement of the German television-viewing audience against Germar Rudolf, what would? It goes without saying that reports of this kind are loaded with pictures of con-

[643] In the referenced novel by Max Frisch, Herr Biedermann played just the opposite role of a desk criminal, as he was the victim of a criminal (and his own gullibility). But this fact was not made clear to the viewer.

centration camps, deported Jews, and a sea of corpses in order to ridicule the supposed denial claim of a Germar Rudolf. This is the way the left-wing *Report* works.

But which viewer would know that Rudolf had not only not denied, but had actually denounced the frequent injustices that *did* occur at that time?[644] And who would notice that the pictures proved nothing except that thousands in the concentration camps died from sickness and malnutrition? Who noticed that no TV program ever showed a film or a picture of a 'gas chamber' either in operation or capable of being put into operation – the only point in which Germar Rudolf holds a different viewpoint from media outfits such as *Report*?

Report spewed falsehoods and lies into the world. One of them was seized upon by Franziska Hundseder in her book *Rechte machen Kasse* (Right-Wingers Cash In) and will be dealt with in the next section. Here I will discuss another:[645]

In the appendix of his expert report under the heading *Danksagung* (Acknowledgements), Rudolf had thanked a number of persons and institutions who had helped him in many ways in the collection of data or sources, the recovery and analysis of samples, or for any assistance in the production of the report. Among these were the firms DEGUSSA AG and Institute Fresenius, since the first had supplied important technical data on the stability of Iron Blue and the second had analyzed most of the samples in Rudolf's presence and initially with his help. Such acknowledgements are usual in scientific publications – also they are polite.

In their commentary, *Report* reproached Rudolf that he had used the names of well-known institutes and firms to give his report the appearance of competence. In view of the facts just given, this reproach is both malevolent and ridiculous. *Report*'s additional assertion that a criminal complaint for fraud had been filed against Rudolf due to this misuse of well-known names, was pure invention. Up to today, January 2003, there have been no criminal complaints from any of the persons or institutions directly or indirectly involved in the production of the report. *Report*'s false accusation was a direct smear.

Stefan Rocker also participated in an *ARD-Tagesthemen* news broadcast on June 6, 1996, covering the book-burning trial of the book

---

644 Cf. G. Rudolf (ed.), *Dissecting the Holocaust*, *op. cit.* (note 24), pp. 31-34.

645 There is a detailed discussion of this broadcast in: W. Schlesiger, *Der Fall Rudolf*, *op. cit.* (note 615); there Rudolf disputes that he hid behind the pseudonym Ernst Gauss. He had admitted that during the trial at the District Court of Stuttgart, ref. 17 KLs 83/94.

Grundlagen zur Zeitgeschichte,[646] edited by Rudolf, then before the County Court of Tübingen. A written version of this piece appeared in the *Frankfurter Allgemeine Zeitung* of June 10, 1996, p. 14. It began with the following sentence:

> *"Everyman and the Arsonist: diplom chemist German*[647] *Rudolf, 31, was sentenced to 14 months imprisonment by the Stuttgart District Court a year ago for incitement to racial hatred and denial of the holocaust."*

Rudolf was also accused of having published a "pseudo-scientific" "hack-job" titled *Grundlagen zur Zeitgeschichte*, whereby he had proven himself a repetitious right-wing extremist offender. It was stated he had left the country and was sought by the police.

The fact that 100 academics had placed an advertisement in the *Frankfurter Allgemeine Zeitung* during the book-burning trial[648] which criticized the use of censorship and the violation of civil rights by German courts was termed a "frontal assault on the Federal German justice system" in this commentary. Throughout that piece, the authors threw everyone who was politically right-of-center into one big brown bucket.

Ripple Effects

In mid-May 1995, the left-wing political TV show *Panorama* (again from the German public station ARD) reported on several medium-size businesses that had become known as supporters of right-wing circles.[649] This broadcast was a cinematic presentation of the book *Rechte machen Kasse*,[650] (Right-Wingers Cash In) written by the journalist who produced the broadcast, Franziska Hundseder. In the book, the author discusses Germar Rudolf or his expert report twice. Both times her discussion is full of errors and falsehoods.

For example, in referring to the invented DPA press release about the alleged instability of cyanide compounds, Frau Hundseder concludes:

> *"Therefore, this so-called expert report of Herr Rudolf – like the expert report of Frederick A. Leuchter, which similarly found no traces of cyanide in the walls of Auschwitz-Birkenau crematoria 1 and 2 – contains no proof*

---

646 Cf. Part II, chapter 5.2. in this volume.
647 Should be: Germar. Error in Original.

649 Cf. *Die Welt*, May 15, 1995: "Unterstützen Unternehmer die rechtsextremen Szene?" (Do Businesses Support the Right-wing Extremist Scene?). As a result of this broadcast, Germar Rudolf's employer was placed under such pressure from his customers, suppliers, competitors, and employees that he terminated Herr Rudolf's employment contract.
650 Knaur, Munich, May 1995.

of anything other than the methods by which right-wing extremists conduct historical research."

Though notified in writing about the falsity of the DPA press release she was relying upon, Frau Hundseder never changed her position on this. The same is true for a passage on page 212 of her book, where she claims I had tried to collect several tens of thousands of deutschmarks in order to buy copies of the death books of the Auschwitz camp. She gives the impression that I was trying to get the money. But this is not true. The letter quoted by her had already been distortedly quoted by the above mentioned *Report* journalists who must have illegally received a complete copy of this letter from the trial record. However, if read completely, the letter reveals that I did not want any money, but was asking several personalities to donate money to a third person I had no personal connection with.

The Verdict a Foregone Conclusion

As the trial against Germar Rudolf in the State Security Chamber of the District Court of Stuttgart began at the end of November 1994, there were several media individuals who distinguished themselves by their painful ignorance of the subject matter of the trial. The cause for this seemed to be that no journalist deemed it necessary to ask for information from anyone involved in the trial. So it happened that repeatedly items were misunderstood or misreported. One might not attribute purposeful distortion to the journalists if it were not for the fact that these misunderstandings were always decidedly unfavorable to Rudolf.

The partisan orientation of the *Süddeutscher Rundfunk*, *SDR*, another public broadcasting station (almost all German public broadcasting stations are left-wing oriented) was exposed when it decided to report only one side of the story, namely that of the investigating police officer. Since his statements were apparently not critical enough for the *SDR*, soon items were invented. The *SDR* took the only two statements from the several hundred pages of correspondence in which Rudolf had mentioned two Jewish personalities in a disapproving way, which were cited by the police officer. *SDR* then asserted falsely, the officer had characterized the rest of my correspondence "as the vilest incitement and defamation." The *SDR* also attributed to the police officer that he had understood Rudolf to have said he wanted to "rewrite the history of Germany from 1871 onward, without the Holocaust or World War II," which in view of the absurdity of the statement may cause doubt about

the sanity of the journalists involved. And of course, the *SDR* was silent on the substantial mitigating evidence presented by the defense in the following months.[651]

With a few exceptions, the entire media was silent until the end of the trial. It could be seen from the behavior of the journalists present that they were not looking for the real story, but were intent on bringing in a sacrifice for the *Zeitgeist*: all but one of them – a new person from *Südwestfunk* radio – looked only to the prosecuting attorneys and judges in their search for information.

The *Stuttgarter Zeitung* (*StZ*) provides a clear example of the tendentious method of reporting used by the media. Since not enough incriminating material turned up in the several thousand pages of Rudolf's correspondence that were found in the first house search in September 1993, on January 27, 1995, the *StZ* conjured up "writing in the hand of the defendant with indisputable [...] xenophobic content." However, in the whole trial there was never any talk of xenophobia or racism, because there was never any basis for same. At the end of a piece of the *Landesschau* of *Südwest 3* TV station on December 27, 1994, the Christian-Conservative Rudolf mutated into a neo-Nazi: the trial against Rudolf was characterized as another case of a neo-Nazi in the Stuttgart District Court, following a real trial against several National Socialists that had taken place in the same court a short time before.[652]

That the verdict was assumed to have been decided before the fact became more and more noticeable as the question was raised whether there would be difficulties in convicting Rudolf of the crime he was accused of, as if it were not the task of the court to determine the truth without respect to party, but rather that it should find guilt whether or not the crime had been committed.

The *Böblinger Kreiszeitung* reported in this vein on May 10, 1995, as the trial was nearing its end. There, on page 13 under the headline "Sentence Before Pentecost," one found:

> *"He* [the presiding judge] *believes that the prosecuting attorney will conclude her case at the next session on May 18 of this year, and that the sentence against the chemist will be handed down before Pentecost unless something unforeseen happens."*

How can it be that, according to this press report, the presiding judge can announce before the end of the trial (it ended on June 23, 1995) that the expected judgment will be *against* the defendant, that it will be de-

[651] *Süddeutscher Rundfunk*, in all four afternoon radio programs on Nov. 25, 1994.

[652] The video of this program distributed by the Süddeutscher Rundfunk was correspondingly labeled with the caption "Neo-Nazi."

cided to his disadvantage? It would have made sense to state that the judgment will be given *in* a case or *about* the defendant. If the journalist here reported the presiding judge's words correctly, the choice of words shows the partisanship of the judge; otherwise it shows that of the journalist.

It is worthwhile to note the relative emphasis the media gave to the pleadings of the prosecution as opposed to that of the defense. On June 13, 1995, the *StZ* reported the arguments of the public attorney in a detailed 3-column story on page 2, while the defense appearance was covered the following day in a small single-column story which merely recapitulated the events of the trial and did not report any of the arguments of the defendant.

To be fair, it should be mentioned that after the sentence came down on June 24, 1995, Sonnhild Maier, the journalist for the *StZ*, mentioned some of the defense arguments:

> *"The court ruled that the expert report and the preface were a single work and were to be seen as a 'common production' of Rudolf and Remer.*
>
> *This is what the accused chemist vehemently disputed. He is a practicing Catholic, believes in the political order of the Federal Republic and would never have entered into an association with Remer, whom he took to be a 'living political fossil.' In the chemist's words: 'I would not have been so stupid – this would have undermined me in the final phase of my doctoral program.'*[653] *At the time he was preparing his doctoral thesis at the Max Planck Institute in Stuttgart. When his expert report became publicly known, he lost his job."*

In a 3-column story on June 14, 1995, the *Stuttgarter Nachrichten* summarized the prosecution case. The story gave the defense's claims responding to the prosecution's points, but not a single argument supporting these claims. Instead of this, the defense arguments were superficially refuted by the journalist Frank Schwaibold using somewhat erroneous counterarguments.

Against the assertion of the prosecution that Rudolf had revealed himself as a politically motivated criminal by his work under the pseudonym Ernst Gauss and therefore deserved no probation, the defense objected that the Gauss case could not be applied. It was hidden from the reader that in a state under the rule of law a defendant cannot be disadvantaged through a court case that had not even started. In response to the defense counterargument to the prosecution charge that Rudolf cooperated with Remer, journalist Frank Schwaibold asserted

[653] Because of the Remer's commented version, the University of Stuttgart refused to give Rudolf an appointment to take the *rigorosum*, the final examination for his PhD title.

falsely that Rudolf had met and talked with Remer three times. The truth is that Rudolf and Remer met only by chance in the course of Rudolf's work as expert witness for Remer's defense attorney. During these accidental encounters, there was no conversation between them, which even the court acknowledged.[654]

Against the defense's assertion that the defendant was no neo-Nazi, the journalist cited a letter absurdly out of context in which Rudolf "referred to the 'Jew Republic Germany' in context with the person Ignatz Bubis." In that letter,[655] Rudolf criticized a proposal made in spring 1993 that Ignatz Bubis be elected Federal German President. Taking into consideration that Bubis had almost no political experience at that time but had a criminal past, Rudolf commented that the proposal reflected the immense importance that was given to him as the leader of a diminishing minority in the German state (the late Ignatz Bubis was head of the *Zentralrat der Juden in Deutschland*, Central Council of Jews in Germany, at that time). For that reason, Rudolf stated that it was appropriate to rename the name of the German nation, using this minority as a prefix: *Judenrepublik Deutschland* (Jew Republic of Germany).[656] The Jewish witness Horst Lummert, who testified on behalf of Germar Rudolf, confirmed before the court on January 9, 1995, that this reasoning was justified.[657]

Given these facts, it remains for Frank Schwaibold to explain to us where neo-Nazism is hidden in Rudolf's remarks.

Execution by Media

Naturally, after the announcement of the sentence of the District Court of Stuttgart, according to which Rudolf was to be punished with 14 months imprisonment without probation, the media found it easy to drag him through the mud. The first was the *Süddeutscher Rundfunk*. Following the imperative of the *Zeitgeist*, without making use of the

654 Confidential letter of G. Rudolf to H. Herrmann, Dec. 20, 1992, Computer Data File 2, sheet 222, in records of the District Court Stuttgart, ref. 17 KLs 83/94, introduced Dec. 6, 1994.

655 Letter to K. Philipp on March 1, 1993, Investigation File 1, sheet 351, in records of the District Court Stuttgart, ref. 17 KLs 83/94, introduced on Dec. 17, 1994.

656 Response of G. Rudolf to accusation May 1994, introduced in trial before District Court Stuttgart, ref. 17 KLs 83/94, on March 17, 1995 in chambers, in records.

657 H. Lummert thinks that one should stay with the abbreviation for BRD: "*Bubisrepublik Deutschland*" (Bubis Republic Germany). Approximately 30 witnesses testified that they had never heard Germar Rudolf make anti-Semitic remarks and that he had even protested against their use. There was no contrary testimony. The media likewise ignored a speech at an academic fraternity by Rudolf to students which was clearly pro-Jewish. On May 9, 1995, the court verified that the speech had taken place.

decision of the court or any other evidence, it labeled Rudolf a "neo-Nazi." It also attempted to make the Rudolf expert report ridiculous by resurrecting the DPA notice from a year before. *SDR 3* simply claimed that it was known to competent chemists that cyanide compounds disintegrate within a few weeks in rocks.[658]

The program *Landesschau* of the regional television station *Südwest 3* made comments similar to those of *SDR 3*, but piled even further on the defamation by misrepresenting an article that appeared in the *Stuttgarter Nachrichten* the week before. This article of June 14, 1995, was entitled "Only a Victim of the 'Father-figure of Neo-Nazism'?" Under the Word "Neo-Nazism," a picture of the defendant was shown. The question raised by this newspaper headline was whether Rudolf had been a victim of O. E. Remer, who was identified as the "Father-figure of Neo-Nazism."

In filming a copy of this article, the *Südwestfunk* bent the paper so that the viewer would see only the words "Father-figure of Neo-Nazism" over the photograph of Rudolf. The viewer would unavoidably receive the impression that the harsh sentence on Rudolf was a judicial determination that with Rudolf one was dealing with the father-figure of Neo-Nazism. It is difficult to imagine how media distortion could get any worse.

Many media sources considered the sentence handed down by the court as an insufficient condemnation of Rudolf, as can be seen from several examples. On June 24, 1995, the *Böblinger Bote* wrote that Rudolf could be linked to National Socialist race doctrine. This complete fabrication is so absurd and so far from any reality that it was never an issue during the course of the trial, nor was it mentioned in the court's spoken opinion giving the basis for the written verdict. Unfortunately, this did not hinder the court from inserting this unfounded assertion into the written verdict for the sentence.[659]

On the same day, and despite Rudolf's personal appeal, Frank Schwaibold of the *Stuttgarter Nachrichten* could not help but once again misconstrue the contacts between Rudolf and Remer, in that he wrote, Rudolf had been "provably in personal contact with Remer three

---

[658] *SDR* 3, June 23, 1995, 13:30 hours.

[659] Verdict of the District Court Stuttgart, ref. 17 KLs 83/94, pp. 15, 156ff. As evidence the court used an unpublished writing of the defendant. In it, Rudolf commented how the confirmation of revisionist theses might cause many to disdain Jews. Records of the District Court Stuttgart, ref. 17 KLs 83/94, Computer Data File 3, introduced on Jan. 26, 1995. Where there is racism in these speculative remarks is unclear.

times," where the word "personal" imputed a relationship between the two that had never existed.

On June 24, 1995, the *Süddeutsche Zeitung* outdid itself in manipulating the news. It wrote that Rudolf had occasionally been a member of the right-wing extremist Republican Party. But, in fact, Rudolf had been a member of the party at a time when it was not considered "right-wing extremist" and even important members of the semi-conservative Christian Democrats (CDU/CSU) maintained contacts with members of the party. Whatever opinion the media and the German internal secret service, the Office for the Defense of the Constitution (*Verfassungsschutz*) had after Rudolf left the party in summer 1991 cannot be taken as a criterion for the evaluation of Rudolf's political views. Also, Rudolf was not on trial for his political beliefs, which, according to Article 3, Para. 3 of the German Basic Law can never be cause for deprivation of rights. Finally, it is absurd to try to associate the patriotic-conservative views of the Republicans with the National Socialist views of Remer, which was clearly the intention of the *Süddeutsche Zeitung*.

The *Süddeutsche Zeitung* also was the only one of Germany's bigger daily newspapers that again trotted out the fable of the supposedly long-ago refuted Rudolf expert report, based on the DPA notice:

> *"According to information from competent chemists, hydrogen cyanide compounds disintegrate within a few months from the effects of weather and are no longer detectable."*

With this perpetual falsehood, the point was made to every uninitiated reader that the Rudolf expert report was the technically worthless hack-job of an incompetent chemist. At the beginning of the trial on November 23, 1994, the *Böblinger Bote* had spread the same nonsense:

> *"According to expert opinion, no traces of cyanide can be found after 50 years since they disintegrate quickly."*

In their report of 1997, p. 64, even the Bavarian Office for the Protection of the Constitution (*Bayerisches Amt für Verfassungsschutz*) has the nerve to repeat that nonsense.

In view of the supposedly proven pseudo-science in the Rudolf expert report, the newspapers avoided the words "expert report" or printed them in quotation marks and also characterized it as a "hack-job" (*StZ*, November 23, 1994). However, on that date, November 23, 1994, the court declared that it did not consider itself competent to decide to what extent the expert report satisfied scientific criteria. It avoided the issue of scientific evidence by attributing to Rudolf the preface and epilogue

written by Remer's friend in Remer's version and sentenced Rudolf on that basis.

In a wider context, Hans Westra, Director of the Anne Frank Foundation in the Netherlands, has commented on the technical correctness of the Rudolf expert report. The Anne Frank Foundation is one of the most well-known of the institutions world-wide that occupy themselves with uncovering and documenting proofs of the Holocaust. In response to the question of a journalist as to whether the scientific conclusions of the Rudolf expert report were correct, Hans Westra replied:[660]

> *"These scientific analyses are perfect. What one cannot determine is how this Rudolf got them, how he obtained the samples."*

Certainly Mr. Westra could not restrain himself from casting doubt on the authenticity of the samples, since established researchers seem to be able to find no other loop-hole in the scheme of arguments in the Rudolf expert report.

News for Public Instruction

The day of the announcement of the sentence in the case of Germar Rudolf may be the only one in which the media outside the local region reported on it. As mentioned above, the *Süddeutsche Zeitung* devoted an extensive story to the sentence.

Also, on June 23, 1995, the nationwide TV news show *heute* of the ZDF (German public Television 2) felt called on to write a short story reporting that the diplom chemist Germar Rudolf had been sentenced to 14 months imprisonment without probation on account of an expert report on the gas chambers of Auschwitz. Since as the media outside the local region had reported almost nothing on the case previous to this, the normal television viewer would hardly know what to do with this very brief piece of information. Therefore, the report can have had only one purpose: It should be made clear to every potential technical witness Republic-wide that those who voice views about the Holocaust complex that deviate from those officially allowed – however factually correct, reputable, scientific and perhaps even professionally correct – will be thrown in jail without probation.

The news reports of the local press on May 6, 1996, ran in the same direction after my application for a revision of the verdict was turned down by the German Federal Supreme Court. They hinted to the reader that the scientist Rudolf had been sentenced because of his expert re-

[660] BRT 1 (Belgian Television), *Panorama*, April 27, 1995.

port, which had come to an incorrect conclusion and thereby denied the Holocaust. It apparently did not interest anyone that the expert report had not been an issue at the trial. Naturally, the *Böblinger Bote* could not restrain itself from digging up the DPA lie again:[661]

> *"In opposition to competent scientific authorities, the Jettingen chemist asserted that mass-killing of humans with hydrogen cyanide would leave traces of cyanide in the masonry of the remaining buildings in the camp, but no such traces can be found."*

That the extremely harsh sentence against Rudolf was due to reasons of public instruction, and thus for the purpose of frightening any scientist who might play with the idea of publishing a deviating opinion (general prevention), was also the opinion of the *Böblinger Bote* on June 27, 1996:

> *"No probation was granted for the sentence of 14 months imprisonment handed down in June last year on grounds of general prevention."*

Hunted Abroad

In March of 1996, Germar Rudolf went into exile. The press initially lost track of him and for the time being, lost interest as well. This changed in the fall of 1999, when British journalist Chris Hastings (34) set about tracking him down in England. Since Rudolf had registered, as required by law, and residency records are open to the public, it was not difficult to establish that Rudolf was residing in England. In addition, Rudolf had listed his post office address on his website (PO Box 118, Hastings TN34 1YL). Chris Hastings succeeded in locating the apartment in which Rudolf was registered. He left a note requesting an interview. Rudolf granted his request by allowing him a two hour interview at Victoria station in London. The content of this interview concerned primarily the present state of human rights in Germany as well as the official persecution of Rudolf. But as Rudolf suspected, Hastings was not interested in the present state of human rights in Germany. In Hastings' article in the *Sunday Telegraph* of Oct. 17, 1999, the subject was not even mentioned. Instead, under a subtitle demagogically slandering Rudolf as a "neo-Nazi," Hastings wrote:[662]

> *"He* [Rudolf] *confirms that, during his stay in Britain, he has forged links with far-Right extremists including members of the National Front and the British National Party.*[...]

---

[661] *Kreiszeitung Böblinger Bote* and *Gäubote/Südwestpresse-Verbund*, May 6, 1996.

[662] Jessica Berry and Chris Hastings, "German neo-Nazi fugitive is found hiding in Britain," *The Sunday Telegraph*, Oct. 17, 1999; repeated on Oct. 18, 1999 in the *Independent.*

> *'In Britain I work as an Holocaust revisionist 24 hours a day. My work has brought me into contact with people on the far Right. I have met leading members of the National Front and the British National Party while I have been in England.'"*

In the worst tradition of yellow journalism, Hastings took individual words and phrases totally out of context and rearranged them to suit his sensationalistic purposes. Rudolf never uttered such sentences, with the exception of the sentence about working 24 hours a day for revisionism. It is a fact that, in the spring of 1999, Rudolf met with Nick Griffin and discussed Griffin's experiences with the British justice system. The year before, Griffin was, among other things, accused of having published an article with revisionist statements in a small right-wing periodical edited by himself, but he had been acquitted. Because of Rudolf's own exposed position, and because he had extensively reported on official censorship in his publication *Vierteljahreshefte für freie Geschichtsforschung* (*VffG*) before, Rudolf was naturally very interested in Griffin's story, but he was not interested in Griffin's organizational memberships or functions. Before this meeting, Rudolf was not aware that Griffin held a leading position in the nationalist British National Party. However, during the meeting, Griffin informed him that he aspired to chairmanship of the party, to which position he was subsequently elected. When asked by Hastings whether he was in contact with members of the political right, Rudolf straightforwardly told him of the conversation with Griffin. Hastings used this to suggest to his readers that Rudolf had forged contacts with the organizational leadership of the leading rightwing extremist parties of England. But to the best of his knowledge, Rudolf has never made contact with any member of the National Front.

Hastings went so far as to interview Rudolf's former landlady, whom he absurdly quoted as follows:

> *"Sheila Evans, Rudolf's former landlady, said: 'I remember he said he was a writer working for journals in Germany. I was struck by how clean he left the house when he left. He stripped it bare. I think he was trying to cover his tracks.'"*

In fact, when he negotiated the tenancy contract in July 1996, Rudolf had told his landlady that he will write for a German periodical. (*VffG* first appeared in spring of 1997, published by the Flemish organization Vrij Historisch Onderzoek). Mrs. Evans was the most ferocious housedragon that Rudolf ever met. When Rudolf moved out, he had to repair and repaint every little scratch on the skirting boards, every bit of chipped enamel on door frames and heaters, every tiny dent in the walls

before she would return his deposit. Surely it was normal behavior for Rudolf to take his belongings with him when he moved out. It seems that when people read about their neighbors in the newspapers, they see ghosts and goblins everywhere.

Chris Hastings continued to make Rudolf's presence and activities known to a very large number of nosy and peculiar people. He prompted them to agree that England needs a law to protect holocaust lore against scientific examination. And he prompted them to agree that Rudolf should be extradited to Germany immediately.

The results were not long in coming. The established media in Germany ground out another sensationalistic story. "Indicted Neo-Nazi in Great Britain," blared the DPA (German Press Agency) on October 18, 1999 (it was printed on the 19th in *Die Rheinpfalz* and other newspapers.) "Holocaust denier hiding out in England" announced the leftwing *Stuttgarter Nachrichten* on October 21, page 4. On October 31, Chris Hastings jubilantly announced in the *Sunday Telegraph* that Germany would now seriously pursue Rudolf's extradition. He predicted that England would comply because Rudolf had not been convicted for holocaust denial, but for incitement to racial hatred, which is a violation of English law, too.[663] On October 22, the local press in Hastings, where Rudolf resided, chimed in with "Fleeing neo-Nazi uses base in Hastings" (*The Hastings and St. Leonards Observer*). The monthly English manhunter tabloid *Searchlight* joined the hunt in December with "Auschwitz liar hides out in Britain" on page 13.[664] Chris Hastings added more wood to the flames in his update of January 16, 2000:

> *"Neo-Nazi accused of 'racial hatred' goes on the run.* [...] *Germany has issued an international arrest warrant for Germar Rudolf, who fled to England to escape a prison sentence for inciting racial hatred."*

The manhunt turned completely into hysteria with a BBC report about Rudolf on March 28, 2000, which was repeated the day after by the south English regional TV station ITV. Six or seven photographs of Rudolf were shown during the report which had been taken from Rudolf's website www.vho.org. The public was warned to beware of this "Nazi sympathizer." The audience must have gained the impression that Rudolf was so dangerous that he was running around murdering people. Mr. Michael Whine of the British Jewish Board of Deputies was pleased to appear before the cameras and announce that regarding Rudolf, England was dealing with a "new breed of dangerous Nazis." The

[663] This was echoed, *e.g.*, by the *Australian Jewish News*, Nov. 5, 1999.

[664] The German matching piece to this periodical, *blick nach rechts*, started its campaign as late as June 2000 with a contribution by Thomas Pfeiffer in the same style, of course.

local press chimed in once more with "Escaped Neo-Nazi still hiding in Hastings [...] he [...] was still being hunted." (*The Hastings and St. Leonards Observer*, March 31, 2000). Obviously, the powers that be are striving to familiarize the local populace with Rudolf's likeness and condition them to be afraid of him. It wants them to complain to the police about the desperado in their midst.

On May 27, 2000, Günther Hoerbst of the *Hamburger Abendblatt* reported on a report of the Israeli university of Tel Aviv entitled *Anti-Semitism Worldwide 1998/99*:

> *"Twelve pages of the report are dedicated to Germany. The report complains about the growing acceptance of the holocaust lie, primarily by means of the internet and rightwing extremist groups. The report acknowledges that present German legislation provides the most 'advanced and effective attempts at combating the holocaust lie,' but 'it nevertheless is a growing phenomenon.' For instance, the leading German holocaust liar Rudolf continues to disseminate his writings over the internet from foreign countries, even though he has been convicted and sentenced in Germany."*

What a pity that is!

So far, the only more or less impartial article about Rudolf has appeared on January 7, 2000, in the *Los Angeles Times*, in connection with the Irving vs. Lipstadt trial. It was written by Kim Murphy.[665]

Freedom of the Press = A Truthful Press?

Against several of the above-mentioned media pieces, namely those where the person of Germar Rudolf himself had been attacked, it would have been possible to demand a right of reply in the press. However, with respect to factually false assertions such as the fabricated DPA notice which did not touch Rudolf personally, there can be no recourse under current law.

The District Court of Stuttgart sentenced Germar Rudolf to 14 months imprisonment without probation for the reasons that Rudolf was deeply marked with anti-Semitism, that he was entangled in a revisionist and right-wing extremist environment, and that he was obviously a fanatical, politically motivated criminal. In that moment, the court gave the media license to vilify and malign him without let or hindrance, since in the Federal Republic of Germany, anyone labeled as an anti-Semite or right-wing extremist is a de facto outlaw. That the court did not find that Rudolf was a right-wing extremist, merely that he had had dealings with supposedly "right-wing extremist" persons, was of sec-

[665] Online at: www.germarrudolf.com/persecute/docs/ListPos111.pdf.

ondary importance and in view of the media practice of imputing guilt by association no cause to hold back. Rudolf's applications for rebuttal in the press were denied out-of-hand, since in the meantime the version of the story spread by the press had been confirmed by the courts.

In a democracy, the people are the sovereign. Should the voice of the people become the voice of God not only with respect to power, but also partly with respect to infallibility, care must be taken that the people are comprehensively and truthfully informed. In this modern information age, the media play the central role in forming the public will. For this reason, it must be guaranteed that the people are comprehensively and truthfully informed.

The intentional presentation of false and one-sided information to the public must automatically lead to false conceptions of reality and thence to unwise political decisions. The intentional presentation of disinformation through suppression of news or spreading of false news should be considered one of the most serious crimes of a political nature that can be committed in a democracy.

The question of the executive and judicial means by which the people can be guaranteed to be kept comprehensively and truthfully informed is bound to be a difficult one in view of the fundamental freedoms of press and speech. It would be necessary to require, for example, that the media be subject to democratic control in that the formation of political or economic monopolies would be prevented. One proposal would be to allow access to the media in their area of operations to political parties proportional to the vote they received or to socially-concerned organizations (such as religions) proportional to their membership, without a limiting minimum percent.

Also the right of reply in the press should be expanded such that it should apply not only when a person's reputation is harmed, but also when it can be shown that a news item is grossly one-sided or wrong, and that the truth itself has been harmed.

The criminal prosecution of persons of whom it can be proven that they deliberately composed and distributed false information is problematic, since the proof of the assertion that a journalist deliberately spread false news – that he lied – could only rarely succeed. The simple assertion that the journalist must have known that his report was not true since all others knew it should never suffice.[666]

[666] This is the trick used to send revisionists to jail: Since everyone knows that the Holocaust happened, revisionists must know it also. When they still assert the opposite, they must do so wittingly and therefore they lie. Whoever lies has evil intentions and therefore belongs behind bars. Such is the logic of terror.

After all, I think we do not need laws to censor liars, but laws that punish censors. That alone can be a remedy for the escalating censorship in modern Europe.

> *"Thank heaven, we live under the rule of law. But unfortunately, that does not apply to the territory of the Federal Republic of Germany."*
>
> Johannes Gross, *Capital*, Germany, Nov. 1994, p. 3

7. Outlawed in Germany

The Disfranchisement of Unwelcome Citizens[667]

In antiquity and in the Middle Ages, many European nations possessed the legal power to disfranchise citizens for gross misdeeds. With the rise of secularized constitutional nations, the use of this power disappeared until it resurfaced in the 3rd Reich as thought-crime laws. In the Federal Republic of Germany, the possibility of far-reaching revocations of civil rights was built right into the constitution in Article 18 of the Basic Law, but until recently no use was made of it. Jochen Lober has shown that the equivalent curtailment of the civil rights of citizens has been achieved by extra-constitutional regulation.[668] We will examine here Lober's question, whether a form of *de facto* outlawry was introduced with the revision of section 130 of the German Penal Code, which made any kind of Holocaust denial – or revisionism – and opposition to multi-culturalism a potential criminal offense punishable by up to five years in prison. This will be done by studying the fate of Auschwitz researcher Diplom-Chemist Germar Rudolf. What happened to him will be examined phenomenologically, not chronologically, in order to focus on the effects of German criminal law on the civil rights of German citizens.

First Step: Denunciation

From September 20 to 22, 1991, a seminar took place in Nuremberg (Bavaria) on Holocaust revisionism, sponsored by the libertarian Bavarian Thomas Dehler Foundation.

Among the participants, besides Germar Rudolf, there was a certain Diplom-Physicist Hermann Körber from Bünde, in northern Germany. His behavior during the seminar was highly unpleasant. During a discussion period, for example, he stated that the German people should

[667] Written after reading the mentioned article by J. Lober (next footnote); first published in *Staatsbriefe* 12/95, Castel del Monte, Munich, pp. 10-15.

[668] *Staatsbriefe* 7/95.

not only be considered as murderers, but as plunderers as well. He also suggested that the Germans themselves were to blame for the many deaths among old people, women and children that were caused by the Allied aerial bombardment, because they had started the bombing (which is not true) and had knowingly failed to evacuate the civil population (which was also not true, since many children were sent to the country). During the Sunday dinner, Körber threatened a fellow participant sitting at his table with a dinner knife because the person did not share his opinion on the Holocaust, and at the close on Sunday afternoon, he loudly called the participants Germar Rudolf and Winfried Zwerenz pigs, because they had disagreed with him on scientific grounds.

On November 5, 1992, this Hermann Körber filed a criminal complaint with state attorney Baumann in Schweinfurt against Germar Rudolf for instigating Otto Ernst Remer to incitement to racial hatred.[669] He claimed that it was Rudolf and his expert report that had caused Remer to begin publishing material on the Holocaust in his *Remer Depesche*.[670] Subsequently, the state attorney of Schweinfurt initiated a criminal investigation against Rudolf on grounds of incitement to racial hatred, and others, in which O. E. Remer was also named.[671] Both defendants denied the accusations.

Then, on April, 19, 1993, at the state attorney's office in Bielefeld, Körber filed a witness affidavit in which he stated:[672]

> *"As a Diplom Chemist, Rudolf knows and must know that his theses are scientifically untenable.*
>
> *It can be proven that that which Rudolf convinced Remer of is trickery."*

On April 27, 1993, as proof of his assertion that Rudolf was knowingly deceitful, Körber filed another affidavit in which he interpreted Rudolf's technical arguments made in an exchange of correspondence with Werner Wegner, as incitement to racial hatred, and characterized Rudolf's assertion that unambiguous technical evidence was superior to ambiguous documentary evidence as "unscientific and unprofessional procedure."[673]

In another affidavit made on April 30, 1993, Körber asserted falsely that Rudolf supported

670 The *Remer Depesche* had already appeared in Spring 1991, before Rudolf had begun his research as expert witness.

671 Ref. 8 Js 13182/92, Investigation File 1 (District Court Stuttgart, ref. 17 KLs 83/94), sheet 17ff.

672 *Ibid.*, sheet 58.

673 *Ibid.*, sheet 63

"the Leuchter thesis that there was a danger of explosion throughout the Auschwitz compound, at least for structures, whenever gassing operations with Zyklon B were going on."

Rudolf had in fact stated that the use of high concentrations of Zyklon B to reduce execution periods to minutes or seconds, as the witnesses had reported, would mean that there would be safety problems due to explosive concentrations of hydrogen cyanide (see chapter 6.3.). He had never spoken nor written of a general danger of explosion.

The busy witness Körber was at it again on May 26, 1993, this time to assert that the references to the Rudolf Report in various editions of the *Remer Depesche* proved that the author Rudolf was the cause. Körber also claimed that Rudolf's attempt to testify as an expert witness, which was refused by the court, constituted conspiracy to commit perjury.[674] On June 7, 1993, he repeated his accusations that Rudolf had instigated Remer to his misdeeds in the *Remer Depesche*, and offered evidence that would defer the possible termination of the investigation.[675]

It should be pointed out that there is no mention among Körber's statements of the fact that Rudolf had written him a lengthy letter in January 1993, in which Rudolf presented detailed arguments supporting the conclusions of his report.[676] Körber had never answered the letter. His only response had been to make false accusations about Rudolf to the police.

In mid-April 1993, the state attorney of Stuttgart set in motion another prosecution against Rudolf in addition to the ongoing prosecution concerning incitement. This one was initiated by retired Generalmajor O. E. Remer's distribution of a commented version of the Rudolf Report.

The first copies of Remer's version were sent to various notable personalities in politics, justice, and science on April 16, 1993.[677] On the same day, Prof. Dr. Hanns F. Zacher, President of the Max Planck Society (Max-Planck-Gesellschaft, MPG), received a call from the Chairman of the Directorate of the *Zentralrat der Juden in Deutschland* (Central Council of Jews in Germany), Ignatz Bubis, in which Herr

[674] Investigation File 1 (District Court Stuttgart, ref. 17 KLs 83/94), sheet 84f.

[675] *Ibid.*, sheet 86.

[676] In the exhibits of the trial against Rudolf (District Court Stuttgart, ref. 17 KLs 83/94), Correspondence File K. Rudolf had added thanks for Körber's Christmas present – his criminal complaint.

[677] Germar Rudolf's doctoral supervisor, Prof. Dr. Dr. h. c. H. G. von Schnering, as well as several other professors at the Max Planck Institute for Solid State Research received Remer's version on this day: decision, District Court Stuttgart, ref. 17 KLs 83/94, p. 126.

Bubis told Prof. Zacher of his concern about the effect of the Rudolf Report by Diplom-Chemist Germar Rudolf, at that time an MPG employee.[678] It is not known what Prof. Zacher did in response to the call. In any case there was no attempt by the MPG administration to terminate Rudolf's employment at that time.

In mid-May 1993, Rudolf received at his office two calls from journalists (the German weekly magazine *stern* and the private TV station *SAT 1*) dealing with the distribution of the Remer version. During one of these calls, a colleague of Rudolf was in the room. The colleague later told another colleague, Jörg Sassmannshausen, who immediately reported the event to the executive Director of the Max Planck Institute, Prof. Arndt Simon.[679] Subsequently, Rudolf was asked not to appear at the Institute anymore unless at the explicit request of his doctoral supervisor, Prof. Dr. H. G. von Schnering, in order to make sure that there might be no further contact with journalists during work hours. His employment contract had not been mentioned.

This request was subsequently repeated in writing. Nine days afterwards, Rudolf entered the Max Planck Institute in order to copy some documents and to discuss the reproduction of his doctoral thesis with his doctoral supervisor. He deliberately avoided his office in order to avoid being confronted with questions from the media. Rudolf was seen by Institute workers, however, and they reported his presence to the executive director.

Second Step: Professional Ruin

Rudolf had neglected to ask his doctoral supervisor for permission to enter the Institute. The following day he was asked to accept termination of his employment contract without notice.[680] The justification for this was primarily that Rudolf had sent letters on stationary with the Max Planck Institute letterhead while working on the Report. Rudolf

[678] A later letter of the Central Council of Jews to the President of the MPG on June 22, 1993, refers to this telephone call. Facsimile published in Wilhelm Schlesiger, *Der Fall Rudolf*, *op. cit.* (note 615); from the records of the Labor Court Stuttgart in the case Rudolf v. Max Planck Institute for Solid State Research, ref. 14 Ca 6663/93.

[679] According to information from his secretary, Prof. Simon knew what role he was being forced to play, but for opportunistic reasons he put his career and the reputation of the Max Planck Institute ahead of upholding the principles of scientific research; information received from my former wife who at that time still worked at this institute. On this affair, cf. also Prof. Simon's revealing statements and the discussion on the social taboo that must be observed by German scientists in: W. Schlesiger, *Der Fall Rudolf*, (note 615).

[680] This description is based on the transcript of Rudolf's testimony from memory from this time, Computer Data File 2, (District Court Stuttgart, ref. 17 KLs 83/94), 175-220.

had privately engaged the Fresenius Institute to analyze the wall samples from Auschwitz for traces of cyanide. But when the Fresenius Institute was already working on his samples in Rudolf's presence, he handed in a letter typed on a letter head of his employer with a detailed specification of the work to be conducted by the Fresenius Institute and a detailed description of the samples. Though the unauthorized use of official letterheads for private purposes was widespread at the Max Planck Institute at the time, in Rudolf's case it became a no-no. It was this use of Institute letterhead, about which the management of the Institute first became aware through news reports,[681] that established the connection of the Institute with the Rudolf Report.

Apparently because of the failure of the MPG to respond to the intercession of I. Bubis (see above), on June 22, 1993, the *Zentralrat der Juden in Deutschland* (Central Council of Jews in Germany) felt it necessary to notify the President of the MPG that he was expected to take appropriate measures to restrict the activities of Report researcher Germar Rudolf. On July 14, 1993, the President of the MPG informed the Central Council that the MPG had no further responsibility for the activities of Herr Rudolf, since he had been fired.

The subsequent labor court proceeding instituted by Rudolf against the Max Planck Institute with respect to his termination without notice turned on the question, whether the generally-practiced and, in his case, already known infraction "private use of official letterhead" could be used as grounds for dismissal without notice when the Auschwitz issue was mixed in. Labor court judge Stolz made it clear that an employer could dismiss an employee anytime who held such views as the plaintiff Germar Rudolf. This amounts to the principle that Rudolf and others who think like him are outlaws with respect to the labor law. For reasons of social concern, the Max-Planck-Institute offered to make an agreement with the plaintiff out of court, by which the termination without notice would be revoked and at the same time replaced by a mutual agreement that the employment contract would be terminated, barring further recourse.[682]

Despite this dispute between Rudolf and his now former employer, his doctoral supervisor Prof. H. G. von Schnering continued to support his doctoral candidate and in July 1993 certified that Rudolf possessed

[681] *Wiesbadener Kurier* on 8./9. and 13. May 1993.

[682] Labor Court of Stuttgart, ref. 14 Ca 6663/93. A detailed description of the events in the Max Planck Institute and elsewhere about the Rudolf report during the year 1993, with a series of reproduced documents, can be found in the brochure W. Schlesiger, *The Rudolf Case*, *op. cit.* (note 615).

the necessary professional and ethical qualification to take the next step, the final examination called the Rigorosum. In that month, Rudolf submitted to the University of Stuttgart his doctoral thesis with all necessary supporting documents and applied for admission to the Rigorosum. By fall 1993, however, permission for the promotion had still not been granted. On inquiry at the University, Rudolf was told that his application had been put on hold because of the criminal investigation initiated against Rudolf for incitement to racial hatred as well as that against O. E. Remer for distribution of Remer's version of the Rudolf Report. The University of Stuttgart maintained that it was questionable whether the candidate possessed the necessary ethical qualification.

The grounds for this decision was section 4 of the Law On Academic Degrees, enacted by Adolf Hitler in 1939 and still in force in Germany today. By this provision, an academic degree can be revoked or withheld, if one does not possess the necessary ethical qualification. According to a decision of the Administrative Court of Baden-Württemberg, an academic title can only be withheld when there has been a judicial sentence for a serious crime that has been entered on the person's police record of conduct.[683]

Since at the time of his application for admission to the Rigorosum 1) Rudolf had not been judicially sentenced and 2) such a decision was not expected by him, Rudolf filed a complaint against the University of Stuttgart in the County Court of Stuttgart for failure to act. At the behest of the University of Stuttgart, the County Court Stuttgart stalled on grounds that the ongoing criminal proceeding against Rudolf would have to be concluded before it could be decided whether Rudolf possessed the necessary qualifications for promotion.[684]

After the sentence against Rudolf was handed down in March 1996, the University of Stuttgart advised him that it was in his best interest to withdraw his application for promotion, since otherwise the University most likely would refuse his application because of Rudolf's conviction for a severe crime. Rudolf complied, because he might otherwise have

[683] Ref. IX 1496/79, decision on March 18, 1981. At that time, a person who had been convicted to five years imprisonment for a drug offense, which was entered in his police record, was certified as *having* the necessary ethical qualification, and the University was ordered to admit him to the final PhD exam. In this decision, it was held that this Hitler law is still in effect because it does not contain National Socialist thinking and should be considered as having been legally enacted.

[684] Ref. 13 K 1329/94. After the prison sentence against Rudolf was announced, Rudolf's doctoral supervisor commented that he would have to sit out his punishment before he could complete his doctoral program. Hence, Prof. von Schnering was at that time apparently still ready to stand behind his candidate.

to reckon with the problem that his doctoral work might be unacceptable everywhere else in the world.[685]

By good fortune, in fall 1994 Rudolf obtained a position as a field representative with a firm dealing in corrosion inhibiting products. During her research into "right-wing businesses," left-wing journalist F. Hundseder stumbled onto the fact that Rudolf was employed at one of them. In the ARD broadcast *Panorama* in mid-May 1995, this discovery was described as a scandal, and both the company and their employee Rudolf as heinous Neo-Nazis. The company came immediately under such heavy pressure from customers, suppliers, employees and competitors that by mutual agreement they and Rudolf terminated his employment contract in order to prevent further loss to the company. Due to this denunciation by the media, Rudolf lost his job within a few days.

In the current state of German labor law, if in future applications for employment Rudolf were not to mention his revisionist activities and this were to become known to his employer, it would be considered grounds for dismissal. If he duly mentioned these activities, however, he could expect not to find any ordinary employment anywhere in Germany.[686]

Third Step: Persecution through Prosecution

A more complete analysis of the prosecution against Rudolf will be left to other works. Rudolf was accused not only because of Remer's political commentary, which was falsely attributed to Rudolf, but also because of the purely technical conclusions in his Report.[687] In the principal hearing Presiding Judge Dr. Dietmar Mayer stated that the competence of the court did not extend to the evaluation of the scientific validity of the expert report. Because of this, the contents of the expert report were not addressed in the proceeding, but only the question whether the defendant was responsible for Remer's commentary.

In its decision, the court made no secret of the fact that it held revisionist thinking itself to be reprehensible and punishable by increasing the severity of the sentence.[688] However, the sentence against Rudolf to 14 months prison without probation was based on the false contention

[685] See the letter of the University as well as Rudolf's reaction (in German only online: vho.org/Authors/UniStgt.html and vho.org/Authors/RudolfUniStgt.html).
[686] There remained the non-ordinary way that he has followed successfully until 2005.
[687] Criminal indictment by the States Attorney of Stuttgart on 19. April 1994, ref. 4 Js 34417/93.
[688] Trial District Court Stuttgart, ref. 17 KLs 83/94, decision p. 239.

that Rudolf had at least knowingly contributed to the political commentary contained in Remer's version of his expert report. The court justified its sentence with a tiresomely assembled chain of proofs amounting to 240 pages which in decisive points departed from the actual evidence and which completely ignored the contradictory evidence on the main point of the defense.

The chemical and construction problems of the buildings at Auschwitz dealt with in the Rudolf Report were characterized by the court as "hardly clarifiable details of the National Socialist mass-crimes," thus, under no circumstance a matter of "common knowledge."[689]

Rudolf's trial on account of the business with Remer's version ended in summer 1995. Under which star this trial was held was made blindingly clear by a document from the trial records: Rudolf's judges in the District Court of Stuttgart wanted to prevent that they themselves should come under the wheels of denunciation and inquisition, as had the judges of the District Court of Mannheim in the Günter Deckert Case, who were massively criticized by media and politicians, threatened with prosecution, and eventually sent to early retirement because they had dared to call a leading revisionist a man of good character and sentence him only to one year imprisonment *with* probation. Before the opening of the trial against Rudolf, the judges therefore carefully inquired with the German Federal Supreme Court with respect to its decision against Günter Deckert and receive an immediate reply.[690] Since the German Federal Supreme Court revised the Deckert decision so many times until a sentence of imprisonment without probation was certain, it is obvious that in the Rudolf Case the same sentence of imprisonment without probation was the only option if the judges wanted to stay out of trouble.

At the same time as the above-mentioned prosecution, there were three other prosecutions underway against Rudolf. In the first case, he was accused of being mainly or at least partially responsible for the publication of the journals *Remer Depesche* and *Deutschland Report*.[691] The second involved his publication of the work *Grundlagen zur Zeitgeschichte* (see Part II., chapter 5.2.). The third was directed against an exchange of correspondence between Rudolf and the Krakow Institute

for Forensic Research on chemical questions concerning the gas chambers of Auschwitz that was published in *Sleipnir*, issue 3, 1995.[617]

It was clear already then that these would not be the last measures taken against Rudolf, especially since he intended to defend himself in print. In view of the fact that the District Court of Stuttgart was able to find the defendant guilty contrary to the evidence, one could justifiably fear that in each outstanding trial, the innocent defendant would be found just as guilty, and that he would find himself incarcerated under the terms of several sentences of increasing severity.

In the meantime, Rudolf's home had been searched three times, and each time books, archives, correspondence, technical data and his computer equipment were seized. The principal loss was not that of physical items, but the intellectual loss of data and archive material. The result was that Rudolf could no longer work as a scientist and also could not defend himself unrestrictedly in court, since his resources to do so were continually taken away. Even the standard literature on the Holocaust was confiscated.

Only those who have themselves undergone the same thing can judge the psychological stress caused to an innocent person through undergoing years-long criminal prosecutions. In addition to these psychic burdens, there are the legal expenses to consider. Currently, they can be calculated only with difficulty but, loosely estimated, they must run into a few hundred thousand dollars. It is clear that at the close of the trial against him, Rudolf was financially ruined for the foreseeable future – quite apart from the fact that for the foreseeable future he would be given no chance to meet these burdens through employment in his profession, at least not within Germany.

Fourth Step: Defamation

At the close of the labor court hearing of the case against the Max Planck Institute, the *Deutsche Presse-Agentur* (DPA) published its already mentioned false announcement on the Rudolf Report.

Rudolf not only proved that the expert opinion cited in this announcement by the DPA was wholly fabricated – the MPG distanced itself from the announcement – but also that the report based on the phantom opinion is so false that no expert in the world would embrace it. But this does not hinder the media from spreading the announcement far and wide and using it as proof of the obvious falseness of the Rudolf Report (see Part II., chapter 6). In the meantime, this false press release

even appeared in the media in foreign countries.[692] Since then, Rudolf has been defamed as a right-wing radical,[693] a right-wing extremist,[694] a Neo-Nazi[695] and a brown doctoral candidate.[696] His Report is always named in quotation-marks, and characterized as hack-work[697] or merely as a "false report."[698] Unfounded accusations of xenophobia[699] are accompanied by the false assertion of Judge Dr. Mayer that Rudolf was deeply marked by anti-Semitism, which, since it is wrong, is all the more ferociously maintained.

By 1994, Rudolf had had no success with his attempts to defend himself against the effects of hostile descriptions, but this was due more to financial difficulties than to judicial defeats.[700] But once Rudolf was sentenced for his supposed crime, the media declared open season on him.

Fifth Step: Destruction of the Personal World

When the ARD smeared Rudolf in the most vicious way in its spring 1994 broadcast *Report*,[701] Rudolf's parents distanced themselves from him and refused to come to his wedding, scheduled for several weeks later. All his relatives joined them in this, except for his siblings.[702] His godmother Hannelore Dörschler distanced herself expressly from the views of the people with whom Rudolf surrounded himself, without knowing with which persons Rudolf actually surrounded himself or what views they held.[703]

Since November 2, 1983, Rudolf had belonged to the Catholic German Student Fraternity AV Tuisconia Königsberg in Bonn. This fraternity is a member of an umbrella organization that claims to be the largest academic organization of Europe, and to which famous personalities

[703] Letter of the defendant to his godmother on April 30, 1994, introduced in the main trial proceeding on Feb. 23, 1995 in Trial District Court Stuttgart, ref. 17 KLs 83/94.

belong(ed): Josef Cardinal Höffner, Joseph Cardinal Ratzinger, Friedrich Cardinal Wetter, Archbishop Johannes Dyba, Franz-Josef Strauß (former Ministerpresident of Bavaria, Federal Defense Minister), Philipp Jenninger (former President of the German Parliament), Matthias Wissmann (former Minister for Science and Technology), Alexander von Stahl (former federal general state attorney), Herbert Hupka, Rainer Barzel, Otto von Habsburg, Friedrich Wilhelm, Prince von Hohenzollern, Prof. Peter Berglar, Prof. Josef Stingl, Thomas Gottschalk and others.[704]

When Rudolf's revisionist activity became known in spring 1994, the umbrella organization exerted pressure on Rudolf's organization to expel him. Because of this, his organization convened a session of various of its members that spring, without the knowledge or participation of Rudolf, at which his revisionist activity was discussed. An expulsion process followed that held a hearing on August 20, 1994, and ended by expelling him in the fall.

This expulsion was by reason that:[705]

> *"The Holocaust and the acknowledgement thereof is the normative foundation of our* [German] *Constitution. The legitimacy – in the sense of worthiness of acceptance – of the Basic Law is based on the recognition of the fact of National Socialist criminal measures by which Jews were subject to a systematic technical mass murder. Inasmuch as Fraternity Brother Rudolf raises doubts about the deliberate annihilation of the Jews, he also raises doubts about the normative consensus on which the Basic Law is based.*
>
> *Content (normative consensus) and form (institutional order) of the Basic Law are inextricably interwoven and their substance cannot be altered.*
>
> *Thereby, Fraternity Brother Rudolf violates our Patria Principle."*

The Patria Principle is one of the four principles of the semi-conservative umbrella organization.[706] Today, the principle is primarily understood as meaning constitutional patriotism. It is left to the reader to judge the mental health of the lawyers that composed these pronouncements. The fact is that the decision to expel Rudolf because of the pressure from the superior organization was inescapable, and it was admitted that the decision would have been otherwise, had there been no outside pressure.[707]

[706] The other three are: religio, scientia, amicitia.

[707] Testimony of union brother Dr. Markus Kiefer in the trial in the Conduct Court.

Sixth Step: Homelessness

When the police searched Rudolf's home a second time on August 18, 1994, the local media described him as a well-known right-wing extremist personality. In the small village of Jettingen, where Rudolf lived at the time, it was thought necessary to do something to rid the town of this unwelcome citizen. It was made clear to Rudolf's landlord that the community did not wish him to lease a dwelling to Rudolf. It was also made clear to the landlord that he should have an interest in getting rid of his lessee, too, since otherwise he would have to deal with such things as that his son could no longer bring his friends home, because their parents would not allow them to enter a house in which Neo-Nazis lived.[708] Therefore, Rudolf's occupancy of the dwelling was terminated as soon as the lease allowed, at a time when his wife expected the birth of their first child within four weeks.[709]

When the landlords of the dwelling that Rudolf had rented thereafter, the couple Sedlatschek of Steinenbronn, learned from the news on June 23, 1995, about the fact that Rudolf had been sentenced to 14 months imprisonment, they had their lawyers communicate the following to him:[710]

> *"In the name of and on behalf of our clients we hereby terminate immediately the lease under the lease contract executed October 26, 1994, between you and them.*
>
> *Our clients became aware through the press, by radio, and television that you, Herr Rudolf, were sentenced to 14 months imprisonment by the District Court of Stuttgart for the crime of incitement to racial hatred. Our clients therefore no longer desire to continue the lease.*
>
> *I am required to demand of you to depart from the dwelling no later than*
>
> ***July 31, 1995***
>
> *and to surrender the premises to our clients in the agreed-upon condition.*
>
> *If you fail to comply with this demand, we are authorized to file a complaint without delay."*

When Rudolf requested his landlord to withdraw the termination, threatening otherwise he would file a counter-complaint, the landlord threatened eviction. For private reasons, among them that his wife was

[708] So the statement of the landlord at the time, Karlheinz Bühler, to G. Rudolf in later Summer 1994.

[709] It was not necessary to give a reason, because by the German Civil Code (BGB) no reason for termination is necessary with respect to a two-family house in which the landlord himself lives.

[710] Facsimile reproduction of this document in *Sleipnir* 4/95, insider back cover.

expecting her second child, he submitted, found a new residence and settled with his landlord out of court.

Seventh Step: Special Treatment

On May 5, 1995, the GRÜNE/Alternative Liste (a radical-left environmental splinter party) of the parliament of Hamburg demanded access to court records in the Rudolf case. Though denied at first, a subsequent request for records access on July 3, 1995, apparently succeeded,[711] although it is not legal to grant access to the court records to outside persons who have no direct interest in a case. It is reasonable to fear that the records may have come into the hands of radical anti-fascist groups, where data on witnesses could be collected and compared.

The dot on the "i" was the request on October 16, 1994, of the Project for Study of Anti-Semitism, Faculty of Humanities of the University of Tel Aviv, in which a certain Sarah Rembiszewski requested information on the state of Rudolf's prosecution.[712] The judges also were aware of the world-wide attention on the case. Tel Aviv also pressed for records access. Was it possible to hope that records access would remain denied despite the ever more strident pleas out of Tel Aviv, inasmuch as the research institute has no legal claim to such access? Under current law, access to court records cannot normally be granted to outside persons with no interest in a case. If it should turn out that Tel Aviv got access to the records without legal ground, that therefore Jews in Germany still receive *Sonderbehandlung* (special treatment),[713] presumably a copy of the records will soon appear in the offices of a university that probably would like to have intimate details of the revisionist scene in Germany. It is even likely the records will find their way to other offices where a more active use might be made of them.

---

[711] Sheet 1411 of the Records in Trial District Court Stuttgart, ref. 17 KLs 83/94, with the handwritten note by Dr. Mayer that access to the records should be granted after records had been returned by the defense.

[713] From the letter of the defense attorney Dr. G. Herzogenrath-Amelung to the District Court of Stuttgart on this subject on Nov. 16, 1995, in Trial District Court Stuttgart, ref. 17 KLs 83/94.

Eighth Step: Destruction of the Family

After his 14 months prison sentence was confirmed in March 1996 by the German Federal Supreme Court, and considering the prospect of perhaps even more severe convictions in several other pending criminal investigations, probably ending with a summary sentence of up to four years in prison, Rudolf decided to leave Germany with his family and to settle in England, where he thought freedom of speech was more than mere lip service. Having built up a revisionist publishing company abroad, his wife decided at the end of 1998 that she could not bear the life in exile, permanently fearing the extradition of her husband, being separated from all her old friends and relatives, having difficulties to find new friends and acquaintances, and thus heavily suffering from homesickness. Hence, in early 1999, she and their two children returned to Germany and later started the divorce procedure from her husband, leaving him alone in exile.

In fall 1999, when the British media started a smear campaign against Rudolf, his wife's nightmare came true: Rudolf became fair game of British politics, media and the justice system.[714] Before this witch hunt began, it had been possible for his wife and his children to visit Rudolf frequently. But ever since it has been extremely difficult, since Rudolf left Europe in late 1999 and entered the USA, where he applied for Political Asylum in October 2000. Especially the abandoned father and his two children suffered terribly under this situation of being almost totally isolated from each other.

In February 2000, Rudolf's father urged him to get sterilized, since it would be irresponsible both for his first family as well as in general – considering the conditions he had to live in – to father any more children.[715] Fortunately Rudolf did not heed his father…

Formerly, the persecution of the Jews by some Germans led to consideration to get certain Jews sterilized. Today, the persecution of Germans, mainly promoted by some Jewish lobbies, leads to considerations to get Germans sterilized.

In August 2000, a week before he was legally divorced from his wife, Germar Rudolf was told by his mother that his parents had disinherited him and entered his children in their last will instead.

---

[714] See part II, chapters 3 and 6.

[715] Email by Georg Hermann Rudolf from February 19, 2000.

Nineth Step: Loss of Freedom

Rudolf's asylum case dragged on for many years and was finally decided – rejected – in early 2006. In the meantime Rudolf had married a U.S. citizen, and at the beginning of 2005 he had become the proud father of a daughter. Due to their marriage the Rudolf couple had applied for an adjustment of his immigrant status with the U.S. authorities in late 2004, so that his status as a visitor who had applied for political asylum would be changed to that of a legal permanent resident.

Following conventional procedure, the Rudolf couple was asked to appear at the nearest office of the U.S. Immigration and Naturalization Services for an interview on Oct. 19, 2005, which is meant to verify that their marriage truly is a *bona fides* (real) one. Coming in with their baby in its stroller, it was a breeze for the Rudolf couple to get their marriage certified as genuine.[716]

Yet right after the officer had handed them the certificate of recognition, two other officers declared that Rudolf was under arrest for allegedly having missed an interview appointment five months earlier – which had actually never existed to begin with.[717] Although Rudolf's lawyer tried to prevent his arrest, and although the local officer was inclined to heed this plea, an order came from Washington that very hour to arrest and prepare Rudolf for his deportation to Germany anyway. His recognized marriage to a U.S. citizen did not impress the U.S. officials at all. They simply claimed that no person who has entered the U.S. as a tourist "on parole" (which applied to Rudolf) has a right to even apply for adjustment of status, a claim which clearly contradicts statutory law, as was later confirmed.

Rudolf was subsequently shackled with hands and feet onto a long chain together with numerous criminals – like dangerous wild animals – and brought to the Kenosha County Jail (WI) awaiting his deportation. According to the wrist ID band he obtained in that prison, he was the only "non-criminal" inmate in the entire facility, which raised the eyebrows of both prisoners and guards.

---

[716] See http://germarrudolf.com/persecute/docs/ApprovedMarriage.pdf

[717] Rudolf was told during his arrest that this alleged appointment should have served to take his fingerprints and a passport-size portrait, although his fingerprints had already been taken back in 2001 and he had regularly sent in updated portraits every year during his asylum proceedings, the latest just in spring 2005. Later the U.S. government claimed that Rudolf was meant to present himself on April 7, 2005, for his deportation; see U.S. Immigrations and Customs Services, "ICE deports 'Holocaust revisionist' to Germany," once at www.ice.gov/pi/nr/0511/051115chicago.htm, but now removed; cf. www.revisionisthistory.org/revisionist18.html.

The U.S. Federal Court in Atlanta dealing with Rudolf's asylum case – which was still pending then! – turned down Rudolf's request to have the deportation stayed until the Court had reached a decision.

The U.S. Supreme Court did not even bother to look at the case.[718]

So the question is: what is an application for political asylum good for, if a government deports the asylum seeker *before* the court dealing with the case has decided whether the case has any merits?

And what is the value of the guarantee of due process – given to every person on U.S. soil by the Fifth Amendment to the U.S. Constitution – if the government can simply abort a pending legal review by deporting a defendant to a foreign dungeon? Or as Rudolf's lawyer put it:[719]

> *"If all petitioners like Rudolf* […] *seeking judicial review of agency decisions to issue orders of removal could simply be taken into custody and removed, the Government could avoid judicial review of agency decisions altogether.* […] *Upon removal, Rudolf* [was] *separated from his U.S. citizen spouse and infant child and he* [faced] *continued persecution by the German government.* [...] *After removal, these injuries could not then be redressed by any favorable ruling from this Court. Rudolf's removal* […] *violate*[ed] *his right to due process under the Fifth Amendment to the United States Constitution."*

On November 14, 2005, Rudolf was notified that he will be banned from returning to the U.S for five years for having overstayed his tourist parole time (90 days). Then he was deported to Germany, where German officials immediately arrested him at the airport and ferried him to the Rottenburg prison in southwest Germany, so that he may serve the outstanding 14 months prison sentence. A few days later Rudolf was transferred to the Stuttgart jail, as the German authorities had realized that there are more cases pending against Rudolf for his publishing activities during the previous nine years while residing in England and the U.S. Although Rudolf's publishing activities there were completely legal in those countries, the German authorities opine that they have to apply the German Penal Code on legal activities in foreign countries as soon as the "effects" of that crime are noticeable in Germany – that is: if the publication deemed illegal can be accessed in Germany via the Internet or if a hardcopy of it is imported to Germany.

When the Federal Court in Atlanta finally rendered a decision in the asylum case some three months *after* Rudolf's deportation, it stated

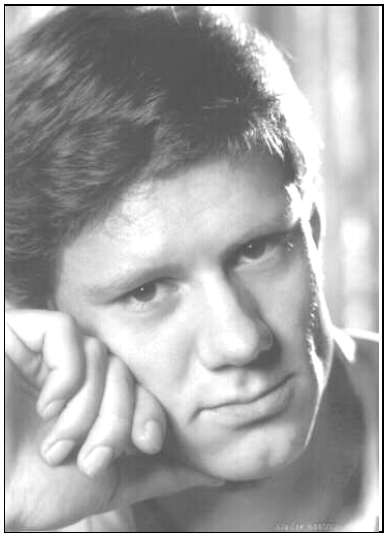
---

[718] For both court's rejections see http://germarrudolf.com/persecute/docs/Denial.pdf

[719] Motion to the U.S. Supreme Court to stay Rudolf's deportation, http://germarrudolf.com/persecute/docs/USSCEmergencyApplication.pdf

simply that the U.S. government has a right to deport any asylum seeker it wishes. Rudolf's argument that his premature deportation was a crass violation of the right to due process as guaranteed by the Fifth Amendment to the U.S. Constitution was simply hushed up and ignored in the Court's decision.[720] That's the way to render "justice" without creating untenable case law: simply sweep the core issues under the carpet and ignore all the evidence.

On the upside, however, the U.S. Federal Court in Atlanta declared as illegal the regulation which the U.S. Immigration and Naturalization Services had used to justify their refusal to adjudicate Rudolf's application for adjustment of status to that of a permanent legal resident (or in plain English: they didn't want to give Rudolf a so-called "Greencard," but now they have to…). In summer of 2006 the U.S. government changed this illegal regulation by allowing future applications for permanent residency filed by tourists to be adjudicated. But the new version specifically excludes from an adjudication all old applications filed by persons who have already been deported. All attempts to get legal redress against this regulation failed, because Rudolf has the opportunity to file a new application after his release from prison.



And that is exactly what Rudolf did after his release in July 2009. While his application for a so-called "green card" was pending, he spent a year in England, where his U.S. wife and daughter joined him for five months and where he could give his eldest daughter from his first marriage an opportunity to spend one school year abroad, to become fluent in English, and to get to know her own father.

In April 2010 the U.S. Consulate in Frankfurt indicated that the only thing barring them from issuing an immigrant visa to Rudolf is the still pending five year ban to return to the U.S. However, when this ban expired in November 2010, rather than issuing the visa, the consulate repeatedly postponed a decision and finally declared that it cannot foresee any resolution of Rudolf's case. Against this ongoing procrastination by the U.S. authorities Rudolf filed a Writ of Mandamus on January 31, 2011, in order to force the U.S. government to adjudicate his pending application.

8. Biographical Notes on the Author

Germar Rudolf, a certified chemist, was born on October 29, 1964, in Limburg/Lahn, Germany. Elite High School Diploma (*Gymnasium Abitur*) in 1983 in Remscheid, followed by study for a certified chemist's degree at the University of Bonn, graduation *summa cum laude* in September 1989. Completion of compulsory military service with the German *Luftwaffe* (Air Force). Between October 1990 and June 1993, Mr. Rudolf worked on the preparation of a doctoral thesis at the Max Planck Institute for Solid State Research in Stuttgart. Despite the highest recommendations, he was forced to withdraw his dissertation, because the University of Stuttgart threatened to rejected it on political grounds (due to his involvement in revisionism).

The Author in summer 1991, while doing the main work for this expert report

Since early 1993, he has been the defendant in several criminal prosecutions resulting from the publication of scientific texts. One of the cases resulted in a 14 months prison sentence. Shortly after the appeal for this case had been rejected in March 1996, but before an arrest warrant had been issued for him, he decided to leave his native Germany and to go into exile, first England, then, in late 1999, the United States, where he applied for political asylum. In late 1996, Mr. Rudolf established the publishing house Castle Hill Publishers and, simultaneously, a quarterly historical periodical in the German language, with the aim of addressing critical aspects of contemporary history currently suppressed in all Ger-

The author in late 2002

man speaking countries. In 2000, he started publishing English language books on revisionist topics under the imprint of Theses & Dissertations Press, a firm originally established by Robert H. Countess and purchased by Rudolf in summer 2002. Between 2003 and 2005, he also published a quarterly historical language of English language, which focuses on the same topics as his German periodical.

The author in April 2010

In late summer 2004 Rudolf married a U.S. citizen. Due to this he applied for permanent residence in the U.S. while his asylum case was still pending. As a result he and his wife were asked to appear to an interview with the U.S. Immigration Services on October 19, 2005. Their marriage was subsequently certified as valid and genuine, but right after the couple had obtained their certificate, Rudolf was arrested and four weeks later deported to Germany, with the reason given that Rudolf, as a rejected asylum seeker, has no right to apply for permanent residence. In Germany he was arrested at the airport and incarcerated. In the years 2006/2007 he was tried for numerous items he had published while residing in the USA. Although perfectly legal there, Germany nevertheless applies German law to those cases, if such publications are accessible in Germany via the internet or are being imported to Germany. Rudolf was sentenced to an additional 30 months of imprisonment. Together with his old verdict of 14 months, he subsequently spent 44 months in various German prisons before being released on July 5, 2009.

Roughly one month after his release he left Germany for good – or so he hopes.

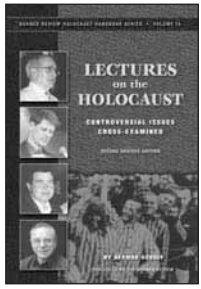
Praise for the first edition of *The Rudolf Report*:

"I am extraordinarily impressed. To my knowledge, you are the first expert in Germany who has addressed this particular topic in a scholarly, impeccable and well-founded way. It is not for me to attribute an ice-breaker function to your expert report. It is easy to see which political-historical effects will originate from it, though its entire dimension cannot yet be estimated." —Prof. Dr. Hellmut Diwald, Historian, January 22, 1992

"I read it with great interest. … My impression is, however, that this expert report is an important contribution to a very important question which, since the 'Leuchter Report,' needs to be answered urgently. … One can only very much hope that the well-known tactics of hushing up is not applied to your expert report, but that critical responses and comments will be made." —Prof. Dr. Ernst Nolte, Historian, January 28, 1992

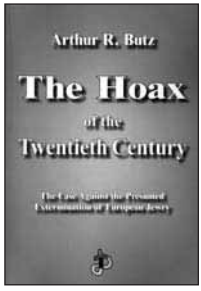
"For me, the significance of receiving your report rests on the fact that it substantially contributes to our stock of knowledge. With many of my colleagues active in the field of contemporary history, I am overjoyed and thankful for you having initiated this research activity. Of course, I am even more delighted regarding the results of your accurate scientific investigation." —Prof. Dr. Werner Georg Haverbeck, Historian, January 31, 1992

"I calmly read your report. It gives me hope to realize that a representative of the younger generation courageously sets out, with scientific thoroughness, noticeable great expertise, and corresponding investigative curiosity, to get to the bottom of a controversial question that is of worldwide significance. The result is clear and unequivocal. True facts cannot be suppressed forever. I wish that your work will make the breakthrough."—Prof. Emil Schlee, Historian, April 1, 1992



"I sincerely hope that all statements about this topic would obviously be based on long and intensive work such as yours. Most of it is certainly unverifiable for the layman, but the photographs are already quite informative." —Prof. Dr. Ernst Nolte, Historian, January 6, 1993

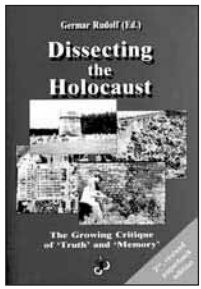
"Germar Rudolf is a young scientist who tried to prove in an excellently layed-out work, with tables, graphics and so on, that the gas chambers were technically impossible. … These scientific analyses are perfect." —Hans Westra, Anne-Frank-Foundation, BRT 1 TV (Belgium), Panorama, April 27, 1995



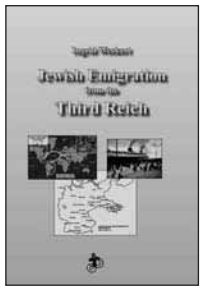
"All in all, [Rudolf] relies on literature which was written long before this report was completed, and the report must be described as scientifically acceptable." —Prof. Dr. Henri Ramuz, Chemist, interrogated as expert witness about *The Rudolf Report* by the Swiss Court at Châtel-St.-Denis, May 18, 1997

THE HOLOCAUST HANDBOOK SERIES . . .

This ambitious series of scholarly books addresses various topics of the so-called Jewish "Holocaust" of the WWII era. They all have a highly critical, if not skeptical attitude toward the commonly held views on this topic and are usually referred to as "revisionist" in nature. These books are designed to have the power to both convince the common reader as well as academics in this field. The following books have appeared so far:



Lectures on the Holocaust. Controversial Issues Cross Examined—updated and revised Second Edition. By Germar Rudolf. Between 1992 and 2005 German scholar Germar Rudolf has lectured to various audiences about the Holocaust in the light of new findings. Rudolf's sometimes astounding facts and arguments fell on fertile soil among his listeners, as they were presented in a very sensitive and scholarly way. This book is the literary version of Rudolf's lectures, enriched with the most recent findings of historiography. It is a dialogue between the lecturer and the reactions of the audience. Rudolf introduces the most important arguments for his findings, and his audience reacts with supportive, skeptical, and also hostile questions. The Lectures read like an exciting real-life exchange between persons of various points of view. The usual arguments against revisionism are addressed and refuted. This book resembles an entertaining collection of answers to frequently asked questions on the Holocaust. It is the best introduction into this taboo topic for both readers unfamiliar with the topic and for those wanting to know more. Softcover, 566 pages, B&W illustrations, bibliography, index, #538, ***$30*** minus 10% for TBR subscribers.



The Hoax of the Twentieth Century. By Arthur R. Butz. With this book Dr. Butz, Professor of Electrical Engineering and Computer Science, has been the first writer to treat the entire Holocaust complex from the revisionist perspective in a precise scientific manner. The Hoax exhibits the overwhelming force of historical and logical arguments which revisionism had accumulated by the middle of the 1970s. It was the first book published in the U.S. which won for revisionism the academic dignity to which it is entitled. It continues to be a major revisionist reference work, frequently cited by prominent personalities. This new edition comes with several supplements adding new information gathered by the author over the last 25 years. It is a "must read" for every revisionist and every newcomer to the issue who wants to learn about revisionist arguments. Softcover, 506 pages, 6"×9", B&W illustrations, bibliography, index, #385, ***$30*** minus 10% for TBR subscribers.

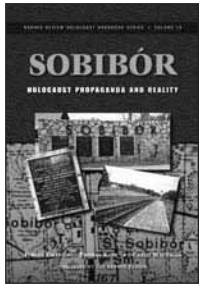
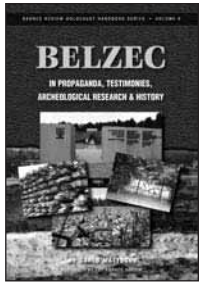
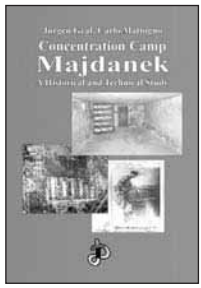
Dissecting the Holocaust. The Growing Critique of 'Truth' and 'Memory.' Edited by Germar Rudolf. *Dissecting the Holocaust* applies state-of-the-art scientific technique and classic methods of detection to investigate the alleged murder of millions of Jews by Germans during World War II. In 22 contributions—each of 30 pages—the 17 authors dissect generally accepted paradigms of the "Holocaust." It reads as exciting as a crime novel: so many lies, forgeries and deceptions by politicians, historians, and scientists. This is the intellectual adventure of the 21st century. Be part of it! "There is at present no other single volume that provides a serious reader with a broad understanding of the contemporary state of historical issues that influential people would rather not have examined." —Prof. Dr. A. R. Butz, Evanston, IL. "Read this book and you will know where revisionism is today. . . . Revisionism has done away with the exterminationist case." —Andrew Gray, THE BARNES REVIEW. Second revised edition. Softcover, large format, 616 pages, B&W illustrations, bibliography, index, #219, ***$30*** minus 10% for TBR subscribers.



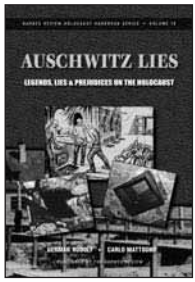
Jewish Emigration from the Third Reich. By Ingrid Weckert. Current historical writings about the Third Reich paint a bleak picture regarding its treatment of Jews. Jewish emigration is often depicted as if the Jews had to sneak over the German border, leaving all their possessions behind. The truth is that the emigration was welcomed and supported by the German authorities and occurred under constantly increasing pressure. Weckert's booklet elucidates the emigration process in law and policy, thereby augmenting the perceived picture of Jewish emigration from Germany. Softcover, 72 pages, index, #539, ***$8*** minus 10% for TBR subscribers.



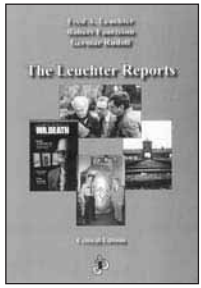
The First Holocaust. Jewish Fundraising Campaigns With Holocaust Claims During and After World War One. By Don Heddesheimer. Six million Jews in Europe threatened with a holocaust: this allegation was spread by sources like *The New York Times*—but the year was 1919! Don Heddesheimer's compact but substantive *First Holocaust* documents post-WWI propaganda that claimed East European Jewry was on the brink of annihilation (regularly invoking the talismanic six million figure). It details how that propaganda was used to agitate for minority rights for Jews in Poland, and for Bolshevism in Russia. It demonstrates how Jewish fundraising operations in America raised vast sums in the name of feeding suffering Polish and Russian Jews, then funneled much of the money to Zionist and Communist "constructive undertakings." *The First Holocaust* is a valuable study of American Jewish institutional operations at a fateful juncture in Jewish and European history; an incisive examination of a cunningly contrived campaign of atrocity and extermination propaganda two decades before the alleged WWII Holocaust—and an indispensable addition to every revisionist's library. Softcover, 142 pages, B&W illustrations, bibliography, index, #386, ***$15*** minus 10% for TBR subscribers.



Treblinka: Extermination Camp or Transit Camp? By Carlo Mattogno and Juergen Graf. It is alleged that at Treblinka in East Poland between 700,000 and 3,000,000 persons were murdered in 1942 and 1943. The weapons used were said to have been stationary and/or mobile gas chambers, fast-acting or slow-acting poison gas, unslaked lime, superheated steam, electricity, diesel exhaust fumes etc. Holocaust historians alleged that bodies were piled as high as multi-storied buildings and burned without a trace, using little or no fuel at all. Graf and Mattogno have now analyzed the origins, logic and technical feasibility of the official version of Treblinka. On the basis of numerous documents they reveal Treblinka's true identity: it was a transit camp. Even longtime revisionism buffs will find a lot that is new in this book, while Graf's animated style guarantees a pleasant reading experience. The original testimony of witnesses enlivens the reader, as does the skill with which the authors expose the absurdities of Holocaust historiography. Softcover, 365 pages, B&W illustrations, bibliography, index, #389, ***$25*** minus 10% for TBR subscribers.



Sobibor: Holocaust Propaganda and Reality. By Juergen Graf, Thomas Kues and Carlo Mattogno. Between 25,000 and 2,000,000 Jews are said to have been killed in gas chambers in the Sobibór camp in eastern Poland in 1942 and 1943. The corpses were allegedly buried in mass graves and later incinerated on pyres. This book investigates these claims and shows that they are not based on solid evidence, but on the selective use of absurd and contradictory eyewitness testimonies. Archeological surveys of the camp in 2000-2001 are analyzed, with fatal results for the extermination camp hypothesis. The book also thoroughly documents the general NS policy toward Jews, which never included an extermination plan. Softcover, 434 pages, B&W illustrations, bibliography, index. #536, ***$25*** minus 10% for TBR subscribers.

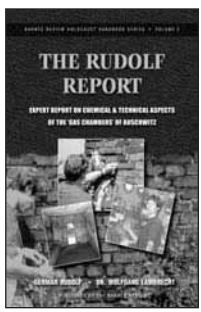


Belzec in Propaganda, Testimonies, Archeological Research and History. By Carlo Mattogno. Witnesses report that at least 600,000, if not as many as three million, Jews were murdered in the Belzec camp, located in eastern Poland, between 1941 and 1942. Various murder weapons are claimed to have been used: diesel gas chambers; unslaked lime in trains; high voltage; vacuum chambers etc. According to witnesses, the corpses were incinerated on huge pyres without leaving any traces. For those who know the stories about Treblinka this all sounds too familiar. The author therefore restricted this study to the aspects which are different and new compared to Treblinka, but otherwise refers the reader to his Treblinka book. The development of the official image portrait about Belzec is explained and subjected to a thorough critique. In contrast to Treblinka, forensic drillings and excavations were performed in the late 1990s in Belzec, the results of which are explained and critically reviewed. These findings, together with the absurd claims by "witnesses," refute the thesis of an extermination camp. Softcover, 138 pages, B&W illustrations, bibliography, index, #540, ***$15*** minus 10% for TBR subscribers.

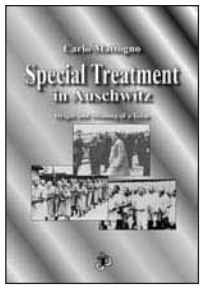
Concentration Camp Majdanek. By Carlo Mattogno and Juergen Graf. Little research had been directed toward concentration camp Majdanek in central Poland, even though it is claimed that up to a million Jews were murdered there. The only information available is discredited Polish Communist propaganda. This glaring research gap has finally been filled. After exhaustive research of primary sources, Mattogno and Graf created a monumental study which expertly dissects and repudiates the myth of homicidal gas chambers at Majdanek. They also critically investigated the legendary mass executions of Jews in tank trenches ("Operation Harvest Festival") and prove them groundless. The authors' investigations lead to unambiguous conclusions about the camp which are radically different from the official theses. Again they have produced a standard and methodical investigative work, which authentic historiography cannot ignore. Softcover, second edition, 320 pages, B&W illustrations, bibliography, index, #380, ***$25*** minus 10% for TBR subscribers.

Auschwitz Lies: Legends, Lies and Prejudices on the Holocaust. By Carlo Mattogno and Germar Rudolf. "French biochemist G. Wellers exposed "The Leuchter Report" as fallacious," but he exposed only his own grotesque incompetence. "Polish researcher Prof. J. Markiewicz proved with analysis that Zyklon B was used in the gas chambers of Auschwitz," but Markiewicz fabricated his results. "Chemist Dr. Richard Green showed that the revisionists' chemical arguments are flawed," yet Green actually had to admit that the revisionists are right. "Prof. Zimmerman proved that the crematories in Auschwitz could cremate all victims of the claimed mass murder." As an accountant, Zimmerman proved only his lack of knowledge. "Profs. M. Shermer and A. Grobman refuted the entire array of revisionist arguments." In truth they covered only a tiny fraction of revisionist arguments, and botched their attempt at refutation. "Keren, McCarthy and Mazal found the 'Holes of Death' proving the existence of the Auschwitz gas chambers." No, they twisted evidence to support their case and suppressed facts. These and other untruths are exposed for what they are: political lies created to ostracize dissident historians and keep the Western world in Holocaust servitude. Softcover, 398 pages, B&W illustrations, index, #541, ***$25*** minus 10% for TBR subscribers.

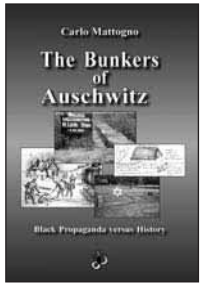
The Leuchter Reports: Critical Edition. By Fred Leuchter, Robert Faurisson and Germar Rudolf. Between 1988 and 1991, U.S. expert on execution technologies Fred Leuchter wrote four expert reports addressing whether the Third Reich operated homicidal gas chambers. The first report on Auschwitz and Majdanek became world famous. Based on chemical analyses of wall samples and on various technical arguments, Leuchter concluded that the locations investigated "could not have then been, or now, be utilized or seriously considered to function as execution gas chambers." Subsequently, this first "Leuchter Report" was the target of much criticism, some of it justified. This edition republishes the unaltered text of all four reports and accompanies the first one with critical notes and research updates, backing up those of Leuchter's claims that are correct, and correcting those that are inaccurate. Softcover, 227 pages, B&W illustrations, #431, ***$22*** minus 10% for TBR subscribers.



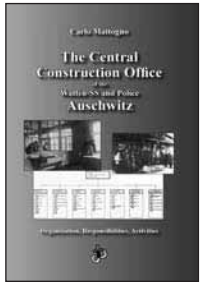
Auschwitz: Plain Facts—A Response to Jean-Claude Pressac. Edited by Germar Rudolf. French pharmacist Jean-Claude Pressac tried to refute revisionists with their own technical methods. For this he was praised by the mainstream, and they proclaimed victory over revisionists. In *Auschwitz: Plain Facts,* Pressac's works are subjected to a detailed critique. Although Pressac deserves credit for having made accessible many hitherto unknown documents, he neither adhered to scientific nor to formal standards when interpreting documents. He made claims that he either could not prove or which contradict the facts. Documents do not state what he claims they do. He exhibits massive technical incompetence and he ignores important arguments. *Auschwitz: Plain Facts* is a must read. Softcover, 197 pages, B&W illustrations, bibliography, index, #542, ***$20*** minus 10% for TBR subscribers.



The Giant With Feet of Clay: Raul Hilberg and His Standard Work on the "Holocaust." By Juergen Graf. Raul Hilberg's major work *The Destruction of European Jewry* is generally considered the standard work on the Holocaust. The critical reader might ask: what evidence does Hilberg provide to back his thesis that there was a German plan to exterminate Jews, to be carried out in the legendary gas chambers? And what evidence supports his estimate of 5.1 million Jewish victims? Juergen Graf applies the methods of critical analysis to Hilberg's evidence and examines the results in light of revisionist historiography. The results of Graf's critical analysis are devastating for Hilberg. Graf's *Giant With Feet of Clay* is the first comprehensive and systematic examination of the leading spokesperson for the orthodox version of the Jewish fate during the Third Reich. Softcover, 128 pages, B&W illustrations, bibliography, index, #252, ***$11*** minus 10% for TBR subscribers.

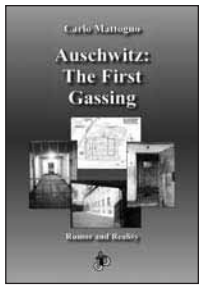


The Rudolf Report. Expert Report on Chemical and Technical Aspects of the 'Gas Chambers' of Auschwitz—Second expanded and revised edition. By Germar Rudolf and Dr. Wolfgang Lambrecht. In 1988, Fred Leuchter, U.S. expert for execution technologies, investigated the alleged gas chambers of Auschwitz and Majdanek and concluded that they could not have functioned as claimed. Ever since, Leuchter's claims have been attacked. In 1993, Rudolf, a researcher from the prestigious Max Planck Institute, published a thorough forensic study about the "gas chambers" of Auschwitz. His report irons out the deficiencies and discrepancies of "The Leuchter Report." *The Rudolf Report* was the first English edition of this sensational scientific work. This new edition analyzes all existing evidence on the Auschwitz gas chambers and offers even more evidence. The conclusions are startling. Appendix describes Rudolf's persecution. Softcover, 457 pages, B&W illustrations, bibliography, index, #378, ***$33*** minus 10% for TBR subscribers.

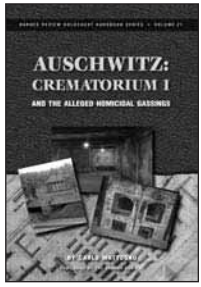


Distribution in the United States: Prices do not include S&H. Inside the U.S. add $5 on orders up to $50. Add $10 S&H on orders from $50.01 to $100. On orders over $100 add a flat $15 no matter the order size. Subscribers to The Barnes Review magazine may take 10% off book prices. Send order to TBR Book Club, P.O. Box 15877, Washington, D.C. 20003, call 1-877-773-9077 toll free to charge to major credit cards or visit www.barnesreview.com.

Special Treatment in Auschwitz: Origin and Meaning of a Term. By Carlo Mattogno. When appearing in German wartime documents, terms like "special treatment," "special action," and others have been interpreted as code words signifying the murder of inmates. While the term "special treatment" in many such documents did indeed mean execution, the term need not always have had that meaning in German records. This book is the most thorough study of this textual problem to date. Publishing and interpreting numerous such documents about Auschwitz—many of them hitherto unknown—Mattogno shows that, while "special" had many different meanings, not a single one meant "execution." This important study demonstrates that the practice of deciphering an alleged "code language" by assigning homicidal meaning to harmless documents is no longer tenable. Softcover, 151 pages, B&W illustrations, bibliography, index, #543, ***$15*** minus 10% for TBR subscribers.



The Bunkers of Auschwitz: Black Propaganda vs. History. By Carlo Mattogno. The so-called "Bunkers" at Auschwitz are claimed to have been the first homicidal gas chambers at Auschwitz specifically equipped for this purpose in early 1942. With the help of original German wartime files, this study shows that these "bunkers" never existed; how the rumors about them evolved as black propaganda created by resistance groups within the camp; how this propaganda was transformed into "reality" by historians; and how material evidence (aerial photography and archeological research) confirms the publicity character of these rumors. Softcover, 264 pages, illustrations, bibliography, index, #544, ***$20*** minus 10% for TBR subscribers.



Auschwitz: The Central Construction Office. By Carlo Mattogno. Based upon mostly unpublished German wartime documents from Moscow archives, this study describes the history, organization, tasks and procedures of the Central Construction Office of the Waffen-SS and Auschwitz Police. Despite a huge public interest in the camp, next to nothing was really known about this office, which was responsible for the planning and construction of the Auschwitz camp complex, including those buildings in which horrendous mass slaughter is erroneously said to have occurred. Softcover, 182 pages, B&W illustrations, glossary, #545, ***$18*** minus 10% for TBR subscribers.

Distribution in the United States: Prices do not include S&H. Inside the U.S. add $5 on orders up to $50. Add $10 S&H on orders from $50.01 to $100. Auschwitz: The First Gassing—Rumor and Reality. By Carlo Mattogno. The first gassing of human beings in Auschwitz is claimed to have occurred on Sept. 3, 1941, in a basement room. The accounts reporting it are the archetypes for all later gassing accounts. This study analyzes all available sources about this alleged event. It shows that these sources contradict each other in location, date, preparations, victims etc, rendering it impossible to extract a consistent story. Original wartime documents inflict a final blow to the tale of the first homicidal gassing. Softcover, 157 pages, B&W illustrations, bibliography, index, #515, ***$16*** minus 10% for TBR subscribers.

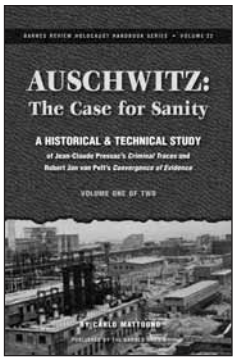
Auschwitz: Crematorium I and the Alleged Homicidal Gassings. By Carlo Mattogno. The morgue of Crematorium I in Auschwitz is claimed to have been the first homicidal gas chamber in that camp. This study thoroughly investigates all accessible statements by witnesses and analyzes hundreds of wartime documents in order to accurately write a history of that building. Mattogno proves that its morgue was never used as a homicidal gas chamber, nor could it have served as such. Softcover, 138 pages, B&W illustrations, bibliography, index, #546, ***$18*** minus 10% for TBR subscribers.

Auschwitz: Open Air Incinerations. By Carlo Mattogno. Hundreds of thousands of corpses of murder victims are claimed to have been incinerated in deep ditches in the Auschwitz concentration/work camp complex. This book examines the many testimonies regarding these incinerations and establishes whether these claims were technically possible. Using aerial photographic evidence, physical evidence and wartime documents, the author shows that these claims are untrue. A must read. Softcover, 132 pages, B&W illustrations, bibliography, index, #547, ***$15*** minus 10% for TBR subscribers.



Concentration Camp Stutthof and its Function in National Socialist Jewish Policy. By Carlo Mattogno and Juergen Graf. The concentration camp at Stutthof near Danzig in western Prussia has never before been scientifically investigated by Western historians. Polish authors officially sanctioned by their Communist government long maintained that Stutthof was converted to an "auxiliary extermination camp" in 1944 with the mission to murder as many Jews as possible. This book subjects this concept to rigorous critical investigation based on literature and documents from various archives. It shows that extermination claims contradict reliable sources. Second edition, 128 pages, B&W & color illustrations, bibliography, index, #379, ***$15*** minus 10% for TBR subscribers. LIMITED QTY: CALL FOR AVAILABILITY!

NEW TWO-VOLUME SET

Auschwitz: The Case for Sanity:

A Historical & Technical Study of Jean-Claude Pressac's 'Criminal Traces' and Robert Jan van Pelt's 'Convergence of Evidence'

By Carlo Mattogno. Because Jewish theologian Deborah Lipstadt had called British historian David Irving a "Holocaust denier," he sued her for libel. In her defense Lipstadt presented Prof. Robert van Pelt as an expert to refute revisionist assertions about Auschwitz. Ever since van Pelt has been praised as the defeater of revisionism and foremost expert on Auschwitz. This book is the revisionist response to Prof. van Pelt and Pressac. It shows that van Pelt's study is "neither a scholarly nor a historical work; it is only a biased journalistic assemblage of poorly understood and poorly interpreted historical sources." This is a book of prime political and scholarly importance! 2 vols. (370 + 390 pages), softcover, B&W illustrations, glossary, bibliography, index. #551, ***$45*** minus 10% for TBR subscribers. Add $25 for a sturdy leatherette case to house the two volumes.

CURRENTLY IN PREPARATION:

Santiago Alvarez: ***The Gas Vans: A Critical Investigation***—During WWII, the German occupational forces in Serbia, Poland and Russia are claimed to have used trucks to kill tens of thousands of people by means of the trucks' exhaust gases. This book is the first to critically investigate all the accessible documents, court verdicts, witness statements and reports about this topic. The anomalies exposed by this study raise doubts about the historical reality of these infamous "gas vans." Softcover, estimated 390 pages, softcover, 6"×9", B&W illustrations, bibliography, index.

Carlo Mattogno: ***The Crematory Ovens of Auschwitz***—An exhaustive technical study of the "core" buildings of the alleged "Holocaust"—and a refutation of mass murder claims based upon false concepts of those crematoria. Projected at two volumes. (Volume I: 550 pages; Volume II: 350 pages), softcover, 6"×9", B&W illustrations, bibliography, glossary, index.

Carlo Mattogno: ***Chelmno. Myth and Reality***—An overview of the mostly unsubstantiated claims and their juxtaposition to provable facts about this camp where thousands are said to have been murdered, mostly by noxious exhaust gases in trucks. Projected at 200 pages, 6"×9", B&W illustrations, bibliography, index.

Distribution in the United States: Prices do not include S&H. Inside the U.S. add $5 on orders up to $50. Add $10 S&H on orders from $50.01 to $100. On orders over $100 add a flat $15 no matter the order size. Subscribers to The Barnes Review magazine may take 10% off book prices. Send order to TBR Book Club, P.O. Box 15877, Washington, D.C. 20003, call 1-877-773-9077 toll free to charge to major credit cards or visit www.barnesreview.com.

THE BARNES REVIEW:

In the maverick tradition of one of the great historians of the modern era . . .

No topic is "too controversial" for The BARNES REVIEW, the most interesting history magazine published anywhere today. Commemorating the trailblazing path of the towering 20th Century revisionist historian, the late Harry Elmer Barnes, TBR's mission is to separate historical truth from propaganda and to bring history into accord with the facts. Founded in 1994 by veteran American nationalist Willis A. Carto—a personal friend of Barnes—*The Barnes Review* concurs with Rousseau's maxim that "Falsification of history has done more to impede human development than any one thing known to mankind." TBR covers all aspects of history from the dawn of man to recent events and also places a special focus on the philosophy of nationalism. As such, TBR proudly describes itself as a "journal of nationalist thought" and dares to be politically incorrect in a day when Cultural Marxism prevails in the mass media, in academia and in day-to-day life. TBR's editorial board of advisors encompasses historians, philosophers and academics from all over the face of the planet, intellectuals united in their desire to bring peace to the world by exposing the lies and prevarications of the past that have brought us to where we are today. If you believe everything you see in the "responsible" media or think that absolutely everything that appears in most college-level history texts is true, you might be shocked by

what you see in TBR—but if you are shocked by what you see in TBR, then that's all the more reason you need to join the growing ranks of independent-minded free-thinkers from all walks of life and all over the world who are longtime TBR subscribers.

THE BARNES REVIEW $46 for ONE year (six bimonthly issues—64 pages each); Including this special free bonus: A FREE COPY OF Michael Collins Piper's blockbuster book *The New Jerusalem*. That's a $20 gift free for a one-year domestic subscription. Subscribe for two years at $78 and get *The New Jerusalem* PLUS Mark Glenn's *No Beauty in the Beast: Israel Without Her Mascara*. Outside the U.S. email TBRca@aol.com for international rates and for S&H to your nation.
